So from the heroic efforts of the early pioneers at the end of the last century, we have in 60 years reached the stage when the future can be viewed with greater confidence. The days of conventional deep-ray therapy are numbered. Mega voltage units have become accepted weapons of great promise. Cobalt units and linear accelerators have fulfilled early expectations and must now prove their worth in the treatment of uterine cancer, but they are expensive and require skilled teams for their handling. This means that the patient with a malignant uterus must go to the center equipped to treat it. If this concept is accepted, as it should be for the surgical as well as for the radiotherapeutic attack, and above all if both surgeons and radiotherapists work in harmony and not as defenders of a vested interest, the prognosis for patients with uterine cancer—be it of the body, the cervix, or both—should exceed all present expectations within the next 10 years. By that time the elusive riddle of cancer may be nearer solution and both surgery and radiotherapy be relegated to a subservient role.

A half century of progress gives grounds for encouragement, but not for complacency. Failures should promote humility and help bring fulfillment of the old promise that "the meek shall inherit the earth." •

85 Banbury Road.

Poliomyelitis and Polio-Like Diseases Differentiated Through Virus Laboratory Studies

Report of the Washington State Polio Surveillance Study—1956

W. R. Giedt, M.D., D. N. Wysham, M.D. and Jack Allard, B.S., seattle, washington

Virus laboratory studies yield much information on paralytic and nonparalytic poliomyelitis. The latter term is erroneous and should be replaced by the diagnosis of aseptic meningitis.

Recovery and identification of the Coxsackie viruses from stool specimens in 1947, and later the ECHO (entero-cytopathogenic-human-oprhan) viruses, gave increased support to the suspicion that many cases of illness diagnosed heretofore as non-paralytic poliomyelitis were actually diseases produced by viruses other than poliovirus. Since the introduction of the use of vaccine against poliomyelitis is still so recent, it remains necessary to accumulate accurate observations as to its efficacy, duration of protection, proper dosage and the like. With these problems in mind, an attempt was made to determine how frequently poliovirus could be recovered from the stools of patients with illnesses suggestive of poliomyelitis, and, conversely, how frequently non-polio viruses could be isolated from such patients if poliovirus was not recovered.

Selection of Cases for Study

The subjects of this study consist of 305 patients from all parts of the state who had illnesses during 1956 in which poliomyelitis was given serious consideration in the differential diagnosis. Included among these are 192 patients whose illnesses were reported officially to the health department as acute poliomyelitis.

Diagnostic Criteria

For the purpose of this study, the clinical descriptions outlined in the National Foundation for Infantile Paralysis booklet "Definitive and Differential Diagnosis of Poliomyelitis" were used as a guide to diagnosis and cases were classified according to the following criteria:

A. Non Paralytic Poliomyelitis

General symptoms of poliomyelitis, such as fever, headache, nausea, without paralysis but including spinal or nuchal rigidity, plus

(1) abnormal spinal fluid (white cells or protein) (more than 10 white cells per cubic centimeter, or protein greater than 50 mg. per cent or both)

(2) isolation of poliovirus from the stool.

B. Paralytic Poliomyelitis

The diagnosis of paralytic poliomyelitis was accepted when a patient had recent onset of definite weakness or paralysis persisting beyond the period of acute illness, and in addition one or more of the following:

(1) An acute illness, with fever and spinal or nuchal rigidity (or cranial nerve involvement).

Dr. Giedt is Chief of the Division of Epidemiology, Washington State Department of Health.

Dr. Wysham is Medical Epidemiologist, Washington State Department of Health.

Mr. Allard is Head of Virus Diagnostic Unit, Washington State Department of Health.

This report is presented as a matter of interest to the practising physicians, and hospital and health department personnel who participated in the study by collecting and supplying the information and laboratory specimens required. The study could not have been made without their contribution for which the authors wish to express their grateful appreciation.

(2) Abnormal spinal fluid (white cells or protein or both).
(3) Isolation of poliovirus from the stool.

C. Aseptic Meningitis Syndrome (after Wallgren)
(1) Acute onset with signs and symptoms of meningeal irritation: Headache, fever, stiff neck, nausea or vomiting (occasionally).
(2) Spinal fluid changes: Increased cell count or protein concentration or both.
(3) Cultures of spinal fluid negative for bacteria.
(4) Short duration without secondary complications (no paralysis or residual weakness).
(5) Absence of parameningeal disease (otitis, sinusitis, trauma).
(6) Absence of systemic infection complicated by secondary meningitis (tuberculosis, typhoid, leptospirosis, syphilis).

The following is a list of viral agents capable of producing the aseptic meningitis syndrome:

Most Commonly Occurring
Poliovirus
Mumps
Coxsackie virus
ECHO virus (enteric-cytopathogenic-human-orphan virus)

Less Common
Western and Eastern equine encephalitis
St. Louis encephalitis
Herpes simplex and zoster viruses
Infectious hepatitis
Lymphogranuloma venereum — Psittacosis (rare)
Infectious mononucleosis (virus?)
Lymphocytic choriomeningitis (not yet identified in state of Washington)

Other conditions occasionally complicated by meningo-encephalitis
Measles
German measles
Smallpox
Vaccinia
Chickenpox

Laboratory Specimens

An attempt was made to obtain feces specimens from each patient during the first week of illness, since it has been demonstrated that the best opportunity to recover poliovirus from stools occurs during this period. Unfortunately, specimens were not always obtained within that time limit for various reasons, and obtaining specimens was delayed up to a month in one instance. The specimens were shipped through the mails, unrefrigerated and a few were in the mail for as long as 6 to 10 days.

When poliovirus was recovered, it was usually isolated from the first specimen submitted, making it unnecessary to examine the second specimen. In 24 cases in which no virus was recovered, two specimens from 6 of the patients were tested, but the second specimens also yielded no virus.

It was suspected that the delay in obtaining specimens or the length of time specimens were in transit were factors which might be unfavor-

Table 1. Elapsed Time Between Onset, Collection and Processing of Stool Specimens from Cases of Paralytic Poliomyelitis.

	Poliovirus isolated (29 cases)		Poliovirus not isolated (23 cases)	
	Median	Range	Median	Range
Time elapsed between onset and collection of specimen	7 days	2-19 days	5 days	1-30 days
Time between collection of specimen and receipt in laboratory	1 day	0-11 days (42% of specimens were collected after first 7 days of illness)	1 day	0-6 days (31% of specimens were collected after first 7 days of illness)
Time between receipt of specimen in laboratory and processing	11 days	0-90+ days (21% of specimens were enroute for more than 2 days)	9 days	1-90+ days (14% of specimens were enroute for more than 2 days)

able to the yield of virus in some specimens. A comparison of these factors was made between 29 cases of paralytic poliomyelitis from which poliovirus was recovered, and 23 cases of paralytic poliomyelitis from which poliovirus was not recovered. (See table 1.) The comparison did not confirm this suspicion. It therefore appears necessary to search elsewhere for the explanation of failure to recover poliovirus from 46 per cent of the paralytic cases tested.

Laboratory Procedures

Since virus diagnostic laboratory service is relatively new to most physicians, it may be of interest to outline briefly the procedures involved in examination of specimens.

1. *Stool Specimens*—Upon receipt of specimens in the laboratory, they were stored in a refrigerator at -15 F. until ready for processing.

Processing consisted of preparing a 10 per cent suspension of the fecal matter in tap water, which was then centrifuged at high speed under refrigeration. The supernatant was then treated with antibiotics to eliminate any residual bacterial or mycotic contamination. Such treated supernatants were then inoculated into tubed monolayer cultures of monkey kidney cells.

If a cytopathogenic effect was produced, tissue culture fluid from the original cultures were treated with type specific antisera against each of the three types of poliovirus, and then inoculated into fresh monkey kidney cell cultures. The presence of any type of poliovirus was confirmed if the cytopathogenic agent was neutralized by one of the three type specific polio antisera.

If the cytopathogenic agent was not neutralized by the polio antisera, it was assumed that the agent was a nonpolio virus. To determine whether the agent might be a Coxsackie or ECHO virus, infected tissue culture fluid was then inoculated into 1 day old suckling mice. If the agent in the fluid was capable of killing or paralyzing the mice, it was considered to be a Coxsackie virus. If the infant mice survived, the agent was presumed to be a virus of the ECHO group.

To determine the precise type of Coxsackie or ECHO virus that had been isolated, infected tissue culture fluids were frozen and shipped for typing to the Public Health Service Viral and Rickettsial Laboratories at Montgomery, Alabama, by air mail. The procedures necessary to determine specific antigenic serotypes of these viruses is a long, tedious and costly operation, and we are greatly indebted to the Public Health Service for performing this service for us.

2. *Blood Specimens*—An attempt was made to obtain acute phase blood specimens from all patients in order to be able to make comparisons with convalescent phase specimens, particularly when it was desirable to rule out such diseases as mumps meningitis or arthropod-borne encephalitis. Also, it was hoped that means could be found to demonstrate rises in antibody titre against the various viruses isolated. Unfortunately it was not possible to carry on the latter type of study.

Findings of Study

Changes in Diagnostic Classification.

By application of the diagnostic criteria established for this study, a shifting of diagnostic categories was produced as noted in table 2.

Table 2.

Original Clinical Diagnosis	Cases	%	Final Diagnostic Classification Cases	%
Suspect Polio	65	21.5	0	0
Non-Paralytic Polio	101	32.8	8	2.6
Paralytic Polio	95	30.1	91	30.0
Aseptic Meningitis	25	8.2	177	58.0
Other Diseases	19	6.2	29	9.4
Totals	305	100.0	305	100.0

It may be seen that the diagnosis of cases originally called suspect poliomyelitis were eventually changed to fall into one of the other four categories; similar shifts occurred in all orignal diagnostic categories. As would be expected, the diagnoses of those cases originally called paralytic poliomyelitis remained quite constant, the most notable shifts being away from the diagnosis of non-paralytic poliomyelitis, and the increase in the proportion of cases finally classified as aseptic meningitis syndrome.

Isolation of Viruses According to Final Diagnostic Classification.

Laboratory specimens were not obtained from 55 of the 305 patients included in this study. The final diagnosis of 37 of these patients was paralytic poliomyelitis, 17 were classified as

aseptic meningitis and 1 case was placed in the other diseases category.

For the purpose of this study, non-paralytic poliomyelitis includes only those cases which have manifested the usual non-paralytic symptoms plus isolation of poliovirus. It is quite possible that there were cases of true non-paralytic polio not included here because no poliovirus was recovered from the patient. Such cases would be classified as aseptic meningitis syndrome.

Table 3 illustrates the recovery of viruses from the 250 patients from whom specimens were obtained and examined. Poliovirus was recovered from only 14.8 per cent of these patients; a non-poliovirus was recovered from 35.2 per cent of them, and no virus was recovered from 50 per cent.

Poliovirus was recovered from only 53.7 per cent of the patients whose final diagnosis was paralytic poliomyelitis. No virus was isolated from 42.6 per cent of the patients with this diagnosis. It is assumed that the paralytic disease in these cases was caused by poliovirus infection. Unfortunately, antibody studies were not carried out to determine whether the patients in this group actually exhibited polio antibody titres which would support this assumption.

Specific Viruses Isolated.

Table 4 presents the frequencies and specific types of viruses isolated according to the final diagnosis. The predominant poliovirus was Type I; no isolations of Type II were made, and Type III poliovirus was recovered from only 3 patients. It is of note that in two instances of paralytic disease, non-polioviruses were recovered—ECHO Type 6 in one case and ECHO Type 14 in another.

We have been impressed by the fact that in no instance was more than one type of virus isolated from an individual specimen or from several specimens from the same patient. It seems reasonable to expect that some persons would be harboring more than one type of virus. Our experience in this regard appears to be the same as in other parts of the United States. This circumstance may be due to one of several

Table 3.

possible causes; our laboratory methods may not be sufficiently sensitive, or the so-called "interference" phenomenon may be operative. At any rate, this situation needs further study.

Seasonal Distribution of Cases.

From table 5 and figures 1 and 2 it may be seen that both poliomyelitis and the aseptic meningitis syndrome caused by other viruses

Table 5. Incidence by Month of Onset—Final Diagnosis.

Month	Poliomyelitis	Aseptic Meningitis	Total
January	10	1	11
February	4	4	8
March	1	2	3
April	1	3	4
May	3	1	4
June	5	3	8
July	10	18	28

September	17	37	54
October	9	37	46
November	3	11	14
December	4	2	6
Totals	98	176	274

were prevalent during the same seasonal period. Both began to increase during June and both reached a seasonal peak during August. However, the incidence patterns were not identical. Poliovirus appeared to become prevalent earlier, while Coxsackie viruses appeared to persist at a much higher incidence following the seasonal peak. Thus, pre-seasonal cases are more apt to be due to poliovirus infection, while late seasonal cases are more apt to be due to non-poliovirus infections.

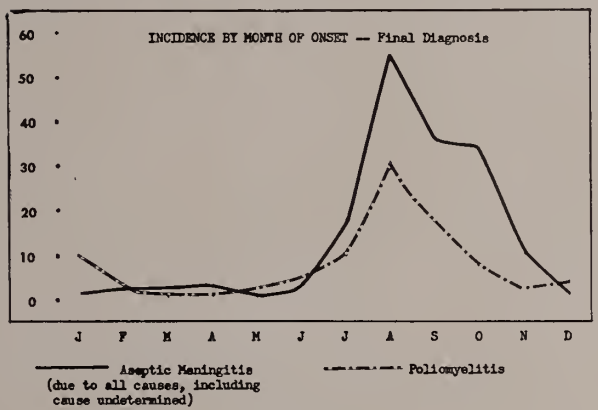

Fig. 1.

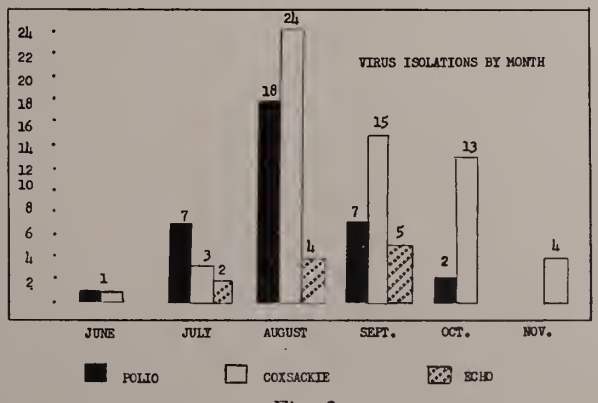

Fig. 2.

Geographic Distribution.

Table 6 illustrates the distribution of cases of poliomyelitis and aseptic meningitis by county.

Table 6. Geographic Distribution of Cases by County.

County	Aseptic Meningitis	Poliomyelitis	Total
Benton	5	3	8
Chelan	0	1	1
Clark	4	12	16
Columbia	1	0	1
Cowlitz	2	4	6
Grant	3	0	3
Grays Harbor	2	4	6
King	52	24	76

Thurston	0	1	1
Walla Walla	1	2	3
Whatcom	5	2	7
Whitman	3	1	4
Yakima	14	6	20
Totals	177	98	275

There were outbreaks of aseptic meningitis in 12 counties with between 3 and 52 cases per outbreak. There were outbreaks of 3 or more cases of poliomyelitis in 11 counties. Outbreaks of 3 or more cases of both aseptic meningitis and poliomyelitis occurred in 8 counties.

Age Distribution.

The age distribution of cases of poliomyelitis and aseptic meningitis (table 7) differed consid-

Table 7. Age Group Incidence Variations Between Poliomyelitis and Aseptic Meningitis.

Age Group Years	Total	Poliomyelitis Cases	Poliomyelitis %	Aseptic Meningitis Cases	Aseptic Meningitis %
0-2	23	15	19.0	8	5.0
3-5	42	16	20.2	26	16.3
6-14	68	13	16.4	55	34.6
15-24	52	17	21.5	35	22.0
25 thru 50	53	18	22.7	35	22.0
Totals	238	79		159	

erably up to the age of 15, but thereafter the pattern was quite similar in both these disease categories. The incidence of poliomyelitis was much higher in the infant group (0 to 2 years) than the incidence of aseptic meningitis. Whereas the incidence of aseptic meningitis was highest in the school age group (6 to 14 years), the incidence of polio was lowest in this group. It is of interest that almost one half of the cases of poliomyelitis occurring in this group had received one or two inoculations of polio vaccine (10 of 22). No doubt a relatively large portion of the children in this age group had received protection against poliomyelitis, but not against aseptic meningitis due to some other virus.

Vaccination Against Poliomyelitis.

Eight poliomyelitis patients each received one inoculation of polio vaccine. Each of these developed paralytic polio. Eight patients each received two inoculations of vaccine; 6 of these developed paralytic polio and 2 of them developed non-paralytic polio. No cases of poliomyelitis occurred in any person who had received three inoculations of vaccine.

It is of interest to note that of the 16 patients who developed poliomyelitis following vaccination, the onset of 7 occurred within 1 to 7 days after the last inoculation; the onset of 2 cases occurred within 20 to 23 days after last inoculation and the onset of 7 cases occurred 2 or more months following last inoculation.

Of 17 persons in the age group 15 through 24 years who developed poliomyelitis, only 2 had received vaccine; one of these had received two inoculations and the other only one inoculation. Of 18 persons over the age of 25 years who developed poliomyelitis, only 1 had received vaccine, and this patient had received two inoculations. This information emphasizes the need for immunization of adults as well as children. See table 8.

Table 8. Vaccination of Patients Who Developed Poliomyelitis.

Clinical Type	Total Inoculations	Date Last Inoculation	Date Onset	Interval
Non-paralytic	2	8-3	8-9	6 days
" "	2	6-?	10-3	4 months

" "	1	8-22	8-24	2 days
" "	1	8-30	9-4	5 days
" "	2	5-26	9-4	4 months
" "	2	2-56	9-12	7 months
" "	1	9-18	9-19	1 day
" "	2	11-29	12-22	23 days

"Other" Diseases.

Poliomyelitis must be differentiated from a wide variety of illnesses which are accompanied by symptoms common to both. In some instances the differentiation can be made by observation of the progress of the illness; however, in many instances a differentiation can be made only with the aid of the virus laboratory. The following is a list of diseases differentiated from poliomyelitis among the cases included in this study:

Final Diagnosis	*Cases*
Viral enteritis	3
Influenza	1
Mumps meningoencephalitis	5
Guillain-Barre syndrome	4
Chickenpox meningitis	1
Abscessed tooth	1
Serratus anterior palsy	1
TB meningitis	1
Trauma left hip	1
Rheumatic fever	1
Neuritis	1
Intestinal parasites	1
Abscess left hip	1
Viral hepatitis	1
Pleurodynia	1
Sickle-cell anemia	1
Fever, undetermined origin	4

Conclusion

A study of 305 patients with illnesses resembling paralytic or non-paralytic poliomyelitis is reported. The final diagnosis, as based on criteria established for this study, was changed in 50 per cent of the cases. The diagnosis of paralytic poliomyelitis remained fairly constant (only a 1.3 per cent shift).

Results of the study indicate that polio-like disease caused by viruses other than poliovirus occur during the same seasonal period and have been classified clinically as non-paralytic or suspect poliomyelitis. Through the use of the virus laboratory it is now possible to differentiate some of these diseases from poliomyelitis.

Of special interest was the finding of a non-poliovirus only in 2 cases of paralytic disease, indicating that other viruses may also be cap-

able of producing the clinical picture of paralytic poliomyelitis.

The findings of this study support the contention of the World Health Organization Expert Committee on Poliomyelitis that the disease category of non-paralytic poliomyelitis, so frequently used in the past, is a syndrome caused by infection with a variety of viruses and other agents, and that the use of the designation *non-paralytic poliomyelitis* should be dropped in favor of the more definitive term *aseptic meningitis* qualified by the designation of etiology as demonstrated, suspected or unknown.

In line with this thinking, the Washington State Board of Health has recently made the aseptic meningitis syndrome a reportable disease. •

The State of Washington Department of Health, Smith Tower (4) (Dr. Giedt).

New Legislation

Union Welfare Funds. Senator McClellan (D., Ark.) proposes to require the registration of labor unions and labor relations counsellors and the observance of minimum standards in bylaws of unions. Name and title of each person responsible for administration of any trust in which a union is interested, including health and welfare funds, would have to be supplied the Secretary of Labor, along with other pertinent information. The bill is S. *3618.*

Diabetes Grants. Senator Anderson (D., N.M.) in S. *3690* would authorize grants to state or local agencies, universities, hospitals and laboratories for projects pointing toward the detection and control of diabetes and for rehabilitating persons suffering from the disease.

Public Assistance. As an anti-recession measure, *H.R. 11678* by Rep. O'Neill (D., Mass.) would set up a fifth category of public assistance recipients for those needy persons not now eligible. General assistance is defined as money payments for medical care "or any type of remedial care . . . in behalf of needy individuals or families." . . . Rep. McCormack (D., Mass.) under *H.R. 11703* would eliminate the 1956 restrictions but not disturb the increases in medical care payments. Prior to the 1956 changes, states were permitted to include money for medical care in their direct payments to recipients or to provide the care by making payments directly to the vendors of the medical services. Now states operate either under the old arrangement or a new system of direct vendor payments with federal participation limited to $3 per adult and $1.50 per child recipient . . . S. *3685* by Senator Yarborough (D., Texas) would (1) increase federal participation in the four public assistance programs, (2) increase U. S. payments for medical care to $5.33 per month for each adult and $2.67 for each child and (3) provide for the U. S. to pay half the cost of administering these activities.

Hill-Burton. Senator Langer (R., N.D.) would amend the Hill-Burton hospital construction program to extend eligibility to nonprofit corporations or associations that have a contractual affiliation with a nonprofit hospital. The number is S. *3699.*

Aid to Education. Rep. Knutson (D., Minn.) is urging enactment of a mammoth grants bill calling for expenditure of $100 billion over 10 years for grants and loans to stimulate primary and secondary school construction, improve teaching and set up a nationwide school health program. The school health program would cost $2 billion over the 10 years. Half the health fund would be apportioned among states on the basis of the number of school-age children in each state, and the other half would go as grants to finance research in child health and to establish pilot programs for detection, control and treatment of children with health problems. The health section of the program would provide (a) medical, dental and mental health services to school children, (b) establish school health clinics and mobile clinics for rural areas, and (c) initiate programs to combat health problems prevalent among children. The number is *H.R. 11960.*

Veterans Benefits. In *H.R. 12001,* Rep. Siler (R., Ky.) would authorize emergency outpatient treatment by Veterans Administration for any veteran, whether the condition is service-connected or not, if the veteran is receiving a pension or compensation. Also, VA would be authorized to reimburse any such veteran for emergency outpatient expenses incurred at a non-VA hospital.

from AMA Washington Letter

Newer Concepts in Surgery for Carcinoma of the Colon

JOHN SONNELAND, M.D.
SPOKANE, WASHINGTON

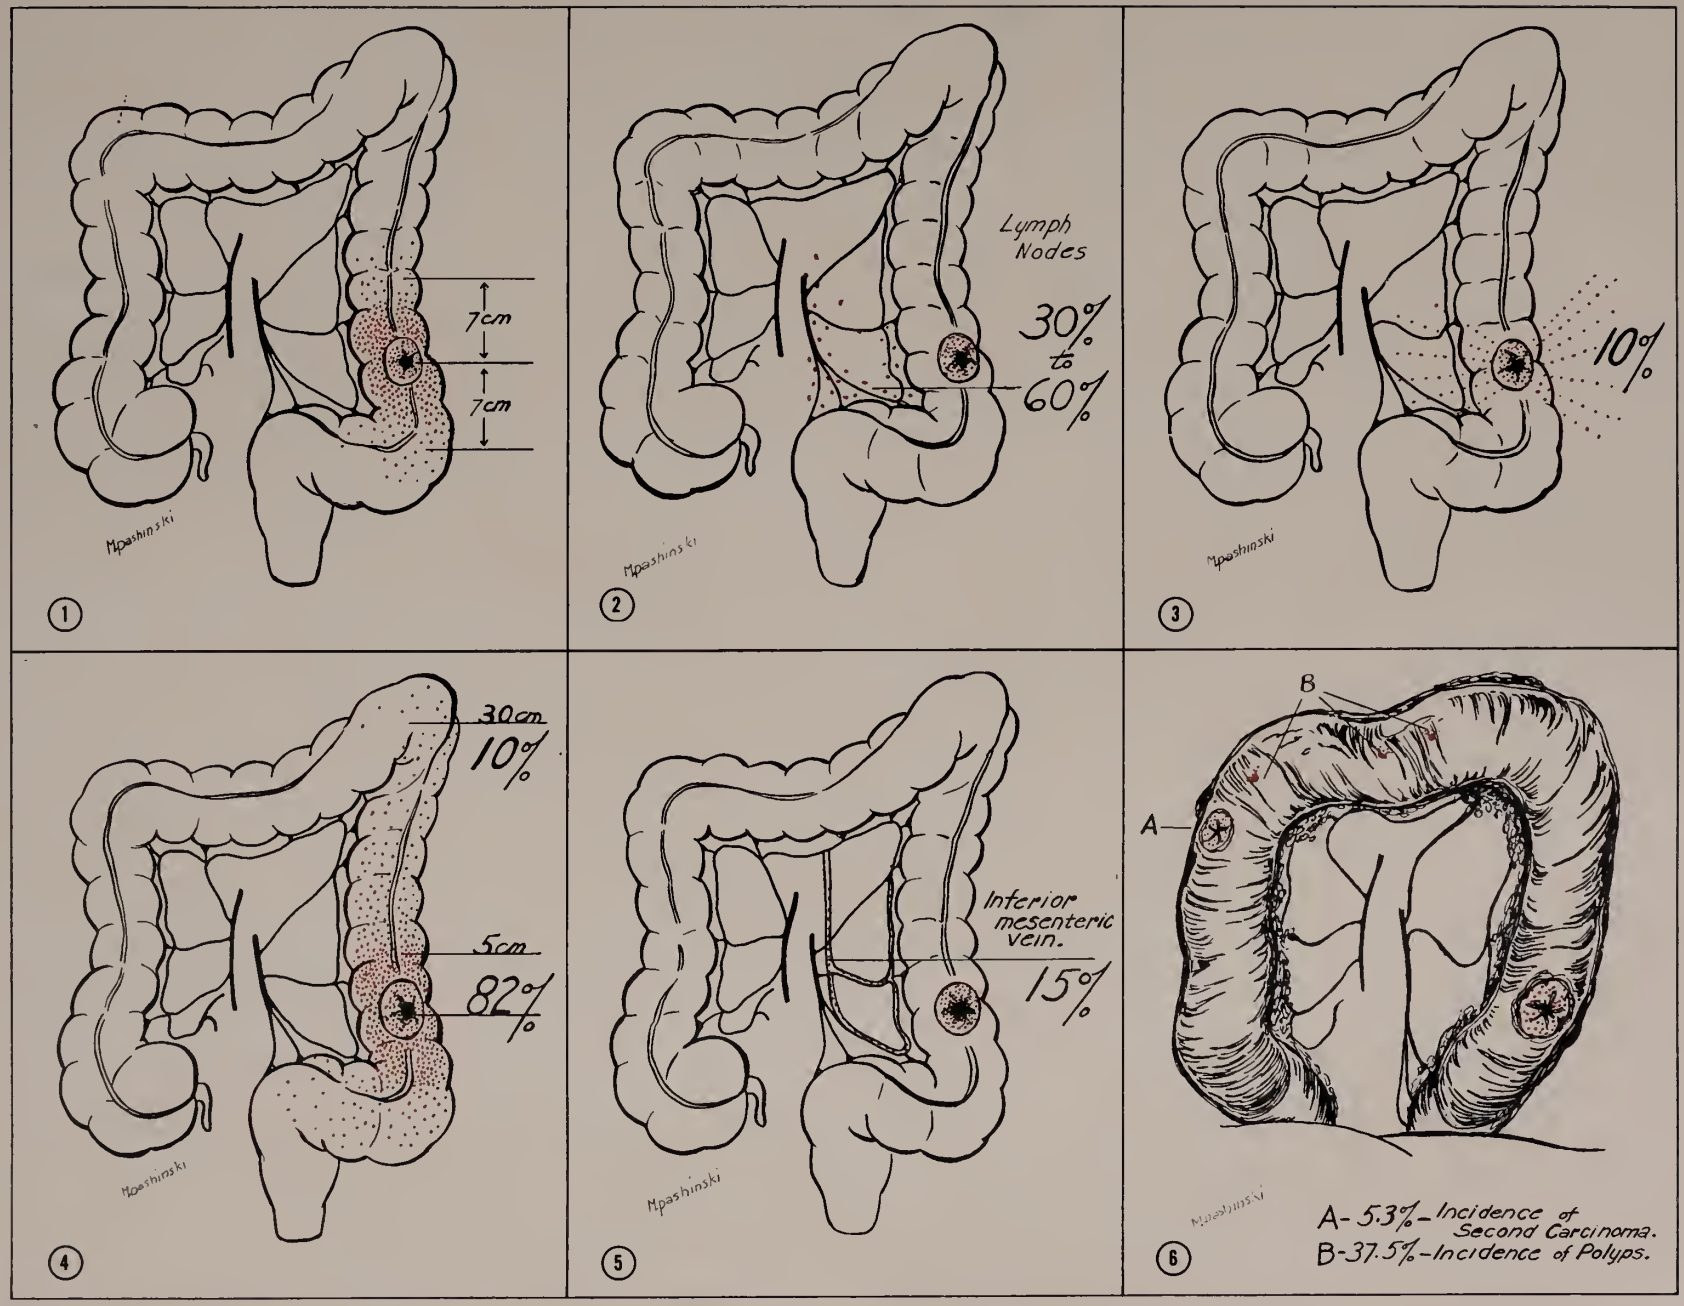
Improved application of known principles usually brings more progress than development of new theories. Resection of the tumor and adjacent lymphatic tissue can cure cancer of the colon. Higher percentage of cures can be obtained by more accurate knowledge of the possibilities of spread and more care in preventing dissemination of cancer cells at the time of surgery.

Surgery for cancer of the colon may well be entering a new era in which fatalistic acceptance of past survival rates will yield to markedly improved results. Advances in this field of surgery have been rapid, and have been little publicized. These advances have been along two broad fronts: the area of lymphatic resection, and quarantine of the tumor during surgery. This paper will outline significant contributions of the past decade, and project from such information a scheme for surgery in cancer of the colon.

At the outset, there are those who would criticize any variation in the surgical approach to cancer until long-term reports on percentage survival rates have been filed in the literature. In the meanwhile, lives may be lost while such data accumulate. The innovations to be here reported can be purchased with a slightly prolonged operative time and, with selection of cases, need not adversely affect operative mortality.

Lymphatic Resection

How much tissue should be excised? This question can be given a reasonable answer if one first considers how and where lymphatic metastases occur. Such metastases occur microscopically within the bowel wall, and they also occur by emboli of tumor cells to nodes near the tumor or at the base of the mesentery.



In the case of intramural extension, microscopic spread occurs up to 7 cm. in the subserosal or perirectal lymphatics on either side of the gross tumor.[1] Thus, considering only the factor of intramural cancer spread, the minimum safe resection should include at least 10 cm. of colon on either side of the tumor. As will be pointed out later, a 30 cm. margin is desirable.

Nodal mestasases have these features: emboli may skip nodes adjacent to the colon and involve nodes at the base of the mesentery;[2] the surgeon's impression of whether or not a node is involved is often wrong;[3] and the artery or

---

FACING PAGE:

Fig. 1. *Intramural Metastases*: Extension within the colic wall along subserosal lymphatics occurs up to 7 cm. beyond the gross confines of the carcinoma. Fig. 2. *Lymphatic Metastases*: Lymph node metastases occur in from 30 to 60 per cent of cases. The percentage varies depending on location of the tumor along the course of the colon, and probably on the thoroughness with which one performs the laboratory dissection. Fig. 3. *Transperitoneal Metastases*: Malignant cells are shed into the peritoneal cavity from the serosal surface of the tumor in approximately 10 per cent of cases. Fig. 4. *Intraluminal Metastases*: Malignant cells are broadcast into the lumen of the colon, 82 per cent of cases showing tumor cells within 5 cm. of the tumor, 10 per cent of cases at a distance of 30 cm. from the tumor. *Ten to fifteen per cent of resections for cancer of the colon fail* because of local recurrence felt due to implantation of intraluminal oancer cells at the time of initial surgery. Fig. 5. *Intravenous Metastases*: With gentle tumor handling, about 15 per cent of cases will show cancer cells in the venous return from a tumor area. Fig. 6. *Secondary Tumors*: Additional tumors of the colon should be sought out. In one series of carcinoma of the colon, 5.3 per cent were found to have two carcinomas, and 37.5 per cent of the series were found to have one or more polyps.

arteries of supply to a colic cancer will usually form the pathway of lymphatic extension.[3]

Wide resection of node-bearing tissue is felt justified in view of several reports. Series comparing cancer of the right colon (hemicolectomy) and left colon (more limited resections) show definitely better five-year survival chances in cancers of the right colon,[4,5] despite a higher incidence of positive nodes on the right.[3,6,7] Exacting autopsies were performed on 11 patients who died within days of surgery for cancer of the colon and rectum: 4 contained residual retroperitoneal tumor, in 3 of which (27 per cent) a dissection only 1.5 cm. wider would have included all apparent tumor![8] In another series of 36 patients upon whom left colectomy with inferior mesenteric artery ligation was performed, 14 per cent had positive nodes within 2 cm. of the origin of the artery.[9]

Deddish of New York's Memorial Center has carried his surgical attack for cancer of the rectum and distal colon beyond the usual radical operations appearing in the literature.[10] Briefly, in more advanced lesions he not only ligates the inferior mesenteric artery, but essentially strips the central area of the dorsal abdominal wall from the duodenum to the obturator areas, coupling this with radical panhysterectomy in females or, at times, with seminal vesiculectomy and partial prostatectomy in males. Five-year end results are ready in 114 patients.[11] Of the group, 14.9 per cent had positive extramesenteric nodes (obturator, para-aortic, hypogastric), which are nodes in addition to those removed by the usual Miles procedure. Of these 14.9 per cent, 17.6 per cent (or 2.6 per cent of the total group) have survived five or more years. It is questionable if the risk of such extensive surgery will be generally accepted, since 85.1 per cent were subjected to the increased surgery without positive extramesenteric nodes being found, and of the 14.9 per cent with these positive nodes, only about one in six actually lived as long as five years.

Cancer Seeding

Cytologic studies have shown that cancer can be broadcast from the colon in at least three directions during surgical manipulation. First, cells can be wiped off the serosal surface of tumors of the colon in a reported 10 per cent of cases.[12] Parenthetically, Duke's classes B and C (extension to serosa without and with node metasases, respectively) comprise about 80 per cent of cancers of the colon.[13]

Fascinating studies have been published in which cancer cells have been found free within the intestinal lumen; these cancer cells may be caught in the line of anastomosis to produce recurrences.[14-16] McGrew *et al.*[17] report that the frequency with which such cells can be found diminishes the further from the tumor one goes in taking mucosal smears.

Whereas 82 per cent of specimens will show positive cells when smears are taken 5 cm. from the tumor, only 10 per cent of specimens are positive at 30 cm. The size, grade and site of the tumor bear no apparent relationship to the problem. Pre-operative enemas are apparently not an aggravating factor. The ileocecal valve is ineffective in preventing retrograde spread, and positive cells are often found in the terminal ileum in lesions of the ascending colon.

Cancer cells are undoubtedly shed intermittently into the blood stream in a high percentage of cases. Turnbull[18] believes that such venous metastases are greatly increased by surgical manipulation. Isolating the venous return from involved colon segments, he massaged the cancer in 33 cases, recovering tumor cells from the blood in 10 patients. Subsequently, in 67 patients in whom the tumor was handled as gently as possible, positive cells were recovered in an additional 10 patients. In a patient with rectal carcinoma metastatic to the liver, he found mulitiple blood samples cancer-free before normal digital examination of the tumor, and then showers of cancer cells following examination.

Host resistance to blood-borne cancer cells undoubtedly varies from patient to patient. In a series of patients shown to have cancer cells free in the blood, many survived and were apparently cancer-free several years following surgery.[13] The factors causing decreased resistance are not well understood. In experimental animals, successful embolization is facilitated by a sluggishly moving blood stream in an organ possessing decreased oxygen saturation and a rich carbohydrate content—for example, the liver.[19]

In rats another study showed that the percentage of liver "takes" is directly related to the number of tumor cells in the injected suspension.[20] It was also found that nitrogen mustard injected shortly after tumor inoculation caused the rate of liver "takes" to fall from 97.4 to 19.4 per cent. Delaying nitrogen mustard adminis-

tration a day or two markedly decreased its effectiveness.

Unforeseen Tumors of the Colon

Polyps and second carcinomas are frequently unforeseen findings in those undergoing surgery for carcinoma of the colon. In 131 patients who died soon following surgery for carcinoma of the colon and rectum, autopsies disclosed the residual colon to contain premalignant polyps in 37.4 per cent, and to contain a second carcinoma in 5.3 per cent.[21] Advocating total or near-total abdominal colectomy for carcinoma, another study indicated that 5 of 43 patients (18.6 per cent) with cancer of the colon either were found to have a second malignancy at initial surgery, or developed a new, primary carcinoma of the residual colon in from 6 months to 17 years after a previous colectomy.[22] In the majority of the 5 cases cited, although surgery was originally intended for carcinoma of the left colon, the second carcinoma was found in the right colon.

The Second-Look Operation

Wangensteen and his group have been reoperating upon patients found to have positive lymph nodes at initial surgery for gastrointestinal carcinoma. Specifically, carcinoma of the colon second-look operations have had more gratifying results than such surgery elsewhere in the gastrointestinal tract. Approximately six months following initial surgery, and while the patients are asymptomatic and without clinical evidence of residual cancer, they are re-operated upon. Any suspicious nodule is removed. If cancer is found, these patients are opened again in another six months.[23]

Of 27 patients with positive lymph nodes at the first operation, *and in whom cancer was found at subsequent operation(s)*, 5 are living and well, with a negative exploration for cancer at the final operation. There have been no operative deaths in this series except in those with advanced cancer; there have been no operative deaths in an additional group of 24 with positive lymph nodes at the initial operation, in whom cancer was not found at the second-look operation.

That is, of 51 patients subjected to second-look surgery, no operative deaths were experienced in those without advanced cancer, and 5, or possibly 6, have apparently been salvaged for periods ranging up to six years. Arhleger of the University of Minnesota contrasts this survival rate with roughly comparable survival rates for surgery of carcinoma of the lung or stomach, indicating that there is as much rationale for second-look surgery as there is for primary surgery of lung and stomach carcinoma.[24]

Arhelger's point seems well taken, but I join most surgeons in being rather reluctant to embark on the second-look venture at this time.

Discussion

The focus should be shifted in surgery for cancer of the colon from an initial attack on the tumor itself, to an approach directed at sealing all known avenues of metastasis before the tumor is mobilized. The extent of resection should be as wide as possible, compatible with the condition of the patient, to include not only an extensive resection of lymphatics but an extensive resection of colon itself. The latter step is important for three reasons: removal of intramural lymphatic extension, removal of mucosal surface contaminated near the tumor with free cancer cells, and removal of possible malignant or premalignant polyps. Prior to anastomosis of remaining segments of colon, an endoscopic search should be made for further tumor growth.

Venous dissemination of cancer cells is the factor which ultimately kills the patient. Chances of cancer cells successfully grafting into host tissue, be it liver, lung or bone, depend apparently upon the quantity of cells released by surgical manipulation, upon the viability of these cells and upon host resistance. Quarantining the vascular supply of a tumor before surgical manipulation seems a reasonable step. The viability of cancer cells may be decreased by administering nitrogen mustard or triethylene thiophosphoramide (thioTEPA) before they have grafted themselves into host tissue. An arresting concept, nitrogen mustard administration, at least in full dosage, will probably not receive wide acceptance until its usefulness has been demonstrated to exceed its potential harm. Factors which can increase host resistance are largely unknown, but it is hoped that generous blood replacement and adequate oxygenation in the immediate postoperative period may be beneficial in this respect.

The above steps, if individualized and applied judiciously, are unlikely to harm the patient, and hold promise of improving our static figures of success.

A Technique of Colon Resection

Based on the information reported up to this

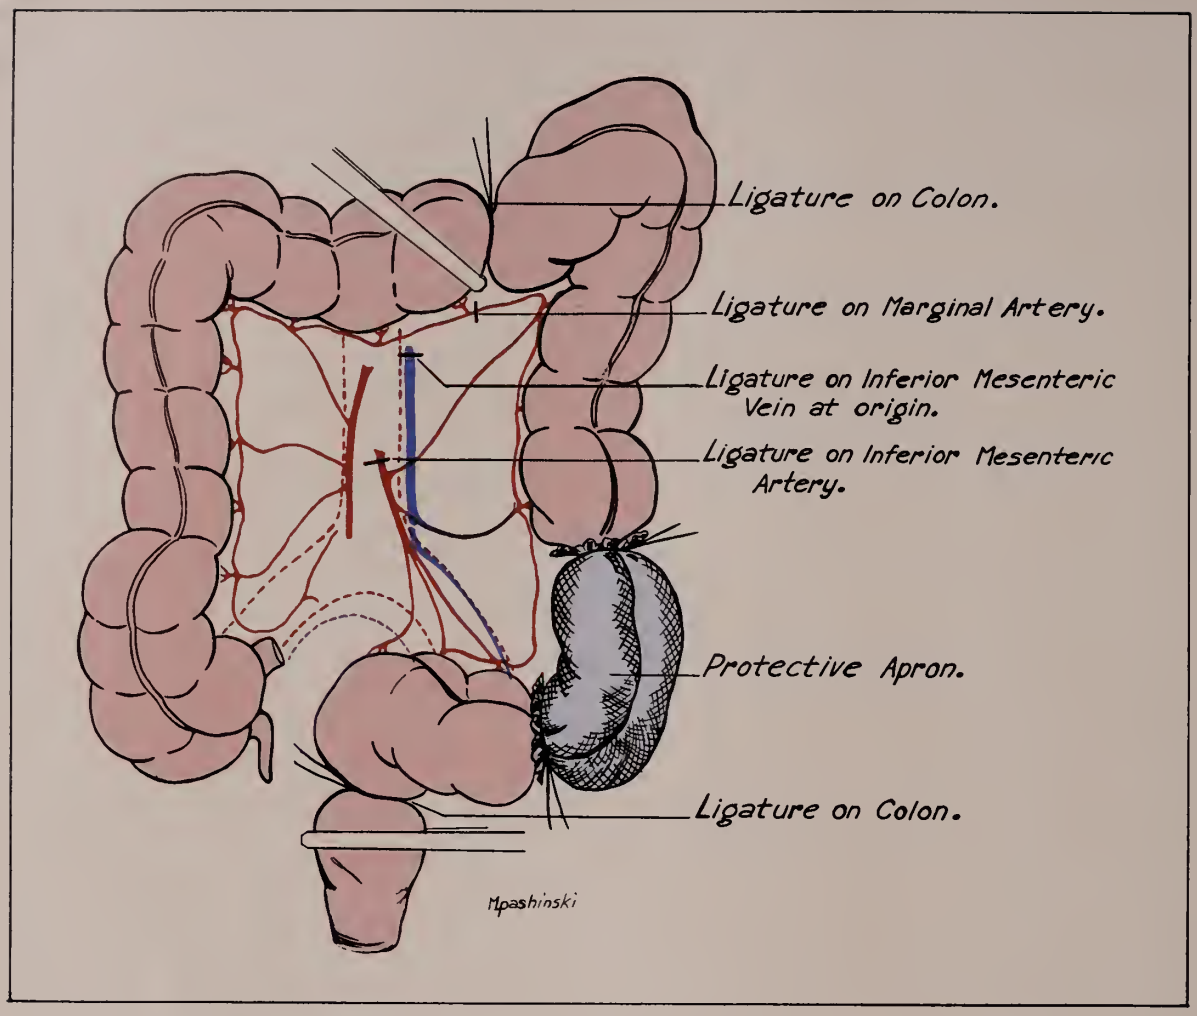

Fig. 7. Summation of operative steps prior to mobilization of the tumor.

point, the following plan of surgery seems indicated. A generous transverse or oblique incision should be outlined, a fraction of the intended incision actually being accomplished initially. If there are no obvious liver or peritoneal metastases, the abdomen should be opened widely. Failure to do so can only lead to unnecessary manipulation of tumor tissue, and may well be an important factor in the generally poorer results in cancer of the flexures and transverse colon.

Ligation of the colon on either side of the tumor is accomplished. Umbilical tape ties should ideally be placed about 30 cm. from the tumor both proximally and distally. In tumors of the cecum the tie should be placed on the ileum, because of the previously mentioned passage of tumor cells through the ileocecal valve. In tumors of the sigmoid a compromise is necessitated if an anastomosis is to be achieved, the tie being placed 8 to 10 cm. distal to the tumor. Two points should be remembered in estimating such distances: the gross tumor is usually larger than estimated to be the case at surgery on the unopened colon; the measurement suggested is based, not on stretched, but on relaxed colon.

The vascular pattern should then be determined, it being the objective to isolate at their origins the major vascular trunks to the involved colon segment. As has been shown in another report,[25] the vascular resection to be accomplished must be determined at surgery; individual variations of arterial anatomy are so numerous that predetermined patterns of resection based on textbook concepts can lead to serious error. In general, the vascular resection should begin along the superior mesenteric or aortic origins of the vessels concerned. That is, in lesions of the ascending colon all colic branches should be divided at the superior mesenteric artery; in lesions of the descending and sigmoid colon and rectum, the inferior mesenteric artery should be

divided at the aorta; and in lesions of the transverse colon and splenic flexure, middle colic artery together with either left colic or inferior mesenteric artery division should be performed, necessitating essentially a total colectomy with anastomosis of cecum or terminal ileum to the lower sigmoid colon.

Since lymphatic trunks accompany the colic arteries, the lymphatics will of necessity be divided in this dissection. In resections of the right colon, venous drainage will also be simultaneously interrupted. However, in surgery of the left colon and rectum, the inferior mesenteric vein should be searched out and ligated in its course toward a junction with either the splenic or superior mesenteric veins: draw the proximal jejunum outward, incise the ligament of Treitz, and find there the terminus of the inferior mesenteric vein.

In accomplishing the vascular transections outlined above, the entire mesentery to the involved segment of colon will be divided near the midline. Involved colon will then be essentially devascularized and anatomically isolated except for the marginal arcade, which passes in a paracolic position, usually along the entire course of the abdominal colon. At this point, ties should be placed on the marginal vessels.

An impervious shield should then be tied in position about the cancer to minimize dissemination of cancer cells from the serosal surface of the tumor. An effective shield may be readily fashioned from polyethylene sheeting approximately 15 cm. on a side, and snugged into position with umbilical tape ties.

The involved colon is mobilized at this point, and divided both proximally and distally. The specimen is given to the pathologist at once for open inspection of the colon. Submucosal bleeding is stopped with Allis clamps. Sterile sigmoidoscopy equipment is now used to perform inspection of the residual colon, the surgeon being governed by his findings of polyps or an unsuspected second carcinoma. A generous irrigation of the proximal and distal segments of colon is then accomplished with normal saline, injecting it into the bowel with a bulb syringe, aspirating it before overflow occurs with a Poole (sump-type) suction tube. Rubber-shod clamps should isolate the segment being irrigated from the rest of the colon; otherwise the operative field may be soiled by an enema effect. A several centimeter margin of colon is next excised from both segments to obtain a fresh surface for anastomosis. Hemostasis is obtained in the submucosal area with ties of fine catgut.

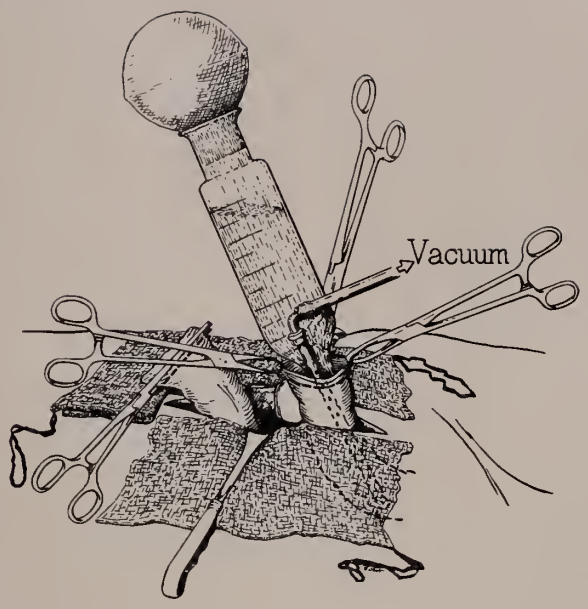

Fig. 8. Irrigation of proximal and distal colon prior to anastomosis. Note dotted line at stoma indicating site of excision of possibly contaminated remnant. Not shown: a rubber-shod clamp should be used to occlude bowel near suction tip to avoid peristaltic rush and soiling of operative field. (Reprinted from issue of August 1952, page 268, by permission of A.M.A. Archives of Surgery.)

Standard anastomosis of the colon is performed at this point. I use a two-layer closure of inner lock-stitch fine catgut from mucosa into muscularis, and an outer interrupted fine cotton from serosa into muscularis. Following repair of the mesenteric defect, and reperitonealization where practical, the wound is closed with stainless steel wire. The sutures pass through peritoneum and all fascial layers in a vertical, figure-of-eight suture. A one-layer closure of strength tissues is thereby accomplished by what are essentially buried retention sutures. Subcutaneous tissues and then skin are approximated with fine suture material. Skin sutures are not removed for three weeks unless marked suture reaction occurs. Thus, an occasional instance of fascial separation will find superficial cover, marking the difference between dehiscence or evisceration, and incisional hernia.

Summary

Advances in the surgical approach to cancer of the colon have taken two general directions: a wider resection of colon and lymphatics, and quarantine of the tumor at surgery.

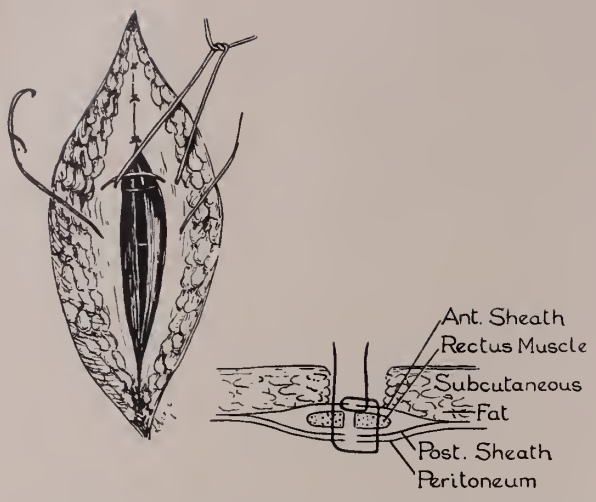

Fig. 9. Stainless steel wire closure of paramedian rectus splitting incision, which is essentially buried retention suture of strength tissues. (From Graham and Gray, in Operative Technic in General Surgery, 2nd Ed., 1955, edited by Warren H. Cole. Courtesy of Appleton-Century-Crofts, Inc.)

The argument for wide colon resection includes the following: removal of microscopic infiltration of the intestinal wall which occurs up to 7 cm. beyond the gross tumor, removal of mucosal surface contaminated with loose tumor cells, and removal of possible premalignant or malignant polyps.

Lymphatic resections have been extended because of the difficulty of assessing the extent of lymph node involvement at surgery, the higher incidence of five-year survival in those receiving wide lymphatic resection, autopsy studies in the immediate postoperative period showing lymphatic involvement limited to just beyond the scope of narrow resections and finally, studies on hemicolectomy specimens in which lymph node involvement can be plotted.

Quarantining the tumor is practiced to prevent tumor cell spread from: 1. the serosal surface into the general peritoneal cavity, 2. along the mucosal surface to be incorporated into the line of anastomosis, and 3. through the venous return upon manipulation of the tumor.

Host resistance to blood-borne tumor cells apparently varies from person to person, and experimentally is related to decreased tissue oxygenation and an abundant carbohydrate supply. Nitrogen mustard will cause a marked reduction in tumor cell liver "takes" in rats, if given soon enough following tumor inoculation.

The problem of multiple tumors of the colon necessitates an acute awareness of the high incidence of pre-operatively unsuspected additional tumors.

Surgical principles proposed are these: initially sealing the vascular channels of possible metastases before mobilization of the carcinoma, ligating the colon at points as much as 30 cm. on either side of the tumor, wrapping the tumor in an impervious shield before mobilizing the specimen, and then coloscopy and irrigation of the remaining colon segments prior to anastomosis. The use of nitrogen mustard immediately following resection is fraught with hazards, at least in full dosage, and should probably be restricted to research cases until its value is established. •

Pioneer Medicine in Clarke County, Washington

JOHN C. BROUGHER, M.D.
VANCOUVER, WASHINGTON

The year 1958 marks the centenary of St. Joseph's Hospital, one of the oldest hospitals in the Northwest, and the first permanent hospital in the Washington Territory.[1]

Dr. Larsell records the founding of an older hospital at Fort Vancouver in 1833. This building was erected by Dr. Meredith Gairdner and was the first permanent hospital in the Pacific Northwest. Previous to this time, Dr. John McLoughlin was the only physician in this area. The "White Headed Eagle," 40 years of age, administered in a limited way to the medical needs of his community but from the first, his medical activities were overshadowed by his administrative duties.

Hudson's Bay Company Physicians

In 1829, there began epidemics of fever which may have been largely malaria. They swept the area, taking heavy toll of the Indian population, and the whites to a lesser degree. When Dr. McLoughlin was attacked with the fever, he instructed a young Englishman, George T. Allan, to care for the sick. Allan wrote to the Hudson's Bay Company telling of his tramps through the men's house with his pockets lined with vials of quinine, and of his report of the state of the patients to Dr. McLoughlin. It is recorded that when there was no quinine, dogwood root was used as a substitute.

Dr. Gairdner, because of ill health, went to the Hawaiian Islands in 1835, and Dr. John Kirk Townsend was in charge of the Fort Vancouver Hospital. After one year, Dr. Townsend returned to the States and Dr. Tolmie took charge of the hospital until Dr. Forbes Barclay arrived from England in 1840 to take charge of the hospital, and here he remained for 10 years.

Dr. Larsell has so ably covered the subject of the doctors serving this area as Hudson's Bay Company physicians, that it is unnecessary to repeat their names and contributions. His description of the crude medical headquarters and the surgical equipment consisting of instruments for amputation, trephining and lithotomy, besides midwifery forceps and a multitude of catheters, sounds, bandages and forceps, gives us an idea of the pioneer facilities. His research, listing the diseases that existed at that time with their symptoms and treatment, makes fascinating reading. Suffice it to say that typhoid fever, whooping cough, measles, malaria, and typhus, appeared and reappeared alternately in mild and epidemic forms. The Indians suffered much higher mortality rate than did the white man. In a letter written by Dr. McLoughlin Sept. 1, 1832 to Mr. P. C. Pambrun, Walla Walla, he states at the end of his message, "I am sorry to inform you that the intermittent fever is raging with great violence at this place, but thanks be to God for His mercies, none of our people as yet have died."[2]

A letter of Dr. McLoughlin Nov. 18, 1830 to Capt. Ryan, requesting among his supplies the following drugs, gives us an idea of the medicine then in use.

½ lb. Gum Camphor
½ lb. Sulphat Quinine
12 lbs. Best Peruvian Bark
1 lb. Acetate Lead
1 lb. Crude Opium
20 lbs. Epsom Salts
4 lbs. Rhubarb Powder

1850 marked the end of the Hudson's Bay Company medical regime and the beginning of Fort Vancouver Hospital as a part of the Mili-

tary Post. Dr. Barclay then removed to Oregon City to cast his lot with the young American settlement, becoming later a citizen of the United States. He continued in active practice at Oregon City until his death on May 13, 1873.

Sisters of Charity of Providence

As the community surrounding the army post grew, there developed a need for hospital facilities. There were an estimated 400 to 500 whites and uncounted Indians. These people were looking for help to the Sisters of Charity of Providence who had arrived Dec. 8, 1856, after a 6,000 mile trip from Montreal, Canada. These five devoted women, led by Mother Joseph of the Sacred Heart, came on the steamer Illinois to the Isthmus of Panama, which they crossed by foot, and embarked on the steamer Golden Gate for San Francisco. After a dangerous journey, they arrived at Vancouver, which then consisted of a small fort, the homes of a few fur traders and their families, together with the more squalid dwellings of a number of Indians and half breeds.[1] The Sisters cared for orphans, visited the sick in their homes and performed other acts of kindness.

The record of the work of these devoted Sisters in this pioneer area showed that they suffered in not being able to admit sick people, not even the destitute, to their Mission.[3] A young unbaptized stranger, John Cloyd, 24 years old and in the last stages of tuberculosis, begged the Sisters for admission at the Providence. The whole town pleaded his cause, and it was evident that a hospital was a necessity. Because of the urgent need, a temporary hospital was opened when Sister Joseph of the Sacred Heart offered the town a part of the building which she was planning to use as a laundry and bakery. The building was 16 x 20 feet and was 8 feet high (Fig. 1). It had no partitions. Father Brouillet, the Vicar General, organized an assembly of local women called an "Association of Charity." To his appeal, 29 of the most respectable persons of Vancouver responded. Of these, about 12 were Catholics, and the others were Episcopalians, Methodists and Jews. The Vancouver Ladies of Charity assembled for the first time April 6, 1853.[4] Sixteen were actually present and 13 others could not attend. Thus on April 9, 1858, began the work of bringing to the Northwest the first hospital. Sister Joseph and one of her workmen put in a ceiling of rough lumber. The walls and ceilings were covered with a lightweight muslin fabric and then with a simple wallpaper. The first furnishings consisted of four beds with four accompanying bedside tables and chairs, purchased with money given by the women of the "Association of Charity" which they had collected from dues of 12½ cents per week. They met twice a month, on Wednesdays, for sewing, providing for the needs of patients unable to pay for hospital care. In addition to these tasks, these same women also installed a pharmacy. The first president of the Association was Mrs. William Rodgers, an Episcopalian, who was the first woman to die in this pioneer hospital. She died from appoplexy Nov. 5, 1858.

Fig. 1. Original St. Joseph's Hospital (St. James Mission) 1858.

First Days of St. Joseph's Hospital

From the record of the Sisters of Providence in Oregon from 1856, the following is recorded in their report of the hospital for the last eight months of 1858: ". . . it was founded April 6, 1858, it had a daily average number of patients, three or four, the total number admitted during the eight months was fifteen, and the number of patients who died at the hospital during the eight months was three."[3]

The insane people, so woefully neglected in early times, were given kindness and good care in this early hospital from 1861 to 1866. In the *Vancouver Chronicle* June 13, 1861, there appeared the following:[5] "The Sisters of Charity have kindly taken care of the poor insane woman who has been for months confined in the county jail. The absence of an insane asylum in Oregon or Washington Territory is seriously felt and should earnestly engage the attention of the

next Legislature. We understand that the Sisters are willing to provide for the insane and secure for them good medical treatment if a barely sufficient remuneration be guaranteed by law." In 1861 to 1862, there were 2 mental patients, and by 1866, some 25 persons were cared for, first at the small buildings on the Mission grounds, and then later at more spacious quarters on Eighth street, directly west of the Military Reserve. Sister Joseph obtained a contract from the Washington Territorial Government, paying $8.00 a week for lodging, board, washing, medical attendance and care for each insane person.[4]

Governor William Pickering visited the house on Eighth street and was "kindly disposed in our regard." Sister Joseph had hoped that a splendid hospital for the insane would develop in this community. However, the contract was not renewed and the building became the new home of St. Joseph's Hospital.

Illnesses that could not be cared for in the hospital may be seen from a report in the *Morning Oregonian* of May 30, 1862:[5] "The scarlet fever is reported to be raging among the children at Vancouver. Some four or five having died during the past few days, and several more are dangerously ill with the dread disease. We have not heard of any adult person being attacked with the disease as yet."

By the summer of 1866, the hospital had become entirely inadequate.[6] When the insane were removed from Vancouver, the building known as St. John's Lunatic Asylum located at what is now the northwest corner of Eighth and Reserve streets, was renovated to serve as a hospital. This structure was described as a white building, two stories high, containing a small chapel, and surrounded by porches which afforded a fine view of the river and the Fort. In 1868, a large addition was added, and in 1872 the then existing hospital was nearly doubled in size by another addition of a new building at its eastern end. On Sept. 1, 1878, it was destroyed by fire. A new hospital was built and patients admitted March 24, 1879 (Fig. 2). Since the founding of the first hospital, there had been 7,325 patients cared for at the time of the Golden Jubilee April 9, 1908.

On July 28, 1909, work was begun on a new hospital, the present modern brick building situated at Twelfth and Reserve streets. The building was completed March 1911. The first class of nurses was graduated on June 8, 1914, four student nurses receiving diplomas.

Fig. 2. St. Joseph's Hospital from 1879-1911.

Hospital Ledger Entries

The earliest ledger used by the hospital is dated May 13, 1858 to Sept. 18, 1881. A statement on the front page gives an interesting summary of these 13 years as follows: "Six hundred and thirty patients have been admitted into the hospital and upwards of 490 have been taken free of all charge." The first patient recorded was Mary Murry, admitted May 13, 1858, age 27, and in that year there were nine other admissions. John Cloyd, the first to apply for admission, was recorded in the ledger as entering on June 7, 1858 and was the first patient to die. In 1859, there were only 14 admissions, and from then on the increase was very gradual. The hospital charge per day was $1.00 which included medicine (Fig. 3). The hospital stay of the first

patient was 33 days, and the hospital received $33.00 in cash. On June 17, the ledger records a patient, Catherine Cosgrove, who remained in the hospital 169 days, and another patient 197 days. The ledger is beautifully kept and the penmanship is shaded. Typical of another patient's hospitalization is the following ledger account:

2 months and 16 days care
at $1.00 per day ..... $ 78.00
Bitters liquors 52.50
Burial expense 23.50

Another expense account:
33 days attendance ..... $ 33.00
Liquor 4.00
Coffin & burial expense 25.00

Another:
6 months attendance $183.00
Coffin $20.00, grave $3.50,
funeral service $6.50,
hearse $5.00 ..... 35.00

The first doctor's fee to be recorded was on Dec. 23, 1874:
Hospital attendance ..... $ 12.00
Doctor's fee 15.00
Burial expense 25.00

Credit Jan. 23, 1881, on a hospital account:
27 chickens @ $ .25
7 ducks @ .50
14 lbs. butter @ .15

Still another entry in the ledger showed a fee of $368.00 for that many days in the hospital.

The second ledger is dated Sept. 18, 1881 to March 1, 1907. The times must have been hard, since many patients have under their names and charge the notation "charity case" written in beautiful shaded writing. The county in 1881 assumed some responsibility for indigents and paid some of the cost. A rather large number of orphans were also cared for without charge by the Sisters of this pioneer hospital. The fees in 1881 were $1.50 a day, and it appears that about this time, the charges were made in some instances on the weekly plan. The charge for the week ranged from $4.00 to $14.00 a week in 1882. For a single day, the charge ranged from $1.00 to $2.00 a day by 1882, but usually it was $1.00.

An interesting charge appeared in the ledger of May 12, 1883. The patient was charged for care at $8.50 per week, and in addition, he was indebted for the following during his last hospitalization:

Liquor $15.00
Washing 35.25
Coffin 25.00
Funeral service 15.00
Hearse 4.00
Grave 6.00
Shroud 2.00

Also, for the first time, a special duty nurse was employed at $1.50 per day for 135 days.

In February 1895 to March 1896, a man was cared for at $16.00 per month. The bill amounted to $220.00 and was paid monthly.

Another recorded payment, other than by money, was made in June 1898, when 18 cords of wood were received and credited at $1.40 per cord. At another time, a bill was credited with potatoes $.20, turkeys $15.75 and pumpkins $3.00.

Rarely was medicine charged for, but in August 1898, an entry was made for liquor $8.00 and medicine $3.50 for a Mr. John Golden. From this time on, small charges were often entered for medicine.

In November 1900, for the first time, a charge was entered of $5.00 for use of a surgery room. There was no indication what type of surgery was performed. Again in January 1901, a patient was charged for use of the surgery. In October 1902, a patient again paid for use of the surgery, and in January 1903, for the first time, a patient was charged for dressings, and the following year, charges were made for plaster of Paris. Use of the surgery became quite common after 1902, but no charge of more than $5.00 was recorded.

Private contracts between the doctor and hospital first appeared in 1904, when Dr. R. D. Wiswall was charged for two patients from the Columbia Quarry at a price of $38.00. In 1907, Dr. Wiswall was again charged for 50 days hospitalization for a quarry patient, Gus Logburg, at $1.00 per day.

The third ledger in excellent condition was dated March 1, 1907 to Jan. 1, 1910. The fee per day was still usually $1.00, with very few extra charges. The diagnosis was occasionally entered, such as pneumonia, and the doctor's name was sometimes entered. Names of doctors recorded were: R. D. Wiswall, Chalmers, West, Smith, Pompe, Golden, Wall, Hixon, Scanlan, Black, Stowell, Carr, Lock, Shaw, Darnell, Van Zant, Pierce, Flagg, Sedgwick, and Leiser.

Drug Stores and Prescriptions

A history of pioneer medicine would be incomplete without some information on the apothecary shops and the doctor who compounded and dispensed his remedies.

Dr. David Wall opened the first drug store in Vancouver in 1865.[7] His advertisement appeared in the *Vancouver Register* of May 2, 1869, for The Vancouver Drug Store. In the *Vancouver Independent* Aug. 28, 1889, Dr. Wall's drug store advertisement also appears. (See figures 4, 5, 6.)

Fig. 4. Dr. David Wall (1824-1902) practiced medicine in Vancouver 40 years.

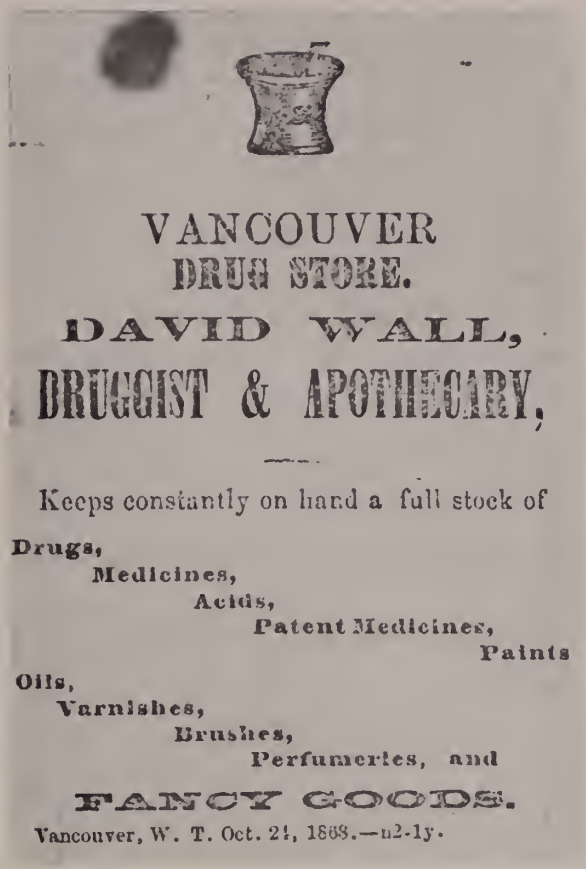

Fig. 5. Advertisement of Dr. David Wall's Vancouver Drug Store appeared in the *Vancouver Register* of May 2, 1869.

This store was located at the northwest corner of Fourth and Main streets. It was erected in 1867 of brick construction. Dr. Herbert Lieser remembers when leeches could be bought for 25 cents each and were used by both physicians and the public.[8] The pharmacy of that day contained much patent medicine as also did the general store.

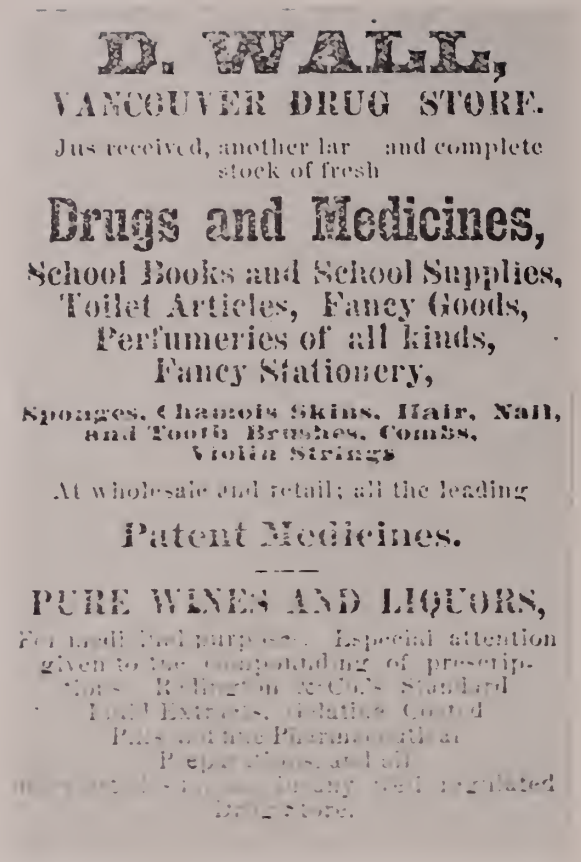
A. C. Chumasero, proprietor of the City Pharmacy, purchased the drug establishment of A. L. Ross. His drug store in 1893 had the prescription department managed by a graduate of pharmacy.[9]

In this old drug store at Sixth and Main, now operated by Matt and Kenneth Zapp, are many bound volumes of prescriptions. *David Wall, druggists, Vancouver W.T., apothecary, etc.*, appeared on prescription pads in these prescription books.

Typical of prescriptions written in 1884:

No. 15108—Dr. J. Randolph Smith
Rx. Acid carbol drachms ss
Hydrate chloral drachms 1
Morph Sulph grs IV
Aqua qs OZ. III
Sig. Use as a gargle
Rx. No. 15127
Inf. Digital Oz. VI
Tinc. Nucis Vom drachm 1
Sig. tablespoonful night and morning
May 5, 1884 No. 15125
Rx.
Opis Pulv. gr. X
Ft. Chart No. VI
Sig. one every four hours for pain
Rx.
Quin. Sulph drachm I
Ft. Pulvule No. XII
Sig. take one every four hours.

Tranquilizers in the form of bromides, chloral hydrate, morphine and spt. frumenti, were common. Purging was evident by the Rx.'s written for C. C. pills, aloes, jalap, calomel and for many other laxatives.



D. WALL,
VANCOUVER DRUG STORE.
Jus received, another lar and complete stock of fresh
Drugs and Medicines,
School Books and School Supplies,
Toilet Articles, Fancy Goods,
Perfumeries of all kinds,
Fancy Stationery,
Sponges, Chamois Skins, Hair, Nail, and Tooth Brushes, Combs, Violin Strings
At wholesale and retail; all the leading
Patent Medicines.
PURE WINES AND LIQUORS,
For medical purposes. Especial attention given to the compounding of prescriptions. Remington & Co's Standard Fluid Extracts, Sealed Cotton Pills and the Pharmacopeial Preparations kept.
Drug Store.

Fig. 6. *Vancouver Independent* of Aug. 28, 1889 carried an advertisement of Dr. David Wall's Vancouver Drug Store.

A prescription for Joseph J. Smith, Veterinary Surgeon with offices at Misner Brothers' Stable on Taylor Street between First and Second, Portland, Oregon, was recorded in the prescription book given me by Kenneth Zapp.

Dr. David Wall, pioneer druggist (Fig. 4), dispensed his medicine throughout the county as he travelled using his horse and buggy conveyance.[10] Dr. Wall was a native of Ireland, born Feb. 29, 1824. He came to this country while he was still young and entered the service of the army as a hospital steward. Soon after his honorable discharge, he started in business for himself and practiced medicine for 40 years in Vancouver. Dr. Wall, in addition to owning an apothecary shop and practicing medicine, was vice-president of the First National Bank of America in Vancouver.[13] He died in San Francisco in 1902 at the age of 78. He was brought to Vancouver, and his body was placed in state in the large hall of Providence Academy before burial. His son, Dr. Harry Wall, died at the age of 53. He was a member of the AMA and the State Medical Society.

Newspaper Reports and Advertisements

From the records of the Clarke County auditor's office, the following named persons are registered as early practitioners of medicine. (Taken from the *Clarke County Register* in March 1882.)[5]

James M. Burt, born Ohio 1832. Practiced medicine Missouri 4 years and in Clarke County the past 7 years. No degree in medicine. Located in Battle Ground, Washington in 1878, moving in 1892 to Vancouver, Washington.

Ephrain T. McKenny, born Michigan 1835, practiced medicine 10 years in Iowa. No degree in medicine. Attended lectures in the Medical Department of the Iowa State University 1872-1873.

Richard S. Davis. Born in Maine. Practiced in LaCenter, Washington. Had no degree in medicine.

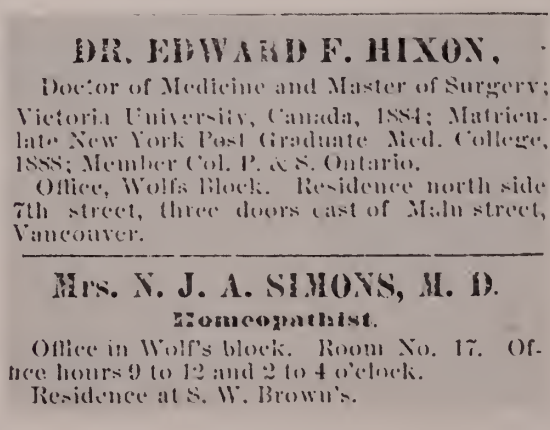
John Randolph Smith. Born Peoria, Ill. Doctor of medicine degree. Willamette University 1878.

Fred Wm. Sparling. Born in Ireland. Practiced medicine in Washington Territory 8 years including hospital for the insane at Steilacoom. No medical degree. Practiced in Vancouver since 1881.

Solomon Lowell, born in New York. Present residence LaCenter. No degree in medicine.

David Wall. Born in Ireland. No medical degree. Practiced medicine in Clarke County since 1856.

A surgical operation made the headlines in June 1882 according to the *Vancouver Independent*. "Important operation—Yesterday Dr. Randolph Smith assisted by army surgeons Heizmann, Moore, Gardner, Wilson and Dr. Wall, performed an operation on Arthur Baker, who has been suffering more than a year from hip disease. Two hours and a half were occupied in the operation. As much of the diseased bone as possible was removed. The patient was left in fair condition, considering the severity of the operation, which was necessary to save life."[5] Dr. Smith, in addition to serving the community as a physician and surgeon, was the mayor in 1891.



DR. EDWARD F. HIXON,
Doctor of Medicine and Master of Surgery; Victoria University, Canada, 1884; Matriculate New York Post Graduate Med. College, 1888; Member Col. P. & S. Ontario.
Office, Wolfs Block. Residence north side 7th street, three doors east of Main street, Vancouver.
Mrs. N. J. A. SIMONS, M. D.
Homeopathist.
Office in Wolf's block. Room No. 17. Office hours 9 to 12 and 2 to 4 o'clock.
Residence at S. W. Brown's.

Fig. 7. In early newspapers, doctors advertised by the use of cards, such as those shown above which appeared in the *Vancouver Independent* of Aug. 28, 1889.

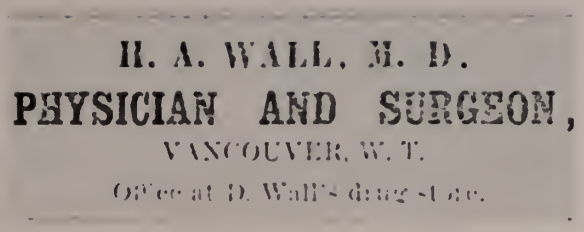


Fig. 8. Doctor's card which appeared in the *Vancouver Independent* of Aug. 28, 1889.

Smallpox was reported in the *Clarke County Register* of Jan. 26, 1882. Dr. J. Randolph Smith ordered the man quarantined in a log house about a mile out of town.

The *Clarke County Register* of June 7, 1888 records "a furious epidemic of measles. In one schoolroom there were forty-four cases of measles out of a total of fifty-five pupils. The St. Luke's Episcopal school was finally reduced to two pupils and that school has also closed up. It is safe to say that at least 500 cases have been reported this spring."

The doctors whose cards appear in the county paper, the *Vancouver Independent*, of Aug. 28, 1889 are:

J. Randolph Smith—Willamette University Medical School.

Edward F. Hixon—McGill Medical School.

Mrs. N. J. A. Simons—Homeopathist.

H. A. Wall—Columbia University Medical School.

John Steiner—Women and Children's diseases a specialty.

The following physicians not mentioned in the hospital records or contemporary papers were recorded by Rev. H. K. Hines.[9]

James E. Stevens, a medical practitioner and druggist of LaCamas, Washington, since 1892 has enjoyed a lucrative practice and conducts the only drug establishment in this thriving village.

John J. Sellwood, one of the prominent medical practitioners of Vancouver, a graduate of Willamette University in 1887, has a large and lucrative practice.

Charles C. Byrne in 1893 was Medical Director of the Department of the Columbia with headquarters at Vancouver Barracks, Washington.

In those days, it was proper to have the doctors' cards in the newspaper. Samples of such advertising may be seen in copies from early newspapers (Figs. 7 and 8).

Patented medicines also were much advertised in the early newspapers (Fig. 9).

Fig. 9. The above example of early day patent medicine advertising was printed in the *Vancouver Independent* during 1889.

The hospital cared for the funeral arrangements for their dead until undertaking became a profession. Figure 10 shows the association of other business with this profession.

In 1902, Dr. R. D. Wiswall located in Vancouver. He had the first x-ray. This machine fitted into a suitcase-like container, and the doctor carried it with him when he made his calls. He took the pictures and had a photographer develop the films.

About this time there were 700 men employed at the Columbia Quarry. Injured men from the

Fig. 10. Before undertaking became a profession, it was associated with other businesses. The above advertisement was published in the *Vancouver Independent* during 1889.

quarry had to be taken by steamer to Portland for treatment, and it frequently happened that these men had to wait long hours by the river bank for the boat to arrive. The quarry superintendent consulted Dr. Wiswall who took the problem to Sister Mary Aurelia, Superior of St. Joseph at that time. With her assistance, a surgical room was prepared for handling these emergencies and injuries. •

111 West 39th Street.

Jaycees Sponsor Year 'Round Health Program

State and county medical societies will be interested in the recent announceemnt by the U.S. Junior Chamber of Commerce that its 3,000 local chapters are embarking on a year around community health program. The program has been developed in cooperation with the National Health Council.

Program guides have been prepared for each of 10 suggested activities: Salk Vaccine Campaign; Health Fair; Better Sight and Hearing for Children; Poison Control; Assistance to Mental Health for Youth; Adventures in Living for Older People; Help for Handicapped Children; Recreation for Mental Hospital Patients; Jaycee Health Forums; Directory of Health Services.

The Jaycee activities in local communities will not be limited, however, to the 10 programs for which guides are available.

The program guides urge Jaycee leaders to get in touch with local medical societies and health agencies.

Ovarian Pregnancy

A Case Report and Short Review of the Literature

Robert M. Hill, M.D.
ELLENSBURG, WASHINGTON

Cases of primary ovarian pregnancy are still such a rarity that it is thought that a report of another case, along with a short résumé of ovarian pregnancy, brought up-to-date, would be of value.

Spiegelberg's criteria must necessarily be fulfilled before a diagnosis of a true ovarian pregnancy can be made. The criteria are as follows:

1. That the tube, including the ovarian fimbria, be intact and clearly separate from the ovary.
2. That the gestation sac definitely occupy a position on or encompassing the ovary.
3. That the sac be connected with the uterus by the tubal ovarian ligament.
4. That ovarian tissue be demonstrable in the walls of the sac.

Only where these four criteria are definite can a diagnosis of true ovarian pregnancy be made. The usual pre-operative diagnosis is tubal ectopic pregnancy, or an ovarian cyst with bleeding, or some like condition. Rarely, if ever, has a diagnosis of ovarian ectopic pregnancy been made pre-operatively, as the signs and symptoms are much the same as in tubal ectopic pregnancy.

In the reported case, and in some of the other cases previously reported, there are two findings which if kept in mind would possibly warrant a pre-operative diagnosis of ovarian pregnancy. These are:

1. Where there is a suspected ruptured ectopic pregnancy, but there is no uterine bleeding or spotting.
2. A suspected ectopic pregnancy where some type of pregnancy test has proven positive, such as a Carson-Saeks or Friedman's test.

It has been stated by various authors that the incidence of ovarian pregnancy is from 0.2 per cent to 1 per cent of all extra-uterine pregnancies. This obviously varies because of the small number reported, and also varies because of the inaccuracy of the diagnosis of a true ovarian pregnancy.

In the Ellensburg General Hospital, there were 1048 admissions for pregnancy in the five years, 1953-57 inclusive. Ninety of these were miscarriages, 6 were ectopic pregnancies and 949 were pregnancies at or near term. This makes a percentage of 0.6 per cent ectopic pregnancies, one of which was an ovarian ectopic pregnancy. The others were true tubal or mixed tubal ovarian ectopic pregnancies.

A thorough review of frequency of ovarian pregnancy and diagnosis of true ovarian pregnancy was made by Baden and Heins in 1951.[1] They reviewed 90 cases of primary ovarian pregnancy which adequately fulfilled the criteria of diagnosis as set down by Spiegelberg. There were 32 cases reported before 1940, and 58 cases, including those of Baden and Heins, through March 1, 1951, making a total of 90 cases.

A review of the literature since this report reveals that there have been 9 additional cases, including the present case, making an overall total of 99.

Courtiss[2] in 1942 reported a total of 125 ovarian pregnancies, but all these did not fulfill the criteria of Spiegelberg. Therefore, Baden and Heins' thorough review of the literature, showing only 90, is a more accurate estimate.

In view of the fact that only 9 cases have been

reported since 1951, and considering the fact that most hospitals now require routine pathologic reports on all tissue removed, one can only conclude that there are proportionately fewer cases of true ovarian pregnancies now than there have been in the past. No reasonable answer to this is forthcoming.

Types of True Ovarian Pregnancy

There are two types of ovarian pregnancy:

1. Primary ovarian pregnancy, which is divided into two parts:
   a. Intrafollicular.
   b. Extrafollicular.
2. Combined ovarian pregnancy. This includes those in which the pregnancy is attached to the ovary, but is also attached to the tube, the fimbria, the uterus, or other organs in the pelvis or abdominal cavity. It is not isolated to the ovary alone.

CASE REPORT

A 23 year old white female was first seen in the clinic July 31, 1957. She complained of severe nausea and vomiting, and stated she thought she was pregnant. Her last normal menstrual period was June 14, 1957, and previous normal menstruation was May 18, 1957.

Menstruation began at 13 years of age, with an interval of 27 days, duration 3 to 4 days, moderate amount, with two plus dysmenorrhea.

Patient had been married for two years, with no pregnancies having occurred.

Weight was 106 pounds. Blood pressure 140/90. Chest x-ray was negative. Examination of the pelvis revealed a clean, edematous cervix, with some slight cyanosis. There was no erosion. The uterus was about the size of a one-month pregnancy. The right ovary and tube were normal. Left ovary and tube were normal to palpation but the patient complained of some tenderness with examination of the left adnexa. Laboratory findings were as follows: hemoglobin 12.9 Gm. Blood type A, Rh positive. Kline was negative. White blood count was 10,000. Urinalysis was negative.

Patient was given 1 cc. polio vaccine at this time, and 1 cc. Gravidox in an attempt to control the nausea and vomiting.

Patient was seen again in the clinic on Aug. 3, 1957, complaining of intermittent abdominal pain which had been very severe during the previous night, and in the early morning.

Physical examination on this date revealed acute tenderness in the entire lower abdomen, not localized on either side. There was rebound tenderness but no rigidity or splinting.

Pelvic examination revealed a non-tender cervix, but increase in tenderness in the left lower quadrant in the adnexal region. Tenderness prevented adequate examination. No mass could be palpated.

Laboratory studies: White blood count was 10,000. Sedimentation rate, 10 mm. in 45 minutes. Hemoglobin was 11.6 Gm.

Diagnosis of possible ectopic pregnancy was made.

Patient was next seen on Aug. 5, 1957, when she was admitted to the Ellensburg General Hospital in excruciating pain. She was pale, very weak, perspiring profusely, unable to stand erect, and it was almost impossible for her to walk. Diagnosis of ruptured ectopic pregnancy was made. Examination on admission was negative except as follows: Blood pressure 128/80, pulse 120 per minute, respiration 26 per minute. The abdomen was flat and extremely tender to percussion and palpation, especially in the left lower quadrant, but also in the entire lower abdomen. There was no rebound tenderness or rigidity.

Examination of the pelvis: There was no uterine bleeding. The cervix was slightly tender. There was some tenderness of the uterus, marked tenderness in the left adnexal region and moderate tenderness on the right. The uterus was about the size of a six weeks' pregnancy. There was a questionable mass in the left adnexal region.

Laboratory studies: Hemoglobin was 9 Gm.; red blood count 3,730,000; white blood count 17,250. Sedimentation rate was 9 mm. in 45 minutes. The patient was crossmatched and 2 pints of blood were given (O, Rh positive)—one during surgery, and one following surgery.

Operative record: Pre-operative diagnosis: Left ruptured tubal ectopic pregnancy. Postoperative diagnosis: 1. Left ruptured ovarian ectopic pregnancy. 2. Left ovarian hemorrhagic cyst.

Approximately 2 pints of blood were found free in the abdominal cavity. Both tubes were normal. There was no dilatation and no evidence of inflammation. A hemorrhagic cyst involved one-half of the left ovary. The uterus was enlarged to approximately the size of a six weeks' pregnancy, and was soft. The hemorrhagic cyst was excised from the left ovary, leaving approximately one-half of the normal ovary intact. This raw surface was closed. The large blood clots were removed from the abdominal cavity, reducing the amount of blood by approximately 50 per cent. The wound was closed, and the patient made an uneventful recovery.

Pathologist's report: This tissue was mainly blood clot, but through it there were numerous placental villi of small size, and well defined trophoblastic epithelium over the surface. Some of these are of ghost type, but most of them are still existing and viable structures. Diagnosis: Ectopic pregnancy of the ovary.

Summary

1. Ninety-nine cases of true ectopic ovarian pregnancy have been reported, including the one presented in this paper.

2. The signs and symptoms of ovarian pregnancy are indistinguishable from those of tubal ectopic pregnancy in general, with two added possible criteria as aids to diagnosis:

   a. Uterine bleeding is usually not present in ovarian pregnancy.

   b. Some type of pregnancy test, either Carson-Saeks, or Friedman, is positive preoperatively.

Tolbutamide Compared to Insulin for Diabetic Control

HOWARD M. HACKEDORN, M.D.
SEATTLE, WASHINGTON

After three years of extensive clinical trials, tolbutamide has recently become available for general use. It has been most useful for the management of diabetes of the mature type, occurring in patients over 40 years of age whose disease is of relatively short duration and who require relatively small doses of insulin (less than 30 units).[1] The sulfonylureas, of which tolbutamide is the only one in clinical use at present, are not insulin substitutes, but hypoglycemic agents, capable of reducing the blood sugar in both normal and diabetic patients. Since they are not advocated for diabetic management in times of stress, such as infections, surgery and above all acidosis and coma, one naturally wonders whether they are genuinely helpful to diabetic patients for day-to-day control. A comparison of the course of action of the two substances would provide an evaluation of tolbutamide for prolonged diabetic care.

Factors that influence blood glucose[2] directly appear in figure 1. A is determined by the amount ingested glucose, the duration and effectiveness of intestinal digestion and the integrity of the intestinal mucosa. B depends upon a supply of hepatic glycogen of normal constitution and an intact enzyme system to convert glycogen to glucose. C and D depend critically upon insulin, the anterior pituitary growth hormone and possibly other anti-insulin agents. E depends upon the concentration of glucose in the blood and the activity of the enzyme structure of the renal tubule. In addition, there is the influence that endocrines exert upon each other, such as thyroid and adrenal cortex.

For purposes of this discussion it matters little whether insulin enhances cellular passage of glucose[3] or activates muscle hexokinase.[4] It is sufficient to say that insulin increases the quantity of intracellular glucose-6-phosphate at the

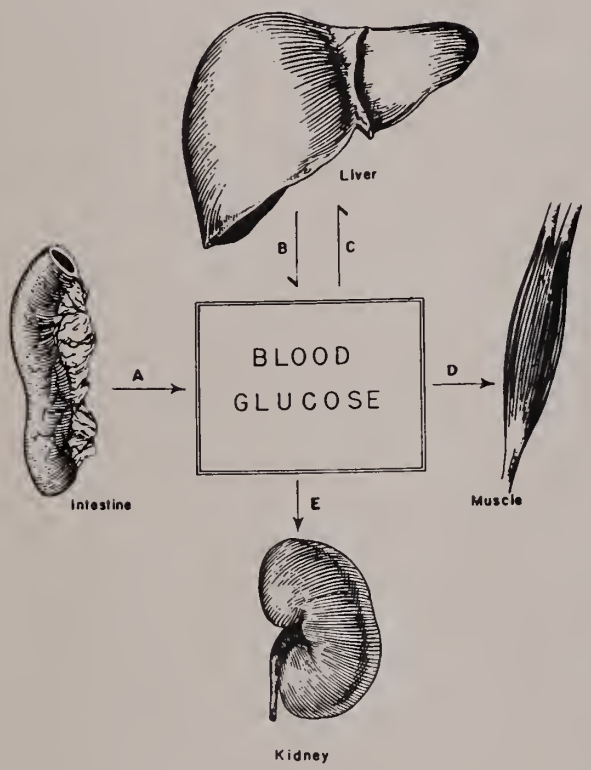

Fig. 1. Factors that influence blood glucose directly, (Reprinted from Currents in Biochemical Research 1956, David E. Green, Editor, page 172, by permission of Interscience Publishers, Inc., New York, 1956.)

expense of extracellular or plasma glucose. The initial formation of the glucose-phosphate ester proceeds by the catalytic action of adenosine triphosphate:

$$\text{Glucose} + \text{ATP} \rightarrow \text{Glucose-6-Phosphate} + \text{ADP}.$$

ATP and ADP refer to adenosine triphosphate and adenosine diphosphate, respectively.

In addition, insulin is necessary for incorporation of amino acids into protein[5] and fatty acids into fat,[6,7] although both are dependent on reac-

tions coupled to the energy developed from anaerobic (Emden-Myeroff cycle) and aerobic (Kreb's cycle) glycolysis.

At the cellular level of metabolism, glucose-6-phosphate is the keystone of carbohydrate intermediary metabolism, and from it four paths are available at respective rates[8] (Fig. 2). There is

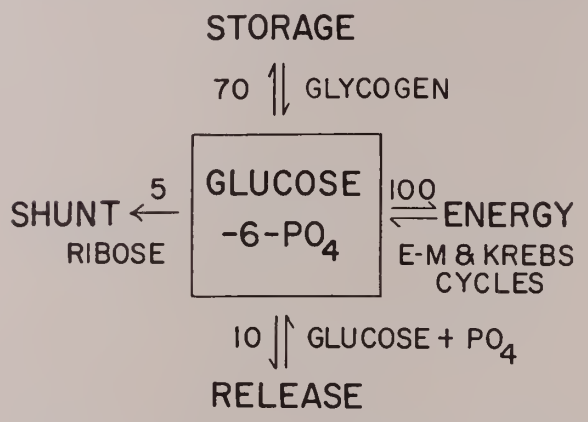

Fig. 2. At the cellular level of metabolism, glucose-6-phosphate is the keystone of carbohydrate intermediary metabolism and from it the four paths shown above are available.

the development of energy arbitrarily set at 100, the storage of glycogen at 70, the oxidative shunt for conversion of glucose into ribose at 5 and the release by hydrolysis to form free glucose at 10. It is generally agreed that the major effect of an insulin deficiency is the decrease in glucose utilization by such tissues as liver and muscle with impeded generation of glucose-6-phosphate. This reduces the formation of products encountered along the Energy Path (pyruvate, acetate and CO_2) and also reduces the formation of glycogen in both liver and muscle. Other reactions, coupled to those of glycolysis less directly, such as protein synthesis and fat synthesis are also retarded. These effects are all reversed by administration of insulin.

In contrast to these multiple cellular and tissue effects, tolbutamide primarily involves a single phase of carbohydrate intermediary metabolism, suppressing the rate of liver glycogen breakdown, a single source of glucose-6-phosphate and blood glucose.[9-11] There is reduction in the rate of conversion of glycogen to glucose-6-phosphate (Fig. 2). Although direct pancreatic stimulation by tolbutamide exhibits a hypoglycemic response suggesting an increase in circulating insulin,[12] C^{14} -glucose studies do not show incorporation into liver and muscle glycogen and depot fat that occurs with insulin.

Tolbutamide does not facilitate glucose utilization. It does not directly influence other hormones except the hypoglycemic effect of insulin, nor do other hormones affect it. It is not an insulin substitute and one would wish to determine its ultimate value in diabetic management, because disturbances in fat and protein metabolism, as well as carbohydrate metabolism, are significant defects of the disease. Clinically we measure only hyperglycemia and ketosis, yet we know both protein and fat metabolism are profoundly affected by insulin and lack of it. While tolbutamide is controlling the hyperglycemia, one earnestly wonders if there is simultaneously an impairment of the tissue fat and protein metabolism that will become manifest after prolonged therapy.

Will there be disturbances in depot fat tissue, accelerated atherosclerosis, defective tissue structures leading to collagen disease, cataracts or cardiovascular changes? One might well keep in mind the possibility that the control of hyperglycemia alone might be a screen that prevents effective observation of more profound tissue changes occurring in the continued absence of adequate insulin supplies. Therefore these patients treated with tolbutamide alone should continue to have regular and careful surveys with these possibilities clearly in mind.•

Clinical Pathologic Conference

PROVIDENCE HOSPITAL, PORTLAND, OREGON

Prepared under direction of Jeff Minckler, M.D.

Protocol

Jeff Minckler: This white male patient, aged 75 years, was admitted to Providence Hospital Aug. 20, 1956 with a chief complaint of abdominal pain. He was last well about two years before at which time he developed deep mid-abdominal ache which radiated up the midline and into his throat and frequently radiated straight through to his back. In December 1955, the pain became more severe and he began to vomit feedings of solid food, but was able to retain liquids. The pain has since been intermittent in nature, not associated with meals or particular types of food and is somewhat relieved by vomiting. The emesis has never contained blood or coffee-ground material, but consistently has been "green bile." There has been a 50-pound weight loss in the past two years and much loss of strength. For the past year he has had frequent bouts of constipation relieved by mineral oil. Alternating with the constipation have been bouts of diarrhea. His stools have been for the most part light colored with an occasional normal brown color and have been of small diameter. The patient was hospitalized in December 1955, for a period of four days with the same complaints. He was treated for pain and received much relief. At this time the patient and family had refused an exploratory laparotomy and the patient returned home on Dec. 13, 1955 for further observation.

Aside from frequent dryness of the mouth, history of the EENT was non-contributory. The patient had had pneumonia in 1918 and had experienced exertional dyspnea, occasional cough and occasional night sweats over the past two years. Other than the information in the present illness, there was no gastrointestinal history of significance; and jaundice, melena, or bright blood in the stools were excluded specifically. The patient had experienced occasional trouble in starting his stream; otherwise, the genitourinary history was negative. He had complained of "no feeling in legs" and unsteady gait for the past seven months, and he described "knobs" in his calves during the same period. Drug history is negative. He took occasional alcoholic drinks and was a non-smoker. His past illnesses were few and were described as limited to the usual childhood diseases with the exception of hospitalization for excision of anal fistula in 1954. Both the father and mother had died of old age with the age uncertain. He had 12 siblings—6 brothers and 6 sisters—with 3 of the brothers and 2 of the sisters having died of unknown causes.

Physical examination on first admission, Dec. 9, 1955: Chest examination revealed nothing distinctive. Blood presure was 110/60, pulse 72 and respirations 16. The patient looked his age of 74 and appeared poorly nourished. His skin was dry, inelastic and loose. The external ocular muscles functioned properly. The pupils were round and equal and responded to light and accommodation. The fundi revealed minimal arteriosclerotic changes. The ears, nose and neck were not remarkable. The lips were pink and moist. The patient had complete dentures. No nodes were palpable. The liver, spleen and kidneys were not palpable. There were no palpable masses and no tenderness could be elicited in the abdomen. Bowel sounds were present and of normal character. The prostate was not enlarged and no abnormal masses were identified on digital rectal examination. A small amount of light brown stool returned on the glove. The external genitalia were those of an adult male. The extremities were wasted; otherwise they were normal in appearance and reactivity. The reflexes tested were physiologic and examination of cranial nerves revealed no abnormality. Blood examination on this admission revealed hemo-

globin 9.68 Gm., red blood cells 3.98, white blood cells 6,800, with 50 neutrophils, 6 bands, 42 lymphocytes and 2 monocytes. Sedimentation rate was 23 mm. in 15 minutes and 100 mm. in 45 minutes. Serum amylase was recorded as 20 units. The Kahn test gave a negative reaction. Urine examination revealed a yellow, clear, acid urine with a specific gravity of 1.013 and occasional pus cells; otherwise it was negative. Glucose tolerance test revealed negative urines in all samples, fasting blood sugar of 98 with 114 in one-half hour, 120 in one hour, 125 in two hours and 120 in three hours. Icteric index was 7.3 and blood urea nitrogen 11.1.

Physical examination on second admission, Aug. 21, 1956: The patient returned to the hospital with essentially the same complaints and presenting as an emaciated 75 year old in no apparent distress. The skin was pale and presented minimal icterus. The admitting blood pressure was 102/68, pulse 76 and respirations 16. Physical examination revealed the following in addition to the findings in the initial admission. The thorax exhibited increased anteroposterior diameter with some impaired resonance at the bases posteriorly. The heart sounds were distinct and there were no murmurs or thrills. The abdomen was flat. The liver edge lay at the rib margin and was non-tender. The spleen was not palpable. There was questionable fullness in the epigastrium with some discomfort in this area to deep palpation. Rectal examination again revealed light brown stool clinging to the rectal glove. There was no abnormality to palpation. Neuromuscular examination revealed slight calf tenderness bilaterally with deep tendon reflexes present and equal bilaterally. Vibratory sense was lost below the knees bilaterally. Tactile sensation was grossly normal. Laboratory findings on Aug. 21, 1956 revealed the following: Hemoglobin 8.39 Gm., red cells 3.03, white cells 9,700 with 70 neutrophils, no bands, 4 eosinophiles, 26 lymphocytes, and no monocytes. Sedimentation rate was 48 mm. in 15 minutes and 122 mm. in 45 minutes. Urine examination revealed yellow, clear, acid urine with a specific gravity of 1.010 at one plus albumin. Icterus index was 2.6, serum sodium 136 mEq. and serum potassium 3.9 mEq. There was four plus occult blood in the stool. Total eosinophile count was 0. Histamine gastric analysis on the fourth postoperative day revealed no free hydrochloric acid in any specimen with titratable acidity of 112 in the fasting specimen, 28 in the 20 minute and 20 in the 30 minute specimens. Three plus, four plus and 4 plus occult blood tests were found in these gastric specimens, respectively. Electrocardiographic examination on Aug. 22, 1956 revealed left axis deviation, horizontal position, left bundle branch block and myocardial damage. There was little change in the second EKG determined on Sept. 6, 1956.

X-ray examination of the chest on Aug. 21, 1956 revealed pressure atelectasis of the bases of both lungs with the lungs otherwise clear. The aorta was widened and increased in density. The heart was normal in outline. No fluid was identified. An abdominal plate on the same day revealed no free gas in the abdominal cavity. There was no fluid level in the small bowel. There was a large amount of gas and fecal matter in the ascending and transverse colon, so that the suggestion of a large bowel obstruction must be considered, along with the possibility of a paralytic ileus.

On Aug. 30, 1956, the test for Bence-Jones protein in the urine was negative, and on Sept. 2, 1956 the urine exhibited four plus albumin with pus and bacteria. Blood study at this time revealed hemoglobin 11.62 Gm., 3.9 red cells, 7,600 white cells with 74 neutrophils, 12 bands, 1 eosinophil, 12 lymphocytes and 1 monocyte. Sedimentation rate on this date was recorded as 8 mm. in 15 minutes and 45 mm. in 45 minutes. Bone marrow aspiration was done on Aug. 30, 1956. It was negative for blood dyscrasia or neoplasm and was in no way remarkable. On Sept. 1, 1956 Rumpel-Leede test was negative; Lee-White 5 minutes, 30 seconds; bleeding time 1 minute, 30 seconds; prothrombin 82 per cent. On Aug. 30, 1956 the patient's serum calcium was 9.4, serum protein 5.4 with an albumin-globulin ratio of 2.25/3.15. On Sept. 3, 1956 (three days postoperative) the total eosinophil count before ACTH (40 units) was 66 and four hours following was 22.

During the period from Aug. 20, 1956 to Aug. 30, 1956, the patient remained fairly comfortable and required nothing for pain. He ate fairly well, although he had occasional emesis of undigested food particles following meals. He also had one or two loose or soft, light brown to clay-colored stools on two occasions in this interval. Twice during this period, portions of the stool were formed. During this period, 2 units of blood were administered.

X-ray of the stomach on Aug. 27, 1956 with a small amount of barium revealed some narrowing of the antrum of the stomach, which was not considered to be organic. A moderate-sized sliding hiatal hernia had been noted in November 1955. The duodenum was dilated and the passage of the barium through the intestine was very slow. The duodenal loop did not appear to be displaced or abnormal, only dilated. A colon examination on the next day revealed a redundant atonic bowel filled with gas and fecal matter. Only the distal half filled. Several diverticula were identified. No obstruction was found. There was good emptying. The stomach was noted to be filled with gas.

An exploratory laparotomy was performed on Aug. 31, 1956. No disease was detected except for a dilated redundant colon with associated dilatation of the distal ileum for about 2 feet. There were areas where the peritoneum seemed to tear extremely easily and hematomas developed. The patient tolerated the procedure well and the immediate postoperative course was satisfactory. Two units of blood were administered.

On Sept. 3, 1956 the patient became confused during the night, got out of bed and stated that he had fallen and hit his head. Examination at the time was negative. There were beginning decubitus ulcers over the lower sacrum. The patient had become incoherent. His appetite and oral intake were poor. A Levin tube was inserted and Calorigen started by nasal drip. On Sept. 4, 1956, 25 mg. cortisone was started every six hours. The patient failed to respond to painful stimuli. The condition remained the same for the next three days. Much thick tracheal mucus was aspirated. He was digitalized on Sept. 6, 1956. Penicillin 300,000 units every four hours and Combiotic 2 cc. every eight hours were started. On Sept. 8, 1956 the patient again became responsive to painful stimulation and attempted to talk. Blood urea nitrogen at this time was 37.2, serum sodium 117 mEq. A portable chest x-ray on this date revealed blunting of both costophrenic angles from a small amount of fluid and atelectasis at the bases of both lungs with some passive congestion. The cardiac shadow was aortic in type, not enlarged. The aorta was moderately widened and elongated. On Sept. 9, 1956, the patient responded readily and was talking much better, but suddenly became cyanotic at 12:30 P.M. Mucus could not be reached by suction. He died at 1:00 P.M.

Discussion

Dr. Minckler: I should like to hear additional commentary from the gentlemen who saw the patient. Dr. Hardiman, can you add anything?

John A. Hardiman: A point not included in the protocol was the unusual brown coloration of this patient's skin on the exposed parts. This appeared to me to be unusual enough to deserve special mention.

Dr. Minckler: Dr. Blanchard, do you have any additional comments?

John A. Blanchard: I have nothing to add, except to admit that I thought this patient had carcinoma of the pancreas and that this justified the exploratory procedure. We were, in fact, quite surprised to find nothing of consequence during the laparotomy and I am relieved to report that we requested a pathologist to review the abdominal cavity at the time of surgery and received concurrence in the negative findings.

Dr. Minckler: Dr. Gambee, do you have any additional apology for your part in operating on this patient?

Louis P. Gambee: The operative procedure was completely uneventful and we found nothing in the way of a clue as to the basic disease in this case.

Dr. Minckler: As there is no further pertinent commentary, it is a pleasure to call upon our distinguished visitor from Astoria for his criticism of this work-up and for his differential and diagnosis. Dr. Straumfjord.

Jon V. Straumfjord: As usual, I have the feeling that the critical features of this patient's record have been purposely left out of the protocol. I would like to know, for example, whether the patient had any fever.

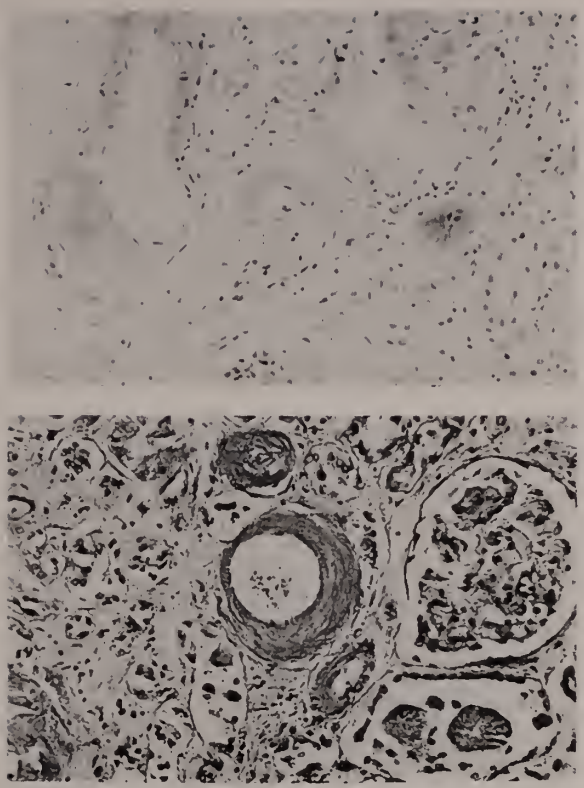
Dr. Minckler: Here is the temperature chart. There appears to be an ordinary variation within normal range from 98 F. to 99 F. during this hospital stay.

Dr. Straumfjord: I also note a gap in the story

of some eight months. What happened to the patient during this interval?

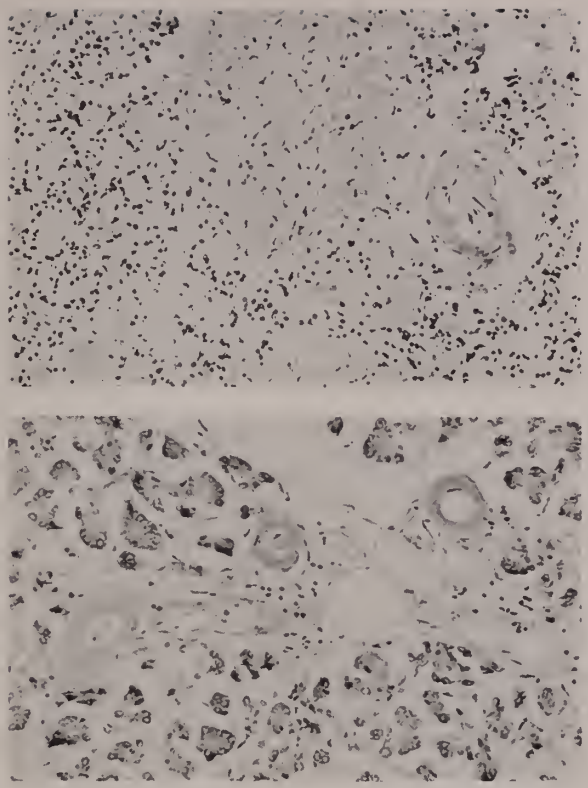
Dr. Hardiman: The patient was not seen by myself during this time. He was, however, seen by George Long in April 1956. After his first admission he had lost weight to 122 pounds and then had regained weight to 152 pounds. In May 1956, the last time seen by Dr. Long, he was feeling fairly well but had diarrhea almost daily and the type of food did not seem to make any difference. Dr. Long had by that time lost interest in the diagnosis of carcinoma of the pancreas.

Dr. Straumfjord: Since I propose to come up with the correct answer in this case, it is obvious that I had to seek other than the usual means to arrive at the diagnosis. Both my son and Dr. Minckler's are second-year medical students and have discussed this case with Dr. Minckler. While not divulging the answer directly, they were quizzed very carefully on the case by me in Dr. Minckler's presence and I took close observation of the doctor's mannerisms during their discourse. I find the gait, the brow-pattern, angle of the jaw and the general facial expression of the pathologist during such conversations reliable guides to diagnoses. Consequently, armed with this information, I can rush very pointedly to an accurate conclusion in this case.



Dr. Minckler: It is a very real pleasure to learn, at long last, the stuff upon which an internist's acumen is based. This does seem more reliable than their usual mumbo-jumbo.

Dr. Straumfjord: This 75 year old man, whose death occurred nine days after an abdominal exploratory operation, had complained of abdominal distress, nausea, vomiting, constipation with periods of diarrhea, weakness, dizziness, nervousness, numbness in his feet and unsteady gait. He lost weight from a normal 175 pounds to 122 pounds, followed by a gain to about 150 pounds four months before death and then loss to 115 pounds. Physical examination was nonrevealing except for minor changes, such as basilar rales, arteriosclerotic changes in his fundi and loss of vibratory sense in his feet. He had anemia, achlorhydria, left bundle branch block and electrocardiographic changes of diffuse myocardial damage, sliding hiatal hernia, dilatation of the colon and terminal 2 feet of ileum. Postoperatively he had confusion and restlessness which cleared after digitalization and cortisone. Marked respiratory difficulty was present with thick mucus in trachea, terminally elevated blood urea nitrogen and depressed serum sodium. Urinary output was adequate but urine contained four plus albumin on the second postoperative day. Death followed cyanosis apparently due to mucus in trachea.



Adrenal insufficiency is unlikely although the patient had increased pigmentation of the exposed skin surfaces, anemia, weight loss, weakness, gastrointestinal symptoms, restlessness and irritability, and terminal depression of the serum sodium levels. But his heart was not small, and he did not develop hypotension. Lymphocytosis was not noted except on Dec. 9, 1955, when his lymphocyte count was 42 per cent and eosinophile count was 8 per cent. His response to ACTH was normal and there was no evidence of tuberculosis. The presence of malignancy is fairly well eliminated by the examination, the course and the exploratory inspection. Nutritional inadequacy such as that of vitamin B deficiency might be considered. He had minimal signs in his feet, vomiting and diarrhea. But his heart was not dilated and he had no edema and his diet was not unusual.

This man seems to have suffered from some widespread disease such as primary amyloidosis or collagen disease. Perhaps the death of 5 out of 12 siblings from unknown causes is significant in this connection. I see nothing in this man's story that makes it possible for me to rule out primary amyloidosis but it is so rare that statistically it would seem unwise to settle on this diagnosis. (Here the discussant failed to follow his previously indicated method of observation of the pathologist. He was too intent upon his discussion.)

I believe that systemic lupus erythematosus is the most likely disease. The gastrointestinal symptoms, the weakness, the weight loss and the cerebral symptoms, the anemia, lowered albumin and the presence of globulin more than 3 Gm., the absence of leucocytosis, the high sedimentation rate, the paresthesia in his legs, and his pulmonary and cardiac findings are consistent with this diagnosis. He is older than most patients with lupus but it has been reported in older patients. Absence of the characteristic skin changes does not rule it out. The absence of joint symptoms and fever is against it. But the man had some widespread disease and I am go-

Top: Congo red stain showing perivascular concentration of amyloid in renal vessels (x70). Bottom: H & E illustrating density of amyloid deposit in major vessels and in glomerular tufts (x70).

Top: Diffuse amyloid deposit in lymph node (Congo red) (x70). Bottom: Perivascular amyloid in pancreas (x70).

ing to stick my neck out for *systemic lupus erythematosus*. It would be helpful to have an electrophoretic separation of proteins. Was the serum electrophoretic pattern determined in this case? It was not included in the protocol given to me.

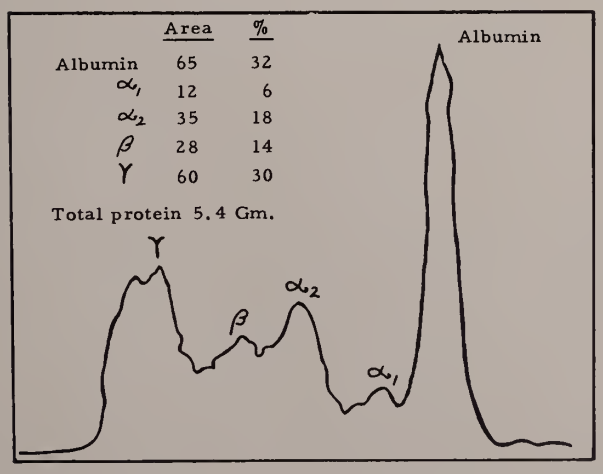


Fig. 1. *Impression*: No gross abnormality seen in this protein electrophoresis.

Dr. Minckler: This was done but unfortunately was missed in the protocol. This was not intentional and I regret that Dr. Straumfjord can now say that a critical feature of this patient's record was in fact left out. Here is the electrophoretic pattern graph. The values are included in figure 1, and the pattern was interpreted as in the range of normal distribution.

Dr. Straumfjord: I think this is an important omission for Rukavina *et al.*[1] have reported that there is an atypical peak in the free electrophoretic pattern associated with α_2 designated by them α'_2, in patients with primary amyloidosis. Although paper electrophoresis does not show enough resolution to demonstrate this peak, I think it is noteworthy that in this electrophoretic pattern α_2 is very significantly elevated (.97 Gm.—normal 0.55 ± 0.08). I do not know whether this does occur in lupus also but Rukavina feels that the presence of α'_2 is of diagnostic value in primary amyloidosis. I would question the interpretation of

the curve as presented. Perhaps the pathologist can clarify this in his analysis.

Conclusion

Dr. Minckler: Once again the discussant has deprived the pathologist of his one remaining simple pleasure—that of an original diagnostic pronouncement at a CPC.

The diagnostic summary in this case is as follows:

1. *Amyloidosis*—universal (atypical or primary).
2. *Bronchopneumonia*—bilateral—terminal.
3. *Operation*—exploratory laparotomy.
4. *Incidental findings* — generalized gastrointestinal distention, diverticulosis of colon, retention cysts of left kidney, encephalomalacia (minimal), emphysema (moderate, bilateral), coronary sclerosis (mild).

Until Dr. Straumfjord's comment, we had regarded the electrophoretic separation as normal. It is my understanding that it is essential to establish a distribution curve for each instrumentation. Certainly, we have had real trouble in learning definite distribution values from graphs supplied as guides. I wish to thank him for this suggestion.

A striking feature in this patient is the remarkably ubiquitous distribution of the amyloid deposits, qualifying the case as one of atypical type unrelated to an associated disease and exhibiting bizarre distribution of the deposits. It is regretted that the index of suspicion clinically was too low to do a congo red test which remains a reliable, although not absolute, indication to the existence of amyloidosis (80 per cent of cases characteristically show less than 40 per cent of the dye retained in the blood stream after 65 minutes).

If there are no further comments the case is closed with additional thanks to Dr. Straumfjord for his erudite discussion. •

U.S. and Russia to Exchange Medical Scientists

Multiple exchange programs of medical scientists covering a two-year period have been agreed upon by the United States and the Soviet Union.

A joint communique said "it is sincerely hoped that the program will be carried out in such a way as to contribute substantially to the betterment of relations between the two countries."

The Russian Ministry of Health will send this year to the United States a group of three or four medical scientists for a period of two or three weeks to deliver lectures and exchange experiences. The Russians will receive a similar group from this country.

The agreement also provides for an exchange of medical journals and 8 to 10 medical films a year.

the clinical results are **positive** when

NILEVAR® restores positive nitrogen balance

The anabolic effects of Nilevar are quickly manifest both to the patient and to the attending physician.

When loss of nitrogen delays postsurgical recovery or stalls convalescence after acute illness and in severe burns and trauma, Nilevar has been found to effect these responses:

- **Appetite improves**
- **Weight increases**
- **The patient feels better**
- **The patient recovers faster**

Similarly Nilevar helps correct the "protein catabolic state" associated with prolonged bed rest in carcinomatosis, tuberculosis, anorexia nervosa and other chronic wasting diseases.

Nilevar is unique among anabolic steroids in that androgenic side action is minimal or absent in appropriate dosage.

Nilevar (brand of norethandrolone) is supplied as tablets of 10 mg. and ampuls (1 cc.) of 25 mg. The dosage of both forms is from 10 to 50 mg. daily.

Filter Queen

Relieves Respiratory Discomforts Caused by Dust and Dirt Irritants In the Home

Patients with dust allergies frequently experience marked discomfort during home cleaning activities due to dust and dirt in the air. The Filter Queen Home Sanitation System relieves such distress by removing the cause. It operates on an entirely different principle—really two principles in one. First, by means of an unique, exclusive *Sanitary Filter Cone* it actually filters the air, cleans it by aeroscopic action of the smallest particles, even matter as fine as smoke. Second, the Filter Queen *Centrifugal Chamber* traps all matter collected, positively eliminates scattering or dispersion of dust in room air. Unbiased scientific proof of Filter Queen's air purifying efficiency is shown in a recent report* from the Biological Sciences Department of an eastern university which states, *"The Filter Queen cellulose Filter Cone removes practically all dust and atmospheric pollen."* This is another reason why Filter Queen has been selected for use in many of America's leading hospitals.

A Filter Queen demonstration in your home or office can be easily arranged at no obligation by writing or calling your local Filter Queen distributor.

Filter Queen carries the seals of Good Housekeeping Magazine, Rice Leaders of the World, Underwriters' Laboratories, and is advertised in A.M.A.'s "Today's Health."

UL — Listed under Reexamination Service — Underwriters' Laboratories, Inc.

Replacement or Refund of Money — Guaranteed by Good Housekeeping — If not as advertised therein

complete protection

To build sound bones and teeth, and to promote body resistance to disease, infants need sufficient quantity of vitamins A, C and D. When you prescribe Special Morning Milk and orange juice, or another source of ascorbic acid, vitamin requirements are normally met. Among all brands of evaporated milk, only Special Morning Milk is fortified with both vitamins A and D (2,000 U.S.P. units vitamin A and 400 U.S.P. units vitamin D per reconstituted quart).

Special
MORNING MILK

The preservation of health is a duty. Few seem conscious that there is such a thing as physical morality.

— HERBERT SPENCER, 1820-1903.

Over half a century has passed since these words were written, yet they become more meaningful with the passage of time. The urgent message they convey becomes clear when one brings them into perspective with modern society. Consider, for instance, the disease of alcoholism. It is estimated that there are almost five million alcoholics in the United States today. These figures are of little import until one realizes that neither the public or the medical profession is aware of the whereabouts of the bulk of those afflicted with this insidious disease. Naturally, the first step in combatting such a problem lies with the medical profession. Competent treatment of those known to be afflicted plus definitive research of the disease; these present the first line of defense. Given such a start, public awareness will soon follow.

A CHAIN OF COMMAND IN TOPICAL INFECTIONS

Whatever the situation — ocular infections and injuries, superficial oral-pharyngeal infections, or a variety of skin wounds and abrasions — there is an ACHROMYCIN preparation ready to meet the call for prompt anti-infective treatment.

Decisive broad-spectrum action has established ACHROMYCIN tetracycline as the antibiotic of choice for prompt control of infection at any site. This is why so many physicians look first to ACHROMYCIN for a dosage form to meet their specific medical requirements.

Only one great name to remember . . .

ACHROMYCIN*

NEW COUGH MODERATOR

®

SPECIFIC ANTITUSSIVE...

"COTHERA" moderates intensity and frequency of coughing through a selective action apparently on the medullary cough center . . . subdues but does not abolish the cough reflex. The natural reflex for removal of secretions is retained.

ACTS WITHIN MINUTES—LASTS FOR HOURS...

"COTHERA" provides a local anesthetic and soothing demulcent action to induce almost immediate relief of 'sandpaper' throat and 'annoying tickle'. . . followed by sustained moderation of the cough reflex, lasting for four to six hours and frequently throughout an entire night with one dose.

NON-NARCOTIC...

"COTHERA" is nonaddictive; does not cause respiratory depression, gastric irritation, or constipation. It is well tolerated by children and elderly patients, even after continued use. (Antitussive action is equal to ¼ gr. codeine per teaspoon dose.)

GUARDS AGAINST BRONCHOSPASM...

"COTHERA" exerts a mild musculotropic spasmolytic action tending to protect against possible harmful effects and cough-aggravation of bronchospasm.

CHERRY-FLAVORED...

"COTHERA" is completely acceptable to all age groups.

Indications: "COTHERA" Syrup is specifically indicated for irritating, useless, or chronic coughs such as those associated with the common cold, children's diseases, excessive smoking. It may be used safely for short-term or prolonged treatment.

Dosage: Adults and children over 8 years — 1 to 2 teaspoonfuls (25-50 mg.) three or four times daily. Children, 2 to 8 years—½ to 1 teaspoonful three or four times daily.

Supplied: 25 mg. per 5 cc. (teaspoonful), bottles of 16 fluidounces and 1 gallon.

Ayerst Laboratories Ayerst New York 16, N. Y. • Montreal, Canada

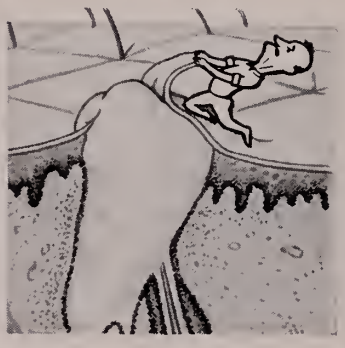
IN ACNE

Fostex® degreases the skin and helps remove blackheads



Fostex contains a combination of surface active agents (Sebulytic*) which:

◄ Completely emulsify excess oil so that it is quickly washed off the skin.

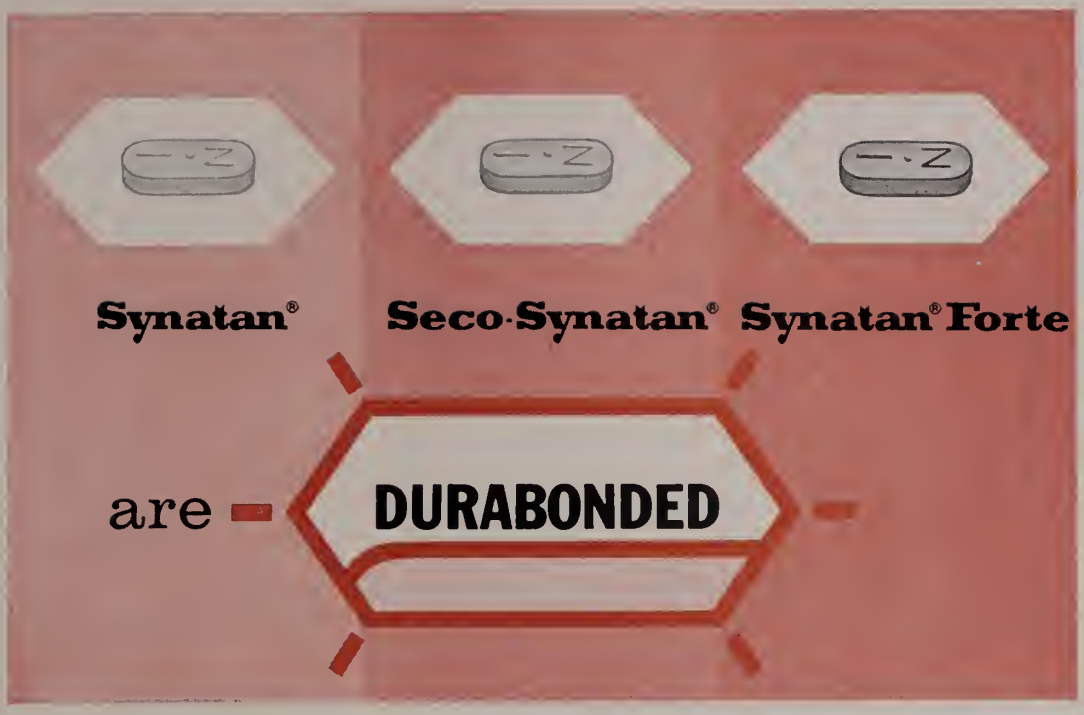
◄ Penetrate and soften comedones, unblocking the pores and facilitating removal of sebum plugs.

Fostex dries and peels the skin

◄ The Sebulytic base of Fostex dries and promotes peeling of the skin . . . actions enhanced by the keratolytic effects of micropulverized sulfur and salicylic acid.

*(Sodium lauryl sulfoacetate, sodium alkyl aryl polyether sulfonate, sodium dioctyl sulfosuccinate.)

FOSTEX CREAM
far therapeutic washing af skin in the initial phase of acne treatment, when maximum degreasing and peeling are desired.



FOSTEX CAKE
far maintenance therapy ta keep skin dry and substantially free af camedones.

Fostex is easy for your patients to use

◄ Patients stop using soap on affected skin areas. Instead they use Fostex for therapeutic washing of the skin. The Fostex lather is massaged into the skin for 5 minutes—then rinse and dry.

to achieve oral repository therapy

DURABOND® is a true repository technic for prolonging therapeutic effects from a single dose of oral medication. In Durabond a large molecular weight polyvalent base acts as a bonding agent and releases medication uniformly, gradually and over a prolonged period, independently of intestinal motility, specific pH or any other physiologic factor. Durabond employs no enteric coatings, waxes, resins or any other "drug traps." The amount of drug given is the amount released . . . all is available for absorption. All Synatan products incorporate the Durabond Principle.

Synatan

for control of appetite and mood

Each Synatan tabule contains:
Tanphetamin (*d*-amphetamine tannate) 17.5 mg.
in a protocolloid complex.

Indications: Whenever sustained, controlled tanphetamin therapy is desired for obesity; premenstrual, menopausal and postpartum depressions; neurasthenia; fatigue due to secondary anemia or other chronic illness; geriatric depression; alcoholism, and drug-induced drowsiness.

Dosage: 1 or 2 tabules at 10 a.m. for all-day control. For prescription economy, prescribe in bottles of 50.

Seco-Synatan

for control of appetite and mood in emotionally disturbed patients

Each Seco-Synatan tabule contains:
Tanphetamin (*d*-amphetamine tannate) 17.5 mg.
Secobarbital ..... 35.0 mg.
in a protocolloid complex.

Indications: In addition to controlling the patient's appetite, Seco-Synatan breaks the barrier of depression . . . creates a sense of well-being . . . buffers the patient against the ups and downs of his environment.

Dosage: 1 or 2 tabules at 10 a.m. for all-day control. For prescription economy, available in bottles of 50.

Synatan Forte

for greater anorexic action and control of mood

A higher potency form of Synatan.
Each tabule contains:
Tanphetamin (*d*-amphetamine tannate) 26.25 mg.
in a protocolloid complex.

Indications: Whenever higher potency tanphetamin therapy is desirable.

Dosage: 1 or 2 tabules at 10 a.m., or 1 tabule before breakfast and 1 before lunch, for all-day control.

helps anemic knights to more vigorous days

Glytinic®

the new amino acid-iron hematinic!

Dragon-slaying in the days of King Arthur was a rugged task for even Sir Lancelot! • Yet blood-building with iron, and iron alone, is often just as difficult...because a protein deficiency frequently accompanies iron deficiency anemia. Without glycine, formation of the blood molecule cannot take place* and iron is unsatisfactorily or incompletely assimilated. • That's why Glytinic, Boyle's new Amino Acid-Iron Hematinic, contains both glycine and ferrous gluconate...and that's why Glytinic often succeeds in building blood where other hematinics fail. Next time you're faced with an iron-deficiency anemia, help him enjoy more vigorous days by prescribing Glytinic...available in 100 tablet or 1 pint bottles.

Daily Dose (2 tablespoontuls or 4 tablets) of Glytinic contains: Ferrous Gluconate-13.5 gr.; Glycine-1.3 Gm.; Vitamin B-12-10.0 mcg.; Thiamine HCl-7.5 mg.; Riboflavin-7.5 mg.; Pyridoxine HCl-2.25 mg.; Niacinamide-45.0 mg.; Panthenol-6.5 mg.; Liver Fraction 1, NF-5.0 gr.; Cobalt-0.05 mg.; Manganese-5.0 mg.

L. A. FORMULA

is still unsurpassed

L. A. FORMULA *normalizes* bowel function. It is equally effective in correcting simple constipation and non-specific diarrhea. It is ideal, therefore, in the Irritable Colon cases in which both constipation *and* diarrhea may occur.

L. A. FORMULA is a vegetable concentrate of naturally occurring hemicelluloses. It is derived from blond psyllium seed by our special Ultra-Pulverization Process and simultaneously dispersed in lactose and dextrose. It provides just the moist, smooth, effective bulk so essential to normal peristalsis.

L. A. FORMULA is not to be confused with the ordinary laxatives, neuromuscular stimulants, or mucosal irritants. They *exaggerate* peristaltic activity. L. A. FORMULA *normalizes* it.

L. A. FORMULA, furthermore, is undetectable in fruit juice or milk, pleasant tasting in water, and available in 7 and 14 ounce prescription containers at significantly lower cost-to-patient prices.

ANNUAL MEETING
September 3-5, 1958
Portland

President, Vern W. Miller, M.D., Salem
Secretary-Treasurer, Max H. Parrott, M.D., Portland
Executive Secretary, Mr. Roscoe Miller, Portland

1958 NEW MEMBER INSTITUTE

On April 19, a group of 36 members, residents and interns attended the 1958 New Member Institute held in Portland under direction of Oregon State Medical Society's Committee on Public Relations. Lee Thompson of Beaverton, chairman of the Committee on Public Relations, served as chairman of the day for this first Institute held under a new Society provision which requires all members to attend within the first two years of membership. In addition to the chairman's timely remarks there were four excellent papers by leading members of the Society. Condensations of two of these papers are printed below. The other speakers were Herman A. Dickel, president-elect, who spoke on The Background and Significance of Medical Ethics, and George B. Long, a member of the Committee on Professional Consultation, who presented a talk entitled The Malpractice Claim—An Ever-Present Danger. Dr. Dickel's remarks will be carried in a future issue. Ed.

What Is the State Medical Society and What Are Its Purposes?

VERN W. MILLER, M.D.*
SALEM, OREGON

Oregon State Medical Society is a federation of the 25 local county and district medical societies in Oregon and brings together into one compact organization the entire ethical medical profession in our State. It unites with similar organizations in other states and territories of the United States to form the American Medical Association. Promotion of the science and art of medicine, advancement of medical education and knowledge and promotion of the welfare of its individual members and of the medical profession, generally, are its paramount purposes.

VERN W. MILLER, M.D.

The Society is a representative organization. Its officers and the members of its policy-forming bodies are chosen in a manner which gives the individual wide opportunity to participate in their selection. Moreover, during recent years, the structure of the Society has been revised to provide the individual member with increasing opportunity to express his views on Society affairs.

Affiliation with Organized Medicine

Affiliation with organized medicine begins with election to membership in the local medical society which is the judge of a physician's qualifications for such affiliation.

Having been elected by the local medical society, commonly referred to as the component society, the new physician then may complete his affiliation with the Oregon State Medical Society by paying the annual dues for the class of membership to which he is eligible. He then may take advantage of the benefits and privileges it offers.

The next step is membership in the American Medical Association which is attained by paying the Association's annual dues for which the member is billed along with State Society dues.

(Continued from page 773)

societies, is operated by a Board of Trustees elected by its House of Delegates on an area representative basis. Some thought is being given to establishment of Trustee districts to assure that the area representation among the nine Trustees is maintained. There is some merit to this suggestion.

Policies of AMA are made by the House of Delegates which meets twice annually. This body is composed of delegates elected by the various state and territorial societies on a physician-population basis—1 delegate for each 1,000 members. Oregon, on this basis, has two delegates: A. O. Pitman of Hillsboro and E. G. Chuinard of Portland. Our alternates are: W. W. Baum of Salem and John G. P. Cleland of Oregon City.

We mention here with great pride that one of the nine Trustees of AMA is a member of the Oregon State Medical Society—Raymond M. McKeown of Coos Bay. Dr. McKeown was a delegate for 10 years. His excellent work as our delegate was rewarded by election as Trustee last June.

Actual routine business of AMA is performed by an extensive administration organization at the headquarters office in Chicago and legislative office in Washington, D. C.

In the packet which you have received is a phamphlet entitled "It's Your AMA." I suggest that you read it carefully. The achievements of AMA will make you proud to be a part of it. Its work in behalf of the "Advancement of the art and science of medicine and the improvement of the public health" represents an unparalleled contribution to our national health and welfare. ("It's Your AMA" is available on request to the Society headquarters office.)

Organization of OSMS

Now, let's take a quick look at our Oregon State Medical Society.

It is an organization made up of 1,825 licensed physicians and still growing rapidly. These 1,825 doctors are grouped together in 25 component medical societies throughout the State, varying in size from Lake County with 5 members to Multnomah County with 900 members.

These component societies are federated to form the Oregon State Medical Society. Policies are made by the House of Delegates which meets annually, or oftener if necessary. This body is composed of delegates elected by the component societies on a physician-population basis, the officers and Councilors and the Society's past-presidents. The Council, which does the routine business of the Society and can make policy between meetings of the House of Delegates, meets monthly. Its membership is the officers of the Society and the Councilors who are elected from the various councilor districts, 13 in number.

Then, there is an Executive Committee of the Council which has certain duties which I will not enumerate. The Committee consists of the officers of the Society and two additional members elected by the Council. The officers of the Society are: The president; the vice-president, William Holford, Klamath Falls; president-elect, Herman Dickel, Portland; immediate past-president, Russell H. Kaufman, Portland; speaker of the house of delegates, Blair Henningsgaard, Astoria; and secretary-treasurer, Max H. Parrott, Portland.

The Society has 24 standing committees, 25 special committees and 6 special representatives to various agencies and governmental organizations which study an enormous number of problems and report their recommendations to the Council or House of Delegates for action.

There is an administrative headquarters in the Medical Dental Building in Portland. Mr. Roscoe K. Miller is our Executive Secretary. He has a staff of four persons. The Society also has available a legal counsel, Mr. John J. Coughlin of Portland, and a legislative counsel, Mr. John P. Misko, of Oregon City.

Purposes of the State Society

What is the purpose of the State Medical Society? It is twofold. First, to study the problems of a rapidly changing society as it relates to the profession, the public welfare and the public health, and to act as the voice of the profession in attempting to influence these changes in accordance with the beliefs of the majority of its members. This is done in order to produce the best environment in which the physician may practice his profession.

Second, to serve the individual physician in a multitude of ways—for example, it will provide information as to opportunities for locations in which to practice, and it will provide information as to the many problems facing practicing physicians—from problems relating to malpractice insurance to regulations with regard to the size of the letters and text on the nameplate on your office, the latter being a regulation of the State Board of Medical Examiners. It is safe to say that every phase of your professional life—from ethics to economics—is directly affected by the action of your Society. You name it and I will tell you how.

Now, the membership of the organization is assigning these jobs to their Society. Are we doing the job well? Are we keeping up with the rapidly changing times? And are we adequately voicing the majority of opinion of our members? Are our members keeping informed so that their majority opinion will reflect their best judgment? What are our assets in this task? Practically the only asset is 1,825 of the best minds in the State. This represents a minority group as compared to the population but one which potentially has a great influence.

We have the organization, and we know its purposes. How can we best go about the job?

How the Job Is Being Done

The most important thing is that our 1,825 well-informed and above average minds in 25 component societies should apply themselves to the problem and take an interest in their business. If they do not attend to it, someone else will and you will have no one to blame but yourself if it is not done according to your wishes. How do you do this? You cannot all be presidents. The one essential, in my opinion, is that you attend your society's meetings and make your vote known. You must elect the best possible representatives and officers and then actively support the majority opinion. If you do not exercise your right to vote in

Society affairs you are neglecting your business, and if you do not have an opportunity to vote you ought to be making some changes.

What is the Society doing about this?

1. We are attempting to keep the membership informed by publications; this could be improved.

2. We are urging the delegates and councilors to keep the local societies informed as to the matters considered in their respective organizations.

3. The officers are making component society visitations.

4. We are corresponding with our membership.

5. We are employing a legislative counsel to interpret to us matters coming before the State Legislature and Congress having to do with medical affairs and to properly interpret our opinions to the lawmakers.

6. Many commitees are doing an excellent job studying and recommending with regard to many problems. For example, the Public Policy Committee will be in action today; the Committee on Industrial Affairs is dealing with the Industrial Accident Commission with regard to the new fee schedule and rule changes; the Committee on Medical Education report will be given at the Council tonight.

We have a smoothly functioning executive headquarters and a good staff. You should take an opportunity to visit it.

You can readily see that to do all things touched upon above, the Society must be adequately financed. I am sure that you can see that you are getting a terrific bargain in service at your present dues. The Society is now adequately financed.

Conclusion

In general, I think you are doing a pretty fair job with your organization and my only real criticism is that too many members are taking the attitude, "let George do it." Well, George just might do it and get you in trouble.

I was a member of this Society for several years before I knew as much about the organization as you do now. This is at best, a sketch. I invite and urge you to make Society business your business—to learn more about your Society and to take an active interest in its affairs.•

Summary of Important Society Activities Which Affect You in Your Practice

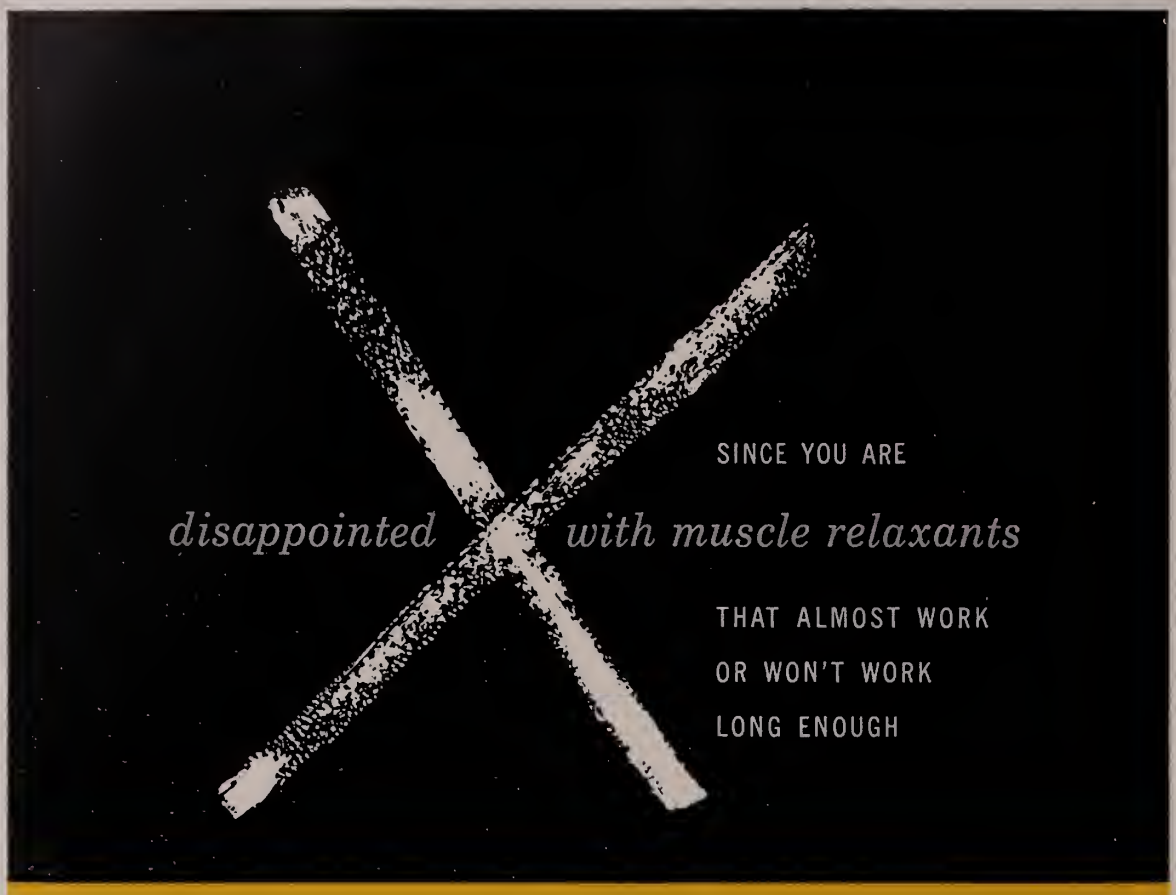
David R. White, M.D.*
NORTH BEND, OREGON

Vern Miller, our president, in his opening remarks at this Institute emphasized that Oregon State Medical Society is the spokesman for its members and represents them in many aspects of the practice of medicine. It is our purpose this morning to summarize some of the areas in which Oregon State Medical Society has been particularly active and effective in establishing policies and developing programs which have been to the best interests not only of the practicing physician in our State but also for our individual patients and the citizens at large.

DAVID R. WHITE, M.D.

Public Health

Perhaps the first public service activity which Oregon State Medical Society undertook when it was organized in 1874 was an attack upon the low level of community health which existed in our State at that time. Early records of the Society carry almost continuous reference to the high incidence of communicable disease in all areas of the State and the, for all practical purposes, complete lack of sanitation. That these conditions should exist in such a newly populated area is only natural but it is to the credit of Oregon State Medical Society that it recognized the need for controlling these two aspects of personal and community health.



At the Society's second annual meeting in 1875 a resolution urging establishment of a State Board of Health was adopted and legislation to create such an agency was supported in the Oregon legislature of that year. The legislature, however, did not respond to the recommendations of the Society. The Society continued to press for establishment of an official Public Health authority at successive legislatures until 1903 when the law was finally enacted. It is interesting to note that the first act of the State Health Officer was to investigate an epidemic of smallpox in Shaniko located in Sherman County.

The control of communicable disease is perhaps one of the most important functions of the official public health agencies in our State. We, as physicians, are asked to report certain communicable diseases which we detect among our patients. Physicians often find this requirement to be a source of irritation. We must recognize, however, that a record of the incidence of communicable disease is an important aspect of control and therefore we should be cooperative. Oregon State Board of Health is currently conducting a number of pilot studies throughout the State to determine whether a more efficient and effective reporting procedure can be developed.

Sanitation is also an equally important phase of

(Continued from page 777)

the work of our State Board of Health and its local components.

The correction and compilation of vital statistics is an equally important function of our health departments. It is interesting to note that the birth and death certificates which are now used in Oregon have been developed by the Oregon State Board of Health in consultation with appropriate committees of the Society.

Harold M. Erickson, the State Health Officer, has always maintained the practice of consulting with the Oregon State Medical Society in all public health matters which involve the physician in private practice and moreover has strongly urged all local health officers to maintain a similar relationship with the local medical societies in his county or district.

The physician upon establishing his practice in Oregon will find it most helpful to make an early contact with his local health department to become familiar with the services which may be available to him as a physician in private practice and also to become familiar with all the laws and policies relating to public health which has a bearing upon the practice of medicine.

The Injured Workman

The Oregon State Industrial Accident Commission under the Workman's Compensation Act has broad powers relating to care of the injured workman. The Act vests in the Commission the authority to make rules and regulations for the "Purpose of supervision and control of medical and surgical services rendered injured workmen who are entitled to service under the provision of the Workman's Compensation Act." Under the provisions of this Act it would be legally possible for the Commission to designate the physicians who can render medical and surgical care to the injured workman and to contract directly with him for such services.

Very early, however, the Commission recognized that restriction of the care of injured workmen for which it was responsible to a limited panel of physicians was not in the best interests of the patient. Moreover, the Society has been insistent that free choice of physician apply in the care of the injured workman in the same manner that it does to the care of other patients.

For many years the State Industrial Accident Commission has been in consultation with the Oregon State Medical Society in developing its "Maximum Medical Fee Schedule" and the Rules and Regulations which it establishes for the administration of the medical aid program. This has been done through the Society's Committee on State Industrial Affairs.

The Commission's Fee Schedule and its Rules and Regulations have been subject to revision approximately every five years. As a matter of fact, a revision is now in progress. The current revision has, however, taken considerably more time than previous revisions because the Society's Committee on State Industrial Affairs recommended to the Commission that it adopt a Relative Value Schedule patterned after the Relative Value Schedule established by the California Medical Association. Due to the unusually long period required for completion of the final schedule, the Commission voluntarily increased their maximum medical fee schedule established on Feb. 1, 1952 by 20 per cent, effective Sept. 1, 1957. The Commission has advised that this voluntary 20 per cent increase will continue until the present discussions have been completed.

The revised Rules and Regulations have been completed and have been adopted by the Society and the Commission and will be placed in effect as soon as the appointment of the Medical Advisory Committee to the Commission, which is provided for in the new Rules and Regulations, has been selected and appointed. The new Rules and Regulations remove many of the objectionable and irritating limitations which the current Rules provide and engender. The newly created Medical Advisory Committee will provide a mechanism through which the physician may bring his problems relating to the care of the injured workman to the Commission, and of course in the reverse, the Commission may bring to the Medical Advisory Committee any misunderstandings which have developed between the Commission and the individual physician.

The new physician should, upon opening his practice, obtain the necessary information and material from the Accident Commission to enable him to treat injured workmen in accordance with the Commission's rules.

Public Assistance Patient

It is one of the time honored principles of the medical profession that a patient shall not be denied medical care because of inability to pay for the cost of the service.

This principle was re-enunciated by the Society in the early days of the depression when funds for medical care were provided by the 1933 Oregon Legislature through enactment of the State Relief Act. Being pressed by State officials to cooperate in the development of a program for the administration of medical aid to relief recipients, the Council adopted the policy that the physicians of Oregon would make their services available to welfare recipients at fees which would represent no more than the physician's "out of pocket" cost and that these services be rendered on a "free choice of physician" basis.

Although the fee schedule has been revised on several occasions it has always been maintained at a level which presumes to reimburse the physician for "out of pocket" costs. By virtue of this policy, physicians of Oregon have made a continuing contribution over the years to the community and to the State of many millions of dollars.

Copies of the latest revision of the Public Welfare Commission's "Maximum Fee Schedule for Services of Physicians and Surgeons" adopted on July 1, 1957 and the Rules and Regulations under which it is administered was distributed to every physician practicing in the State at the time of its adoption and is available upon request to every physician establishing his practice in Oregon. Requests for the Schedule and Rules and Regulations should be mailed to Clinton S. McGill, Director, Medical Division, State Public Welfare Commission, State Office Building, Portland, Oregon, or to the office of the County Public Welfare Commission in your local community.

Responsibility of representing the Society in matters relating to the medical aid program of the Public Welfare Commission has been assigned to the Society's Committee on Charitable Medical Care. This Committee has had frequent meetings with the Commission's Medi-

(Continued on page 780)

(Continued from page 779)
cal Director not only regarding the reimbursement of physicians for services to public assistance recipients but also regarding general policies and practices in administration of the medical aid program.

Most recent development in establishing working relationships with local Public Welfare Commissions has been the appointment by several component societies of a Medical Consultant to its local Public Welfare Commission. Where this has been done the local Medical Consultant is able to interpret the Commission's policies and explain its problems to the members of his society and obtain their cooperation.

Here again, the new physician upon establishing his practice in a community should become familiar with the administration of the public assistance medical aid program in his community.

Veterans' Medical Care

One of the most important concerns of medical organization during recent years has been the rapid expansion of the United States Veterans Administration Medical Aid Program and Facilities. It has long been the position of the American Medical Association that veterans requiring treatment for illness or disability incurred in military service are the primary responsibility of the Veterans Administration, and that there should be no obstacles to the provision of the finest medical care for them. However, growth of the present Veterans Administration program has been attended by an increasing preoccupation with the 83 per cent of discharges from VA hospitals which are non-service-connected and with the development of research and medical training programs which are not considered by medical organization to be the proper responsibility of a tax-supported Veterans Administration. This development has created conflict with state and local medical care programs and has imposed an immense and unjustifiable expense on the taxpayer. Moreover, it has tended to relegate to a minor role attention to service-connected disabilities.

The Veterans Administration Hospital system has grown from 45,000 beds in 1936 to 126,000 beds in 1955. A one day census of Veterans Administration Hospital patients taken in 1954 revealed that only 38 per cent of these beds were occupied by veterans with service-connected disabilities. The remaining 62 per cent were occupied by patients with non-service-connected disabilities.

Another aspect of the care of the veteran which is of importance to the physician is the program known as the Home Town Medical Care Program for service-connected disabilities. Under this program, which was initiated in 1947, the veteran may obtain out patient treatment from his own physician at Veterans Administration expense. The veteran wishing to obtain his out patient care through this program usually submits a request to the Veterans Administration giving the name of his private physician. The Veterans Administration will then send an authorization to the physician. In some instances, the veteran may seek the services of his family physician prior to the issuance of authorization. In such cases the veteran will advise the physician that he is eligible for Veterans Administration care whereupon the physician should request authorization from the nearest Veterans Administration Regional Office. This may be done by telephone or in writing. The physician, however, should request such authorization within 15 days after treatment has been rendered. To receive payment for services rendered under the Home Town Medical Care Program the physician completes Invoice No. 3920 and mails it to Oregon Physicians' Service which administers this program in Oregon. In this program Oregon Physicians' Service is referred to as the Intermediary. Its only function is to make payments to physicians for services authorized by the Veterans Administration. For this service, Oregon Physicians' Service is reimbursed by the Veterans Administration for administrative costs.

In recent years the Veterans Administration has sought to eliminate the Intermediaries in the administration of the program. The Society has strongly insisted that the present form of administration be continued so that the free choice of physician principle may be retained. It is the Society's fear that the elimination of the Intermediary might lead to the establishment of the designated physician practice now followed by many federal government agencies and which has been a source of great irritation to the profession.

In recent years the provision of medical care to veterans with non-service-connected disabilities by the Veterans Administration has been under attack by the American Medical Association. It is a subject of continuing discussion by the House of Delegates. One of the Association's most important committees is the Committee on Federal Medical Services which is under the chairmanship of the very energetic and forceful Lewis M. Orr of Orlando, Florida. It has also been the major subject of consideration by our own Society's Committee on Veterans Affairs. This committee is under the chairmanship of Gilbert Prentiss Lee of Portland.

Medicare

In June of 1956 the 84th Congress adopted the Military Dependents' Medical Care Act which established a program to provide medical care for the dependents of members of the United States Uniformed Services through the use of civilian facilities and physicians. This program had the approval of the American Medical Association which recommended that each state medical society confer with the Department of the Army, which was designated as the administrative agent to execute the law, concerning how the program should be administered in each state. The Oregon State Medical Society designated Oregon Physicians' Service to act as the Fiscal Agent to administer the medical portion of the Act in Oregon and conferred with representatives of the Department of the Army in the development of a contract by which the program would be placed in effect. The contract for Oregon which became effective on Dec. 7, 1956 will be re-negotiated with the Department of the Army by representatives of the Society on October 6 and 7, 1958 in Washington, D.C. A special Committee on Medicare has been appointed to review the operation of this program in Oregon to determine what revisions in the contract should be made. Russell H. Kaufman of Portland, who represented the Society at the original negotiations, is chairman of this Committee and will again represent the Society.

Liaison with Other Professions

In 1951, upon recommendation of the Committee on

(Continued on page 782)

an entirely new concept in broad-spectrum therapy

COSA

Cosa is an abbreviation for glucosamine, a basic substance older than man himself, found throughout the human body and in the whole spectrum of nature—lobster shells . . . mother's milk . . . eggs . . . gastric mucin. . . . It achieved new importance when Pfizer scientists discovered that this interesting compound provided the following significant advantages when added to antibiotics such as tetracycline and oxytetracycline:

what is COSA

1. Higher, faster antibiotic blood levels[1]
2. More consistent high antibiotic blood levels[2]
3. Effective, well-tolerated broad-spectrum therapy[3,4,5]
4. Safe, physiological potentiation with glucosamine, a nontoxic human metabolite[6,7,8]

Your patients will do better when you choose COSA antibiotics

COSA-TETRACYN*

GLUCOSAMINE-POTENTIATED TETRACYCLINE

This excellently tolerated formulation provides highest, fastest blood levels of tetracycline, the most widely used broad-spectrum antibiotic. Capsules (black and white) 250 mg. and 125 mg.; orange-flavored Oral Suspension, 125 mg. per 5 cc.

COSA-SIGNEMYCIN*

TRIACETYLOLEANDOMYCIN GLUCOSAMINE-POTENTIATED TETRACYCLINE

Provides broad-spectrum antibiotic activity (Cosa-Tetracyn) *plus* triacetyloleandomycin effectiveness against many organisms resistant to currently used antibiotics. Recommended for home or office where sensitivity testing is difficult or impractical. Capsules (green and white) 250 mg. and 125 mg.

COSA-TERRAMYCIN*

OXYTETRACYCLINE WITH GLUCOSAMINE

A proven standard in antibiotic therapy for over 8 years now significantly improved through (1) glucosamine potentiation, (2) additional recrystallizations for maximum purity. Capsules (yellow) 250 mg. and 125 mg.; peach-flavored Oral Suspension, 125 mg. per 5 cc.

Public Relations, the Society established a number of liaison committees to represent the Society in the discussion of matters of mutual interest between physicians and other professions and groups. Such liaison committees were appointed to the Oregon Nurses Association, the Oregon Association of Hospitals, the Oregon State Dental Association, the Insurance Industry and the Oregon State Bar.

While all of these commitees have met frequently and accomplished much, perhaps the most significant accomplishment was the development of The Statement of Principles Regarding Certain Lawyer-Physician Relationships, an accomplishment of the Liaison Committee to the Oregon State Bar. This "Statement" was recently prepared in printed form and mailed to every member of the Oregon State Medical Society. Having the approval of the Society and the Bar, it has been an extremely effective aid in resolving many misunderstandings which have developed between physicians and attorneys and quite naturally its existence has, beyond a doubt, prevented many more. Every physician should preserve his "Statement" for ready reference.

Legislation

The Oregon State Medical Society is the watchdog for the members of the medical profession in matters relating to both Federal and State legislation. The American Medical Association maintains an office in Washington, D.C., to keep close contact with the actions of Congress.

A concrete example of this operation is the work which is currently being done to oppose the Forand Bill now pending in Congress. As you are well aware, the Forand Bill proposes to expand the Federal Social Security Program to provide hospital, medical and surgical care for the beneficiaries of the Social Security Program. This afternoon a special conference of "Key Men" is being held in this room to discuss the Society's plan for opposing this Bill.

During sessions of the Oregon State Legislature your Society maintains a legislative representative in Salem. This representative works under the direction of the Society's Committee on Public Policy which studies all legislative proposals relating to health and medicine which may be introduced, and submits its recommendations to the Council.

It is also important to understand that the Society may itself sponsor State legislation which it considers to be in the best interests of the profession and the general public.

Those Insurance Forms

Completing insurance forms is another irritation to most physicians.

To reduce the complexity of this problem, the Society in 1939 developed a Simplified Sickness and Accident Report Form for its members.

It is the recommendation of the Society that physicians provide a patient with the original "proof of loss" without charge. This can be in the form of his own statement, the insurance company's form or, if the physician wishes, the Society's form which most insurance companies accept in place of their own forms. The Society supplies its forms to members at cost—$1.25 per hundred.

It is legitimate for the physician to make a charge for providing additional reports which require him to search his records or to provide information beyond that necessary to the patient to collect the benefits of his policy. You will note that the Society suggests a *minimum* charge of $3.00.

Oregon Physicians' Service

Sometimes it is valuable to remind oneself of historical events, to orient current problems.

Every Oregon physician should remember that Oregon Physicians' Service is the "child" of the Oregon State Medical Society.

There is currently, however, much criticism of OPS on the part of Society members. Many physicians apparently look upon OPS as a thing apart—entirely independent of the Society.

Actually, OPS was established under the sponsorship of Oregon State Medical Society in 1941. The Society appropriated the $5,000 necessary for the paid-up capital required by the Oregon Hospital Association law and $1,000 for its immediate operating capital. Moreover, the Society nominated the members of the original Board of Trustees of 11 physicians.

The background which led to establishment of OPS is important to every physician practicing in Oregon. It began in 1904. In that year the first commercial hospital association was organized followed by 5 others during the next 20 years. These associations originally provided medical and hospital services to lumber workers but soon expanded their field of operations to include other industries as well. By offering to pay the full cost of medical and surgical care for their subscribers, these associations were actually selling the services of the physicians, many times without the consent of the physicians involved.

The so-called commercial hospital associations employed practices which were objected to by many physicians. They were regular corporations, and naturally sought to make a profit on their operations. Any procedure that reduced their payments to physicians would give them a greater profit.

After 25 years of constant conflict, the physicians of Oregon began to establish their own hospital associations. The first was the Physicians' and Surgeons' Hospital Service of Salem. It was followed by many others. At one period during the 1930's 16 local physician-sponsored plans were operating in Oregon.

With so many local plans sponsored by physicians there was, of course, some confusion. Patients covered under one plan were seeking services of physicians who were members of another and benefits varied. To establish general criteria for these associations, the Society established a Bureau of Medical Economics in 1937.

It became apparent that a statewide organization was desirable. Many employers, as well as physicians, recognized this need. The advent of World War II, with big shipyards, and the growing threat of socialized medicine accelerated the movement for a statewide organization. For instance, the Kaiser Corporation executives balked at entering into a contract with the Multnomah Medical Service Bureau to cover its shipyard workers. Upon the recommendation of its Committee on Medical Economics, the Society sponsored the organization of Oregon Physicians' Service. All but four

of the local physicians'-sponsored plans merged with the new organization.

In recent years OPS has undergone a number of important reorganizational changes. In 1951, a new Board of Trustees was elected from nominees submitted by local medical societies, thus giving the individual physician a voice in selecting the members of the policy forming body.

Further opportunity for local control of the medical program of OPS is provided through a local Supervisory Committee—again named by the local medical society.

Physicians who are in disagreement with any policy or practice of OPS may then effectively express their views through normal channels—his local society, his local supervisory committee, or members of the society who are on the Board of Trustees—in addition to OPS itself.

Moreover, the policies of OPS are frequently considered by the Council and House of Delegates of the Oregon State Medical Society.

Our purpose in devoting so much time to OPS in this summary is because your State Society is responsible for its existence and physicians who are members of the Society have a vital interest in its operation.

It should be recognized that OPS is a bulwark against those forces which would destroy the traditional American form of medical practice.

Conclusion

In this brief summary of important Society problems and activities I have tried to impress upon you its importance to you as a member and to the public at large. Not only is your Society important to you but you are important to the Society. It is essential that every new member take an active part in the affairs of his own local component society and be equally available for service to his State Medical Society. In conclusion, it is well to remember that the new member of today is potentially the Medical Statesman of tomorrow. •

Action Deferred on Committee Report

A lengthy progress report and recommendations of the Committee on Medical Education was presented to the Council of the Oregon State Medical Society at its April meeting by Chairman Robert S. Dow.

Due to the length and complexity of the report, the Council voted to defer further consideration of the matter until the next meeting and also requested the Executive Committee to consider the report and present recommendations at that time.

Since its establishment by the House of Delegates at the 1956 Annual Session, the Committee has held 26 meetings, 10 of these with representatives of the University of Oregon Medical School faculty and administrative staff. Included in the report were recommendations regarding nine areas of misunderstanding and disagreement between the Society and the Medical School.

Howard Lewis to Head National Group

Howard P. Lewis of Portland was named president-elect of the American College of Physicians at the organization's recent convention at Atlantic City.

At last—a nipple that new-born babies will take

New Curity* Rib Nipple (PATENTED) reduces air swallowing

Scientifically designed to fit baby's mouth—new hollow side ribs provide continuous flow of formula

When to recommend this nipple:

1. For new babies
2. For supplemental feedings of water and orange juice to breast-fed babies
3. For converting breast-fed babies to bottle
4. For problem feeders

Hollow side ribs make feeding easier because:

- they provide continuous flow despite biting
- they fit the mouth, reducing air intake
- they permit use of naturally pliable rubber

Traffic Safety Committee Recommends Physical Exams for School Bus Drivers

A recent report of Oregon State Medical Society's Committee on Traffic Safety which revealed plans for compulsory physical examinations for school bus drivers opened the door to speculation that the Medical Society may soon play a major role in establishing physical standards for all motorists.

Chairman Arthur A. Fisher of Salem told the State Council at its meeting on April 19 that current control of professional drivers in Oregon is limited to the chauffeur's license which may be obtained without physical examination.

He explained the school bus driver examination plan is first step in a new program to establish standards for all professional drivers. Standards for school bus drivers were established at request of the Oregon State Board of Health.

Following is the complete Committee report which was accepted by the Council:

COMMITTEE ON TRAFFIC SAFETY
REPORT TO THE COUNCIL
SATURDAY, APRIL 19, 1958

On April 15, your Committee convened in Portland at the request of the Oregon State Board of Health to consider the establishment of a uniform physical examination and personal history report form for school bus drivers in Oregon.

Guests at the meeting were Harold M. Erickson, State Health Officer; Ralph R. Sullivan, Director of the Occupational Health Section of the State Board of Health, and Mr. Ed Warmoth, Executive Secretary of the Oregon Traffic Safety Commission.

It was explained to the Committee that school bus drivers in Oregon are now simply required to obtain a chauffeur's license which carries no provision for a physical examination conducted by a qualified physician. The chauffeur's license is all that is required of other occupational drivers who operate vehicles within the State.

The Committee had no information to indicate that the traffic safety record of the estimated 2,300 school bus drivers in Oregon is any better or poorer than the records of other occupational drivers (logging, delivery, taxicabs). However, it was unanimously agreed that it would be desirable to establish uniform physical examination standards for occupational drivers in all categories. The school bus driver group represented a logical starting point.

In compiling a uniform physical examination form, the Committee was aware of the fact that the great majority of school bus drivers are part-time employees who follow other occupations during school hours. One school district employs college students as drivers. In other communities the busses are owned and operated by private contractors, who in turn, employ the drivers. Still other communities, especially smaller school districts, might utilize the services of a housewife or a retired farmer or businessman. Because of this variety of local practices, it was felt that the examination should be as complete as possible to cover the wide range in ages from teen-agers to persons over 65. It also was felt that more extensive diagnostic procedures should be recommended when indicated.

After consideration of a number of recommended physical examination forms for commercial and industrial drivers, some of which are now being used in other areas, the Commitee gave general approval to a suggested examination and personal history report developed in the State of New York.

A few of the items recommended in the New York form appeared to have only a remote connection to a person's ability to safely operate a commercial vehicle. Included in this category were depth preception, glare recovery, teeth, gums, nose, throat, tongue, flat feet, rectum, prostate, and military medical records.

The standard form as approved by the Committee provides for an extensive but realistic physical examination with emphasis on physical qualifications and personality as they might affect occupational drivers. This examination includes such personality data as appearance, intelligence, temperament and schooling, emotional and psychiatric evaluation and basic laboratory (urine, serology, C.B.C., x-ray of chest).

The minimum vision standards were re-worded to provide that if corrected visual acuity in either eye falls below 20/40, the better eye should not be less than 20/40 and the poorer eye no less than 20/70 and the binocular corrected acuity no less than 20/30. The visual field should conform to the standards of the Interstate Commerce Commission and color sense should include the ability to recognize basic red, green and yellow.

In addition the prospective school bus driver will be requested to complete a two-page personal health history. The personal history form requires the applicant to indicate if he has been treated for 47 specific illnesses and injuries and further stipulates a "Yes" or "No" answer to a list of 44 symptoms.

To assist the examining physician the Committee approved a reference list of conditions which may be non-acceptable for school bus drivers.

RECOMMENDATIONS

Your Committee recommends as follows:

1. That the Committee be authorized to submit a standard physical examination form and a personal health history form for school bus drivers to the Oregon State Board of Health with recommendation that the forms be approved for standard use in Oregon School districts as a requirement for employment commencing with the start of the 1958-1959 school year.
2. That the recommended examination and personal health history forms be approved for a period of one year in recognition that further study may indicate the advisability of additions and/or deletions.
3. That physicians be advised it is in the best interest of the applicant and the community to allow for sufficient time to complete the entire physical examination for school bus drivers.

Respectfully submitted,

Arthur A. Fisher, M.D., *Chairman*
Allyn M. Price, M.D.
W. P. Wilbur, M.D.

Oregon Alumni Association

During the seventy years since the first class graduated from the University of Oregon Medical School, there have been forty-three scientific sessions of the Alumni Association. Like all of the meetings since 1941, the session this year included lectures provided in the will of the late Ernst Sommer, now so well-known as the Sommer Memorial Lectures. Scientific papers by members of the Association, as well as the guest lecturers, were given in the Medical School Auditorium, April 16, 17 and 18. Fraternity reunion dinners were held the evening of April 15.

At the business meeting on April 17, John F. Larsell was named president. He graduated with the class of 1943, interned at the University of Kansas Hospital and served with the Army in the ETO. He returned to Portland after the war and trained in urology.

Others named to top posts are: Arthur W. Sullivan, vice president; Faulkner A. Short, secretary, and Joseph E. Nohlgren, treasurer. All are Portland physicians. Those named geographic vice presidents include: Keith P. Russell, Los Angeles; M. Irene Grieve, Spokane; Robert L. Schaeffer, Walla Walla, and Paul G. Hafner, Longview.

Annual banquet of the Alumni Association was held at Piluso's Restaurant, April 17. Certificate of honorary membership was presented to Frank Menne and lifetime memberships were awarded to the following:

Mayes Case, St. Johns, N.B., Canada, '92
Thomas O. Paxton, Seattle, '08
Luzanna Graves, Portland, '08
Zacarian A. Barker, San Diego, '08
H. Stanley Lamb, Portland, '07
O. Miller Babbitt, Portland, '06
William W. P. Holt, Medford, '05
Bertha Patton Baumbaugh, Santa Cruz, '05
Rasmus P. Mortensen, Medford, '04
Sherald F. Wiltsie, Seattle, '02
E. R. Seely, Portland, '01

During the session, Portland newspapers printed a number of stories on the meeting but featured the fact, to them quite amusing, that Lowell Rantz, scheduled to talk on control of infections, was unable to attend the first day's session because of acute gastro-enteritis. Dr. Rantz, however, arrived on the second day of the meeting with his energy and teaching ability unimpaired by the episode. His place on the Wednesday program was filled by Alan Moritz who gave two lectures, one on Unexpected Deaths from Natural Causes and the other on Trauma and Stress in the Causation of Heart Disease. His third paper, given Thursday morning, was on the County Coroner Versus State Medical Examiner System.

Mr. John Stallworthy of Oxford, England, read papers on Advances and Unsolved Problems in the Treatment of Uterine Cancer, Conservation in Obstetrics, and Functional Uterine Bleeding—Endocrine Aspects. The three papers have been presented to this journal for publication. The first of the series appears in this issue.

BERTRAM TRELSTAD, M.D.

MR. J. B. BIRD

Dr. Rantz spoke on Use and Abuse of Antibiotics, Staphylococcal Disease, and Antibiotics and the Intestinal Tract.

Alumni contributors to the meeting were: R. C. Blatchford, G. E. C. Nelson, J. W. Dowsett, H. M. Erickson, R. H. Keane, A. P. Friedman, J. W. Wiley, R. S. Dow, C. C. Carlson, E. Gettlemen, C. E. Gantbein, R. L. Johnsrud, B. N. Kvernland, C. E. Catlow and S. A. M. Johnson. •

Advisory Committee Member Named

Howard C. Stearns of Portland has been appointed to succeed Frank R. Menne on the advisory committee for the Sommer Memorial Lectures. Dr. Menne, chairman of the committee, recently retired as pathologist at St. Vincent Hospital, Portland, and has returned to his native Wisconsin.

Other members of the committee are Joel W. Baker of Seattle and Eugene W. Rockey and Arthur L. Rogers of Portland.

Three Important Meetings Take Place of House Session

Pattern of the past several seasons was changed this year when the Oregon State Medical Society dropped the mid-year session of the House of Delegates and substituted three meetings devoted to Society affairs. One of these was new—the first Annual Key Men Conference. The other two were the New Member Institute and a session of the Council. All were held at the Columbia Athletic Club, Saturday, April 19.

Speakers at first "Key Men" Conference—seated, from left: Vern Miller, Salem, President of Oregon State Medical Society; Arch W. Diack, Portland, Chairman of Committee on Public Policy; and Mr. John P. Misko, Oregon City, Legislative Representative. Standing: Arthur P. Martini, Eugene, member of Committee on Public Policy; and James H. Seacat, Salem, Vice-Chairman of Committee on Public Policy.

The New Member Institute, conducted by Lee Thompson, chairman of the Committee on Public Relations, was held in the forenoon. Dr. Thompson discussed the interests of the new member of the medical community, particularly his need to know more about the operation of medical organization. President of the Oregon State Medical Society, Vern W. Miller, read the paper which appears in this issue. Herman Dickel, president-elect, gave an interesting discussion on medical ethics. This was followed by a comprehensive report of medical society activities given by David R. White. His paper, also, is published in this issue. George B. Long, a member of the Committee on Professional Consultation, gave a report on the dangers of malpractice claims. His remarks were based on many years of experience on the committee and reflected a great deal of serious thought on the problem.

The Key Men Conference followed in the afternoon. This meeting was for those in key positions in the component societies and was planned to assist them in coordinating the activities of state and county organizations. Conferees were welcomed by President Vern W. Miller who outlined the purposes of the meeting.

Arch W. Diack, chairman of the Committee on Public Policy, discussed Federal and State Legislation and the Key Man's Role. The Forand Bill and need to oppose it were discussed by James H. Seacat. Relationship of the Key Man to his society and his community and his responsibilities to each were discussed by Arthur P. Martini.

Mr. John Misko, legislative representative of the Oregon State Medical Society, discussed the help given to the legislature, when in session, by key men from the Medical Society. This was followed by another discussion from Vern Miller on the importance of county society organization. Herman Dickel, president-elect of Oregon State Medical Society, read a paper on Important Activities Which a Component Society Should Undertake.

The program was concluded by a panel on "Major Medical Society Problems." Moderator was William G. Holford, vice-president. Members of the panel were Gene T. McCallum, vice-chairman, Committee on State Industrial Affairs; Clinton S. McGill, director of Medical Division, Public Welfare Commission; Mr. Joseph Harvey, manager of Oregon Physicians' Service and G. Prentiss Lee, chairman of Committee on Veterans' Affairs. •

Committee on Industrial Health To Survey Industrial Plant Operation

Industrial plants in Oregon employing more than 100 will soon be the subject of an extensive survey to be conducted by the Oregon State Medical Society under supervision of Ralph Sullivan's Committee on Industrial Health.

The Committee was authorized by the State Council to conduct a survey on two major phases of plant operation—disaster planning and the use of testing equipment for the purpose of determining eligibility for employment.

First half of the survey is designed to determine whether industrial plants have established plans for disaster control within the plant and further whether a master plan has been adopted in event of a national disaster arising out of enemy attack.

Second phase of the survey dealing with testing devices to determine eligibility for employment follows considerable discussion at the Committee level on the relative merits of such equipment. The survey should indicate the percentage of large employers using audio, visual, psychologic or other testing equipment for job placement.

In addition to approving the survey, the Council appropriated funds to defray expenses of Committee Member John G. P. Cleland of Oregon City while attending a two-day meeting of the President's Commitee on the Employment of the Physically Handicapped in Washington, D.C. The President's Conference was held May 8-9.

Obituaries

Dr. George E. Houck, 92, who was honored in 1952 as the oldest practicing physician in Oregon, died April 14 in a Portland rest home. Dr. Houck received his degree in 1890 from the University of Oregon Medical School, as a member of the school's third graduating class. He was the second physician to serve an internship at Good Samaritan Hospital in Portland. After a year on the staff of the Warm Springs Indian Agency, Dr. Houck entered private practice at Mitchell. In 1898 he moved to Roseburg, where he remained throughout his practicing career. He served as a member of the city council, as city and county health officer and as mayor from 1924 to 1929. He was a captain in the Medical Corps during the Mexican border engagements of 1916 and in World War I he spent 19 months in France as a major. Dr. Houck was a past-president of the Southern Oregon Medical Society and a councilor of the State Society. He was a member of the State Board of Health in 1921-1925 and 1929-1933, and was president of the Board in 1924.

Dr. E. W. Howard, 80, who practiced for 40 years in Corvallis, died April 16 of a heart attack. Dr. Howard received his medical degree in 1908 from St. Louis College of Physicians and Surgeons, and then practiced for 10 years in Brownville before locating in Corvallis in 1918. He served in the Philippine Islands during the Spanish-American War and was a contract surgeon during World War I. He was retired from the 41st Division during World War II as lieutenant colonel.

One Out of Five Tuberculosis Patients Leave Hospital Against Medical Advice

J. Karl Poppe, the Society's representative on the Board of Directors of the Oregon Tuberculosis and Health Association, has expressed concern about the number of patients who leave the state tubercular hospitals each year against medical advice.

Dr. Poppe reported that about 20 per cent of the patients leave before their treatment is complete or while they are still in a contagious state.

He said the high rate of irregular discharge might possibly be reduced if additional explanations were given these patients at the time of original diagnosis before admission. Dr. Poppe recommended that patients be advised to plan for a six or eight month stay in the hospital, or possibly longer, and should make arrangements at home for being absent during this period.

Medical Board Names Officers

Officers of the Oregon State Board of Medical Examiners for the coming year are Wilmot C. Foster of Portland, president, and George H. Lage, also of Portland, re-elected secretary-treasurer.

The Board also issued licenses to nine candidates to practice medicine and surgery in Oregon. Those licensed are: James A. Schneider and John J. Guyer, Portland; Donald A. Forinash, Victorville, Cal.; Mason C. Reddix, Albuquerque, N. M.; Donald McKinley, Ann Arbor, Mich.; Francis L. Sult, Nampa, Ida.; Ceilous L. Williams, Jr., Seattle, Wash.; Marion T. Merrill, Gilroy, Cal.; and Robert C. Turner, Grand Forks, N.D.

Next Board meeting is scheduled for July 18 and 19, and next State Board Written Examination is set for July 16 and 17.

Portland Physician Takes Foreign Post

Philip Selling, Portland internist, left early in May for a two year post under the International Cooperative Administration in Indonesia. He will serve as an assistant professor of medicine at the University of Djakarta under the cultural exchange program of the ICA which is under the state department.

Regional Group Elects Officers

The following men were named to office at the annual meeting of the Portland Regional Academy of General Practice in Portland April 21: Bruce Boyd, Portland, president; Arthur Pochert, Portland, president-elect, and Gerald Harpole, West Slope, secretary-treasurer.

Portland Physician Assumes High Post

Merle W. Moore, Portland allergist, was installed April 24 as president of the American College of Allergists at the group's annual meeting in Atlantic City. He is the first physician from the west coast to be named to the high office.

UOMS Professor Receives Research Grant

Charles T. Dotter, professor of radiology at the University of Oregon Medical School, has been awarded a research grant of $2,630 from the Oregon Heart Association. Dr. Dotter will use the funds toward developing a new technique for x-raying heart arteries.

Fig. 1. Members of the Woman's Auxiliary to Oregon State Medical Society honored their retiring president and new presidents during the 1958 installation ceremony in Portland. Shepard, Eugene, president-elect; Mrs. A. Arthur Underwood, Vancouver, Wash., president-elect, National Auxiliary; Mrs. C. A. Fratzke, Independence, Recording secretary; Mrs. Harry B. Moore, Portland, director; Mrs. Herbert Mason, Beaverton, member, Governor's Safety Council; Mrs. Harvey Baker, Portland, corresponding secretary; Mrs. W. T. Edmundson, Hood River, past-corresponding secretary; Mrs. Roswell S. Waltz, Forest Grove, past-president (1953-54), and Mrs. J. Earl Else, first president of the Auxiliary (1927-29).

Mrs. Underwood Installs Mrs. Pennington As President of State Auxiliary

A large delegation from Oregon is expected in San Francisco this June when Mrs. E. Arthur Underwood, Vancouver, Washington, accepts the gavel as president of the Woman's Auxiliary to the American Medical Association.

Mrs. Underwood, long active in Auxiliary affairs, recently served as installing officer when Mrs. Merle Pennington of Sherwood took office as president of the Woman's Auxiliary to the Oregon State Medical Society. Mrs. Pennington succeeds Mrs. Oscar Stenberg of Hood River, who was honored by the State Council for an outstanding year as president.

The State Auxiliary's new president-elect is Mrs. Willis B. Shepard of Eugene. Mrs. Shepard served as 1957 chairman of the Auxiliary's very successful Christmas card sale which raised a large donation for the American Medical Education Foundation.

The National Auxiliary Meeting in San Francisco will open on June 23, and continue through June 27. As president-elect, Mrs. Underwood will be honored at a number of business and social functions. She will receive the President's Pin and present her inaugural address at the close of the morning business session on Thursday, June 26. Headquarters for the National Auxiliary Meeting will be the Fairmont Hotel. All members of the Auxiliary are invited to attend.

A. O. Pitman Speaks on Medical History

A. O. Pitman of Hillsboro, past-president of the State Medical Society, recounted the work of the medical profession in Oregon, and especially in Washington County, at a recent meeting of the Washington County Historical Society. Dr. Pitman covered the period from the earliest settlement until after the turn of the century.

VERN W. MILLER, M.D.

It is always gratifying when a President has the opportunity to report on a success. The First New Member Institute held under the

David R. White, North Bend, presents detailed report on a few accomplishments of Oregon State Medical Society during recent New Member Institute. (Condensation appears elsewhere in this issue.) At left is Lee Thompson, Beaverton, chairman of the Committee on Public Relations, who presided at Institute. At far right is Vern W. Miller, Salem, State president.

new Society rule that all physicians are requested to attend an Institute within the first two years of membership must have been an extremely pleasant and educational experience for those in attendance.

The success of the event is a tribute to Lee Thompson, Chairman, and the entire Committee on Public Relations for arranging an informative and stimulating discussion of the objectives and principles of your Society.

The 36 new members, residents and interns who registered for the half-day course came from 10 counties. There was a warm atmosphere of enthusiasm displayed by the "student body," and not one person indicated that he was attending only because, "the Society rule forced him to participate."

The history of the New Member Institute is brief, dating but three years. However, the development of the Institute itself is symbolic of what can be accomplished by members interested in working for their Society. The first voluntary Institute was organized in 1956 by A. J. Kreft and his Committee on Public Relations. Although the attendance in '56 was disappointing, the Committee unanimously voted to continue the program. Later a recommendation was brought to the Council that the importance of the course be recognized in the Constitution and By-Laws and all new members be encouraged to attend.

With the presentation of the 1958 program our

Photographer snapped this picture of enthusiastic "students" during 1958 New Member Institute sponsored by Oregon State Medical Society. From left: R. T. Gustafson, H. B. Ballantyne, J. E. Holland, D. B. Franck, R. A. Payne and Delbert Blickenstaff.

New Member Institute has come of age. A future position in the regular calendar of events is assured for this infant among Society activities.

WASHINGTON STATE MEDICAL ASSOCIATION
1309 Seventh Avenue
Seattle 1, Washington

ANNUAL MEETING
Spokane
September 14-17, 1958

President, Milo T. Harris, M.D., Spokane
Secretary, F. A. Tucker, M.D., Seattle
Executive Secretory, Mr. R. W. Neill, Seattle

Convention Breakfast To Honor Past Presidents of WSMA

With President Milo T. Harris as host, past presidents of Washington State Medical Association will be honored at a complimentary breakfast during the Association's 1958 convention, which will be held in Spokane September 14-17.

Dr. Harris said all past presidents are invited to the breakfast, which will be held at 7:00 a.m. September 16 in the Davenport Hotel. Nineteen past presidents are known to be living, the dean of them being Park Weed Willis of Seattle, who was president in 1901. Records for the years prior to 1925 are incomplete, however, and anyone knowing of any other living physician who was president before that is urged to contact the Central Office at 1309 Seventh Avenue, Seattle.

Other convention events will include two days of scientific meetings, one day of scientific movies, business sessions, sports program and a calendar of social functions. Six out-of-state guest speakers will be featured in the scientific program, and will conduct postgraduate courses during the forenoons of September 16 and 17. Pre-registration information for the postgraduate courses will be announced in the near future.

Luncheon meetings announced to date for Tuesday, September 16, include the Washington Chapter, American College of Surgeons; Washington Academy of General Practice; WSMA Section on Internal Medicine, and Washington Association of Local Health Officers.

Shelby Jared Vice-President of Blue Shield

M. Shelby Jared of Seattle, medical director of King County Medical Service Bureau, was elected vice-president of the Blue Shield Plans of the United States at the organization's annual meeting in Chicago April 27-May 1. Dr. Jared previously had served for two years on the Blue Shield Commission.

At the same meeting, Carlton E. Wertz of Buffalo, N.Y., was installed as president, and Frank L. Feierabend of Kanssa City, Mo., was elected president-elect. There are 66 Blue Shield Plans in the States, Territories and Canada.

Physical Therapists To Meet

American Physical Therapy Association will hold its 35th Annual Conference in Seattle at the Olympic Hotel, June 15 to 20. Theme of the meeting will be Neuromuscular Facilitation.

Doctor-Lawyer Meeting—The second annual Chelan County Medical Society-Bar Association meeting was held in East Wenatchee May 5 with the medical society as host. Guest speaker was Richard J. Blandau of Seattle, assistant dean of the University of Washington School of Medicine, who spoke and showed films on "Seeing Life Through the Microscope." In photos, from left, are: (1) Donald C. Phillips, medical society president, Dr. Blandau, and Mr. Robert F. Murray, bar association president; (2) Mr. Larry Carlson, bar association secretary; Warren J. Kraft, medical society president-elect, and State Senator H. B. "Jerry" Hanna; (3) Judge Fred Kemp, retired; Norman M. Bellas, medical society program chairman, and Judge Lawrence Leahy of Chelan County Superior Court.

Hospital practice of infant feeding

Standard formulas for WELL INFANTS

Since age, appetite and digestive capacity vary, hospital practice favors an individualized formula for each infant.

The total daily feeding usually amounts to 2 ounces of milk *per pound of body weight*, plus 1 ounce of Karo Syrup with enough water to satisfy fluid requirements.

The newborn usually takes from 2 to 3 ounces of formula per feeding; the very young infant, 4 to 5 ounces—the daily quota yielding over 50 calories for each pound the infant weighs. The quantity per feeding should not exceed 8 ounces.

Newborns are fed at 3 to 4 hour intervals throughout the 24-hour period—the 2 or 3 A.M. feeding is discontinued after the neonatal period. In the third or fourth month the 10 or 12 P.M. feeding is discontinued, once the infant fails to awaken for the bottle. Standard but individualized formulas which constitute the hospital infant feeding regimen are shown here.

WHOLE MILK FORMULAS

Age Months	Cow's Milk Fluid Oz.	Water Oz.	KARO Tbsp.	Each Feeding Oz.	Feedings in 24 Hrs.	Total Calories
Birth	10	10	2	3	6	320

ADVANTAGES OF KARO® IN INFANT FEEDING

Composition: Karo Syrup is a superior dextrin-maltose-dextrose mixture because the dextrins are nonfermentable and the maltose is rapidly transformed into dextrose which requires no digestion.

Concentration: Volume for volume Karo Syrup furnishes twice as many calories as similar milk modifiers in powdered form.

Purity: Karo Syrup is processed at sterilizing temperatures, sealed for complete hygienic protection and devoid of pathogenic organisms.

Low Cost: Karo Syrup costs 1/5 as much as expensive milk modifiers and is available at all food stores.

Grant County Society Campaigns For Mosquito Control District

Important measures affecting the public health are usually supported by medical organizations. This tradition is being carried on by the Grant County Medical Society in a campaign for a mosquito control district in that area. Members of the Grant County Society are disturbed over the possibility of an outbreak of encephalitis, due to the recent mild winter and anticipated sharp increase in numbers of mosquitos. They have requested the County Commissioners to initiate action leading to formation of a control district.

So far, the Commissioners have refused to act except as result of petition. Some groups oppose the measure because of taxes which would be imposed. Undoubtedly, the Commissioners are considering these complaints. Their position is valid, in view of the permissive legislation passed at the 1957 session of the State Legislature.

S. B. 483, now Chapter 153, Laws of 1957, was introduced at Olympia at the most recent session. As originally written, it applied only to Adams, Benton, Franklin, Grant, Kittitas and Yakima counties. Walla Walla was included by amendment. The law permits the County Comissioners to act on their own initiative or in response to petition. The latter must be signed by at least 10 per cent of the voters and signatures must be certified.

County Commissioners are required to hold hearings in either event and finally must call an election to determine the will of the voters. In the Grant County situation the Commissioners have refused to initiate the movement but are waiting for petitions.

The Medical Society placed itself firmly on record by sending the following letter to the Commissioners:

> At the regular meeting of the Grant County Medical Society, Inc., held last Monday evening the problem of possible increase in encephalitis cases this year was discussed. It is the opinion of the members-physicians of the Medical Society that because of the extremely mild climate condition this year with the probable resulting increase in the number of encephalitis carrier mosquitos that this serious and possible fatal disease may increase to very serious proportions this year.
>
> The Medical Society feels that the County Commissioners should immediately take steps to form the necessary mosquito control districts so that effective area-wide measures can be taken to eliminate, as much as possible, the mosquitos which carry the encephalitis in this area.

Panel Discusses Home Accidents

A panel discussion on home accidents was presented as a public service April 22 in Port Angeles by Clallam County Medical Society. Decision to present the symposium came as a result of great public interest in a similar panel meeting on heart and circulatory ailments held in February.

Panel members and their topics were as follows: Kingsley Morrison, Statistics on Home Accidents; Albert F. Mangan, Causes of Home Accidents; L. E. Paddock, Prevention of Home Accidents, and Frank J. Skerbeck, Treatment of Home Accident Injuries. J. L. McFadden acted as moderator. All are Port Angeles physicians except Dr. Paddock who is located in Sequim.

Fifty Years of Service—On May 7 Herbert E. Coe of Seattle was honored for his 50 years service on the staff of the Children's Orthopedic Hospital by the presentation of a life-size oil portrait of Dr. Coe to the Hospital. From left: Herbert Moon, White Salmon, honorary member of the hospital staff; Dr. Coe; Miss Ruby Fall, hospital librarian and historian; Jay I. Durand, Victoria, B.C., honorary member of the hospital staff, and Vernon Spickard, chief of staff.

Children's Orthopedic Hospital Honors Herbert Coe for Fifty Years Service

Herbert E. Coe, first Emeritus Chief of Surgical Services at the Children's Orthopedic Hospital in Seattle, was given recognition of his 50 years service on the hospital staff at a dinner and special program held May 7 at the hospital. A life-sized oil portrait of Dr. Coe, a gift of the hospital Board of Trustees and the medical staff, was unveiled by Robert Coe, son of the honored man. Willard Goff, president of the medical staff, presented teh portrait to Mrs. Burns Lindsey, president of the hospital board.

During his 50 years as a member of the hospital staff, Dr. Coe served as Chief of Staff for 10 years and for 30 years was Chief of Surgical Services.

Prior to the unveiling, a bound book, containing more than 200 congratulatory letters from former patients, parents and colleagues from throughout the United States and other countries, was presented to Dr. Coe by Miss Ruby Fall, hospital librarian.

Other honors which have been received by Dr. Coe include the Grulee Award given in October 1955 for "outstanding contributions in pediatric surgery" of the American Academy of Pediatrics and a National Citation with Medallion from the National Conference of Christians and Jews awarded in May 1957.

The event was attended by physicians from throughout the state. The physician to come from the furthest point for the unveiling was Miguel Gomez of Guadaljara, Mexico, a former resident at the hospital.

Frank Douglass was master of ceremonies of the program and Edgar Rogge, president-elect of the staff, was chairman.

Doctors and Lawyers Hold Stag

Tacoma physicians and lawyers met at their annual Stag Dinner April 24 at the University Union Club. This year the Tacoma Bar Association hosted the event, adding golf and bridge contests to the regular affairs of the banquet.

Tacoma Surgical Club Annual Meeting Draws Record-Breaking Attendance

Twenty-seventh Annual Meeting of the Tacoma Surgical Club held at Jackson Hall of Tacoma General Hospital, Saturday, May 3, drew the largest registration of any year for the day and evening sessions.

Morning Session

Morning session consisted of the usual anatomic demonstrations by club members and invited guests, and created much comment. Also shown were numerous exhibits which included the heart-lung machine, methods of laboratory analysis and new methods of anesthesia. Orvar Swenson of Boston, guest speaker, toured the exhibits and discussed them.

Afternoon Session

Dr. Swenson, professor of pediatric surgery at Tufts Medical School and surgeon-in-chief at Boston City Children's Hospital, delivered the main address of the afternoon session. His subject was Ten Years Experience with Two Hundred Megacolon Patients. He stated that the operation and resection of a neurogenic portion of the colon with anastomosis of the colon to the segment of the rectum has proved to be the operation of choice for this condition and he showed many cases with cure over a 10 year period with complete continence of the patients. Dr. Swenson stressed the absolute necessity of doing a sharp dissection about the terminal recto-sigmoid area, rather than blunt dissection which would destroy the nerves going to the bladder and also cause loss of sexual function.

The afternoon papers were given by club members. Robert Florence gave a paper on Pain in the Knee in which he stated disease was actually located in the hip—the pain merely being referred to the knee. He cited several cases, and presented an excellent paper.

(Continued from page 796)

dren, summarized experience with tumors of the neck in the four Tacoma hospitals.

Surgical Management of Craniosynostosis in Children was the subject of the paper by John T. Robson. It was illustrated by a movie showing a successful operation in which a segment of the bone was removed and a piece of pliofilm placed around the severed edges to prevent the bones fusing together.

Robert Burt gave a paper on Intestinal Polyps and Their Importance in Children, and Stanley Tuell gave a paper on Inguinal Herniorrhaphy in Infants and Children.

The papers were discussed by Dr. Swenson and a question and answer period followed. Dr. Swenson pointed out that hernias in children should be repaired as soon as possible because danger of incarceration is nearly 25 per cent; the death rate from incarcerated hernias is higher than that from acute appendicitis in children. He felt that hydroceles can be watched up to one year after which time they should be operated on. He also feels that patients with undescended testes should not be operated on until they are 12 years of age since, in many of these cases, the testes will have descended by that time.

Evening Session

Presentation of certificates to new members opened the evening session which was held in the Bayview Room of the Hotel Winthrop.

Principles of Pediatric Surgery was subject of the main address given by Dr. Swenson. Following are some of the main points presented in this excellent paper.

Generally speaking, according to Dr. Swenson, surgery for children or infants should be undertaken at an early age since infants can stand surgery far better than was formerly believed. Dr. Swenson's short diagram showing how to evaluate fluid balance in infants was very enlightening.

He stressed the necessity of using extremely gentle technique and said that in his clinic he has what he calls *disciplinary silk* (6-0 silk) which is so fine one can scarcely see it, but is suitable for tying vessels and tissues. He deplores the use of heavy sutures in children and referred to it as *hawser-type* surgery. Dr. Swenson stated that it is not necessary to make large incisions—rather, they should be kept as small as possible. He also feels that blood should be used very sparingly as children tolerate surgery well without using much blood and this factor should be carefully watched. As an example, Dr. Swenson cited several operations for congenital megacolon, an extensive procedure, without the use of any blood whatsoever.

He went on to say that children should be fed as soon as possible—in fact, the day of the operation, even in intestinal anastomosis; and there is no necessity for feeding children by vein when feeding by mouth is so practicable.

Dr. Swenson deplored the use of hyperdermoclysis, stating that it has not been used in Boston hospitals for the past five years. Anesthesia should be very light, he said, and the child should be awake within five minutes after surgery—even in major abdominal surgery. There is no necessity for recovery rooms, he said, inasmuch as the patients should be fully awake when returned to their rooms. Instead of recovery rooms, Dr. Swenson said, we should have therapy units in the hospital where the very sick patients are kept where they can receive the intensive care they require.

Dr. Swenson was an extremely entertaining and forceful speaker and it was the general concensus of those attending that this was one of the best meetings the Tacoma Surgical Club has had. •

"See what CITRA H.F. capsules do for hay fever—she can now handle ragweed without fear"

NEW CITRA H.F. (Hay Fever)

with Broadspectrum Antihistamines PLUS Vasoconstrictor

Hay fever is a very funny subject... in a cartoon! Your hay fever patients take their problem seriously though, and CITRA H.F. is formulated to help them.

One Citra H.F. capsule every four hours helps to relieve such hay fever symptoms as sneezing, itching and congestion. Each Citra H.F. capsule contains:

Broadspectrum Antihistamines...each in ⅓ their usual therapeutic dosage, providing broader coverage and reduced side effects.

- Prophenpyridamine Maleate .....6.25 mg.
- Methapyrilene Hydrochloride .....8.33 mg.
- Pyrilamine Maleate .....8.33 mg.

Vasoconstrictor...to relieve congestion.

- Phenylephrine Hydrochloride .....10.0 mg.

THE CITRA FAMILY NOW INCLUDES:

New CITRA H.F..... for fast relief from hay fever symptoms.
CITRA FORTÉ (SYRUP)... for immediate cough control.
CITRA CAPSULES... for optimum relief of cold symptoms at any stage.
CITRA COUGH SYRUP... for relief of minor coughs and cold symptoms.

BOYLE & COMPANY Los Angeles 54, California

Seattle Physician Receives Award

Bruce Mackler of Seattle, who has been designated an Established Investigator by the American Heart Association, recently was awarded a total of $11,500 for the support of research projects of his own chosing. The award, $9,500 from the national association and $2,000 from the state organization, will be used by Dr. Mackler for the third of his five years of uninterrupted research support assured him under the Established Investigator program of the Heart Association.

The Seattle physician, who will conduct his investigation at the University of Wasihngton School of Medicine, is doing studies on the metabolic sequences involved in electron transport in heart muscle tissue.

Dr. Mackler's award was among 183 totaling $1,433,-147 given to scientists throughout the country under the national research support program of the Aemrican Heart Association and its attiliates.

Industrial Medicine Discussed

Members of Whatcom County Medical Society heard a discussion of industrial medicine at the group's regular monthly meeting May 6. W. J. Foley, medical consultant to the State Department of Labor and Industries, noted in hsi talk that the department processed 98,000 claims last year.

UW To Build Housing for Interns

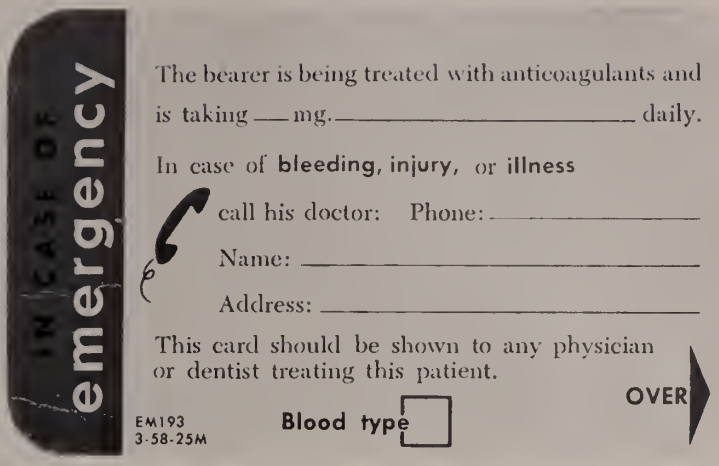
Plans have been made by the University of Washington to build a $440,000 apartment unit to house married interns and residents of the University Hospital. The building will accommodate 40 families and the first units are expected to be ready for occupancy by July 1960.

Yakima Health Officer Re-Appointed

Stanley R. Benner has been re-appointed Yakima County District Health Officer for his twenty-first year. Re-appointment is required by law, and the one year term will expire next April.

During the Health District Board meeting, Dr. Benner reported that since closure of Central Washington Tuberculosis Hospital at Selah in January, the number of Yakima county tuberculosis patients being hospitalized at Seattle, Tacoma or Spokane is about the same as when Selah was in operation.

Prior to the closure of Selah, the opinion had been expressed that many tuberculosis patients would not undergo hospital treatment because of the distance from their homes to the other state institutions.



Ovid O. Meyer Addresses Meeting

Ovid O. Meyer, professor of medicine at the University of Michigan, spoke before a joint meeting of the veterans hospital administration and the Spokane County Medical Society March 20 at the VA Hospital in Spokane. Dr. Meyer, who is a member of the Society for Clinical Research and one of the pioneer researchers in the field of anemia, presented a paper on the use of anticoagulants.

Spokane Surgical Admits New Fellows

During the 21st Annual Meeting of the Spokane Surgical Society April 12, four Spokane surgeons received certificates of active fellowship. New fellows of the Society are: Leonard A. Swinnel and Dale D. Popp, both diplomates of the American Board of Orthopedic Surgery, and Richard N. Kleaveland and John E. Sonneland, both diplomates of the American Board of Surgery.

Heart Association Issues Emergency Identification Card for Patients on Anticoagulant Therapy

Identification card for protection of patients on long-term anticoagulant therapy is now available.

The card points out that the bearer "is being treated with anticoagulants which slow down clotting of the blood." In case of emergency—bleeding, injury or illness—the card advises that a doctor be called, since the patient may require an antidote.

The card contains space for the name, address and phone number of the individual's physician. There is also space to indicate the kind of anticoagulant prescribed and the patient's blood type.

Physicians may obtain samples of the identification card from the Washington State Heart Association, 3121 Arcade Building, Seattle, or its Branches in Tacoma, Spokane and Yakima.

WSMA Recommendations Regarding Visual Screening of Pre-School and School Age Children

I. Pre-School Screening

The correct evaluation of the eye status of every pre-school child is an admirable goal. Although it would encounter obstacles, it should not be considered impossible in an age where the health needs of minority groups are considered of utmost importance. Furthermore, certain eye conditions must be diagnosed in the pre-school age in order to insure a response to treatment.

The examination of the child by the family physician will uncover most but not all of these defects. Some are revealed only after the eyes have been properly medicated and examined by an ophthalmologist—i.e., a medical doctor who is well trained in the diagnosis and treatment of medical, refractive and surgical eye conditions. Limited-type practitioners are not adequately prepared for the necessary diagnosis and treatment.

This is not a school problem but one which should be solved with the combined efforts of the Public Health Department and the medical profession. At present, there is no acceptable plan other than re-emphasizing the necessity for careful screening by the family physicians and pediatricians.

II. School Screening

(A) *Philosophy*:

While it is apparent that the danger of production of permanent damage by poor visual acuity in children has been overstated frequently and some of the other ocular factors even more overstated, it remains that proper vision and eye comfort are very important to the acquiring of knowledge by students.

Since an occasional parent fails to assume his parental responsibility, a school program for efficiently detecting those who need ocular care is necessary. This program is to be considered an expedient until such time as these children have matured sufficiently to assume individual responsibility.

This program should discover those needing care, and not attempt to be diagnostic in scope. To insure against misinterpretation of these aims, professional eye practitioners should not take part in screening. Under no circumstances should an attempt to diagnose a pupil's apparent difficulty be made in a screening program.

The mere fact that a practitioner did the screening and gave a passing report might give a false sense of security to the parent that all is well. Since this screening could be at best only a rough incomplete examination, there is no basis for such an inference being allowed, and if the screening was done by a lay person this danger could be avoided.

No individual, whether he be an ophthalmologist, orthoptic technician, osteopath, chiropractor, or anyone practicing the healing arts, or an optometrist, who could in any way make a financial profit by examining or treating the pupils who are found to have defective vision should be allowed to do the actual screening of the school children. We feel that this rule is so important that to ignore it will put the entire school health program in jeopardy. Furthermore, this screening should be under the direct supervision of the local school health administrator. It should be his right and sole responsibility to decide when and if he needs any outside assistance or advice.

Visual screening should not be over-emphasized, but should be conducted as an integral part of the entire school health program.

In addition, the program should accomplish the following:

1. Identify the pupils with visual defects.
2. Help them receive needed health services.
3. Acquaint teachers with pupils' visual disabilities.
4. Show where adjustments in the individual's educational program are needed.

(B) *The various methods available are*:

1. Snellen
   - (a) Not self-illuminated:
     - (1) Cardboard charts; inexpensive and generally available. Both alphabet and illiterate "E" available.*
   - (b) Self-Illuminated types:
     - (1) Atlantic City — uniformly illuminated. Uses illiterate "E" and provides for muscle balance screening, plus sphere screening and is relatively inexpensive.
     - (2) Massachusetts—relatively same as Atlantic City.
     - (3) Green's Eye Chart—not uniformly illuminated and relatively expensive.
     - (4) Projectochart — uniform illumination. Contains illiterate "E" and alphabet slides; no 20/25 illiterate line. Relatively expensive.
2. Stereoscopic Instruments

   These methods require more training upon the part of the screener. The screening takes longer to perform. The machines are relatively expensive. Repeated surveys have shown the largest per cent of over referral is produced by these systems.
3. Teacher observation for visual symptoms and signs.

   These are valuable and should be considered a basis for referral even in the absence of other findings.

(C) *General Recommendations*:

1. Pre-school screening to be done in the office of the family doctor or pediatrician as a part of a routine complete physical examination.
2. Yearly visual screening of all grade and high school children and more often if requested by teacher, eye physician or optical practitioner.
3. Screening to be done by teacher—this will insure child cooperation and prevent consideration of results as being diagnostic.
4. Teachers to do screening after being qualified according to California State Department of Public Health Plan. This makes yearly screening possible and acquaints teachers with the program.
5. Persons failing should be re-checked by school nurse.
6. No notice of passing to be given.
7. Nurse to complete standard referral form to be sent to the parents of those failing re-check.
8. This form to be completed by eye physician or optical practitioner and given to parents for forwarding to school.

*Symbol "E" Chart is available at 35c through the National Society for Prevention of Blindness, 1790 Broadway, New York 19, N.Y. Publication 180, 5c, containing directions for use of the chart, may be obtained at the same address. However, the Snellen chart may be purchased at most surgical supply houses which carry them in regular stock at approximately $1.50.

Parents Note: PLEASE RETURN THIS REPORT TO THE SCHOOL so it can be made a permanent part of the child's school health record for guidance of the health department and classroom teachers.

Official copies of the above report form recommended by Committee on Visual Screening of the Eye, Ear, Nose & Throat Section of Washington State Medical Association are on 8½ x 11 inch sheets.

9. We recognize that the percentage of cases with active pathology is relatively small among children with poor visual activity, however, if these are not correctly diagnosed and treated the results are often disastrous. Adequate examination generally requires the use of medication. Competent examination and treatment often requires training and experience held only by medical doctors. Proper diagnosis of difficulties often requires examiners who have had adequate anatomic, physiologic, pathologic, medical and surgical classroom and clinical training. We are aware that a type of limited practitioner is licensed by this State. The fact remains, however, that limited type training and experience is often reflected in limited diagnostic and treatment abilities.

(D) *Specific Recommendation*:

1. Type of program to be followed at this time:
   - (a) Check of visual acuity in each eye.
   - (b) Careful consideration of teacher's observation.
   - (c) Adequate follow-up by school authorities:
     - (1) Report form to be sent home with child for doctor's completion and return. Sample form accompanies this report.
     - (2) Permanent health record on each child should be kept continually and is to include eye findings with notation as to type of practitioner.
     - (3) Adequate check system should be applied to assure that referrals are executed and report returned to school in reasonable length of time.
   - (d) Use any funds available to purchase glasses for indigent children rather than purchase expensive testing gear.

2. Experimental Program:

Permissible to be used in certain limited areas to provide statistical evaluation with regard to possible future inclusion in statewide screening program. Extreme care must be used to avoid diagnostic aspect.

- (a) Check of visual acuity in each eye.
- (b) Careful consideration of teacher's observation.
- (c) Adequate follow-up by school authorities:
  - (1) Report form to be sent home with child for practitioner's completion and return.

(Continued on page 804)

(Continued from page 803)

(2) Permanent health record on each child should be kept continuously and is to include eye findings with notation as to type of practitioner.

(3) Adequate check system should be applied to assure that referrals are completed and report returned to school in reasonable length of time.

(d) In addition, Muscle-Balance Screening and Plus Sphere Screening: As found in Atlantic City or Massachusetts screening methods or both. Experimental methods should be registered with State Department of Public Health, stating purpose, methods used and results. We recommend clearance with the Department regarding aims and results to avoid exploitation, unnecessary duplication and to make possible an accumulation of possibly useful data.

3. Specific Method of Screening:
   (a) Snellen illiterate "E" Chart at 20 feet, self-illuminated at plus 10 feet candles without glare, etc. This is carried out by covering one eye at a time. Done by school nurse or teacher. Failures: -20/30 in either eye through second grade. -20/20 in either eye beyond second grade.
   Alphabet chart acceptable in high school.
   (b) Hyperopia and Muscle-Balance Screening: Either the Atlantic City or the Massachusetts Vision Screening methods, whichever is available. While the Atlantic City and Massachusetts methods may eventually prove superior to the recommended methods, they are still under study locally and we recommend these studies be continued. Furthermore, a better modification of the Snellen method than these soon may be improvised by the various medical committees that are now actively studying this problem.
4. Do not check for color vision at this time.
5. Do not check for stereopsis at this time.
6. Standards for referrals:
   (a) Visual Failures
      (1) Those who see less than 20/30 in either eye through second grade.
      (2) Those who see less than 20/20 in either eye after second grade.
   (b) Regarding Hyperopia and Muscle-Balance Screening:
      (1) Where used, the Atlantic City and Massachusetts screening methods should be kept intact for statistical purposes.
      (2) We feel different referral standards would be better, but realize this would create hopeless statistical confusion at this date.

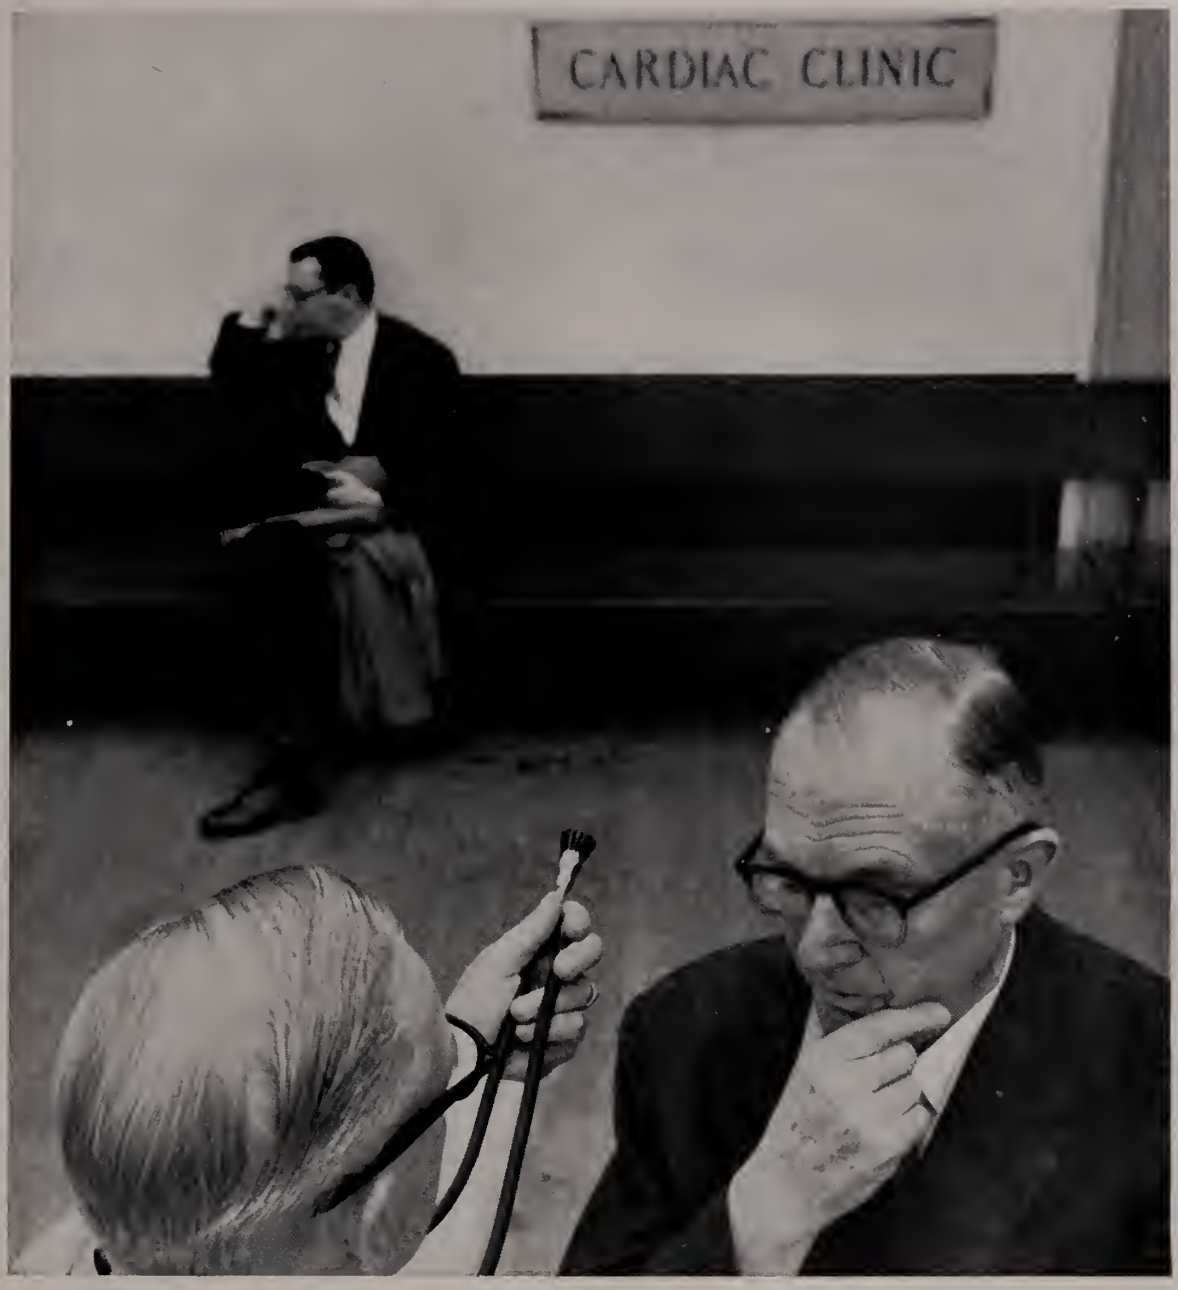
Addendum:

At the January 12, 1957 meeting of the EENT Section of the Washington State Medical Association the Committee on Visual Screening was made a permanent committee.

The members are to serve three year terms, but the terms are not to end simultaneously. The chairman is an ex-officio member of the state's government school health department committee. The Medical Association committee will meet at least two times a year or oftener to review the ocular screening programs in the State of Washington and elsewhere. The chairman, with the approval of the committee members, shall act as free consultant to any government agency or reputable group on visual problems, such as screening. The committee librarian will collect all possible data on the subject and make it available to the committee chairman and members. The members will be as geographically and politically representative as possible.

All of the ophthalmologists in the State of Washington will be informed of its functions and progress. All school health authorities will be contacted and advisory services offered.



The committee will willingly assist any public service organization but avoid association with any group whose policy is tainted with commercialism or financial gain and is not dictated by the highest ideals of public service.

Obituaries

Dr. Angus S. Williams, 88, died April 16 in a Seattle hospital of bilateral bronchopneumonia. Dr. Williams had practiced in Seattle and Renton until 1955, when he retired from active practice. He was graduated in 1899 from the Medico-Chirurgical College of Philadelphia and was licensed to practice in Washington the same year. From 1906 to 1909, Dr. Williams located in mining communities in Alaska. He was an honorary member of Washington State Medical Society.

Dr. William E. Steele, 71, first industrial physician in the state of Washington, died April 17 of a cerebral thrombosis and intestinal obstruction. Dr. Steele received his medical degree in 1913 from the Hahnemann Medical College of the Pacific, San Francisco. He located in Washington soon after his graduation and practiced in Pe Ell, Lewis County and in Longview and Olympia before moving to Seattle about 30 years ago. From 1933 until 1944, Dr. Steele served as the first medical director of the State Department of Labor and Industry. Then from 1945 to 1953 he was medical director for the Bethlehem Pacific Coast Steel Corp.

Dr. Gordon Wotherspoon, 53, assistant to the medical director of King County Medical Service Corp., died April 19 in a Seattle hospital of a bleeding gastric ulcer with complications and severe rheumatoid arthritis. Dr. Wotherspoon received his medical education at the University of Glasgow Medical Faculty in Scotland, from which he was graduated in 1934. That same year he opened a private practice in Seattle which he left in 1953 to become associated with the medical service corporation. During the Second World War, he served as a captain in the Army Air Corps.

"Remember him? Used to need injections every week. Since he takes Neohydrin he only comes once a month for check-ups."

National Association of Claimants' Compensation Attorneys (NACCA)

The medical-legal seminar of the Washington Chapter of the National Association of Claimants' Compensation Attorneys was held at the Roosevelt Hotel April 18 and 19, 1958. The following is copied from the official announcement of the meeting.

NACCA is dedicated to the proper and well qualified investigation, preparation, trial and settlement of claims of injured persons to the end that they receive that money compensation for their injuries and losses to which they are justly and fairly entitled.

Roosevelt Hotel, Friday 8 A.M. to 9 A.M.
REGISTRATION: Mezzanine Floor
PROGRAM: Friday, April 18th
Moderator: Hugh Miracle

9:00 to 9:15 Formal Opening of Seminar, and Welcome Address, T. E. Peterson, President, NACCA of Washington.

9:15 to 9:45 Address of Welcome and Remarks upon the Recent Improvement of Trial Technique, Hon. James W. Hodson, Presiding Judge, Superior Court, King County.

9:45 to 11:00 "The Proper and Effective Use of Court Rules, (including pre-trial procedure) and, Pending Changes in Rules, The Hon. Matthew W. Hill, Chief Justice, Supreme Court of State of Washington.

11:00 to 12:00 What Constitutes a full and fair "independent" medical examination and report thereon, upon behalf of the Defense. Drs. Howard Rickett and John Callahan, Orthopedic Physicians and Dr. John Mullins, Neurological Specialist.

LUNCHEON: ROOSEVELT HOTEL
Moderator: James P. Healy, Tacoma

1:45 to 2:30 Proving the Case Against the Dead Tort Feasor, John Sullivan, Seattle.

2:30 to 3:15 Detrimental Effect upon the eyes and eyesight, caused by cervical injury. Moray Girling, M.D. Occulist.

3:30 to 4:15 Strict Liability Under Federal Tort Claims Act, Prof. Cornelius Peck, University of Washington, School of Law.

4:15 to 5:00 Discussion and Questions from Floor of Current Questions and Problems in the Personal Injury Field, John Walthew, Seattle, Moderator.

PROGRAM: Saturday, April 19th
Moderator: Sam Fancher, Spokane, Washington

9:30 to Noon "Proper Jury Instructions in Personal Injury Litigation, and an evaluation of Uniform Jury Instructions, of King County."
Edward J. Pollock, Los Angeles, California, Attorney Co-Editor of Baji, California Jury Instructions, will make the principal address, followed by a Panel Discussion:
Panel Members: Hon. Ward Roney, Judge—Superior Court of King County, Stanley Soderland and Frederick Orth, Attorneys. Questions from floor will be permitted.
NOTE: Bring your copy of King County Uniform Instructions.

LUNCHEON: ROOSEVELT HOTEL
Moderator: Henry Arnold Peterson, Tacoma

1:30 to 2:30 Emotional Trauma Neuroses, and Functional Injury without Organic Damage. Medical Panel: A. Bernard Gray, M.D. (Orthopedist), A. Mark Hurley, M.D., (Psychiatrist), and Audrey Holiday, Ph.D., (Psychologist).

2:30 to 4:00 Liability on Breach of Warranty, Negligence or Absolute Liability theories for injury or death resulting from vaccines, inoculations and other injections. Lou Ashe, Attorney, San Francisco, California, partner, Belli, Ashe, McBride and Geary.

4:00 to 5:00 A complete Orthopedic and Neurologic Examination will be conducted, with full explanation of tests, their functions and significance. Kenneth L. Martin, M.D., (Orthopedist) and Gerald P. Nowlis, M.D., (Neurological Specialist).

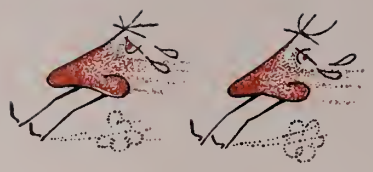
NACCA does not solicit memberships, but does welcome as members all attorneys whose practice in the personal injury field, is primarily on behalf of the injured.

NACCA National membership fee is $20.00 per year, which includes without added costs, NACCA LAW JOURNALS.

NACCA of WASHINGTON membership fee is $10.00 per year.

Local Round Table NACCA discussion groups exist in principal cities for frequent discussion of current questions and problems and for presentation of speakers in the medical, legal, and scientific fields to better qualify attorneys practicing personal injury law.

Spokane Hospital Has Pump-Oxygenator



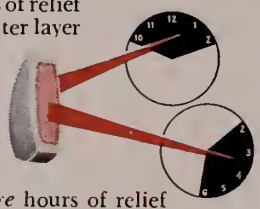
Funds amounting to approximately $4,600 have been used by the northeastern branch of Washington State Heart Association in the procurement and development of the pump-oxygenator at Sacred Heart Hospital in Spokane. The contribution makes the Association one of the major contributors to this community service project. The machine and the research facilities have been provided by the Sisters of Providence of the hospital.

Clark County Medical Society

Regular monthly dinner meeting of Clark County Medical Society was held at the Royal Oaks Country Club on Tuesday evening, May 6. A large turnout greeted Milo Harris, president of the Washington State Medical Association, and Mr. Ralph Neill, executive secretary. Dr. Harris spoke on Medical Society Activities on a State and County Basis, and Mr. Neill discussed Legislative, Malpractice, and Defense Fund Matters.

running noses . . .

caused by pollen allergies



TRIAMINIC stops rhinorrhea, congestion and other distressing symptoms of summer allergies, including hay fever. Running nose, watery eyes and sneezing are best relieved by antihistamine *plus* decongestant action—systemically—with TRIAMINIC.

This new approach frequently succeeds where less complete therapy has failed. It is not enough merely to use histamine antagonists; ideally, therapy must be aimed also at the congestion of the nasal mucosa. Triaminic provides such effective combined therapy in a single timed-release tablet.

TRIAMINIC brings relief in minutes—lasts for hours. Running noses stop, congested noses open—and stay open for 6 to 8 hours.

Triaminic provides around-the-clock freedom from allergic congestion with just one tablet t.i.d. because of the special timed-release design.

first—3 to 4 hours of relief from the outer layer

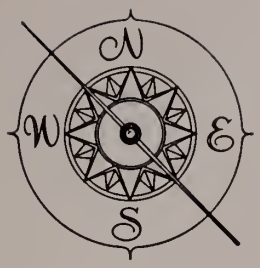
then—3 to 4 *more* hours of relief from the inner core

Dosage: One tablet in the morning, mid-afternoon and at bedtime. In postnasal drip, one tablet at bedtime is usually sufficient.

Each timed-release TRIAMINIC Tablet contains:

Phenylpropanolamine HCl	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

TRIAMINIC FOR THE PEDIATRIC PATIENT



TRIAMINIC Juvelets*, providing easy-to-swallow half-dosages for the 6- to 12-year-old child, with the timed-release construction for prolonged relief.

*Trademark

TRIAMINIC Syrup, for those children and adults who prefer a liquid medication. Each 5 ml. teaspoonful is equivalent to ¼ Triaminic Tablet or ½ Triaminic Juvelet.

Triaminic®

Boise, Idaho

SIXTY-SIXTH ANNUAL MEETING
July 6-9, 1958
Sun Valley

President, H. B. Woolley, M.D., Idaho Falls Secretary, W. B. Ross, M.D., Nampa Exec. Secy., Mr. A. L. Bird, 364 Sonna Bldg., Boise

Memorial Lectures Set for Annual Meeting

Four Memorial Lectures will be presented by Guest Speakers during the 66th Annual Meeting.

A new lecture, the Walter R. West, M.D., Memorial Lecture, sponsored by Mrs. W. R. West, Idaho Falls, will be presented by Carl A. Moyer.

The W. A. Tall Memorial Lecture, sponsored by Asael and Aldon Tall of Rigby, and members of their family, will be presented by Ralph C. Benson.

The Alexander Braclay, Sr., M.D., Memorial Lecture, sponsored by Mrs. Alexander Barclay, Sr., Coeur d'Alene, will be presented by C. Donald Creevy.

The H. Smith Woolley Memorial Lecture, sponsored by Hoyt B. Woolley and family, Idaho Falls, will be presented by Don H. O'Donoghue.

The Clayton Jones Memorial Lecture, sponsored by Arthur Curtis Jones and family, Boise, will not be presented this year.

State Association Officers Visit Component Medical Societies

During April, President Woolley and other Association Officers visited the four component medical societies in North Idaho.

The visits started with officers and members of the North Idaho District Medical Society in Lewiston on Wednesday, April 16; with the Kootenai-Benewah Society in Coeur d'Alene on Thursday, April 17; a luncheon meeting with members and officers of the Bonner-Boundary Society in Sandpoint on April 18; and a dinner meeting with officers and members of the Shoshone County Medical Society in Wallace on the evening of April 18.

Making the visits in addition to President Woolley, were President-Elect Donald K. Worden, Lewiston; Secretary-Treasurer W. B. Ross, Nampa; Councilor, District No. One, Robert E. Staley, Kellogg; Program Chairman Fred E. Wallber, Idaho Falls; Idaho AMA Legislative Chairman E. V. Simison, Pocatello; President, Woman's Auxiliary, Mrs. E. R. W. Fox, Coeur d'Alene, and Exccutive Secretary Bird.

Association Officers also made visits to four societies in Southeastern Idaho early in May. The societies and dates visited are as follows: Bear River Valley Medical Society, Soda Springs, May 6; Upper Snake River Medical Society, St. Anthony, May 7; Southeastern Idaho District Society, Pocatello, May 8, and Idaho Falls Medical Society, Idaho Falls, May 9.

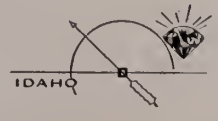
Fifty-Year Physicians To Be Honored During 66th Annual Meeting

Plans are being made to bestow high honors during the 66th Annual Meeting on Idaho physicians who have been in practice 50 years or more. The following list has been compiled in the State Office, but may not be complete. If you know of any physician residing in the state whom you think would qualify, please send their names and year of graaduation from medical school to the State Office.

Names of physicians and their year of graduation, currently on the State Office list, include:

Ethel P. Westwood, Sandpoint, 1899; Joseph H. Murray, Meridian, 1899; J. M. Lyle, Lewiston, 1902; George O. A. Kellogg, Nampa, 1903; D. C. Ray, Pocatello, 1903; Fred A. Pittenger, Boise, 1905; H. H. King, Montpelier, 1905; Robert H. Wright, Hailey, 1906; C. M. Cline, Idaho Falls, 1907; C. J. Kinsolving, St. Maries, 1908; H. C. Mowery, Wallace, 1908; A. R. Soderquist, Idaho Falls, 1908; William F. Tyler, Sandpoint, 1908; E. W. Fox, Hailey, 1908; and Sam W. Forney, Boise, 1908.

President Woolley Names Members of House Reference Committees



President Hoyt B. Woolley has appointed the following to serve as members of the Association's House of Delegates Reference Comittees:

LEGISLATION AND PUBLIC RELATIONS
Raymond L. White, Boise, *Chairman*
G. Curtis Waid, Idaho Falls
Joseph B. Koehler, Pocatello
Jerome K. Burton, Boise

INSURANCE, MEDICAL AFFAIRS AND WELFARE
Murland F. Rigby, Rexburg, *Chairman*
A. M. Peterson, Wallace
Lee Nowierski, Boise
Wallace H. Pierce, Lewiston

OFFICERS AND SECRETARY
Richard D. Simonton, Boise, *Chairman*
E. R. W. Fox, Coeur d'Alene
Wallace Bond, Twin Falls
Allen H. Tigert, Soda Springs

MISCELLANEOUS BUSINESS
Alexander Barclay, Jr., Coeur d'Alene, *Chairman*
Reuben C. Matson, Jerome
Melvin M. Graves, Pocatello
O. D. Hoffman, Rexburg

County Societies Elect Officers

Newly elected officers for the Southeastern Idaho District Medical Society for the coming year include:

PRESIDENT—Louis G. Bush, Pocatello.

PRESIDENT-ELECT—W. L. Olson, Pocatello.

SECRETARY-TREASURER—J. E. Comstock, Pocatello, (re-elected)

New officers for the Idaho Falls Medical Society for the coming year are:

PRESIDENT—G. Curtis Waid, Idaho Falls.

VICE-PRESIDENT—Robert S. Butz, Idaho Falls.

SECRETARY-TREASURER—James D. Davis, Idaho Falls.

S. M. Poindexter Honored by National Group

S. M. Poindexter, Boise, chairman of the Idaho State Board of Medicine, received high recognition for his outstanding work in the preparation of the "Guide to the Essentials of a Modern Medical Practice Act" during the 54th Annual Meeting of the Federation of State Medical Boards held in Chicago February 8-12. A resolution commending Dr. Poindexter was unanimously adopted at the meeting.

During the session, Dr. Poindexter also served as Chairman of the Committee on Reports of Officers and Committees of the Federation.

Pediatric Surgery Problems Discussed

Dean W. Tanner of Ogden, assistant clinical professor of surgery at the University of Utah College of Medicine, was guest speaker at the April dinner meeting of the South Central Idaho Medical Society at Magic Valley Memorial Hospital, Twin Falls. Dr. Tanner spoke on common problems in pediatric surgery.

Location

Paul F. Miner, who left Boise in December 1956 to practice in Denver and to become associated on a part-time basis with the University of Colorado School of Medicine, has opened his office in the Eastman Building, Boise, for the private practice of internal medicine.

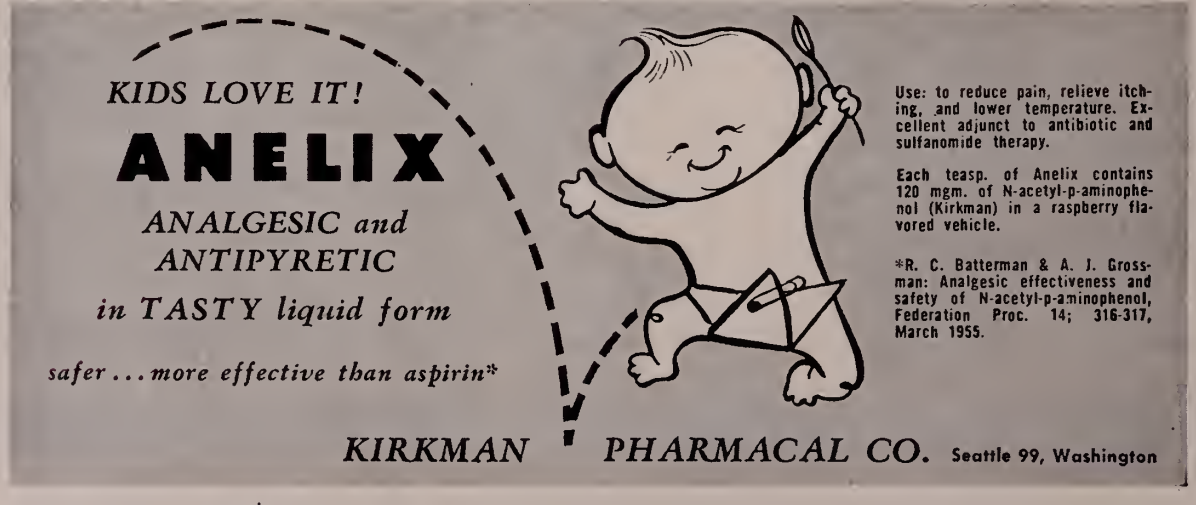
State Board of Medicine

Joseph E. Baldeck, Lewiston, has been appointed a member of the State Board of Medicine by Gov. Robert E. Smylie to succeed Paul M. Ellis of Wallace who has resigned. Dr. Baldeck's appointment will run until 1961. Dr. Ellis has served on the State Board of Medicine since 1949 and last August accepted the Governor's appointment as Chairman of the new State Board of Health. More than 15 years ago, Dr. Baldeck served as a member of the Medical Licensing Examining Committee.

Two Temporary Licenses were granted in April. Receiving them were:

Gordon Wesley Johnson, Caldwell. Graduate University of Colorado School of Medicine, Denver. M.D. Degree 1957. Internship Bernalillo County-Indian Hospital, Albuquerque, N. M., 1958. Granted T-204 April 25. General.

Burt Read Erickson, Caldwell. Graduate University of Colorado School of Medicine, Denver. M.D. Degree 1957. Internship Bernalillo County-Indian Hospital, Albuquerque, N. M., 1958. Granted T-205 April 25. General.



Ada County Health Director Named

J. E. Wyatt has announced that he will assume the duties of director of Ada County Health Department in Boise early this month. Dr. Wyatt for the past four years held a similar position in Pocatello as director of the Southeast District Health Department.

Dr. Wyatt is making the change at the request of Terrel O. Carver, State Health Department Administrator. Dr. Carver held the post of director of the Ada County Health Department before his appointment to the state department.

Mental Health Committee Meets

The Association's Mental Health Advisory Committee held a dinner meeting in Boise May 2. Dale D. Cornell, Boise, is chairman of the committee. Other members include: Maurice M. Burkholder, Boise; Glenn Voyles, Twin Falls; John L. Butler, Boise; and Glen M. Whitesel of Kellogg.

Many such hypertensives have been on *Rauwiloid* for 3 years and more*

for Rauwiloid IS better tolerated... "alseroxylon [Rauwiloid] is an antihypertensive agent of equal therapeutic efficacy to reserpine in the treatment of hypertension but with significantly less toxicity."

*Ford, R.V., and Moyer, J.H.: Rauwolfia Toxicity in the Treatment of Hypertension, Postgrad. Med. *23*:41 (Jan.) 1958.

For gratifying Rauwolfia response

Rauwiloid®

ALSEROXYLON, 2 MG.

virtually free from side actions

just two tablets at bedtime

After full effect one tablet suffices

Enhances safety when more potent drugs are needed.

Rauwiloid® + Veriloid®
alseroxylon 1 mg. and alkavervir 3 mg.
for moderate to severe hypertension.
Initial dose, 1 tablet t.i.d., p.c.

Rauwiloid® + Hexamethonium
alseroxylon 1 mg. and hexamethonium chloride dihydrate 250 mg.
in severe, otherwise intractable hypertension. Initial dose, ½ tablet q.i.d.

Both combinations in convenient single-tablet form.

Northwest Physician-Artists Invited To Exhibit at AMA Annual Meeting

All physicians interested in any of the crafts and photography, as well as painting in all media, will please note that they are invited to become members of the American Physicians Art Association. This organization is recognized by the American Medical Association and the annual art exhibit is held at the time and place of the annual AMA meeting, this year in San Francisco June 23 to 27.

This will be one of the finest art shows ever held by the organization in the past 21 years. Anyone from Oregon, Washington or Idaho interested in joining or exhibiting, please communicate with Edmund H. Smith, M.D., Northwest Regional Director, 3434 Cascadia Avenue, Seattle 44, Wash.

Pacific Coast Oto-Ophthalmological Society Honors Boise Surgeon at Annual Meeting

Arthur C. Jones, Boise surgeon, was guest of honor at the 42nd Annual Meeting of the Pacific Coast Oto-Opthalmological Society which was held in Vancouver, B.C., May 11-15. Dr. Jones, a past-president of the society and currently a member of the governing council of the group, was presented with high honors at the general session on May 12. Presentation was made by Merle Taylor of Portland, who is also a former president of the society.

Dr. Jones is a past-president of the Idaho State Medical Association and the Idaho chapter of the American College of Surgeons. He has practiced in Boise since 1921.

Neurologists and Psychiatrists Elect

At the annual meeting of the North Pacific Society of Neurology and Psychiatry held in Victoria, B.C., April 11-12, the following men were named to head the group for the coming year: John W. Evans, Portland, president; J. Lester Henderson, Seattle, president-elect; and Robert M. Rankin, Seattle, secretary-treasurer. Those on the executive committee are: Robert Dow, Portland; Peter Lehman, Vancouver, B.C.; and Wallace W. Lindahl, Seattle.

premenstrual

'DIURIL'

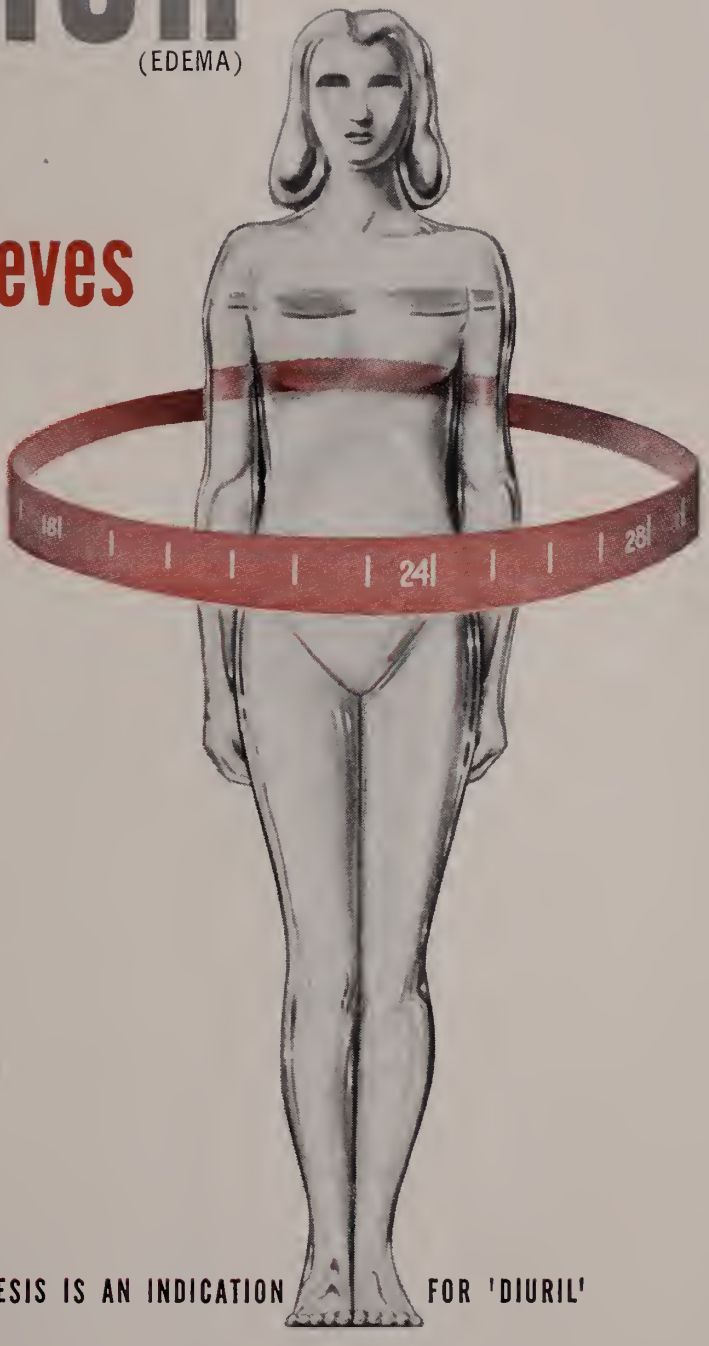
(CHLOROTHIAZIDE)

FORD, R. V., Rochelle, J.B.III, Handley, C. A., Moyer, J. H. and Spurr, C. L.: J.A.M.A. **166**:129, Jan. 11, 1958.

". . . in premenstrual edema, convenience of therapy points to the selection of chlorothiazide, since it is both potent and free from adverse electrolyte actions." In the vast majority of patients, 'DIURIL' relieves or prevents the fluid "build-up" of the premenstrual syndrome. The onset of relief often occurs within two hours following convenient, oral, once-a-day dosage. 'DIURIL' is well tolerated, does not interfere with hormonal balance and is continuously effective—even on continued daily administration.

DOSAGE: one 500 mg. tablet 'DIURIL' daily—beginning the first morning of symptoms and continuing until after onset of menses. For optimal therapy, dosage schedule should be adjusted to meet the needs of the individual patient.

SUPPLIED: 250 mg. and 500 mg. scored tablets 'DIURIL' (chlorothiazide); bottles of 100 and 1,000.



DIURIL is a trade-mark of Merck & Co., Inc.

LIVER-BRAIN RELATIONSHIPS. By Ian A. Brown, M.D., Ph.D., Associate Professor of Neurology, Division of Neurology, Department of Neurology and Psychiatry, University of Minnesota. 198 pp. Illustrated. Price $6.50. Charles C Thomas, Springfield, Ill. 1957.

On occasions a monograph will be presented to the profession that gives evidence of a detailed and thorough knowledge of the subject and a familiarity with the world literature on that subject. In addition it will be presented in excellent form, and be written with considerable clarity. It will be concise and yet approach the proportions of a reference book, with an extensive bibliography.

This is such a text.

It has been written primarily for the physician interested in internal medicine, and the physician interested in neurology. It represents a successful attempt to deal with a problem common to both fields—namely, liver disease and the central nervous system complications that can result therefrom.

It was written with the neurologist in mind who might wish a concise review of the functions and anatomy of the liver, and current tests used in the study of liver disease.

The internist was also considered in the discussion of the anatomy of the blood-brain barrier, cerebral blood flow, and the physiologic and pathologic effects of certain enzymes and minerals on the brain itself.

Chief value of the book to the clinician lies in the careful analysis of 42 patients with hepatic disease in coma, and 40 patients with hepatic disease without coma. Based on this case material, clinical and pathologic features were discussed and tabulated. The biochemical aspects of the problem were presented, and an attempt was made to relate the various aspects of liver and brain disease.

The final chapter, entitled Possibilities, Speculations and Conclusions, summarizes the present knowledge of liver-brain relationships and points the way to further research in this area.

Aquatyl®

a natural peristaltic stimulator with effective stool softening action

restores normal bowel physiology to provide normal, lasting correction of constipation. Each Aquatyl tabule contains 50 mg. dioctyl sodium sulfosuccinate and 100 mg. cholic acid. Dioctyl sodium sulfosuccinate safely softens the stool . . . cholic acid, an elemental body constituent, sparks natural peristalsis and a return to normal evacuation.

Dosage: Initially, two or three tabules with a full glass of water 3 times daily for three days. Maintenance therapy, usually 1 or 2 tabules daily.

To serve your patients today—call your pharmacist for any additional information you may need to prescribe Aquatyl. For prescription economy, prescribe in 60's.

Wound Healing with Cod Liver Oil Ointment

Harold G. Grayzel, M.D.
Saul Schapiro, M.D.
Brooklyn, New York

The primary aim in the treatment of wounds is to restore structure and function to a damaged tissue or organ in the shortest possible time. To accomplish this, suitable local as well as general medical and surgical measures must be employed. At the present time there are many local methods for the treatment of wounds, especially infected ones. The attitude appears to be that no single method offers any particular advantage over the others forms of treatment." We feel that the local treatment of certain types of wounds with a bland, nonirritating protective cod liver oil ointment offers certain advantages over other accepted local applications. There are many reports of the successful treatment of wounds with cod liver oil ointment.[1-11] Most of these publications appeared prior to the era of antibiotic therapy. To determine the value of cod liver oil ointment under present-day conditions, 70[1] patients with a variety of wounds were studied and compared with the experience of others using different measures.

METHODS AND RESULTS

The patients were unselected. To obtain as large and as varied a series as possible, there were taken all cases now treated by others according to their preferred methods of surgical management. The only exceptions were the excision of large, open suppurative and necrotic wounds, or multiple complicated compound fractures or extensive third-degree burns. The patients were treated at five different institutions. Except for the agreement to use a specified cod liver oil treatment* as the sole local application, the entire management was in the hands of 16 cooperating physicians. Usually one or two surgeons handled a particular case. In a few instances it was possible to treat one involved area with cod liver oil ointment and other somewhat similarly involved areas with other sterile vaseline-impregnated gauze or dry sterile gauze dressings. The wounds included in this study were of seven types (Table I).

All wounds, whether of traumatic, thermal, chemical or infectious origin, are essentially similar. They are practically always infected in varying degree. Some traumatic wounds may present a striking picture in that, if the wounds are considered sufficiently clean and sterile, they may be closed immediately by suture and kept in that state by local dressings.

The objectives of treatment in all the cases were to sustain the patient, correct shock, supply fluids, electrolytes and blood if indicated, improve the nutritional state, and to promote the tissue and prevent infection. If warranted, the wound was closed by primary or secondary intention or otherwise allowed to heal well and rapidly, so that either skin grafting or closure of the wound could be performed as soon as possible, preferably within one to three weeks.

To prevent infection in contaminated wounds, mineral debridement and cleansing were instituted. If cellulitis or pockets of purulence were encountered a combination of mechanical debridement and wet dressings was used. Cod liver oil ointment was then applied liberally and evenly either directly to the wound and its margins or by means of a sterile gauze pad containing a heavy application of the ointment. Over this, cellulose-cotton gauze pads or gauze dressings and cotton bandages were applied. This dressing was retained for four to seven days depending upon the nature of the wound. At the end of this period, the dressing was removed and the wound was inspected. If it were thought necessary, similar dressings were reapplied after debridement and cleansing of the wound with the sterile normal saline, and kept in place another four to seven days. In a few instances a third dressing was necessary. If at any time suppuration of the wound or skin grafting were indicated, these procedures were employed. In addition, appropriate antibiotics and, when indicated, gas-bacillus antetoxin and tetanus antitoxin or toxoid were given. As early as possible, to aid wound healing and to supply optimal nutritional needs, the patient was given a high caloric diet containing a high protein and a high carbohydrate level as well as large doses of vitamins. In this report we shall concern ourselves

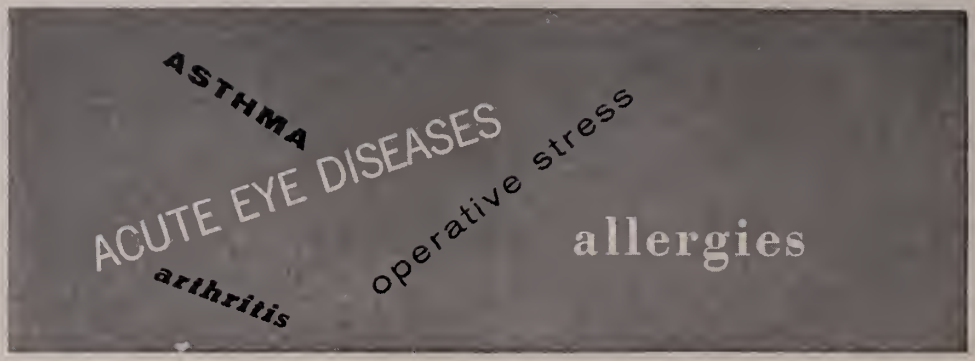
* The cod liver oil ointment used in the local treatments of all wounds, was Desitin Ointment, supplied generously by Desitin Chemical Company, Providence, Rhode Island.

DESITIN® ointment

promotes "early, clean and healthy healing"

in

- **traumatic and infectious wounds**
- **burns (first, second, third degree)**
- **abdominal fistulae and wounds**
- **pressure sores and ulcers**
- **pilonidal cysts and sinuses**
- **ano-rectal wounds • chest wounds**



This confirms previous findings regarding the efficacy of soothing, protective, non-irritant Desitin Ointment—rich in cod liver oil—to accelerate healing in many other skin conditions . . . diaper rash, ulcers (decubitus, varicose, diabetic), etc.

Economical treatment of the many conditions amenable to ACTH therapy

CORTROPHIN-ZINC*†

Use Cortrophin-Zinc to provide relief in the 100 or more conditions amenable to ACTH therapy. It's economical because each injection lasts at least 24 hours in the most acute cases, to 48 or even 72 hours in milder cases. It's easy to handle, too, because it is an aqueous suspension which flows freely through a 26-gauge needle with no preheating. Clinically proven in thousands of patients, an advance in ACTH therapy.

Available in 5-cc vials, each cc providing 40 U.S.P. units of corticotropin with 2.0 mg zinc.

*T.M.—Cartraphin

†Patent Pending. Available in other countries as Cartraphine-Z.

SIGN OF GOOD TASTE

She's Been **SONATED**

She's just one of more than a million patients who have been treated with Ultrasound by the more than 20,000 physicians using Ultrasonics in their practices. If you are thinking of buying an Ultrasonic examine the mechanical features · look at the transducer. Is it adaptable (adjustable) to all five of the recommended treatment positions ? Is the crystal small enough (5CM² is the experts' choice) to treat the concave areas ? Is the electronic circuit stable so that output remains constant throughout treatment ? Is the dosage always what reads on the meter ? Is the manufacturer experienced in producing equipment for the medical profession ? Does he have dealers everywhere to give you service when you need it ? You owe it to yourself to know the answers to these questions.

In all sincerity we believe that every Birtcher MEGASON Ultrasonic (there are four models, you know) will meet your every qualification.

64 page booklet "Medical Ultrasonics in a Nutshell" answers 25 commonly asked questions about ultrasound and contains abstracts of several medical journal articles.

BAKER'S MODIFIED MILK

A complete formula in liquid and powder form prepared exclusively from Grade A Milk

- **Protects Normal Skin Integrity**
- **Assures Optimal Caloric Utilization**

Recent work has pointed out that linoleic acid plays a significant metabolic role in infant nutrition. Too low an intake results in dryness, thickening and leathering of the skin,[1] and an increased caloric consumption.[2]

In Baker's Modified Milk the troublesome butterfat has been entirely replaced with easily digested corn and cocoanut oils, which provide five times the amount of linoleic acid in cow's milk formulas.

Infants fed on Baker's Modified Milk are protected against eczematous and other dermatologic conditions caused by lack of linoleic acid, and are also assured optimal caloric utilization.

Prescribe Baker's Modified Milk to protect skin integrity and assure optimal caloric utilization.

DIAGNOSIS AND TREATMENT OF INFECTIONS. By D. Geraint James. M.A., M.D.(Cantab.), M.R.C.P. (Lond.), Clinical Assistant, The Middlesex Hospital, London. 234 pp. Price $6.00. Charles C Thomas, Springfield, Ill. 1957.

With the rapid advances in the field of antibiotics and chemotherapy, a book on these subjects may be compared to a book on airplane design. It is somewhat obsolete by the time it is published and reviewed. But this book by a British author utilizes liberally the then current literature (1956-1957) and opinions of world authorities. Short, concise descriptions are arranged into three parts. The first part deals with the chemotherapeutic agents. Part two describes the microorganisms individually, and part three describes infections as they present in various systems. There are many charts which would, no doubt, appeal to the medical student just about to take his final examination but offer little practical use except bitter nostalgia.

This book is a monologue and not meant as a reference textbook. It can be quickly read in its entirety and would offer a rapid review of the field of infections and antibiotics for those who desire it. There are several short sections on drug sensitivity reactions and bacterial resistance that are highly worthwhile.

Abbey Franklin, M.D.

ANTIBIOTICS ANNUAL 1957-1958, Proceedings of Fifth Annual Symposium on Antibiotics, October 2, 3, and 4, 1957, Washington, D.C. Edited by Henry Welch, Ph.D., Director, Division of Antibiotics, Food and Drug Administration, Department of Health, Education, and Welfare, Washington, D.C.; and Feliz Marti-Ibanez, M.D., Professor and Director of Department of History of Medicine, New York Medical College, New York, N.Y. 1070 pp. Price $12.00. Medical Encyclopedia, Inc., New York. 1958.

This volume is a collection of papers presented at the Fifth Annual Antibiotic Symposium at Washington, D.C., last October. Many of the articles represent important contributions to this rapidly advancing field. The average physician will not be interested in reading through the book, but may find it a useful source of reference. There is a good subject index, with references to the latest information concerning amphotericin B, ristocetin and vancomycin. In addition, there are good panel discussions of rheumatic fever prophylaxis, host resistance and chemotherapy, and antibiotics as antitumor and antiviral substances.

PSYCHIATRIST FOR SEATTLE VA CLINIC

The Veterans Administration Regional Office Mental Hygiene Clinic in Seattle has a vacancy for a full time psychiatrist. The Mental Hygiene program provides for at least three balanced Mental Hygiene teams. It is sponsoring training programs in Clinical Psychology and Psychiatric Social Service. The clinic now has a staff of two psychiatrists, four clinical psychologists and four psychiatric social workers. Highly qualified local consultants are regularly available for the staff. For further information write or visit the Chief of the Clinic or the Chief Medical Officer.

PHYSICIANS FOR STATE INSTITUTIONS

Staff, specialty and administrative personnel are urgently needed in nearly all areas of the state. Specialty and administrative personnel (Physician II, $11,916-$14,220) are required to have four years of experience in the practice of medicine or two years of supervisory medical experience, or two years of approved residency training, or four years in the practice of a specialty. Staff physicians (Physician I, $10,908-$13,020) need only have their licenses to practice in the State of Washington. For further information regarding these positions, contact the State Personnel Board, 212 General Administration Building, Olympia, Wash.

GP ASSISTANT OR ASSOCIATE

General practice in large, well established clinic in heart of thriving community in North Renton, Wash. Equipped with laboratory and x-ray; competent technician on staff. Near 100-bed hospital, Pacific Car and Foundry and Boeing Airplane Co. For interview appointment call or write Rudolph Heilpern, M.D., North Renton Clinic, 920 1st Ave. No., Renton, Wash., ALpine 5-4581.

OPPORTUNITY FOR GENERAL PRACTITIONER

Physician is needed for a small town and community of 1500 persons. New clinic available July 1958 on advantageous terms. Building of the clinic was supported by 340 families. Hospital within 20 minutes of town. Housing available. Good schools, churches, roads and community facilities. Contact Mr. W. H. Ritchey, Lind, Wash.

OPPORTUNITY FOR INTERNIST

Internist desired for salaried position in group practice with opportunity for eventual partnership in four physician clinic in Central Oregon town. Write Box 52-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

OPPORTUNITY FOR GENERAL PRACTICE

Well-established general practice available in Eastern Washington. Write Box 53-A, Northwest Medicine, 1309 7th Ave., Seattle, Wash.

LOCATIONS DESIRED

ADMINISTRATOR FOR HOSPITAL OR CLINIC

M.S. Degree in Hospital Administration, B.S. Degree in Business Administration. Married, 39 years old. Experience in 50-bed hospital as administrator-anesthetist 5½ years; 8½ years total administrative experience. Considerable experience in planning, equipping and staffing new hospitals. Prefer combination administrator-anesthesia position of 30- to 50-bed hospital or business manager-anesthetist of clinic. Send inquiries to Box 47-A, Northwest Medicine, 1309-7th Ave., Seattle, Wash.

GP DESIRES ASSOCIATION

Young general practitioner (K.U. '55), due for discharge from the Navy in August, desires to affiliate in practice with another physician or with a small group. Write Ray M. Lyle, M.D., 711 Heliotrope, Corona del Mar, Calif.

OFFICE SPACE

MEDICAL OFFICE FOR LEASE

New medical office with 800 sq. ft. located at Kenmore near Seattle. Adjoins dental office. Available now. Call EMerson 3-3240 or LAkeview 4-1867, Seattle, Wash.

For Ample Air Right Now!

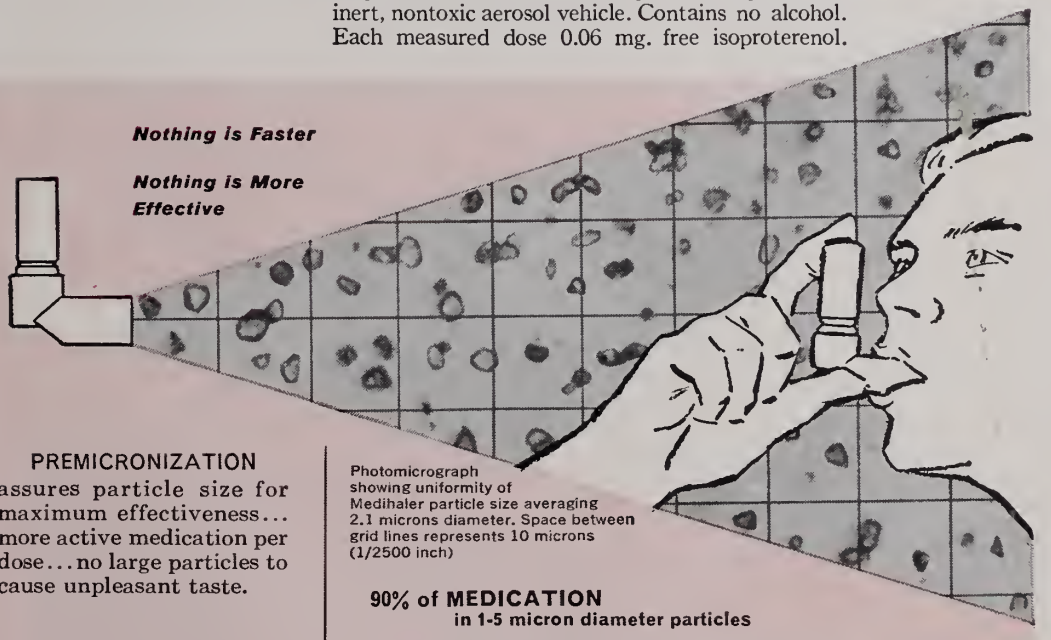
in Asthma

and other Allergic States

Medihaler-EPI®

For quick relief of bronchospasm of any origin. More rapid than injected epinephrine in acute allergic attacks.

Epinephrine bitartrate, 7.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.15 mg. free epinephrine.



Medihaler-ISO®

Unsurpassed for rapid relief of symptoms of asthma and emphysema.

Isoproterenol sulfate, 2.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.06 mg. free isoproterenol.

Nothing is Faster

Nothing is More Effective

Photomicrograph showing uniformity of Medihaler particle size averaging 2.1 microns diameter. Space between grid lines represents 10 microns (1/2500 inch)

PREMICRONIZATION assures particle size for maximum effectiveness... more active medication per dose... no large particles to cause unpleasant taste.

THE MEDIHALER® PRINCIPLE means automatically measured-dose aerosol medications in spill-proof, leakproof, shatter-proof, vest-pocket size dispensers.

90% of MEDICATION
in 1-5 micron diameter particles

99.9% of PARTICLES
in 1-7 micron diameter range

New Improved Premicronized Medihaler suspension ...55 mcg. drug/dose 1-5 microns range

Old type aerosol solution.....	10-12 mcg. drug/dose 1-5 microns range
Squeeze bulb nebulizers.....	2-3 mcg. drug/dose 1-5 microns range

now you can protect

older children  **teen-agers**  **and adults** 

against diphtheria-tetanus without serious reactions

Adult **DIP-TET*** Alhydrox®

CUTTER

for immunizing patients from 8 to 80

Booster injections through the teen years and into adulthood may be provided without fear of serious reactions. Routine active immunity can be established in all your patients.

Adult Dip-Tet is adsorbed on Alhydrox (aluminum hydroxide) which slows absorption of the diphtheria toxoid thus reducing reactions. The tetanus toxoid component has been purified and the high purification of the diphtheria toxoid permits a reduction in the amount used, further minimizing reactions.

This type of vaccine was developed by the Armed Forces and is now used by them for routine immunizations. It is specifically recommended for children over 8 years of age, teenagers and adults.

*T. M.

Easily administered ½ cc. injections

Both booster and basic immunization require only 0.5 cc. of vaccine per injection. Adult Dip-Tet is easily administered subcutaneously or intramuscularly. Primary immunization: 2 injections of 0.5 cc. each given 4 to 6 weeks apart. Routine booster: 1 injection of 0.5 cc. 6 to 12 months after initial series followed by 0.5 cc. every 3 to 4 years. Booster following injury or exposure to diphtheria: 1 injection of 0.5 cc. if previously immunized.

For complete descriptive literature, dosage information and a supply of wallet-sized immunization record cards far your patients, ***ask your Cutter man*** or write to Dept. .7-F

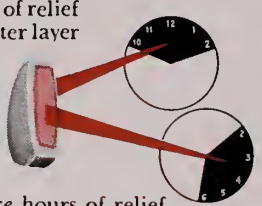
running noses . . .

and other hay fever symptoms



TRIAMINIC stops **rhinorrhea,** congestion and other distressing symptoms of summer allergies, including hay fever. Running nose, watery eyes and sneezing are best relieved by antihistamine *plus* decongestant action — systemically — with TRIAMINIC.

This new approach frequently succeeds where less complete therapy has failed. It is not enough merely to use histamine antagonists; ideally, therapy must be aimed also at the congestion of the nasal mucosa. Triaminic provides such effective combined therapy in a single timed-release tablet.

TRIAMINIC brings relief in minutes—lasts for hours. Running noses stop, congested noses open—and stay open for 6 to 8 hours.

Triaminic provides around-the-clock freedom from allergic congestion with just one tablet t.i.d. because of the special timed-release design.

first—3 to 4 hours of relief from the outer layer

then—3 to 4 *more* hours of relief from the inner core

Dosage: One tablet in the morning, mid-afternoon and at bedtime. In postnasal drip, one tablet at bedtime is usually sufficient.

Each timed-release TRIAMINIC Tablet contains:

Phenylpropanolamine HCl	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

TRIAMINIC FOR THE PEDIATRIC PATIENT

TRIAMINIC Juvelets*, providing easy-to-swallow half-dosages for the 6- to 12-year-old child, with the timed-release construction for prolonged relief.

*Trademark

TRIAMINIC Syrup, for those children and adults who prefer a liquid medication. Each 5 ml. teaspoonful is equivalent to ¼ Triaminic Tablet or ½ Triaminic Juvelet.

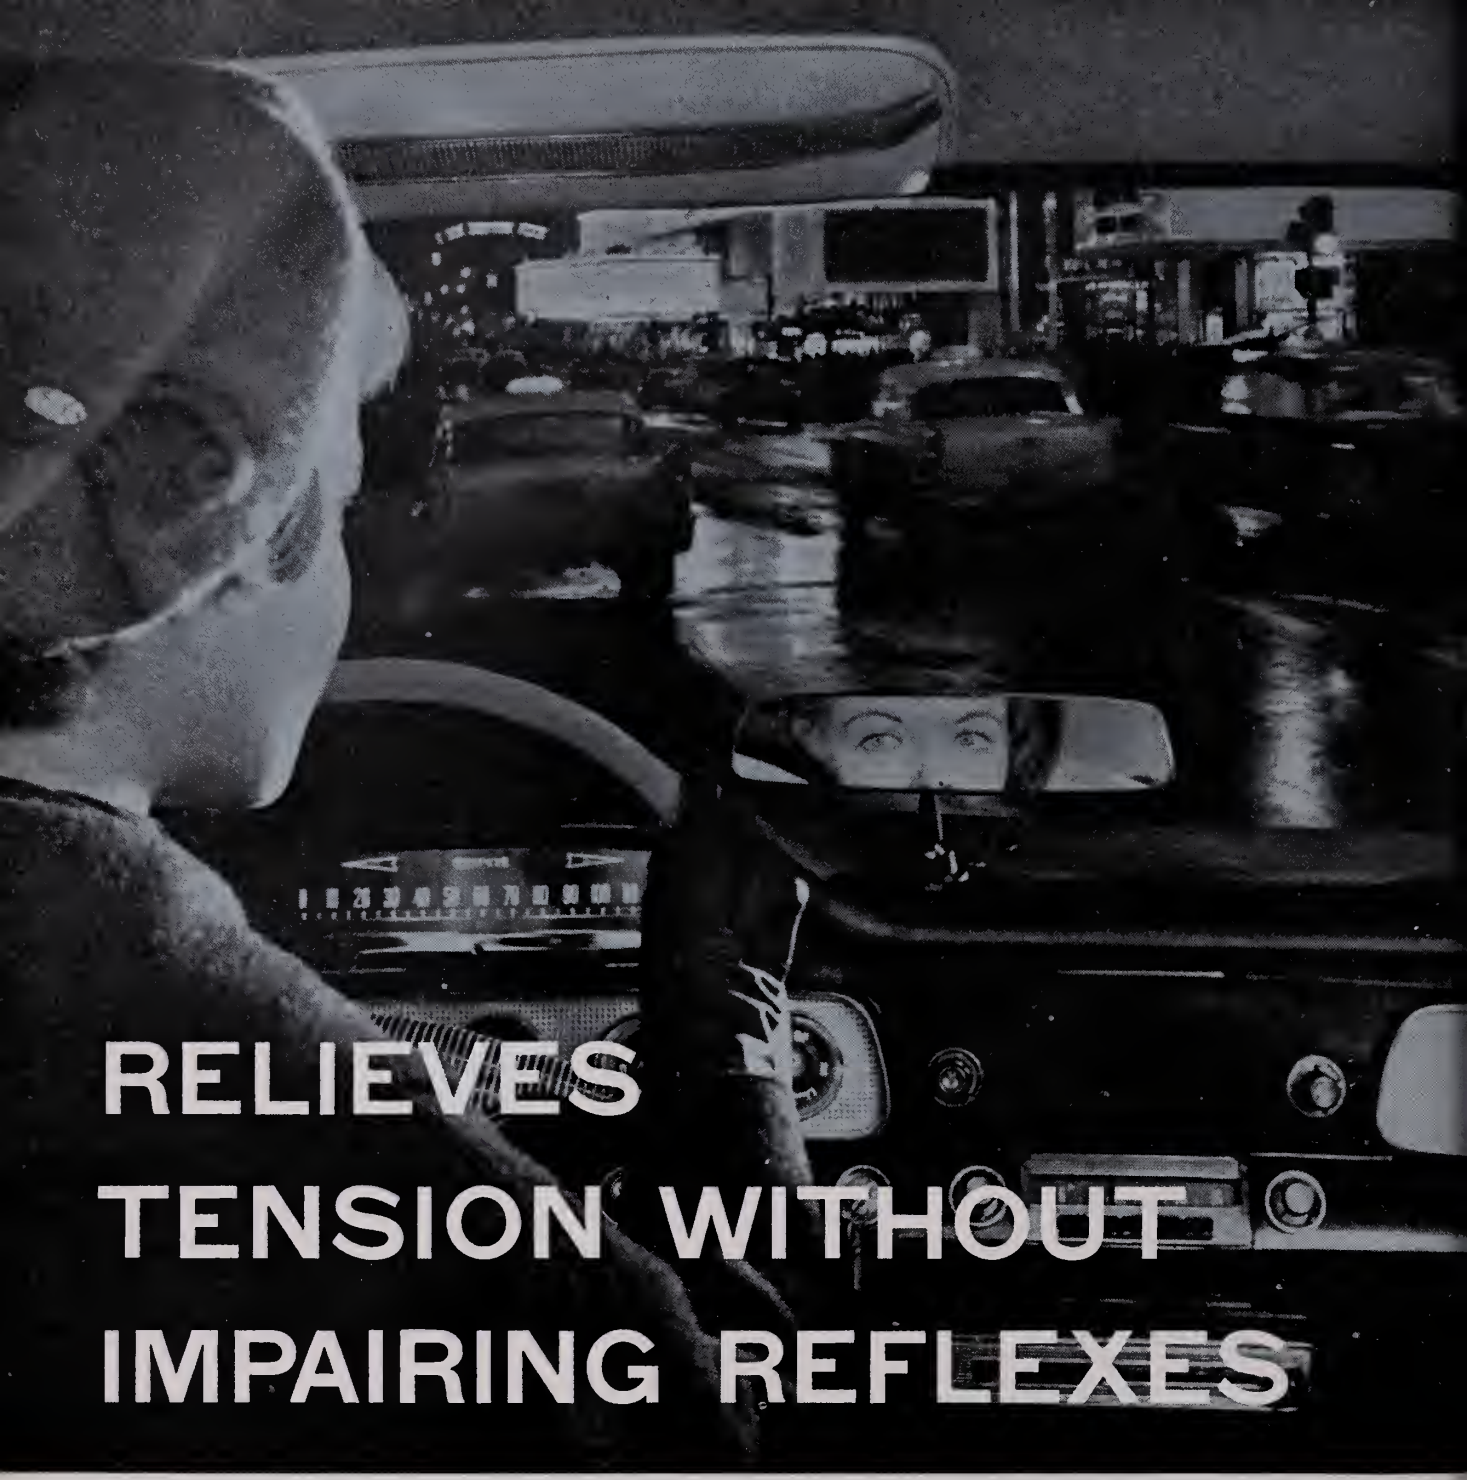
ocort®

Triamcinolone LEDERLE

...in Respiratory Allergies: "Good to excellent" results in 29 of 30 patients with chronic intractable bronchial asthma at an average daily dosage of only 7 mg.[6]... Average dosage of 6 mg. daily to control asthma and 2 to 6 mg. to control allergic rhinitis in a group of 42 patients, with an actual reduction of blood pressure in 12 of these.[7]

...in Other Conditions: Two failures, 4 partial remissions and 8 cases with complete disappearance of abnormal chemical findings lead to characterization of ARISTOCORT as possibly the most desirable steroid to date in treatment of the nephrotic syndrome.[8,9]... Prompt decrease in the cyanosis and dyspnea of pulmonary emphysema and fibrosis, with marked improvement in patients refractory to prednisone.[10,11,12]... Favorable response reported for 25 of 28 cases of disseminated lupus erythematosus.[13]



Depending on the acuteness and severity of the disease under therapy, the initial dosage of ARISTOCORT is usually from 8 to 20 mg. daily. When acute manifestations have subsided, maintenance dosage is arrived at gradually, usually by reducing the total daily dosage 2 mg. every 3 days until the smallest dosage has been reached which will suppress symptoms.

Comparative studies of patients changed to ARISTOCORT from prednisone indicate a dosage of ARISTOCORT lower by about ⅓ in rheumatoid arthritis, by ⅓ in allergic rhinitis and bronchial asthma, and by ⅓ to ½ in inflammatory and allergic skin diseases. With ARISTOCORT, no precautions are necessary in regard to dietary restriction of sodium or supplementation with potassium.

ARISTOCORT is available in 2 mg. scored tablets (pink), bottles of 30; and 4 mg. scored tablets (white), bottles of 30 and 100.

EDITORIAL

Diverticulitis

Diverticulitis is becoming increasingly important for two reasons. Since it is a disease of the latter half of life, it is being seen more frequently because of the increased proportion of older persons in the population. The second reason is the opportunity to employ surgical treatment more frequently due to lowered surgical mortality. The latter factor calls for better understanding of the disease and more prompt decision as to the method of handling.

Comprehensive discussion of the problem of diverticulitis was presented by Claude Welch at the convention of the American College of Gastroenterology last October.[1] He reported that diverticulosis was found to increase steadily with age in a series of 2,000 barium enemas performed at the Massachussetts General Hospital. Age range was from 35 to 90. Two-thirds of those in the advanced age group had diverticulosis and nearly half had some evidence of diverticulitis.

Welch believed that 70 per cent of the cases of diverticulitis may be treated medically and that those requiring surgery either develop more severe symptoms rapidly or suffer continuing disability. The decision can be made only by following the individual patient and not on the basis of any special signs or symptoms. Occasionally symptoms are severe enough to demand surgery immediately.

Constipation and diarrhea are less important sign posts than abdominal pain and abdominal distention. Increasing importance must be attached to palpable mass, nausea or vomiting, rectal bleeding, dysuria or frequency, pneumaturia and fecal fistula. Rectal bleeding is seen more frequently than has generally been recognized. Welch reports that 27 per cent of the cases show gross bleeding. Initial attack, in most cases, is characterized by pain in the lower left quadrant, localized tenderness, slight fever and either constipation or diarrhea.

Pattern of recurrence is extremely variable. Welch has no fixed rules for selection of patients to be treated surgically but lists a series of conditions pointing in that direction. One or more of the serious symptoms, such as bleeding or dysuria, may lead to the decision. X-ray evidence of deformity which may lead later to obstruction, or persistent recurrences under good medical management may indicate surgery. Surprisingly enough, Welch operates on the younger patients more frequently than those older for two reasons. When symptoms develop before the age of 50, the patients tend to have more serious complications. Also, they have longer to live with the disease. He admits to more enthusiasm for surgery if the patient is not obese and if diverticuli are confined to a relatively short segment of the colon.

While diverticulosis and cancer are often associated, it is not common to find cancer in the patient with active diverticulitis. However, accurate diagnosis is important. The two are readily confused. No serious error is apt to ensue if diverticulitis is mistaken for cancer since surgery is apt to be undertaken promptly. If the diagnostic error is in the other direction, with cancer mistaken for diverticulitis, there may be temptation to delay. Diagnosis requires adequate radiologic examination and careful sigmoidosco-

1. Welch, Claude E., Diverticulitis of colon, Am. J. Gastroenterol. 29:374-384, (April) 1958.

py. Patients with repeated episodes of rectal bleeding or those with persistent obstruction which does not yield promptly to conservative measures should be suspected of having cancer rather than diverticulitis.

Welch believes that 70 per cent of cases of diverticulitis will improve on medical therapy. Persistent symptoms will indicate surgery in 10 per cent and 20 per cent will have complications requiring surgical treatment. These include perforation, fistula formation, obstruction and severe hemorrhage.

Choice of surgical procedure depends on condition of the patient, severity of deformity, if any, and extent of complications. Any procedure should be considered as a step toward ultimate resection of the involved segment. Exteriorization is not often applicable because the disease is often low or the colon has been so shortened and adherent that it cannot be mobilized. Primary resection and anastamosis may be done if operating conditions are optimum and the disease is in a relatively early stage. Welch feels that this recommendation may seem somewhat radical but that it may prove to be safe. Somewhat more conservative, but proven to be safe, is closure of the perforation and transverse colostomy. Drainage may be necessary if the abscess is large or contains foul pus or necrotic tissue.

Welch resects the involved colon and does primary anastomosis in about half his cases. Cecostomy may be done, either previously or at the time of operation in some cases. The anastomosis is considerably more difficult than that done after removal of a carcinoma because of the unexplained fact that the proximal colon is of small caliber, with edema and thickening of the wall. Stricture may follow unless prevented by extra care in making the anastomosis.

Subtotal resection of the colon has been advocated by some and may be necessary if the disease is widespread. However, it is confined to the sigmoid in 90 per cent of the cases although there may be scattered diverticuli in other parts. Resection of 20 to 25 cm. usually suffices.

Welch reports a significant trend toward more radical treatment. Closure of perforation without resection and simple colostomy, both employed extensively prior to 1942, have now fallen into disrepute. Mortality was 17 per cent. Between 1942 and 1957, 218 sigmoid resections were performed with hospital mortality of 2.7 per cent. End results have been excellent.•

Spokane Surgical Society

Publication in this issue of most of the material presented at meeting of the Spokane Surgical Society, last April, represents something of a departure from the customary pattern. Emphasis on a single topic is usually avoided. In this case, however, it seemed worthwhile to present all of the submitted papers in a single issue. The subject of cancer is broad enough to encompass discussions of interest to practitioners in any field. Six of the eleven papers presented by members are published in this issue together with two of the three papers given by Dr. Pack.

Washington Chapter of the American Cancer Society participated in the meeting and provided the transcriptions of the material given by Dr. Pack. Due to the differences between interesting verbal discussion and formally prepared manuscripts, it was necessary to rewrite the two papers published in this issue. The third was composed only of comment on lantern slides shown and did not lend itself to publication. In spite of the fact that the first rewritten version was sent to Dr. Pack at a time when his schedule was already overcrowded, he very carefully revised the two papers and returned the manuscripts now published.•

Physical Therapists Meet

Third phase of medical care was given emphasis in this region last month when the American Physical Therapy Association held its thirty-fifth annual session in Seattle. It was the first Northwest visit of this long established and active organization. Emphasis was on better understanding of the patient and better methods of carrying out the therapy prescription of the physician.

As pointed out by Howard Rusk, medical care is not complete with diagnosis and treatment but must be carried through the third phase, rehabilitation, until the patient has regained maximum usefulness to himself and society. It is for this reason and because of growing appreciation of what physical therapy can accomplish, that activities of the American Physical Therapy Association should be of interest to physicians.

The six day conference was attended by more than 800 physical therapists from all parts of the nation. The list of speakers included many physicians. Subjects ranged from reports of recent fundamental research to communication problems in teaching, to practical demonstrations of new therapeutic techniques.

A few of the subjects presented may give an idea of the scope of the program: Neurophysiology a Physical Therapist Should Know, Ernst Fischer, Ph.D., Medical College of Virginia; Clinical Recognition of Factors Which Limit Purposeful Movement, Lawrence Knopp, M.D., University of Washington; Testing and Measurement—Purposes and Methods, William Duncan, M.D., Sherburne Heath, M.D., Seattle, and others; Understanding of the Patient's Emotional Reactions to Disability and Treatment, Herbert Ripley, M.D., University of Washington; Basic Principle of the Therapeutic Application of Ultrasound, Justus Lehmann, M.D., University of Washington; Variations of Muscle Force Through the Range of Joint Motion, Marian Williams, Ph.D., Stanford University; An Experimental Study in the Neonatal Guinea Pig on a Possible Cause of Cerebral Palsy, Miss Eleanor Flanagan and R. Frederick Becker, Ph.D., Duke University Medical Center; Myofascial Pain, John Bonica, M.D., Tacoma; Responses to Physical Therapy Under a Hallucinogen by a group from V.A. Center, Los Angeles; Electrical Stimulation for "Spot Reducing"—Study of a Single Case, Mr. Robert Babbs, Jr. and Miss Elizabeth Wood, Chicago. There were many panel discussions and demonstrations on problems commonly encountered by technicians.

Actually, a meeting of physical therapists, such as the one held in Seattle last month, is more than just an event of interest to physicians. It is a challenge. Physical therapists are not only willing but anxious to render their service completely in accord with the directions of physicians. Most physicians in practice see some patients who could benefit from physical therapy. Need for knowledge of how best to use it is the challenge.•

Government Feeds on Inflation

Observe the history of all hyperinflations. In every instance they were preceded by "creeping" inflations.

The question is: Are we headed for hyperinflation? The answer comes clear if we recognize the nature and cause of inflation. Inflation is a form of taxation, resorted to by government as a means of obtaining revenue. When the activities of government become so expensive that it is no longer politically expedient to obtain the needed revenue by direct taxation, inflation will be invoked. The whole historical record confirms this conclusion. *Inflation inheres in overextended government, and there is no remedy whatever except to shrink the activities of—and thus the expenses of—government.*

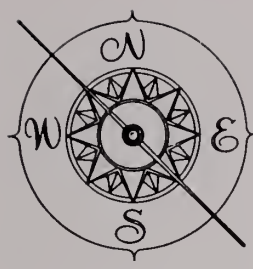
To answer the question—Are we headed for hyperinflation?—only requires that we answer the question—Are we headed toward the extension or the shrinking of governmental activities? The answer is clear: We are, as of now, politically committed to the further extension of governmental activities. All proposals from Washington confirm this. Unless the political design is reversed, we are hopelessly bound for hyperinflation.

By Leonard E. Read in The Freeman, June 1958, Volume 8, pp. 4-5.

. . . acts fast to provide unusually long-lasting relief

'Co-Pyronil' combines a long-acting and a short-acting antihistamine with a synergistic sympathomimetic. It usually begins to combat symptoms within fifteen to thirty minutes and eliminates them for as long as twelve hours. Thus you can give your hay-fever patients and other allergy victims remarkably complete relief on a dosage of only 2 or 3 pulvules daily.

*'Co-Pyronil' (Pyrrobutamine Compound, Lilly)



Prescribe 'Co-Pyronil' in attractive green-and-yellow pulvules for adults; in tiny red pediatric pulvules or tasty suspension for children.

Each Pulvule 'Co-Pyronil' provides:

'Pyronil' (Pyrrobutamine, Lilly)	15 mg.
'Histadyl' (Thenylpyramine, Lilly) . .	25 mg.
'Clopane Hydrochloride' (Cyclopentamine Hydrochloride, Lilly)	12.5 mg.

Conservatism in Obstetrics

JOHN STALLWORTHY, F.R.C.S., F.A.C.S. (HON.)
OXFORD, ENGLAND

The ancient and beautiful city of Oxford, from which you have done me the honour to invite me to deliver this memorial lecture, is famed for more than its University. Its exports carry its name to the four corners of the earth and include bibles, dictionaries and automobiles. These provide a guide to the next world, advice on this and, for the unfortunate few, a means of rapid transport from one to the other. It was natural therefore that I should consult the Oxford dictionary in an endeavor to get my definition correct and to understand exactly what conservatism in obstetrics meant. For once it was not very helpful. While the port was circulating after dinner round the beautiful mahogany table resplendent with its ancient silver in the candle-lit senior common room of Queens College, I asked a Classics Don for his definition and without hesitation he replied—"I will give it you in four words—resistance to new ideas."

Contrast

Conservatism in obstetrics is instinctively contrasted with what we imagine to be the radical approach. One man having assessed the problem of a high head at term in a primigravida says "nature can deal with this," while a colleague reviewing the same problem decides that the knife and not nature must prevail. The one is considered conservative, the other radical, but to accept this classification without knowing what happened to the patient would be to over simplify the position. Generally speaking, one cannot with justice label a man radical or conservative by his handling of isolated selected cases for which we had no clinical responsibility. It is easy to be wise and infallible when the final decision is not ours. The general pattern of a man's practice is found only in a comprehensive survey of his work. If we all spent longer in critical assessment of results, our standards of achievement would rise. Therein are annual clinical reports justified, be they of individual practice or departmental work. They promote humility.

British medicine is renowned for its conservative tendency, its resistance to new ideas, which on occasions has made it the laughing stock of the public at home and the profession abroad. The conservative attitude is deeply rooted and has been a stabilizing factor, but this is not its raison d'etre. If the profession with closed minds had continued to be ultra conservative, there could have been no Lister, no Simpson, and in modern times no Fleming nor Florey, or if such men existed they would have died unrecognised. On the other hand if the influence of British conservatism, with its insistence that two essentials to good obstetrics were patience and cleanliness, had prevailed in Vienna when Boer was replaced early in the 19th century by the

Sommer Memorial Lecture presented at the 43rd Annual Meeting of the University of Oregon Medical School Alumni Association, Portland, Oregon, April 17, 1958.

more radical Semmelweiss with his new ideas on the scientific approach to medicine, many tragic pages of the history of puerperal sepsis need never have been written.

Patients Are Individuals

Let us consider the basic problem philosophically. For every patient there must be one form of treatment superior to all others. I say "for every patient" and not "for every disease or emergency," because in all branches of medicine there is a tendency to forget the importance of the individual in our pre-occupation with clinical techniques. An illustration may clarify this. Mrs. Brown and Mrs. Jones are the same age and in their late thirties. They are of the same build and in excellent general health. They are due to have their first babies on the same day and at term they have infants of estimated equal size presenting by the vertex with the occiput anterior, the head at the brim, but no disproportion. They appear to be identical clinical problems—but they are not. One is radiantly happy and confident. She is relaxed in body and in mind and when labour commences, its smooth course can be predicted with assurance. The other is tense and fearful. The months of ante-natal preparation have not succeeded in overcoming her fears. An only child, she has never forgotten that her mother died when she was born, and deep in her heart she has always associated childbirth with death rather than with life. The doctor who encourages the one elderly primigravida to have a normal delivery is no more conservative than he is radical when he performs a caesarean section on the second to avoid a prolonged unsatisfying labour with its attendant dangers. Let us imagine that an obstetrician, proud of his conservative practice, decided to enforce a vaginal delivery on the second patient and in the process lost the infant. He has been resistant to the idea of interference in spite of a combination of adverse factors and to that extent has by the Don's definition been conservative. This interpretation is untenable. Among its other meanings, to conserve means to preserve, and in obstetrics this must mean to preserve life and health for both mother and babe. All obstetric techniques should have this as their aim and it is important to note today that conservative obstetrics is different in outlook from what it was even twenty years ago. The radical approach of yesterday can become the conservative attitude of tomorrow.

Jellett, a former Master of Rotunda Hospital, Dublin, and a great exponent of conservative obstetrics, in his book on Maternal Mortality referred to abuse of caesarean section—an abuse that still exists in many places.[1] He classified the conditions most commonly responsible as minor degrees of contracted pelvis, eclampsia, and placenta praevia—a triad many would still indict. Referring to placenta praevia he contrasted results reported from America by Holmes with an estimated caesarean maternal mortality of 20 per cent with the 2 to 5 per cent reported by Essen-Moller, Pinard, Williams and others, following vaginal delivery using a de Ribes bag or Braxton Hicks manoeuvre. He considered vaginal delivery a manifestation of the conservative approach and made this significant comment:—"The foetal mortality in these cases was necessarily very high. It is possible that some infants might have been saved by caesarean section, but the important point is that from the mother's point of view operation was unnecessary." Remember these remarks were made by an acknowledged leader of conservative obstetrics. Improved techniques have altered all this and today the choice between mother and child is unnecessary.

It was considered conservative (with justification) twenty years ago to avoid operation, even at the expense of almost certain foetal death whereas today, by the definition we have accepted, treatment could not be regarded as conservative if it subjected either mother or child to increased hazards. The interpretation of this guiding principle differs widely in different clinics. In 1950 I expressed the view that placenta praevia could be treated with no maternal mortality and an uncorrected foetal loss not greater than 10 per cent.[2] Maternal mortality in selected teaching units at that time was 3 per cent with a foetal loss of 30 per cent and more. That pipe dream, as some called it, proved a correct forecast which results published from many centers have confirmed. Careful selection of the right case for the right treatment rather than the adoption of a routine procedure either radical or conservative is the key to success.

Two general principles should be accepted in treating placenta praevia. One is the conservative policy to avoid prematurity first expounded by Johnson[3] and Macafee.[4] The other is that caesarean section must play a more important role in the future than it has in many places in

the past. Lawson Tait could not have foreseen, when he performed his first caesarean hysterectomy for placenta praevia in 1898, that conservative section alone would become an accepted technique within fifty years (table 1).

Table 1. Conservatism.

MATERNAL MORTALITY

Caesarean Section

Author	Number	Mortality
Merriman (1835)	52	75%
Kerr & Holland (1911-20)	1218	1.56%
Marshall & Cox (1943-47)	3126	0.19%
Ministry of Health* (1952-54)	59000	0.4%

* Report No. 98. Her Majesty's Stationery Office 1957.

The Major Issue

This leads me to a major issue between conservative and radical treatment. The following comments have been formulated after a wide experience in many clinics in different countries. There is a tendency for a man's attitude to medicine to be coloured by his own capabilities and these are largely governed by the extent of his training, particularly in matters surgical. We honour those excellent pioneer and self-taught surgeons who laid the firm foundations of modern techniques, but if a man is to achieve the highest of which he is capable in surgery or obstetrics he needs to serve an apprenticeship. This does not mean visiting a theatre or labour ward once a month to see spectacular techniques. It demands close liaison with experienced chiefs willing to teach. The apprentice achieves the confidence necessary for satisfactory performance of the more difficult and intricate procedures by assisting and later by being assisted. The poorly trained man tends to be radical in obstetrics but conservative in surgery. Without spending many hours by the bedside of a labouring woman to see what nature is capable of, man is inclined to underrate her powers. Moreover if he has not seen what a skilled hand can accomplish he is inclined to underrate his own potential ability. The result is that he knows only one answer for too many of his obstetric problems—caesarean section when patience and experience could have triumphed.

So much is written of the safety of caesarean section that it is well to consider whether this description is justified. Many obstetricians and many units can produce a fine record of large series of sections without a maternal death. Generally speaking these are not the units where the section rate is highest although the number performed may be considerable.

Parallel Progress

The pattern of progress in our two countries has been virtually parallel through the years. In England and Wales the maternal mortality was 0.6 per 1,000 for the years 1952-4, but the estimated rate for caesarean section was seven times as great (4 per 1,000). Of 175 deaths following caesarean section, 70 per cent were due to operative causes (table 2). This equals the overall mortality for 1908-17—a rather alarming comparison. The lives of many women are undoubtedly saved by section and there are so many variable factors to equate that comparisons between caesarean and general mortality rates can be unfair. The claim that a high proportion of postoperative deaths are due to associated diseases, such as nephritis or eclampsia, and not to the operation, is not supported by the evidence. Even more arresting is the fact that when section was performed before labour, twice the number died as with section during labour. Haemorrhage, shock and collapse were responsible for 73 per cent of the pre-labour deaths whereas sepsis and ileus accounted for 69 per cent of those dying when operated on during

Table 2. Mortality Results Published in Great Britain from Three-Year Survey of Maternal Deaths.

MATERNAL MORTALITY

Caesarean Section

Immediate Cause of Death	Not in Labour	In Labour
Shock and Collapse Haemorrhage	48	13
Embolus Sepsis Ileus	30	26
Total	78	39

labour. These figures give food for thought and while there are clinics with a massive material and low mortality there are others in which both the section and death rates are high. The lesson is that the operation is not as safe as is sometimes claimed and the more it is abused by those unaware of its dangers the greater will be the mortality.

Four points are worthy of consideration in considering section in relation to conservatism:

1. *The extra-peritoneal operation.* In the British Commonwealth this operation is seldom performed. It is interesting but unnecessary. The criticism that this view is a resistance to new ideas and therefore a sign of conservatism will not be disputed, but when an old friend proves faithful he should not be deserted. The lower segment technique using the muscle splitting transverse uterine incision has proven its value in many thousands of infected cases even before the days of chemotherapy and antibiotics. Even today we seldom use these agents with the lower segment operation and in a consecutive series of nearly 1,200 sections in the Oxford Department, there has been no death from infection nor has a caesarean hysterectomy been performed for sepsis. This radical procedure was performed on rabbits by Blundell of Guys Hospital, London, as early as 1828. He suggested its possible use in the human, but it was Porro of Pavia in 1876 who proved its lifesaving potential. The need, however, no longer exists and while it might be regarded conservative in tradition it is unduly radical in practice to sacrifice a uterus which can be saved by modern techniques.

2. *Repeat caesarean section.* The conservative attitude to which we subscribe at Oxford rejects the view that "once a section always a section," nor does it agree with sterilisation after an arbitrary number of operations. This practice demands certain safeguards in its clinical application, but is independent of the type of operation originally performed. During the war a great deal of emergency obstetrics on patients evacuated from London was handled at Oxford and many patients had previously been delivered by section, both classical and lower segment. Vaginal delivery was accomplished safely in 70 per cent of all previously delivered by section and neither a patient nor a uterus was lost because of rupture.

It would be foolish to deny the risk of rupture, but with adequate precautions it need not be the excuse for unnecessary surgery. The time to start treating serious haemorrhage is before it occurs. For this reason the blood picture, always important in obstetrics, is doubly so when a patient has previously been delivered by section. Anaemia is an unnecessary and dangerous hazard. After classical section the risk of subsequent rupture is increased, as is the threat to life if it occurs—two excellent reasons why the operation should become a rarity.

Early admission is advisable after previous classical section, at least a fortnight before term and earlier if there is reason to suspect an anterior placenta or if the scar becomes tender. If labour cannot be conducted in an institution with surgical and anaesthetic facilities for immediate section and with a competent medical staff in attendance, conservative vaginal delivery is not justified. Either the patient should be transferred to another institution where adequate supervision is possible, or the operation should be repeated. Caesarean section can be a wonderful friend but a ruthless enemy. The dangers of the transverse lower segment technique are much less, and in the absence of wound tenderness, early admission is not essential, but the same precautions are necessary during labour. If the obstetrician would always pause to consider the ultimate effect on a woman's life when he advises her first caesarean, the operation rate would fall.

There is one further important aspect of the repeat operation and this concerns foetal salvage. Many patients and doctors have a misplaced belief that section guarantees the safe delivery of the child. If there are any conditions under which this should apply they would be in relation to the elective repeat operation. Unless one is obsessed by the danger of early rupture there is no urgent hurry for the operation and it would be reasonable to assume that it would be arranged to give the child the maximum chance of survival. A babe alive when a caesarean is commenced should be alive when it is completed, and after 38 weeks gestation its chance of survival should be as good as at term. Repeat sections do not always achieve this with you, or with us in Britain, as recorded by Bubalo.[5] A foetal mortality of 40 per 1,000 occurred with repeat operations as against 29 per 1,000 in an overall series of 10,825 deliveries. When repeat section is necessary the timing of operation is important. An analysis of 1,363 caesarean sections reported from eight British

teaching hospitals revealed that 171 infants (12.5 per cent) were premature and of these 37 (21.6 per cent) died. Even when the operation was elective with the babe not apparently at risk 33 produced premature infants, 5 of which (15 per cent) died.

Caesarean Myomectomy

Finally, in relation to caesarean section, comment is indicated on the controversial subject of Caesarean myomectomy. It has for long been taught that this is a highly dangerous operation which should not be performed. The traditional reason given is the alleged risk of haemorrhage. This is a physiologic error provided the depth of anaesthesia is not excessive. At no time does a uterus contract and retract more efficiently than when empty at term. This fact is apparent after both normal delivery and section. It is true that to perform myomectomy during pregnancy is to play with fire and endanger both mother and babe. With an empty uterus the problem is different and it is not usually justified to perform caesarean section and re-open the abdomen later for myomectomy. Rules which Bonney postulated in reference to myomectomy on the non-pregnant uterus are even more important when removing fibroids after caesarean section. It is necessary to avoid tissue necrosis, secure haemostatis, and obliterate dead spaces. Interrupted figure of eight sutures are ideal for this. Incisions should be on the anterior uterine wall when possible and be covered by peritoneum from the utero-vesical fold. With these precautions the operation can be commended with confidence for one or more large fibroids complicating delivery.

If the caesarean section rate is regarded as an index of conservative or radical obstetrics, it will often be found that where the rate is high the incidence of forceps and surgical induction is low. The Oxford Department in the last six years has delivered 19,000 mothers with a section rate varying from 2.4 per cent to 4.2 per cent, equivalent to 1.4 per cent to 2.5 per cent for all deliveries in the area, as only 60 per cent of mothers have hospital confinement. This is not through choice, but because of inadequate hospital facilities. A department responsible for the maternity services of a wide area admits all the abnormal and problem patients and only the normal have home delivery. Even those major complications occurring unexpectedly at home are transferred, usually by means of the obstetric flying squad service, to the main department and then are featured in its annual report. In 18,918 deliveries conducted during the last six years the forceps rate has varied annually from 10.8 per cent to 15.4 per cent. This is a high rate for England, but it must be remembered that the incidence of abnormal and emergency admissions is high. Figure 1 summarises a comparison

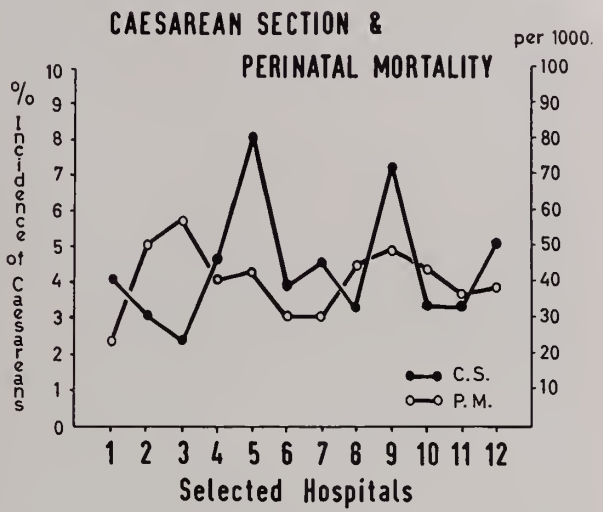

Fig. 1. Comparison of caesarean rate and perinatal mortality in 12 selected teaching hospitals in Great Britain and America.

between the caesarean rates and foetal mortality in twelve teaching hospitals in Britain, the Commonwealth, Eire, and America, selected at random. A high section rate is not necessarily correlated with a low perinatal mortality and in only three hospitals were both rates low.

There is a tendency today to decry surgical induction of labour, and no less an authority than my good friend Mr. Gibberd of Guy's Hospital, London, in a challenging article has questioned its value in post-maturity.[6] Carefully supervised, with or without an oxytocic drip, it can be a valuable weapon in obstetrics. It can reduce the need for section in toxaemia, post-maturity, and in selected cases of previous section. For example, at the Churchill Hospital, Oxford, 1,025 toxaemic mothers were delivered with no deaths in the years 1953 to 1957. Surgical induction was performed in 44.5 per cent and 94.3 per cent of these delivered vaginally with an uncorrected perinatal mortality of 25 per 1,000. Rupture of forewaters and hind waters was performed in approximately equal proportion according to the relation of the presenting part to the pelvic inlet. The lower segment op-

eration has proved safe over many years when induction fails or the patient's condition deteriorates.

X-ray

To speak of conservatism in obstetrics without reference to x-ray pelvimetry would be comparable to describing steak and onions without mentioning the onions. Anything allegedly scientific commands great respect but also demands critical appraisal. Some radiologic techniques give precise pelvic measurements, but their widespread abuse has prevented countless women from having their babies not only naturally but easily. It has been my privilege to work in association with such international authorities on pelvimetry as Nicholson, Chassar Moir, Allen and others, while at the same time with healthy scepticism conducting an extended study of trial labour in association with pelvimetric forecasts. This work has been described by Hawksworth and Allen, the latter of whom found that 30 per cent of the primigravidae referred to him for x-ray studies in New Zealand were delivered by section, usually elective.[7] Until he worked with critical control, Allen described a pelvis with a conjugate under 12 cm. as contracted. His reports showed that the clinician had too often been biased by an unfavourable forecast and resorted to elective operation. The conflict between the conservative and the radical in obstetrics has seldom been better illustrated than in the history of radiologic pelvimetry.

Progress of Conservatism

Two further examples of the triumph of conservatism in obstetrics are found in the recent history of cardiac disease in relation to pregnancy, and erythroblastosis. No longer is it considered necessary to advise therapeutic abortion or tubal ligation for these conditions. When indicated, stenosed valves are divided and even coarctation successfully dealt with surgically during pregnancy. Nor do these procedures make delivery by section necessary. In 132 consecutive cardiac patients delivered in the Oxford Department from 1947 to 1955 only 2 sections were performed. There were no maternal deaths and 127 babies survived. Similarly, 141 mothers with rhesus antibodies in the years 1954 to 1957 produced 120 healthy children and 1 surviving with

Figs. 2 and 3. Deformed chest of hypertensive cripple. Fig. 4. Compensated pelvis of same cripple who was delivered vaginally.

kernicterus. Seventy-two of the infants required transfusion and 13 of these repeated exchanges. These figures demonstrate that when assessing the prognosis in early pregnancy one can have reasonable optimism when facilities for adequate treatment are available.

Because of its association with a large orthopaedic hospital, the Oxford Department cares for many women with gross skeletal deformity due to poliomyelitis, tuberculosis and other diseases. The way nature can be kind to the pelvis of those terribly crippled is most impressive. Many of these women have a deep desire to produce their babies naturally and when life has denied them so much it is the more important to offer encouragement when this can be done safely. The twisted spine and compensated pelvis of one such deformed cripple delivered shortly before I left England are illustrated in figures 2, 3 and 4. This patient like so many others with skeletal tragedies was thrilled by her ability to achieve in childbirth what her normal sisters had done.

Conclusions

The subject of conservatism in obstetrics is wide, but the selected examples given, and the lessons learned from them, must suffice. In the last fifty years techniques have changed, often dramatically, to the great advantage of mother and babe. Neither the conservative nor the radical attitude has consistently yielded rich dividends, but each in its time and place has contributed to progress. Contrary to what is often said and written, obstetrics can still be an art for those who wish to practice it as such. General principles can be a guide, but in art there is infinite variety for self expression linked with a constant striving for perfection. When this desire is nurtured we need not fear the future. •

Tumors of the Parotid Gland

Ausey H. Robnett, M.D.
Milton W. Durham, M.D.
and
Harry P. Harper, M.D.
Spokane, Washington

Tumors of the parotid gland have been recognized and treated surgically for two centuries.[1] However, there still persists a lack of understanding of the clinical course of the different types of parotid tumors. Although recurrence rates of benign mixed tumors have been reported as high as 40 to 45 per cent,[2] enucleation of the tumor is, unfortunately, common practice. Malignant tumors of the parotid, such as undifferentiated carcinoma, have a frightful mortality rate of the order of 75 per cent, yet totally inadequate local excisions continue to be done.

Inadequate surgery of parotid tumors has been the result of lack of knowledge of the clinical course of each type of parotid tumor, and fear of damage to the facial nerve. In some neoplasms of the parotid, sacrifice of the facial nerve is mandatory if cure is to be attained. In most parotid tumors, although the operation is difficult and tedious, it is possible to remove radically the parotid gland and preserve the facial nerve. Furthermore, when sacrifice of segments of the nerve or a major portion of the nerve is necessary, nerve graft is being utilized with promising results.[3,4]

Clinical diagnosis of tumors of the parotid necessitates the differentiation of non-parotid swellings in the region, such as sebaceous cysts, branchial cleft cysts, adenitis due to inflammation, metastases from lesions of the pharynx, and cellulitis. The most common error is diagnosis of a tumor in the tail of the parotid posterior to the angle of the jaw as lymphadenitis.

Clinical differentiation of types of tumor of the parotid is most difficult. Characteristics of benign and malignant neoplasms, without pain or nerve involvement, are often identical. Sex and age of the patient are of little aid. Cervical node metastases, involvement of the branches of the facial nerve, pain in the region of the tumor, fixation of the tumor and rapid growth are presumptive signs of malignancy. Sialograms may suggest that the tumor is either superficial or deep, but are of little practical value. Needle biopsy is used but involves the theoretic danger of implantation of tumor cells, is of value only when positive, and does not obviate the necessity of surgical exploration.

Surgical approach to any parotid tumor must be such as to expose the entire parotid area widely and to permit identification of the trunk of the facial nerve as it emerges from the stylomastoid foramen. Only this approach, which has been well described by Janes,[5] Byars,[6] Bailey,[7] and State,[8] permits adequate removal of benign tumors with preservation of the facial nerve or wide radical resection of parotid gland and nerve where indicated. It must be emphasized that the surgeon cannot be certain pre-operatively that the clinically benign tumor is not of a malignant type necessitating wide radical resection. Each patient must be warned pre-operatively that it may be necessary to sacrifice portions or all of the facial nerve if indicated by the diagnosis on frozen section or by gross involvement of the facial nerve.

In formulating the plan of approach to each parotid tumor, the surgeon and the pathologist should use a tumor classification which has a background correlating histopathologic findings with the clinical course. Foote and Frazell[9] in 1954, after intensive study of nearly 900 salivary gland tumors formulated a classification and correlated clinical course with tumor histology (table 1). Utilizing this classification, and correlating other reported series, one is able to formulate a rational plan of surgical attack upon each type of tumor and can estimate prognosis.

Mixed Tumors

Representing two-thirds of parotid tumors, the mixed tumor is a slow growing painless tumor more common in women than men. The capsule of the tumor is thin and excresences of tumor tissue jut into the surrounding parotid so

Read before the Spokane Surgical Society Annual Meeting, Spokane, Washington, April 12, 1958.

*Adopted from Foote & Frazell.

that enucleation is likely to leave behind islands of mixed tumor, explaining the usual multicentric feature of recurrent mixed tumors. Histologic picture is that of epithelial and connective-tissue-like growth in varying proportions. Pseudo-cartilaginous structures are common.

Mixed tumor is most commonly benign in proportion of about 10 benign mixed tumors to 1 malignant mixed tumor. Marshall has observed that average duration of benign mixed tumors is 5.5 years whereas average duration of malignant mixed tumors is 9.6 years, suggesting transition of benign to malignant. Slaughter has presented 12 malignant mixed tumors which he believes may have been, originally, benign mixed tumors.[10] Histologically, the malignant mixed tumors have areas of benign mixed tumor and areas of dysplasia suggestive of adenocarcinoma or squamous cell carcinoma. Invasion or lack of encapsulation is noted.

Great tendency of benign mixed tumors to recur is emphasized by the fact that in almost all series reported one-third of the patients have had prior operations elsewhere. Kirklin[11] and Marshall,[12] report recurrence rates of 10 to 11 per cent in 5 years and 14.6 to 17 per cent in 10 years. In secondary operations on recurrent benign mixed tumors the recurrence rate is double that seen after primary operation, being reported as 22 per cent in 5 years and 35 per cent in 10 years.

Injury to the facial nerve in part or in total occurs in 6 to 10 per cent of primary operations for mixed tumors whereas in secondary operations for recurrent mixed tumors the nerve damage rate is much higher.[1,12] In those patients for whom the nerve is identified and more radical resections effected, not only has the incidence of recurrences declined but the incidence of permanent nerve damage has been reduced.[1]

Surgical treatment of benign mixed tumors and malignant mixed tumors necessitates identification of the trunk and branches of the facial nerve, wide resection of the parotid gland and preservation of the nerve unless it is infiltrated. Prognosis in the benign mixed tumor is excellent, being in the vicinity of 98 per cent for 5 year survival.[11]

Cervical nodes are involved in 15 per cent of malignant mixed tumors at the time of initial operation and in 40 per cent of recurrent malignant mixed tumors.[9] Radical resection of the parotid for malignant tumor, therefore, should be accompanied by radical neck dissection and followed by radiation therapy. With lesser procedures, the local recurrence rate is 40 to 50 per cent.[9-12] Five year survival rate of patients with malignant mixed tumors is approximately 75 per cent.[13]

Mucoepidermoid Tumors

Comprising 3 to 12 per cent of parotid tumors,[9,14] the mucoepidermoid tumor contains both mucin secreting and epidermoid cells. Slow growing and seldom over 4 to 5 cm. in diameter, the tumor is more common in women. Clinically, it is mistaken for benign mixed tumor or carcinoma and its clinical course lies between the two.

The tumor is circumscribed but often there is little or no capsule. On cut surface its mucin secreting nature is apparent.

Foote and Frazell have described two major variants, the low grade mucoepidermoid tumor and the high grade mucoepidermoid tumor. Clinical course and prognosis of the two differ as do the histologic findings.

The low grade mucoepidermoid tumor is painless, with no nerve involvement. Histologically, the mucus and the epidermoid cells predominate and there are relatively few of the small intermediate cells. Microcysts and foreign body reactions are common. Local recurrence rate is 15 per cent. Of 28 patients followed 5 years, 3 died of the disease (90 per cent 5 year survival rate).[9]

The high grade mucoepidermoid tumor presents the clinical characteristics of carcinoma; pain, vigorous growth, nerve involvement. Microscopically, epidermoid and hyperchromatic intermediate cells dominate and lymphatic permeation is common. Prognosis is not good, for regional node metastases occur in two-thirds and distal metastases in one-third. Five year survival is in the vicinity of 25 per cent.

Treatment of the low grade mucoepidermoid

tumor is wide or total resection of the parotid with preservation of the uninvolved nerve. Diagnosis of high grade mucoepidermoid tumor indicates total resection of the parotid with sacrifice of the facial nerve, radical neck dissection and postoperative radiation therapy.

Squamous Carcinoma

The highly malignant squamous cell carcinoma is reported as composing 1.8 to 6.0 per cent of parotid tumors.[11,13] The tumor is hard, often fixed and painful. It grows rapidly. Involvement of the facial nerve is common. Cervical nodes are often involved at the time of initial examination. Highest incidence is in the sixth and seventh decades.

Grossly the tumor is gray. It is unencapsulated and it infiltrates contiguous structures. Histologic characteristics are those of other squamous cell carcinomas.

Prognosis is grave. Buxton reports survival of 2 of 11 patients;[1] Foote and Frazell 4 of 16;[9] and Ariel 3 of 6,[13] a combined survival rate of 22.5 per cent. Treatment is radical resection of the parotid, involved contiguous structures, the facial nerve, and radical neck dissection in continuity. Postoperative radiation therapy may be of value.

Adenocarcinoma

Roughly 10 per cent of tumors of the parotid are adenocarcinomata. In the adenocarcinoma group are several variants with distinctive histologic characteristics which can be correlated with distinctive clinical courses. Unfortunately there is no commonly accepted terminology for these variants so that it is difficult to summarize published reports.

Adenocystic carcinoma, the designation proferred by Foote and Frazell, is apparently synonymous with the term cylindroma preferred by others. Clinically, the lesion may suggest a benign tumor of long duration. However, pain is common. Grossly, the lesion is often infiltrative and the capsule nebulous. Microscopically, cords of small dark cells may seem to form cylinders, or be in solid arrangement with accellular mucohyalin zones. These tumors exhibit slow, relentless growth with marked tendency to local recurrence, 44 per cent according to Beahrs.[15] Kirklin reports that 23.6 per cent have involved cervical nodes, 29.4 per cent pulmonary metastases, and 60 per cent are dead in 10 years.

Solid adenocarcinoma, anaplastic adenocarcinoma, and mucus cell carcinoma are rare variants. Evidence of facial nerve involvement, cervical metastases, and distant metatastes are commonly found on admission. The prognosis is poor with only 30 per cent free of tumor in 5 years.

Acinic cell adenocarcinoma is an uncommon adenocarcinoma varient of low grade clinical malignancy. Clinically and grossly the tumor resembles mixed tumor. There is marked tendency for these tumors to recur locally, but cervical metastases are infrequent, and the five year survival rate is markedly better than in the other forms of adenocarcinoma.

Surgical treatment of the adenocarcinomas, with the possible exception of the acinic cell adenocarcinoma, is radical resection of the entire parotid, sparing only that portion of the facial nerve not contiguous with or infiltrated by the neoplasm, and radical neck dissection. Postoperative radiation may add to survival time.

Papillary Cystadenoma Lymphomatosa

Representing roughly 5 per cent of reported parotid tumors, the papillary cystadenoma lymphomatosum (Warthin's tumor) is, happily, a benign parotid tumor. Significantly more common in men, the tumor is often mistaken clinically for a benign mixed tumor. Fluctuation may be present. Pain is rare and nerve involvement has not been reported. Grossly the tumor is encapsulated. Its cut surface exudes a brownish fluid and cystic zones are visible. Microscopically, large numbers of lymphocytes are present about distinctly acidophilic epithelial cells which line cystic areas in such manner as to suggest papillary formation. Simple excision, preserving the nerve but removing all of the tumor with a margin of parotid gland, is required. Recurrences were seen in 5.5 per cent of the 291 cases collected by Orloff.[16]

Benign Lymphoepithelial Tumors

Although these lesions may be diffuse in the parotid gland, they are often localized and simulate a true neoplasm of the parotid requiring surgical investigation. They are often bilateral. At the time of operation, the inflammatory character is often suspected. Histologically, lymphoid tissue predominates and epithelial cells present do not suggest a neoplastic process. Biopsy diagnosis of benign lymphoepithelial disease or Mikulicz disease obviates further dissection. Radiation therapy has been advocated.[16]

Miscellaneous Tumors

Such rare tumors as the oxyphilic adenoma, sebaceous cell adenoma, and sarcoma still remain in the category of pathologic curiosities.

Parotitis

Parotitis is mentioned because it may be mistaken easily for true neoplasm. The patient complains of tenderness in the parotid area almost from the onset of the swelling which may be localized. However, if the swelling persists for more than one month, the tenderness may disappear while the seeming localized swelling persists. Trial of antibiotics and observation for three or four weeks are warranted. If surgical exploration is undertaken, the inflammatory nature is often grossly apparent as the trunk of the facial nerve is sought and biopsy with frozen section is done. If the pathologist reports inflammatory process present, further exploration should be terminated and appropriate treatment instituted.

Authors' Series

Our own series of parotid tumors is too small at this time to warrant detailed analysis. Distribution of the type of parotid tumors is as anticipated (table 2). Presence of four inflammatory lesions is a demonstration of the problem of differential diagnosis. In retrospect, two of the inflammatory lesions should have been recognized as such clinically. The other two lesions had been present several months, failed to respond to antibiotics and, in one sialogram, had been interpreted as demonstrating a mixed tumor.

TOTAL		22

In one patient with adenocarcinoma the facial nerve was deliberately sacrificed. The mandibular branch in one patient and the temporal branch in another were sacrificed. In two patients unanticipated paresis developed but, over a period of six months, return to normal function has been apparent.

There has been insufficient time for determination of recurrence and mortality rates. Thus far, there has been no recurrence of the benign tumors and one local recurrence of adenocarcinoma.

Conclusion

1. Inadequate surgical treatment of tumors of the parotid is still common and is the result of a lack of understanding of the dangerous potential of parotid tumors plus fear of damage to the facial nerve.

2. If results of surgical treatment of benign tumors of the parotid are to be improved, the surgeon must widely expose the parotid gland and identify the facial nerve trunk and its branches. Only in such manner can he carry out adequate resection of the parotid gland with preservation of function of the facial nerve.

3. Surgical treatment of the more malignant neoplasms of the parotid requires sacrifice of the facial nerve, total parotidectomy and radical neck dissection. Postoperative radiation therapy is indicated in the more malignant neoplasms. •

Dysgerminoma of the Ovary

Francis M. Lyle, M.D.
SPOKANE, WASHINGTON

In 1931 Robert Meyer[1] first described the ovarian tumor known as dysgerminoma and was the first to advance the concept of the neuter germ cell. He further postulated that this tumor is derived from the gonadal cells prior to differentiation into either male or female types, and that the cells remain in this neutral state as the tumor develops. Meyer expressed the opinion that the seminoma of the testis is the male counterpart of the dysgerminoma, and that these tumors are similar in clinical behavior and response to treatment.

Pathology

Dysgerminomas comprise 3 per cent of all solid tumors in most series and less than 2 per cent in our hospital series of 125 ovarian tumors. Seventy-five per cent of dysgerminomas occur in persons under 30 years of age. Dysgerminomas may vary in size from a small ovoid mass to a tumor that fills the entire abdomen. The tumor is of solid rubbery consistency with external configuration like brain tissue. On cut surface, the tumor is grayish yellow in color. Microscopically there is a distinctive appearance, for the tumor cells are arranged in alveoli separated by loose connective tissue which is infiltrated with an abundance of lymphocytes. The cells are large, ovoid, clear cells (Figs. 1, 2). The centrally placed nucleus is also large and stains heavily. Mitotic figures may be seen. Metastasis may take place by way of the lymphatics or the vascular route, and may extend directly to neighboring organs. The growing impression is that dysgerminomas are more malignant than formerly believed.

Survival rate of 70 patients followed for 5 years was 27.1 per cent, and the mortality rate was 72.9 per cent. One-third of the patients followed less than 5 years have metastasis or recurrence of the tumor. Poor prognosis is indicated in the presence of perforation of the capsule of the tumor, bilateral ovarian involvment, tumor cells within the lymphatics or blood vessels of the ovary, hemorrhagic ascites, and in prepuberal and post menopausal individuals. The rate of recurrence for these for the first year is 52.9 per cent. Two year survival is considered excellent prognosis for the case.

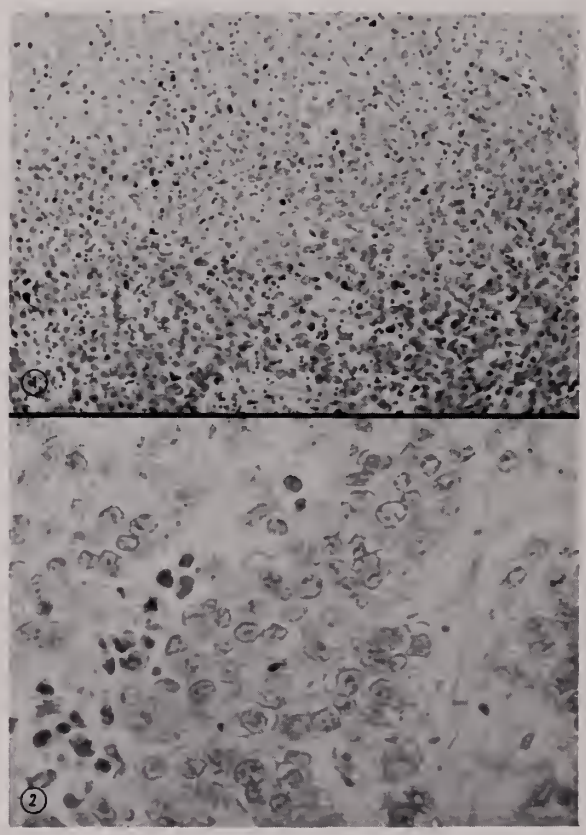

Fig. 1. Low power photomicrograph of dysgerminoma of ovary. Fig. 2. High power photomicrograph of tumor.

Read before the Spokane Surgical Society Annual Meeting, Spokane, Washington, April 12, 1958.

Clinical Symptoms

A pelvic or abdominal mass is invariably the finding that causes the physician to suspect the presence of an ovarian tumor. Ascites, if present, usually indicates poor prognosis. The menstrual history is usually regular. If a positive Friedman or Aschheim-ondek test is found the tumor is probably a granulosa cell tumor or a teratoma, pregnancy being ruled out. Unless both ovaries are involved the patient will have normal sexual development.

Treatment

Removal of only the involved ovary was the first accepted method of treatment, as most of the patients were in the second and third decade of life, and child bearing potentiality of the patient was thought to be more important than the malignant potentiality.

The present preferred treatment is a total hysterectomy with bilateral salpingo-oophorectomy in all cases, regardless of age, followed by x-ray therapy. George Pack has suggested that the greater omentum be removed in all ovarian malignancies as the sweeping action of the omentum collects many tumor cells.

CASE REPORT

This case of dysgerminoma of the ovary was a girl, age 16, a student in high school, whom I first saw Nov. 13, 1957. She was referred to me by an internist because of a large abdominal tumor which extended slightly above the umbilicus. This was nodular and stony hard in consistency. The patient had no other complaints. Her menstrual history was regular. There was no engorgement or color changes of the breasts. X-ray of the abdomen revealed no calcium or pregnancy present, but only a large solid-type tumor. Pregnancy tests were negative. On pelvic examination the uterus could be differentiated from a large hard nodular tumor mass that appeared to be fixed in the left adnexa area extending upward. The patient's blood picture was that of mild anemia. She had 3,800,000 red cells with 12 Gm. hemoglobin. Chest x-rays were negative for metastasis. On Nov. 19, 1957, in surgery, a large solid tumor was found which had a pedicle arising from the left ovarian vessels, with convolutions similar to but firmer than brain tissue (Figs. 3, 4). There were some transplants on the pelvic peritoneum. The regional nodes and also the nodes along the aorta were enlarged. The liver was free from metastasis. The uterus was normal and the right ovary was of normal size. Nodes along the aorta were negative, by frozen section and this was confirmed later by permanent sections. The regional nodes along the left iliac were positive. These were removed along with all of the left adnexal tissue. The pelvic peritoneum was excised widely, removing the transplanted tissue. The right ovary was not removed and the uterus was not disturbed.

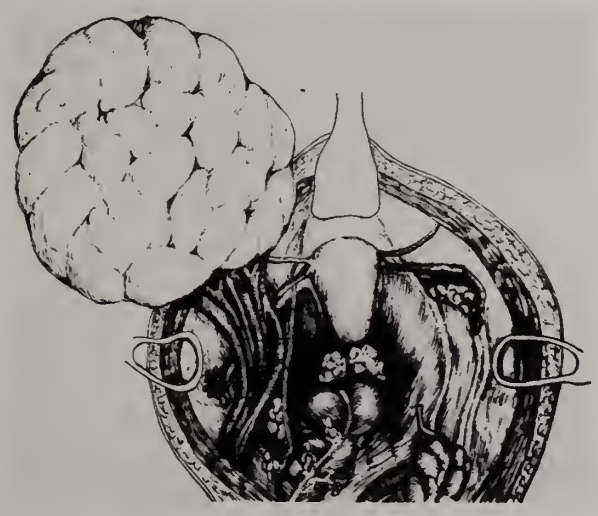

Fig. 3. Dysgerminoma of ovary in a 16 year old girl.

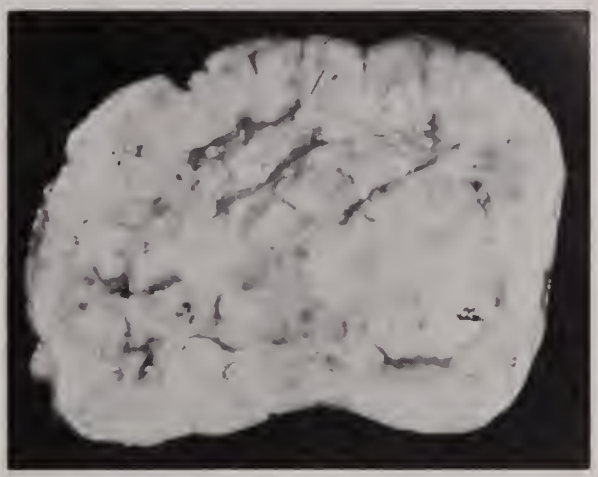

Fig. 4. Gross pathologic section of dysgerminoma of left ovary from a 16 year old girl.

Postsurgically she was treated by x-ray therapy, 2100 r to both anterior and posterior pelvic ports on the left side. These fields were sharply localized, so that the right ovary should not have received any significant amount of irradiation. This patient has been followed with chest x-rays and there has been no evidence of metastasis or recurrence to date, although the time elapsed is very short.

This method of treatment is less radical than the advised treatment for this type of tumor. Following consultation with the patient's mother during surgery at which time radicalism was refused, we elected to perform the less radical procedure.

Conclusions

1. There is nothing new or exciting about ovarian tumors.

2. Four per cent of patients with ovarian malignancies after the age of 39 have had previous hysterectomies. Most surgeons advise removal of ovaries in this age group with associated other disease.

3. Complaints and symptoms are usually due to growth.

4. Diagnosis can only be made by:

a. Periodic general and pelvic examinations.
b. Inclusion of ovaries in complete intraperitoneal examination whenever the abdomen is open.
c. Investigation of any abdominal enlargement in a woman past the menopause.
d. Investigation of all post menopausal bleeding.
e. Investigation of any ovary 5 cm. or more in diameter prior to menopause.

5. Management of malignancies should be uncompromising. Surgery should consist of removing the uterus, tubes, and ovaries, regardless of age, and also of resecting contiguous structures when such resections appear worthwhile. Follow-up x-ray radiation should be given.

6. Later look surgery is usually disappointing because distant metastasis rather than local recurrence is the rule. •

Capitalism and Our Culture

In recent years, business and industry have gone through the wringer. Businessmen, who are as good and as bad as any other group of men, have been singled out for special treatment. Industry as a whole has been tied down with a network of laws and controls. While some branches of it were treated to special privileges by government, other branches suffered from political discrimination.

During this same period a new conception of government has gained popularity. It is the very concept against which eighteenth century Americans protested and fought—the concept that government is the seat of ultimate power in society anad therefore possesses all the rights which it dispenses provisionally to people as political expedience dictates. Thus the older American concept of the relation of government and people is turned inside out.

Whenever men have yielded to the lust for power and the greed for possessions, there have always been impairments of political and economic liberty of great or less degree. In the past when the going got rough, men pulled in their belts, grumbled, and consoled each other with the literature of freedom, sacred and secular. They were sustained by their faith that those who loved liberty were on the side of the right, and that the right would eventually triumph. They might perish, but their principles would outlast any tyrant. But now the situation is different. Values have been transvalued, and impairments of political and economic liberty are made on principle. Thus the blows struck at limited government and free enterprise do not stop after doing their damage there. They go deeper and strike at the spiritual and cultural bases of our society, at that substratum of our life which we, until recently, have so taken for granted.

In our present situation, the most immediately oppressive things seem to emanate from an overgrown, bureaucratic government. Merely to remove these restraints and directives is of little use, however, if we leave intact the *concept* of omnipotent government—or the seeds of this concept—to spawn more restrictions. An erroneous idea of government must be replaced by a correct idea. But when we seek to refurbish the American idea of limited government, we find that originally the concept stemmed from a spiritual need of rehabilitation. It is at this fundamental level that the most intensive work needs to be done. But because so few people are aware of the importance of this level, almost no one is working at it. Unless this spiritual foundation is rehabilitated, work at the less profound levels cannot endure, touching as it does only the margins of the problem.

By The Reverend Edmund A. Opitz in The Freeman, March 1958, Vol. 8, pp. 37-38.

Surgical Management of Primary and Metastatic Cancers of the Liver

George T. Pack, M.D.
NEW YORK, NEW YORK

In earlier years there have been two deterrents to an aggressive surgical attack on cancers of the liver. One of these stems from the memory of a statement made by my professor of physiology in medical school who listed some 70 different functions attributed to the liver, the majority of which were vital and necessary for life. The second deterrent was the fear of tragic and perhaps fatal hemorrhage consequent to radical hepatectomy. The liver, being a huge vascular sponge, is supplied with three great circulations. One is a high pressure arterial system supplying 40 percent of the blood. The other is a low pressure portal venous system which is also afferent carrying 60 per cent of the blood to the liver. It is from this portal circulation that the liver receives the many noxious substances for detoxification from the cesspool of the intestines and all the nutritious elements for synthesis and metabolic needs. The liver, by some miraculous feat of chemistry and in a matter of seconds, renders the one harmless and converts the other into our human tissues. The third is the most intricate, complicated biliary circulation. Knowledge of the tremendous importance of the multitudinous functions of the liver and the equally important fact of its triple circulatory system has prevented me, as an individual, from an earlier surgical attack on the liver for the extirpation of cancer.

Incidence and Distribution

In 1930 I analyzed some 20,000 case histories of cancer at the Memorial Hospital and found that only 0.17 percent of admissions to this cancer institute were for primary cancer of the liver. It is not a common problem in the United States. It may increase in frequency with the more common occurrence of viral hepatitis, which apparently may have some etiologic bearing. Primary liver cancers are more common in the Orient among the Japanese, Filipinos, Indians and Chinese; it is particularly common with the Bantu in Africa, causing 30 to 40 percent of all cancer deaths. The incidence of primary cancer of the liver varies considerably in different parts of the world, which disparity in occurrence has been of great interest to investigators studying the epidemiology of cancer.

Last year a committee of the International Union Against Cancer went to Africa to study the distribution of these liver cancers among the natives, particularly among the Bantus. Liver cancer occurs in the Bantus at a much earlier age than it does in the people of the United States. Many young males are seen with this disease, and the tumor grows with great rapidity—sometimes causing death within three or four months from the time that it is first recognized. If these natives move to urban territories such as Johannesburg, where they live in the same environment as the white people and work under the same conditions, they do not develop primary cancer of the liver with this great frequency. Children born in these urban districts apparently do not develop primary cancer of the liver with greater frequency than those born in white families.

There may be a predisposing deficiency in diet which renders these people susceptible to the development of liver cancer. There is probably also some cryptic carcinogen which is influential. Some English investigators thought it was the ragwort which was growing wild in the fields inasmuch as these people make medicine from ragwort, give it to their children for diseases in infancy, use it as a panacea all through life, and in old age for diseases of senility. An extract of ragwort has been found carcinogenic and is reported to have caused cancer of the liver in laboratory animals. Suguira and Rhoads of the Sloan-Kettering Institute for Cancer Research, a division of the Memorial Cancer Center, have been able to induce primary cancers of the liver by very much the same mechanism. Rats on a diet deficient in vitamin B were given a carcino-

Read before annual meeting of Spokane Surgical Society, Spokane, Wash., April 12, 1958.

gen such as butter yellow, and a fairly high percentage of the animals developed primary liver cancer. When vitamin B was added to this basal diet and the animals were given the same dosage of butter yellow, they did not develop primary cancer of the liver. From these experiments one may assume that, as time goes on, cancer of the liver among these peoples, particularly in the Orient and in Africa, will decrease as their nutrition is improved and as the carcinogens are identified and eliminated.

Considering the fact that the liver is the largest organ in the body, that no other organ contains so many epithelial cells and that no other tissue is so constantly bombarded with toxic agents, the surprising fact is not that primary liver cancer is common among the Bantus and Orientals but that it is so uncommon among Europeans and Americans.

Cirrhosis is found associated with 60 to 70 per cent of malignant hepatomas and 30 to 40 per cent of cholangiocarcinomas. It has been estimated that about 3 per cent of Americans with cirrhosis may expect to develop primary liver cancer. It is doubtful if the cirrhosis *per se* is responsible for the cancer in a causative way; it is more likely that both the cirrhosis and the liver cancer have a common cause.

Surgical Treatment of Liver Tumors

My earlier experience with removal of liver tumors has been the occasional extirpation of some hepatic neoplasm which by fortuitous circumstances had lent itself well to excision. In reviewing the early medical literature, the majority of the case reports have been of instances in which a tumor of the liver has become pedunculated, and thus the surgeon has been able to remove it by transfixing and ligating the pedicle. In some instances, the mobile tumor was exteriorized on the surface of the abdomen and the abdominal wall sewed around it, with later transfixion of the pedicle and removal. Very few cures of malignant tumors were obtained under those circumstances, but seldom in earlier years did anyone boldly enter the main liver substance and take out these tumors.

Benign hamartomas may be removed readily without surgical difficulty but often require incisions extending well into the liver substance. Another benign tumor of the liver encountered with great frequency is the hemangioma. We do not ordinarily remove these benign hemangiomas if they be small but occasionally we do have to intervene surgically when complications occur. Such a complication is spontaneous thrombosis in a large cavernous hemangioma which produces acute abdominal signs and symptoms. Also I have had to operate when these large hemangiomas showed growth exacerbations during pregnancy. Sometimes these tumors are quite formidable in appearance but they are easy to remove and not as dangerous as one might think. They are encapsulated and usually have a deep intrahepatic vascular pedicle, which may be encountered in the process of dissecting around the capsule. It is then ligated and severed after which, the tumor can be removed without tremendous loss of blood. Protection afforded by antibiotics and blood banks has given us the courage to do more of these operations.

The primary malignant liver tumors are classified into two main categories based on their histogenesis. One is the hepatoma which runs the gamut from a relatively low grade cancer to one of high grade malignancy and celluarity. They are more common in males than in females and are usually unicentric in origin. They tend to grow at first in an expansile way. Some are situated near the surface of the liver and they may dissociate themselves from the liver as they grow and enlarge much in the same way that a subserous fibromyoma of the uterus would behave. Another type is the cholangioma and the cholangiocarcinoma composed of bile duct epithelium. They are often multicentric in origin. They occur more frequently in women than in men as might be expected in view of the greater frequency of gallbladder disease and cholangitis occurring in women.

Vascular Control Essential to Major Hepatectomy

The surgeon who plans to do major extirpative surgery for tumors of the liver should be thoroughly familiar with the vasculature of the organ. The prevention of uncontrollable hemorrhage is of paramount importance. If sudden hemorrhage occurs before the blood vessels to the lobe being removed have been ligated, temporary arrest of the bleeding may be achieved by strong digital compression of the hepatic artery and portal vein or by the use of a very soft clamp, although it is not safe to keep even such a clamp compressing these vessels for longer than 15 to 18 minutes.

We are indebted to Charles T. Michele of Philadelphia for more precise information on hepatic anatomy. He dissected some 200 cadavers to demonstrate the variations and anomalies

of the hepatic artery. Seventy-five per cent of the cases had the orthodox pattern of distribution, breaking up into the conventional right, middle and left branches. One anomalous arrangement is an entirely separate origin of the right hepatic branch from the superior mesenteric artery. The main hepatic artery then supplies only the middle and left lobes. This arrangement occurred in one of the patients for whom I did a total right hepatic lobectomy. Another anomaly is the situation in which the hepatic artery supplies the right and middle lobes but we do not see the left hepatic artery. A cautious surgeon who plans to ligate the right hepatic artery before removing the right lobe of the liver would first identify the arterial supply to the left lobe. An anomalous left hepatic artery may come from the left gastric artery, hugging the undersurface of the left lobe and not be readily apparent. The arterial supply to the left lobe can also arise from the celiac trunk. I have also twice encountered an accessory left hepatic artery in addition to the normal distribution to the right, middle and left lobes. The right and left lobes of the liver do not have intercommunicating arterial branches across the septum. The liver is a bipartite organ as far as its arterial supply is concerned, just the same as if the patient had two livers as he has two kidneys.

One does not find much arterial bleeding when the interlobar septem is transected but there is much bleeding from the branches of the vein in that region because the left branch of the portal vein going to the left lobe has recurrent branches traversing the interlobar septum into the right lobe. The right portal branch is very short. If the right lobe of the liver is to be removed in its entirety a preliminary ligation of the short right portal branch is a preliminary necessity. In a left hepatic lobectomy the much longer left portal vein can be readily exposed and ligated.

The hepatic veins usually consist of only one main branch from the left lobe but there are several on the right. To do a left hepatic lobectomy one need have no concern about accessory hepatic veins and the major left hepatic vein is easily found at the posterior and superior part of the incision through the interlobar septum. On the right side, draining into the inferior vena cava can be found at least six or eight of these major veins.

Technique of Right Hepatic Lobectomy

The incision we make is first an exploratory vertical or paracostal incision extending into the chest if we find the hepatic lobectomy to be possible. If the right lobe is to be removed the hepatoduodenal ligament is first dissected and the cystic duct is cut. Then the right hepatic duct, the right hepatic artery, the middle hepatic artery, and finally the right branch of the portal vein are dissected, identified, ligated and transected. The portal vein is not done until the last step in this procedure and sometimes, because of difficulty of exposure, we have to wait until we mobilize the liver before the ligation. The liver is freed from the diaphragm and the patient's position is changed on the table by rotation to the right. Two rows of interlocking mattress sutures of heavy chromicized catgut are placed through the septum, then the liver is transected between these sutures with minimal loss of blood. If the falciform ligament can be preserved it is tacked down over the raw area of incision and if not a free peritoneal graft may be taken from the parietal peritoneum and placed over the denuded cut surfaces. This procedure is important because it lessens the amount of serum and bile leakage which occurs from the cut end. At the time the right portal vein is ligated the left lobe suddenly swells and becomes turgid, firm and purplish. In some patients the liver function improves almost immediately after the operation due to this prompt change in circulation. If the blood has been going to the right lobe but not going through much normal liver tissue, the patient may suffer from inadequate liver function. Just as soon as the flow is diverted to the normal left lobe, all of the blood receives the benefit of the good function still inherent in the normal left lobe.

Cancer of Gallbladder

Cancer of the gallbladder has been a problem because we have not been familiar with the phenomenon of metastasis within the liver. The situation differs entirely from that of invasion of solid tissue such as a sarcoma invading muscle or cancer invading the lip. In the case of gallbladder cancer the invasion takes place through the gallbladder bed into the vascular channels of the portal system where the cells break off and are disseminated through the liver where they produce secondary deposits. Because of this sequence of events, even a cancer that is only superficially invading the surface of the liver may very shortly have secondary and tertiary deposits within the liver parenchyma.

Because of this frequent occurrence and the very low cure rate for gallbladder cancer by

cholecystectomy and excision of the gallbladder bed, we have advocated and practiced total right hepatic lobectomy for all gallbladder cancers. We have employed this procedure for this indication seven times to date.

In two recent cases we have performed middle lobe hepatectomy. We hope this may prove to be a useful procedure for gallbladder cancer. In removing the middle hepatic lobe it is necessary of course to spare the right and left branches of the portal vein and the right and left hepatic ducts. The gallbladder is removed in continuity with the middle lobe. Both of the patients have done well postoperatively but the time is too short to evaluate this more conservative operation.

Surgical Treatment of Metastatic Cancer in the Liver

As a palliative measure, it is sometimes worthwhile to attack metastatic cancer within the liver. It is not rational surgery to pick out little nodules from the liver like you would raisins out of a cake. We divide our patients with metastases to the liver into three categories depending upon the time of appearance of the metastases in relation to the time of treatment of the primary cancer. First, there are the precocious metastases. If the patient comes to us with a nodular liver or palpable mass, and there are no symptoms of the primary site, we can conclude that this is a very bad situation. The primary cancer must be so small that it does not produce focal symptoms at the point of origin, and it must be a very cellular tumor to have produced bulky metastases without itself growing to an appreciable size. The prospect of help for these patients must be very slight.

The second situation is the so-called synchronous metastasis indicating that the primary cancer and metastasis in the liver are discovered at the same time. These are commonly discovered when an exploration is made for example, for cancer of the stomach or cancer of the colon and metastatic cancer is found in the liver. What to do depends on one's judgement and the conditions surrounding the individual case. I have not had any success whatsoever of doing hepatic lobectomies for metastatic cancer primary in the stomach, but I have had quite a series of patients who have cancer of the colon with metastases to the liver, who have secured palliative benefit from hepatic lobectomy.

Metachronous metastases, the third category, are those in which the primary cancer has been treated and controlled, or let us say, locally cured. At some subsequent date, the longer the better, evidences of metastasis to the liver appears. This is the most favorable setting for a lobectomy or segmental excision of metastatic cancer of the liver, because there is some reason why there has been growth restraint of the cancer in these people. I have done this twice for melanoma in the liver metastatic from ocular melanoma. These patients have lived in comfort for one to three years.

Liver Regeneration After Major Hepatectomy

Patients who have had a major hepatectomy tend to have marked hypoproteinemia, and one needs to be very careful about giving them the proper diet rich in protein. I do not mean intravenous amino acids just to give them a positive nitrogen balance. I mean old-fashioned proteins by mouth absorbed through the intestinal tract and carried into the portal system up to the liver where it can be used. The administration of protein food after right hepatic lobectomy causes some danger of getting ammonia intoxication. Therefore, the postoperative period of management requires every caution and attention.

The liver has an irresistable urge to regenerate itself. The internists knew it many, many years ago, because after acute yellow atrophy or after phosphorus or carbon tetrachloride poisoning, they watched the liver regenerate as much as 50 to 100 Gm. a day. I often tell my students that even the ancients knew about it, reciting the fable about Prometheus who, you may remember, stole a bit of fire from the sun and gave it to the humans out of sympathy for their plight. Jupiter, in anger at his presumption, chained him on the mountain top where the vultures ate his liver all day long, but by the next morning it had grown back. We have taken the livers from a series of cadavers and cutting through the interlobar septum have divided it into the right and left lobes. In a fairly large series, we have found that the left lobe weighs 18.2 per cent of the total normal weight of the liver. That means that if we take out the right lobe of the liver that the human has less than 20 per cent of liver substance from which to regenerate a new liver. The little left lobe can take care of it and it becomes as large even as a normal liver.

In rats and mice one can excise 70 per cent of the liver, and within three weeks the animal will have a liver larger than it had in the beginning. In a series of animals with variable portions of

the liver removed it will be found that the animals from which the largest portion of liver has been excised will regenerate more rapidly and will produce in the end larger functioning livers. The impetus for regeneration is very, very great and is a proportionate stimulus to the amount of liver removed. It depends a great deal also upon the portal venous pressure. We have done experimental surgery in dogs designed to increase the portal pressure which is measured in mm. of water before hepatectomy and after hepatectomy. We have arterialized the portal vein by diverting part of the gastroduodenal artery into it or the splenic artery into the splenic vein. When the portal vein has been arterialized the regeneration is much more rapid. We have never applied this knowledge or procedure to a human patient but we are prepared to do so in the face of impaired circulation to the remaining left lobe and as a method of increasing regeneration of the left lobe of liver. If we find a patient in whom the left lobe of the liver does not appear to be viable I would have no hesitation in diverting the artery into the portal vein in order to insure that the patient would live.

In some animals we have given cortisone and have found more rapid regeneration of the liver. Cortisone has, I am sure, saved the lives of two of our human patients who were almost moribund for reasons we could not determine. Our internists gave them cortisone as a stimulant and the patients were demanding food on the following day. Now we give cortisone, guardedly, to our patients postoperatively. I do not know whether cortisone is the humoral factor responsible, but in experiments on parabiotic rats we have taken out 70 per cent of the liver of one rat leaving the liver of its attached twin intact. There was some regeneration of the removed liver, but the important observation was that the liver in the unoperated twin was the one showing amazing hyperplasia.•

Management of the Patient with Gastric Cancer

George T. Pack, M.D.
NEW YORK, NEW YORK

Cancer of the stomach has long engrossed the attention of all disciplines in American medicine. Long ago our federal government selected this regional cancer for an intensive pilot study and appointed a National Gastrointestinal Cancer Advisory Committee, of which I have long been a member and in later years the Chairman. The function of this Committee has been to review applications for grants-in-aid, to coordinate research on gastric cancer in various cancer institutes, cancer hospitals, teaching institutions and general hospitals and at stated intervals to conduct symposia which brought into review the accomplishments of recent research on this subject. The programs of these congresses have been published in monographic form and afford an interesting recital of the evolution in our knowledge of gastric cancer during the past 20 years.

Read before annual meeting of Spokane Surgical Society, Spokane, Wash., April 12, 1958.

Incidence of Stomach Cancer

Contrary to our experience with other malignant tumors, cancer of the stomach seems to be decreasing in the United States. A quarter of a century ago, 25 to 30 per cent of all cancer deaths could be attributed to cancers of the stomach. At the present time, certainly no more than 15 per cent of cancer deaths are due to gastric cancer. During the same interval, cancers in other locations, notably the lung, colon, and rectum, have increased in frequency. The reason for the decrease in frequency of cancer of the stomach in this country has not been discovered. Epidemiologic studies are in progress. We surgeons who

treat gastric cancer wish it could be credited to our surgical efforts, but the percentage of cures is still too small to account for the improvement.

An epidemiologic team from the Memorial Center has been collecting possible etiologic data in two countries, Japan and Iceland, where the incidence of gastric cancer is abnormally high. A possible contributing factor in Iceland could be the great consumption of smoked fish and smoked meat. Perhaps the process of smoking or curing meat and fish adds carcinogens or carcinogenic hydrocarbons to these staple foods.

Cancer of the stomach also occurs with great frequency in Costa Rica. On the occasion of a recent visit, I was impressed by observing in one of the hospital wards a group of 20 patients with cancer of the stomach awaiting operation. Young surgeons who are investigating the problem there believe that they too have found a possible etiologic factor. The victims are mostly country people who eat great numbers of tortillas which are smoked; these tortillas are also prepared from corn treated with ashes. Possible carcinogens are being investigated.

The economic importance of gastric cancer is revealed by comparing its incidence with another great American illness—poliomyelitis. In every million American children there are 750 victims of poliomyelitis. Of these, 430 recover without any residual defects, 175 recover with some residual paralysis, and 45 die. For every one million American adults of cancer age, there are 1,700 with cancer of the stomach, no spontaneous recoveries, only 85 five-year cures and 1,615 die. I do not wish in any sense to belittle or lessen the importance of the campaign against poliomyelitis. It has been richly rewarded. I only wish to emphasize that as far as cancer of the stomach is concerned, we have failed to arouse proportionate public and professional interest.

Detection of Gastric Cancer

I wish there were some specific signs or symptoms which could be used for the early detection of gastric cancer, but unhappily there are none. The textbook picture of gastric cancer is that of the advanced and inoperable stage of the disease. Progressive weight loss can be due to many other diseases—e.g., cancer of the pancreas may cause more dramatic deterioration. The same is true of pain and epigastric distress which of course are not specific for gastric cancer because the stomach is the biggest "liar" in the abdomen. Cancers on the lesser curvature are attended by pain more frequently than those in other segments. Cancers at the inlet or outlet of the stomach causing obstruction result in dysphagia or vomiting as the case may be.

Study of Possible Precursory Groups

One of the research projects sponsored and encouraged by the National Advisory Gastrointestinal Cancer Committee was designed to find certain precursory groups of patients in whom gastric cancer might be detected at an early stage. The first group studied is composed of apparently normal adults who did not have indigestion and were over 40 years of age. This study was done concurrently at several centers. It was discovered that 1 in every 800 such males had an early gastric cancer so small as to be asymptomatic. Would it be practical to apply this knowledge by surveying the entire population of the U.S.A.? The answer is that such a survey is not feasible because there are 45 million Americans over 40 years of age in this country. If roentgenologists were occupied to fluoroscope these people, one every five minutes, the roentgenologists working eight hours a day, five days a week, the project would occupy the full time of some 1,800 roentgenologists. The plan is impractical inasmuch as such examinations would have to be repeated at least every six months. It is sufficient to know that 1 of every 800 American adult males is carrying a latent asymptomatic cancer in his stomach.

The next precursory group is composed of those patients with anacidity. We never discharge from our out-patient service or our private offices any patient who has achylia gastrica. These patients are examined yearly since they have greater incidence of gastric carcinoma than the general population; possibly about 1 out of every 100 will develop gastric cancer.

The third precursory group comprises those patients with pernicious anemia. This group is most productive of gastric cancer. About 5 to 6 per cent of these patients ultimately may be expected to develop cancer of the stomach. Gastric atrophy, which is inconsistent but still a fairly frequent precursor of gastric cancer in general is always present in patients with pernicious anemia. This relation of the two diseases was noted in earlier years but convincing evidence was obtained only after the discovery of the specific management of primary anemia. The application of this knowledge has enabled these patients to live long enough to develop gastric cancers. Anyone with primary anemia should have frequent examination of the stomach in

order to detect early asymptomatic gastric cancer. A corollary to this relationship is the assumption that anyone who could find a means of reversing the atrophic gastritis constantly present in patients with pernicious anemia probably would discover at the same time a means of preventing some gastric cancers.

Relation of Gastric Polyps to Gastric Cancer

We have been concerned with patients who have gastric polyps and recently have reviewed our experiences at the Memorial Center. The incidence of gastric cancer has been higher in patients with multiple gastric polyps than in those who have single gastric polyps. Those single polyps that are less than 2 cm. in diameter have been consistently benign—at least in our experience—but perhaps this should not be applied as a general rule. Many of the larger ones have been polypoid carcinomas.

There are differences of opinion on the management of gastric polyps. Dr. Wangensteen and I hold somewhat different viewpoints. He does not operate on their discovery believing that surgical intervention is unnecessary unless some changes in the radiographic or fluoroscopic appearance or the clinical aspect occur, or there is evidence of infiltration. Admittedly, we find that polyps less than 2 cm. in diameter and occurring singly have been benign. However, the operation of gastrotomy and polypectomy is relatively safe and provides an opportunity to inspect and biopsy the gastric mucosa. We therefore remove these ployps as they are discovered.

Accuracy of Diagnosis

It is not difficult to diagnose established cancers of the stomach. If we examine the records of all patients seen who have developed gastric cancer, we find that on our first thorough examination we are able to make a correct preoperative diagnosis in 96 per cent of the cases. We can do this with the facilities at hand—the fluoroscope, serial gastro-intestinal x-ray films, gastroscopy plus cytologic diagnosis. Papanicolaou employed material from the Gastric Service of the Memorial Cancer Center for some of the early work he did on the cytologic diagnosis of gastric cancer. We are not concerned about using cytologic diagnostic methods for the obvious cancers of the stomach since the diffuse or fungating cancer is evident to anyone. We believe its great indication is as a supplementary procedure on those patients in whom the diagnosis is in doubt. Perhaps the percentage of diagnostic errors is greater in studying gastric exfoliation than it is in studying cells from the uterus. Occasionally gastric cystologic study will give us a positive report which added to the gastroscopic image, x-ray diagnosis and physical examination enables us to increase our percentage of diagnostic accuracy.

Diagnosis and Management of Ulcerative Defects

One of the most controversial problems in diagnosis and management has been ulcer of the stomach. I will leave for other physicians the discussion and ultimate determination as to whether a given gastric ulcer may become malignant. The question of practical importance for those of us who are called upon to treat a patient is whether or not this ulcer in this individual patient is cancer. We are immediately concerned for the individual rather than with the academic question of whether or not an ulcer in the stomach, if left alone, will ultimately become malignant, or whether an ulcerating cancer was preceded by a benign gastric cancer.

I do not believe *any one* of the different items of information about an ulcerating lesion in the stomach can be applied specifically in establishing the correct differential diagnosis between benign gastric ulcer and ulcero-cancer. We decide to operate or not to operate on the summation of findings rather than because of one specific feature about the ulcerative defect.

There are several items on which we base our final decision to operate or to employ conservative medical management. The size of the ulcer has been given considerable importance. Once it was commonly said that any ulcer larger than a quarter was malignant. There are many exceptions to this opinion—e.g., there are some very large ulcers which are benign and some tiny ulcers that are malignant. Size alone is not a sufficient diagnostic criterion. It is true, however, that the larger the ulcer the greater the tendency to be malignant. Thus, in ulcers of 1 cm. in diameter about 10 per cent are malignant. If the ulcer is 2 cm. in diameter, 20 per cent are malignant. Those 3 cm. in diameter have an incidence of 30 per cent malignancy and the figures proceed in that fashion.

Another item is the location of the ulcer in the stomach, but here again one cannot be absolute. It has been said that all ulcers on the greater curvature are malignant; in 30 years of study and management of these tumors I have seen only three benign ulcers on the greater curvature

which contradicted this rule. If one must have an ulcer of the stomach the best place to have it is on the lesser curvature, near the incisura, because this region carries a high percentage of benign ulcers. The frequency of ulcero-cancer and benign gastric ulcer at the cardia on the lesser curvature is 50-50. In our experience ulcers in the immediate prepyloric area on the lesser curvature have been malignant in 65 per cent of cases.

The gastroscopic image is another item to be included in our summation. If it is a clean cut ulcer, we do not know whether it is benign or malignant. If there is necrotic tissue in the ulcer, we believe it to be malignant which is usually the case. The rugal pattern too is significant. There is an old statement to the effect that if the rugae converge toward the ulcer and the folds are apparent up to the margin the ulcer is probably benign. If the pattern stops before reaching the ulcer and there is a plateau around the ulcer, this is assumed to be evidence of infiltration and the ulcer is probably malignant.

Gastric analysis is not as helpful as one might think. Many patients with ulcerating cancer have some free hydrochloric acid in the stomach and the acid-secreting cells will respond to histamine stimulation. Some will have normal acidity and a few may even have hyperacidity. This observation is not true of polypoid cancer but may be with ulcerating cancer.

What about the therapeutic test conducted by putting the patient on conservative medical management? Is this enough? No, it is not. Even when immediately successful, the medical treatment of true gastric ulcer is followed by recurrence in 60 or more per cent of patients. It is also true that you can advise conservative management for a patient with ulcerating cancer and sometimes get complete relief of symptoms. The patient may even gain weight. I had one patient who gained 40 pounds in a year. X-ray study may show evidence of healing but the healing is a bit bizarre and not like that of the benign ulcer. Benign ulcers tend to heal equally in all three dimensions whereas ulcerating cancers tend to heal from the depth up, which means that the crater is filled with cancer tissue. Palmer has shown that epithelization may take place right over the ulcer. Therefore, if you are going to give a patient a therapeutic test and check by x-ray, do not base your judgment on diminution in size of the ulcer. You must demand that the ulcer disappear completely and not leave any residual thickening or induration of the gastric wall; otherwise, the possibility of ulcero-cancer has not been eliminated.

It is my opinion that surgical removal is better for these gastric ulcers than conservative management. One of the reasons is that the pathologist may not be able to make an accurate gross diagnosis even with the specimen in his hands. In a hundred cases called benign from gross appearance, he will find 12 to 15 in which microscopic study will reveal evidence of gastric cancer in the wall. I contend that the operative mortality for subtotal gastrectomy for benign gastric ulcer does not approach the hazard of incorrect diagnosis. If the pathologist cannot make a correct differential diagnosis on gross inspection, how can one expect the surgeon to diagnose it in the opened abdomen or the roentgenologist to diagnose it from a shadow seen on an x-ray film?

Indications for Extent of Removal

We see more and more patients referred to us with recurrent cancer of the stomach. These patients have had subtotal gastrectomies and for the recurrent cancers we have been doing total gastrectomies, removing the rest of the stomach and adjacent organs. Of course a more adequate operation should have been done in the first place. McNeer of the Gastric Service in the Memorial Cancer Center undertook a survey in a group of New York hospitals in order to determine adequacy of subtotal gastrectomy for cancer. He utilized approximately 100 cases in which the patient had a gastric cancer, had undergone subtotal gastrectomy and recovered, had been discharged from the hospital but finally readmitted and died from recurrence. The hundred cases used were those in which post mortem information was available. In 40 per cent of these cases, there was recurrent cancer in the remnant of the stomach. In 11 per cent there was recurrence in the duodenal stump, and in 20 per cent there was cancer in perigastric lymph nodes. These findings indicate that the removal of the stomach and duodenum for cancer had been inadequate in half of the cases. If one adds the 20 per cent who should have had dissection of the perigastric lymph nodes, it is realized that 70 per cent of the patients had not had adequate first operations.

This study of the results of subtotal gastrectomy for cancer as performed in a group of New York hospitals offers cogent argument for revalu-

ation of the indications for total gastrectomy. Of course the mere ability to perform a total gastrectomy with relative safety is not the proper indication for it. In the treatment of gastric cancer as in treatment of any disease the patient must be considered as an individual and therapy applied as the case may demand. We have certainly been influenced by these findings and have extended the scope of gastric surgery. Our definition of an adequate operation is quite different from what it was 10 years ago, but we still find a place for subtotal gastrectomy and have established no absolutely inflexible rules.

For cancers of the distal third of the stomach, a subtotal gastrectomy is done removing the entire lesser curvature. A perigastric lymph node dissection is completed. The spleen and pancreas are not molested. Anastomosis is done, employing the greater curvature side of the fundus. Lymph flow studies using Direct Sky Blue injections indicate that if we wanted to remove the entire lymph drainage basin of cancers of the distal third of the stomach, it would be necessary to do an associated pancreaticoduodenectomy which we have not done as yet. The lymph nodes along the hepato-duodenal ligament and along the superior margin of the pancreas are dissected and removed.

In cancers of the middle segment of the stomach metastatic dissemination to so many groups of nodes occurs that we believe total gastrectomy should be employed. We also do splenectomy and subtotal distal pancreatectomy, removing the pancreas up to the level of the crossing of the superior mesenteric vein in association with the total gastrectomy.

In the case of cancers of the proximal third of the stomach, it has been found that remote metastases even into the infrapyloric group of glands occur in 14 per cent of the cases and to other groups with fairly high frequency. Therefore, for cancers of the gastric cardia, unless there is some contraindication, we do a total gastrectomy of the extended type with splenectomy and subtotal pancreatectomy. If the patient is elderly or a poor surgical risk and has a very early cancer, we might do an abdominal or transthoracic cardiectomy.

Technique of Extended Total Gastrectomy

A vertical abdominal incision, or a transverse or oblique incision ending at the costal margin, may be employed for the initial exploration. If the cancer is operable, the incision is extended into the chest by an abdominothoracic approach. The greater omentum is freed from the transverse colon. If the transverse colon is involved or adherent, it is resected and a primary end-to-end anastomosis is accomplished. Because of this possible involvement, we always have our patients prepared for colonic surgery. Strangely enough, we have had better results in those cases in which cancers of the stomach are invading the colon than in those in which it was free—perhaps because the extent of the resection is necessarily so much greater. After the colon has been dealt with, the dissection is carried from the right and from the left. A liberal margin of the duodenum is taken and the stump of the duodenum is closed in layers and inverted. Then on the patient's left the peritoneal gutter is incised and the spleen elevated. With it of course comes the pancreas and the vessels taken off the anterior surface of the kidney and the adrenal. All of the involved tissues are swept to the left until entirely free and the stomach is suspended only by the esophagus. After transection of the pancreas at the level of the superior mesenteric vein, the stump is closed and inverted with mattress sutures. The ducts of course are ligated with silk. The esophagus is transected and the anastomosis constructed by a termino-lateral esophagojejunostomy. I always construct a supplementary enteroenterostomy because without it many of these people who have had total gastrectomy will complain even years later that they will be awakened in the middle of the night with a mouthful of bile which has been regurgitated.

End Results of Total Gastrectomy

When the end results of total gastrectomy for cancer are considered they must be viewed from two aspects. One is the rate of survival for the period of definitive cure. The other aspect which is cause for concern is the general health and digestive functions of the patient after a total gastrectomy. Is he a gastric invalid? Does he continue to suffer and is it worthwhile? We have evaluated these problems by getting our patients back for study, some even 10 years after they have had their stomachs removed. Many patients did not have an adequate diet. Many of our totally gastrectomized patients were subsisting on three small meals a day and they were not adequate meals. Furthermore, even 10 years after removal of the entire stomach, two-thirds of these patients had dumping syndromes. Many surgeons have told me that they did not find the dumping syndrome to be an important post-

operative complication in their patients. I believe that the number of cases of post-gastrectomy dumping syndrome found will be in direct proportion to the amount of time that we, as surgeons, spend questioning our patients about their digestion and comfort after the operation. The responsibility of the surgeon extends beyond the operating room and the immediate postoperative recovery. The totally gastrectomized patient now receives five small meals of high protein and low carbohydrate content daily.

Metabolic studies have been done on our patients after total gastrectomy. These patients volunteered, and some of them were in the hospital from six weeks to five months. It was found that, after total gastrectomy, the patients had increased output of fat in the stool which varied with the individual. The increase was not always clinically apparent. They also had creatorrhea because they were not digesting proteins completely. It has been claimed that this deficiency will not be as serious if an esophagoduodenostomy is used so that the food passes through the duodenum and thereby stimulates external pancreatic secretion. This observation is true, but its value is perhaps not sufficient to compensate for the added hazard of attempting to connect the duodenum to the esophagus.

The question of substitute stomachs has been raised and various devices have been employed. A section of the transverse colon has been used between the esophagus and duodenum, and a segment of the jejunum is now enjoying some popularity. The right half of the colon has been interposed between the esophagus and the duodenum. These transplants may act as reservoirs. For instance, the right colon acts very well as a reservoir, but its employment does not lessen the incidence of the dumping syndrome—the appearance of the syndrome is merely delayed. Fat absorption is just as bad in these patients as it is in total gastrectomy without a reservoir. Using vitamin B_{12} labeled with radioactive cobalt, we found diminished uptake of the vitamin. Theoretically these people should have primary anemia. Our patients have gone as long as 15 years without developing primary anemia but we have taken the proper precautions to avoid it.

The dumping syndrome is produced by the too rapid absorption of carbohydrates and not by the proteins or by fats. The blood volume decreases and blood concentration goes up. These very rapid interchanges occur when the carbohydrates get into the small intestines speedily. The potassium level increases and electrocardiographic changes indicating coronary ischemia correspond with the period of symptoms. The way to combat the syndrome of course is to give patients a high protein, high fat diet with minimal amount of carbohydrates.

Definitive Cure Rate

Twenty years ago, a study of end results in the treatment of gastric cancer showed that of every 100 patients coming to the hospital, 50 were hopeless at the time they applied and were admitted for treatment. Of the 50 remaining, only 25 had resections and the other 25 had palliative or so-called short circuiting operations, laparotomies or nothing. So, only 25 of the original 100 patient applicants had any prospect of cure whatsoever. Twenty years ago, the operative mortality was 22 per cent. A residue of only 17 or 18 patients of the original 100 left the hospitals alive and apparently free of cancer. Two-thirds of them were dead at the end of three years and three-fourths at the end of five years. At the end of five years, therefore, only 2 to 6 out of 100 were living. In 1950 we published a report of cases treated prior to 1945. There was a definite improvement over the earlier records. We were then subjecting 82 per cent of our patients with gastric cancer to some operative procedure. Our operative mortality was 9.8 per cent. Of those individuals surviving the operation 34.5 per cent were living and well for the five year period of definitive cure. This record is better than we will ever enjoy again because since 1945 we have been doing more of the extended operations for advanced cancer and therefore will never have 34.5 per cent of resection survivors.

An analysis of our experience from 1931 to 1955 has recently been completed. It is not necessarily fair as representing our present effort because in those early years we certainly did inadequate operations. As to the degree of malignancy or anaplasia, not many of the cancers were grade I, less than 5 per cent. About a third have been classified as grade II; a little more than a third, grade III. About 24 per cent are grade IV. Five year survivals without recurrence in the interval show that 11.9 per cent of the cases are in grade I, 48 per cent in grade II, 28 per cent in grade III and only 10 per cent in grade IV.

As the years have gone by, we have increased the number of resections and decreased the percentage of by-passing operations. A gastroenterostomy for an obstructive lesion of the pylorus

enables the patient to live longer and suffer more, which is not the desired accomplishment. At the present time there are very few patients we refuse for operation. The number of non-curative operations is approximately the same—about 50 per cent. The palliative operations of choice are now resections, rather than gastro-enterostomies or gastrostomies. The operations we call curative—we do not actually expect universal cures but do the procedure with a curative intent—have more than doubled in the period. The presence of an abdominal mass indicates a lower grade of curability than when the mass cannot be palpated. This means that if you can feel the cancer in the stomach, the patient does not have as good a prospect of being cured or having a curative operation. However, it does not necessarily imply that the patient has an inoperable cancer. It still may be operated upon and with an intent to cure in almost a third of the cases.

The duration of symptoms has no influence at all on the operability of these gastric cancers. I wish it were so. The same finding applies to osteogenic sarcoma. If a patient with bone sarcoma has a long history followed by an amputation, there is a much higher cure rate than if there is a short history followed by an amputation. This simply means that in a patient with a short history the tumor has grown so rapidly and the discomfort has become so acute that the patient has become alarmed and seeks medical advice at an earlier time. The same thing is true of patients with gastric cancer. The explanation rests in the fact that the more malignant and therefore less curable gastric cancers, grow more rapidly and induce symptoms earlier.

Age seems to make very little difference except in patients under forty. In the younger group, the opportunities are not so good for carrying out curative operations as in the rest. It remains about the same through all decades until around eighty years. The operative mortality goes up at a rapid rate with advancing age. It becomes almost prohibitive in patients who are over 70 years of age.

There is a relation between the number of five-year survivals and the type of symptomatology. These patients who have had the ulcer syndrome are the most favorable. Next most favorable is the group who had cryptic anemia leading to early discovery of the cancer. Patients whose predominant symptoms was indigesion had a very low cure rate, less than 7 per cent perhaps because this discomfort was readily tolerated and self-treated.

The five year survival in relation to gross pathology showed that polypoid and ulcerating cancers offer the best prognosis with 44.8 and 45.5 per cent survivals. Those cancers with ulceration and infiltration had only 20 per cent cures and cancers of the diffusely infiltrating type were cured in only 6 per cent of cases.

An important factor in the survival figures is that most recurrences show up within the first three years after gastrectomy regardless of whether the nodes were involved or whether the cancer was diffusely infiltrating or not. If the patient had lived three years after the gastrectomy for cancer he will probably live out his life expectancy unless he dies with an intercurrent disease. It is not like melanoma, synovioma or breast cancer which you cannot pronounce cured after five years because of the constant possibility of latent metastasis. With gastric cancer, if the patient is to have a recurrence in the stomach, it usually is apparent within the first three years. If my patients live for three years after total gastrectomy, I do not guarantee a cure of course, but I can assure the families that there is an excellent chance that late or delayed metastases will never appear. This is true of gastric cancer more than of any other malignant neoplasm.

Gastric cancer is still a most serious problem, and the number of patients salvaged by these operations is not great enough to cause rejoicing.•

A Five-Year Survey of Primary Bone Tumors

R. D. Luther, M.D.
SPOKANE, WASHINGTON

All bone tumor admissions to Sacred Heart Hospital from January 1952 through December 1956 were reviewed. There were 79 primary tumors of bone subjected to surgery either for biopsy or for definitive surgical treatment. During this five year period, admissions to Sacred Heart numbered 112,265 cases, not including new births—a ratio of one bone tumor case for every 1,450 admissions. Fourteen of the tumor cases were proven malignant by biopsy (table 1). You can see that multiple myeloma was most frequent, followed by osteogenic sarcoma.

Table 1. Malignant Tumors.

Type	Cases
Chondrosarcoma	1
Fibrosarcoma (endosteal)	1
Multiple Myeloma	6
Osteogenic Sarcoma	4
Undifferentiated Cell Tumor (or rhabdomyosarcoma)	1
Reticulum Cell Sarcoma	1
Total	14

I am sure that there were many other myeloma cases admitted during these years that were not subjected to biopsy and therefore not included in this series.

There were 65 benign bone tumors included in the study and classified as shown in table 2. As you can see, osteochondromas were by far the most common benign tumor, followed next by osteomas, and then giant cell tumors.

Treatment

Benign tumors were treated by various accepted surgical methods, such as excision, curettage, or curettage and bone graft.

Table 2. Benign Tumors.

Type	Cases
Ademantinoma	2
Chondroma	4
Chondromyxoid Fibroma	1
Enchondroma	3
Eosinophelic Granuloma	4
Giant Cell Tumor	6
Non-Ossifying Fibroma	1
Ondontoma	1
Ossifying Fibroma	2
Osteoma	11
Osteochondroma	28
Osteoid Osteoma	2
Total	65

The aim of treatment of malignant tumors is ablation of the growth either by radical excision, where feasible, or by amputation. Generally speaking, the accepted level of amputation for malignant bone tumors is through the bone above the one affected by tumor. Coventry and Dahlin,[1] in reporting 430 cases of osteogenic sarcoma from the Mayo Clinic, stated that this principle had been followed with one modification. In sarcomata of the distal end of the femur most of their reported cases had the amputation through the upper part of the femur. They stated, though, that in recent years some of the cases had had disarticulation at the hip. Luck,[1] when discussing Coventry and Dahlin's paper, favored disarticulation of the hip when involvement of the lower end of the femur existed.

In this series of cases only one disarticulation of the hip was performed for involvement of the distal end of the femur; likewise, in this series neither hemipelvectomy or shoulder girdle disarticulation, as recommended by Pack,[2] was performed.

Cade,[3] and others, take such a pessimistic view that no surgery is recommended—only roentgen

Read before the Spokane Surgical Society Annual Meeting, Spokane, Washington, April 12, 1958.

therapy. Hatcher[1] of Chicago, in discussing Coventry and Dahlin's paper, stated that surgical ablation is preferable to irradiation. He questions the value of hip disarticulation over mid-thigh amputations.

Since early surgical removal is the most successful treatment at the present time, it must be instituted prior to lethal embolization. It is therefore essential to amputate as soon as possible after the correct diagnosis has been made. The problem then arises whether to depend on fresh frozen sections from the lesion or to wait until the pathologist has had time to prepare and study his permanent sections. Coventry and Dahlin[1] established their diagnoses by frozen sections and did immediate amputation. They applied two tourniquets, one above the tumor and one above the proposed site of amputation, thus precluding embolic dissemination by biopsy. Luck,[4] and others, do not depend on frozen section, feeling that certainty of diagnosis is of more importance than danger of embolization of tumor cells. Pack,[5] in a paper read at the American Orthopaedic Association meeting in 1951, made the following statement regarding sarcomata of the soft somatic tissues, but did not specifically mention bone malignancies: "If incisional biopsy is necessary, the following precautions should be observed: On an extremity a tourniquet is placed above the tumor. After the biopsy the tourniquet remains in place while frozen section is prepared and analyzed. If the tumor is benign or of low-grade malignancy, local excision or radical dissection is immediately completed. If the report classifies a lesion as a sarcoma with invasive propensities and the regional anatomy is not conducive to local radical removal, an amputation is done proximal to the tourniquet."

Prognosis

MacDonald and Budd,[6] in reviewing the registry of bone sarcomas in 1941, found 654 cases of tumors classified as osteogenic sarcoma that had been treated five years or more prior to their survey. They found 97 cases, or 14.8 per cent of this total, that were considered to be five year cures. Likewise, of 115 instances of tumors classified as chondro-sarcomas there were 21 five year survivals, or 11 per cent, giving a total of 118 five year survival cases of osteogenic sarcoma in the bone tumor registry as of that date. These 118 cases were carefully reviewed microscopically and 37 cases, or 31 per cent, were primarily of the fibroblastic type; 56, or 46 per cent, belonged to the chondroma series, and only 14, or 12 per cent, were true bone-producing sarcomas (table 3). They concluded that true osteosarcoma is almost uniformly fatal, chondrosarcoma is distinctly less malignant, and fibrosarcoma is in a median position.

Table 3. Relative Incidence of Types of Osteogenic Sarcoma.

Type	Cases	% 5-Year Survivals
Osteosarcoma	14	11.8
Chondrosarcoma	56	47.5
Fibrosarcoma	37	31.4
Others	11	9.3
Total	118	100.0

In this series of 14 malignant cases some did not have a five year follow-up; briefly, though, all four patients with osteogenic sarcomas are deceased, as is the one who had a fibrosarcoma. The patient with chondrosarcoma was well at two years. The patient with undifferentiated cell tumor (possible rhabdomyosarcoma) was dead. The multiple myeloma cases were not investigated.

Summary

1. Most benign bone tumors are treated adequately by local excision, although a few do require curettage and bone graft.

2. The most common primary malignant bone tumor is multiple myeloma.

3. Osteogenic sarcoma is the most frequently seen malignant bone tumor that is amenable to surgery, whereas Ewing's is the least common and has the poorest prognosis (tables 3 and 4).

Table 4. Survival Rates for Osteogenic Sarcoma.

Author	Cases	% 5-Year Survival
Lichtenstein[7]	25	8.0
Coley[8]	265	21.9
Geschickter & Copeland[9]	268	18.5
Coventry & Dahlin[1]	430	19.3

4. Fibrosarcoma and chondrosarcoma, with adequate surgery, have a much higher rate of survival at five years than does osteosarcoma or Ewing's tumor (tables 5, 6 and 7).

Table 5. Survival Rates for Ewing's Sarcoma.

Author	Cases	% 5-Year Survival
McCormack, Dockerty & Ghormley[10]	80	12.1
Lichtenstein & Jaffe[11]	17	0
Coley, Higinbotham & Bowden[12]	91	4.1
Tracey, Brindley & Murray[13]	8	0

Table 6. Survival Rates for Chondrosarcoma.

Author	Cases	% 5-Year Survival
O'Neal, Ackerman[14]	28	21.4
Tracey, Brindley & Murray[13]	7	42.9

Table 7. Survival Rates for Fibrosarcoma.

Author	Cases	% 5-Year Survival
Batts[15]	25	40.0
Tracey, Brindley & Murray[13]	5	33.0
Gilmer & MacEwen[16]	22	26.3

Conclusion

The frequent failure of amputation to achieve a long-term survival of the patient, to quote Pack, "is attributed to two factors, the inherent natural history of the cancer, and procrastination in performing the major amputation." Perhaps better results could have been achieved in these cases had more radical amputation been performed. •

Death of a Colony

Job Harriman, noted lawyer, was an ardent socialist, and he tried to promote at least two communal colonies. One colony planted in Antelope Valley, in the barren country north of Los Angeles, failed for good reasons. Along in the early twenties, Mr. Harriman bought the Ramona Ranch in Riverside County. Job Harriman's Ramona Rancho communal experiment failed. It failed because something in man rebels, and finally dies, when his personality and individuality is taken from him, and he's merged into "the group." We have a right and a sacred obligation to be ourselves, to work out our own destiny, and to see the total result of our effort. Man wants to be able to stand back and say: "This I have done." The experiment failed for other reasons, any one of which would have doomed it from the start.

By Mr. Vollie Tripp in The Freeman, March 1958, Vol. 8, pp. 27 and 31.

The Quandary of Laryngopharyngeal Cancer

Cornelius E. Hagan, Jr., M.D.
SPOKANE, WASHINGTON

The Funk and Wagnalls Standard Dictionary defines *quandary* as a state of hesitation or perplexity; predicament. Certainly the patient with laryngopharyngeal cancer fits such a description perfectly. Our job, as doctors, is to banish the hesitation and perplexity and do everything possible to extract the patient from his predicament.

With the advent of newer surgical techniques, antibiotics and supplies of banked blood we are gradually increasing the range of curative surgery in laryngopharyngeal cancer. With a wider knowledge of these procedures and the resultant greater chance for cure, much of the hesitation and perplexity of the past should disappear. I fear that some of the hesitation and perplexity stemmed from attempts at rigid classification of the various lesions according to the point of origin. While such classifications may still serve a purpose, it was and still is impossible to determine the point of origin of the cancer in many cases.

If we consider for a minute the anatomy of the region under discussion we can see that many areas are closely approximated. To talk of cancer of the ariepiglottic fold, the epiglottis, the piriform recess, the ventricular band and of the post-cricoid region may at times call for very fine discrimination, and all too frequently by the time the patient presents himself for diagnosis more than one of these locations may be involved. Therefore, consideration of the individual case on the basis of surgical resectibility seems more logical and justified. At least some authors have begun to divide these cases into those in which,

1. The cancer can be resected *without* removal of the larynx. 2. The cancer can be resected *with* the removal of the larynx.

The following very brief description of cases illustrates some of the problems:

Case 1

When first seen in May 1948, this woman, age 58, complained of a lump in the throat that moved down when she swallowed and then gradually came up again. When she lay on her left side she did not feel the lump. The lump had been present for some period of time but had become worse in the month before examination.

Biopsy on May 4, 1948, from a large mass attached to the right post-cricoid region, was reported as squamous cell carcinoma.

Operation was performed on May 14, 1948 under a combination of local and Pentothal anesthesia. The larynx and a portion of the adjacent pharynx were removed. Because of the presence of a suspicious lesion on the posterior wall of the esophagus (Fig. 1), about ¾ of an inch of the esophagus was removed. (This area was later reported to be leukoplakia.) The posterior

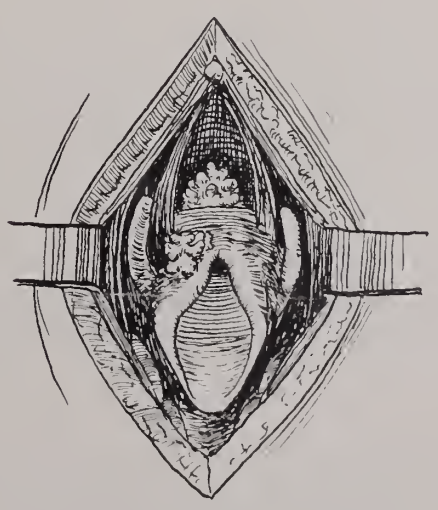

Fig. 1. Case 1—Post-cricoid and esophageal mass as seen at operation.

Read before annual meeting of Spokane Surgical Society, Spokane, Wash., April 12, 1958.

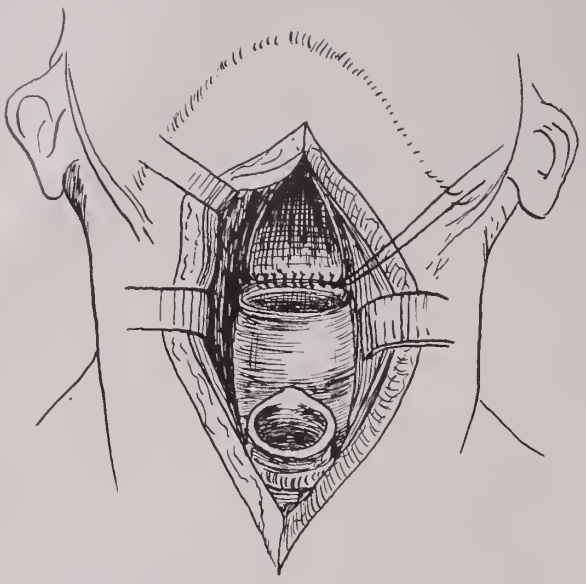

Fig. 2. Case 1—Approximation of pharyngeal mucosa and esophageal stump.

esophagus was mobilized and the edges approximated (Fig. 2). The wound was converted into an open pharyngostomy by approximation of the skin to the mucosal edges (Fig. 3). Approximately three weeks later the pharyngostomy was closed by a barndoor flap and a sliding flap to cover it (Fig. 4). In actual practice the amount of skin turned over was much less than here shown in the artist's sketch.

Five years later this patient was alive and well.

Case 2

In April, 1949, a man of 82 came to the office with a story of having been hoarse for a period of one year. He had used various types of gargles and throat troches, and had seen a couple of doctors for sore throat. On direct questioning he stated that there was some soreness but, as it had never prevented him from eating, he did not think it amounted to much.

Mirror examination disclosed a large mass on the posterior surface of the epiglottis, extending down the ariepiglottic fold (Fig. 5). The biopsy was reported as squamous cell carcinoma.

At the time of operation on April 12, 1949, the entire larynx with the epiglottis and a large portion of the lateral pharyngeal wall were removed. A pharyngostomy was formed in the upper lateral portion of the wound, the remainder of the wound being closed so as to form the smallest pharyngostomy possible without undue tension of the approximated tissues. Closure of the pharyngostomy was delayed because of a slough along the skin mucosal junction on one side. This was watched and when the area had completely epithelized, closure was effected in a manner similar to that employed in the previous case.

Four years and three months later the patient died. He had worked up until three months before he died. Death was ascribed to pneumonia, but the patient had a local recurrence at the time of his death. Question: "What is the life expectancy of an 82 year old patient?"

Case 3

A man, age 73, was first seen in October, 1952 at the request of his physician who had discovered an ulcerated area in the left piriform recess and fullness of the ariepiglottic fold (Fig. 6). The patient complained of difficulty in swallowing for "a couple of weeks." Extent of the lesion indicated that the process had been going on for some time prior to this, but probably had given no trouble until the ulceration had taken place. The biopsy was reported as squamous cell carcinoma.

On October 7, 1952, under a combination of local and Pentothal anesthesia a lateral pharyngotomy was performed. The exposure included removal of the left half of the hyoid and a portion of the left lateral shield of the thyroid cartilage. Upon opening the pharynx the mass could be well defined and it was removed with an adequate margin in all areas except in the area of the arytenoid cartilage where the pathologist said there might be some question. The arytnoid was therefore removed. Delayed closure was considered, but mobilization of the posterior pharyngeal wall allowed for primary closure of the mucosa and obliteration of the left piriform recess. The patient was referred for radiation therapy postoperatively.

The patient is alive and well today—over five years later.

Case 4

A man, age 45, when first seen in November 1952, stated he had been having some difficulty in swallowing for about 3 months. At first he only gagged a little and later there were certain foods that seemed to hurt when

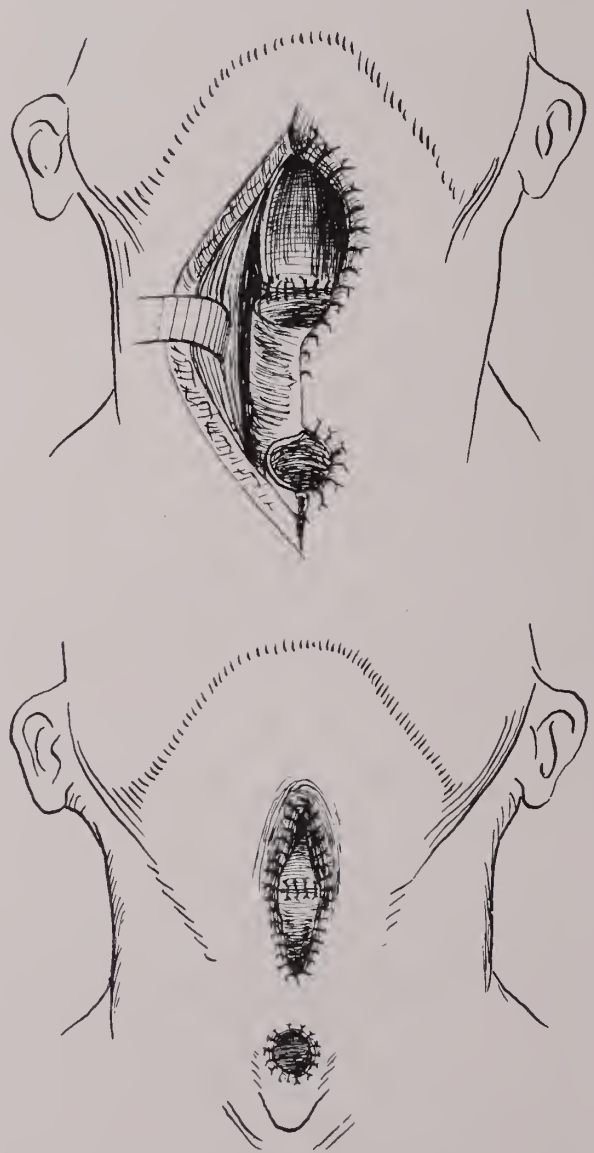

Fig. 3. Formation of the pharyngostomy.

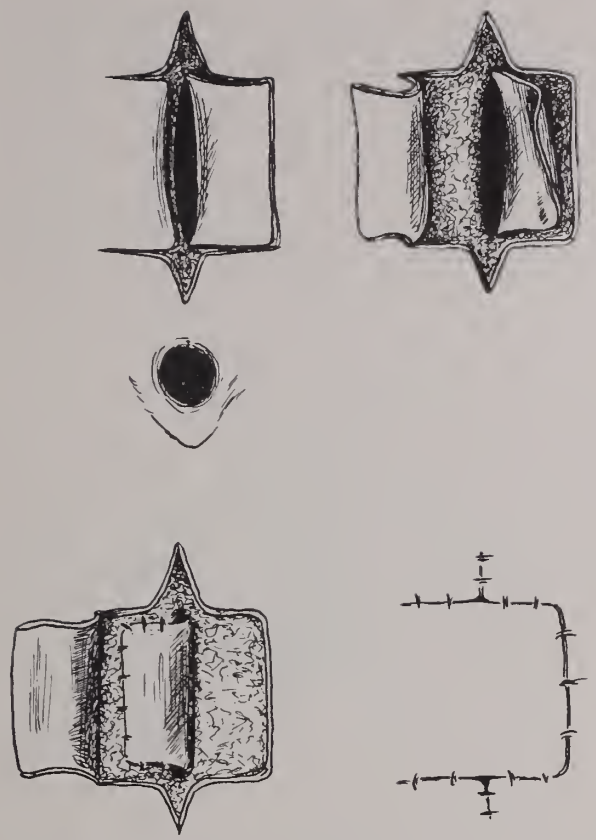

Fig. 4. Closure of the pharyngostomy.

they went down. For the three weeks immediately prior to his visit, the difficulty had rapidly become worse and at the time of examination he said he could not swallow water.

Mirror examination showed a large mass in the left piriform recess. X-rays showed a marked displacement of the larynx.

Direct laryngoscopy was performed and a large biopsy was obtained—actually the main portion of a pedunculated tumor was engaged in an electro-coagulating type snare and the dangling portion of the mass was removed. The entire mass proved to be squamous cell carcinoma.

The original plan was to do a lateral pharyngotomy coupled with radical neck dissection. Dissection proceeded without incident until the moment when it was necessary to determine the amount of lateral pharyngeal wall to be included in the dissection. Then it was found that invasion of the cricoid cartilage was so great as to preclude any attempt to save the larynx. It was necessary to remove the larynx. This complicated the closure, but initial closure was performed in such a way as to leave only a small lateral pharyngostomy. After a period of about three weeks the lateral pharyngostomy was closed using a combination of turned and sliding flaps.

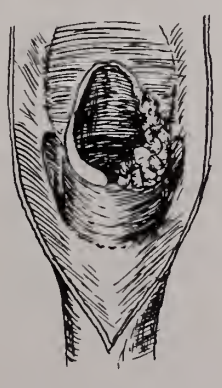

Fig. 5. Involvement found in case 2.

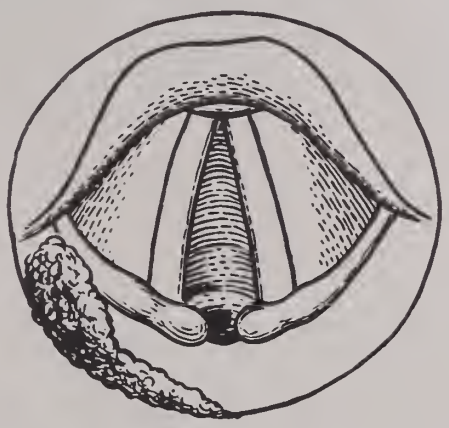

Fig. 6. Involvement found in case 3 (ulceration not shown).

Except for growing excessive hair within the reformed esophagus and the necessity for an occasional esophagoscopy and a "hair cut" the patient had no difficulty until November 1954. at which time he returned with a sore on the tongue (Fig. 7). He had tried various antibiotics for a period of three weeks, including "a couple of shots of penicillin," but had had no improvement. Biopsy showed the lesion to be squamous cell carcinoma. While it was on the same side as the original lesion in the laryngopharynx it was considered to be a primary lesion and one which might well be treated by radiation. He was referred for such treatment. In February, 1955, he returned say the sore was still present (Fig. 8). Biopsy again showed squamous cell carcinoma. Resection of the lesion was urged.

He declined—preferring to go to a "cancer clinic" in the mid-west. I am happy to say they convinced him that resection should be done. When last heard from in December, 1957, the patient was alive and working.

Case 5

A man, age 56, was first seen in October, 1953, with a history of having had a bad cold in March of the same year. The cold had been treated with penicillin. It was stated that he had a severe penicillin reaction from which it took about two months for him to recover. After his recovery he continued to have a "frog" in his throat. At the time of his visit the patient was still very hoarse and said he had a little discomfort on swallowing.

Mirror examination disclosed a granular, reddish mass that appeared to involve the right ventricular band and the vocal cord, extending from the anterior commissure back to and including the arytenoid (Fig. 9).

Two days later, direct laryngoscopy was performed and a biopsy specimen obtained. It was reported as squamous cell carcinoma.

The patient resisted the idea of a laryngectomy, but after a full explanation of the fact that he could learn to talk again or use one of the artificial larynxes, and a promise that we would do everything we could to save a portion of the larynx (if possible), he consented to surgery.

At the time of surgery it was considered possible to remove the entire mass by means of a hemilaryngectomy.

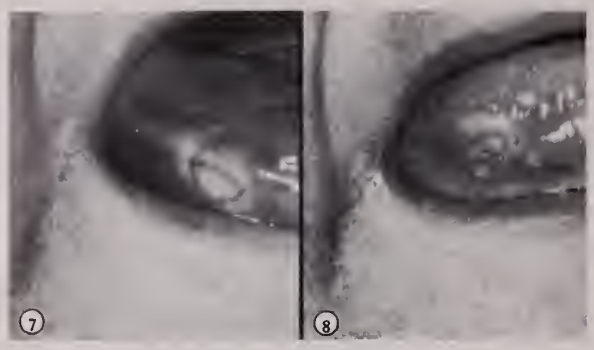

Fig. 7. Case 4—Tongue lesion before radiation therapy.
Fig. 8. Tongue after radiation therapy.

This necessitated rearrangement of the pharyngeal musculature and mucosa.

The postoperative course was attended by some difficulty in learning to swallow. However, at the end of nine days the patient was discharged from the hospital to home care.

The patient has had occasional bouts of allergic rhinitis but has experienced no difficulty from the reduced airway. He has found the alteration in his voice no disability. When last seen, less than one month ago, there was no evidence of recurrence and the patient is carrying on his daily chores as a farmer.

Discussion

Early diagnosis of cancer is still the key that will make the cure of cancer more certain. However, we need to spread the knowledge that prompt, aggressive surgical treatment, individualized for the particular case, offers a reasonable chance of cure. This program should result in:

1. Dimunition in the attitude of hopelessness frequently experienced by both doctors and patient in these cases. 2. Make unnecessary the inclusion of such statements as appeared in the monograph of The American Cancer Society, entitled Cancer of The Head and Neck: "In a large series of cases in one head and neck clinic the five-year cure rate following radiation therapy for pharyngeal wall cancer is about 6 per cent when all patients (in all stages of the disease) are included." As doctors, we must think in terms of possible cure first and consider palliative treatment only when all possible methods that might result in a cure have been carefully considered and eliminated.

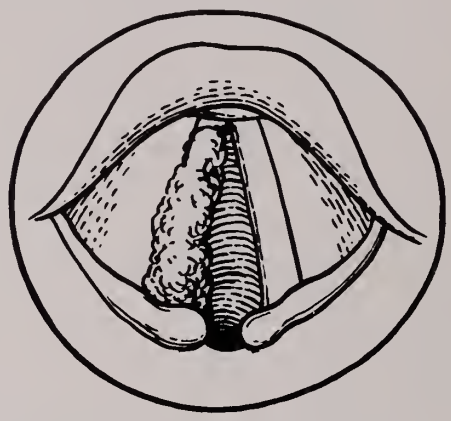

Fig. 9. Involvement found in case 5.

Summary

Surgical resectability of laryngopharyngeal tumors is not only feasible but, until newer and improved methods for the treatment of cancer come along, offers today the best chance of obtaining a cure in many of the cases of laryngopharyngeal cancer now being seen. A timid, hesitant, or hopeless attitude is to be condemned.•

Malignant Tumors of the Jejunum and Ileum

Everett B. Coulter, M.D.
SPOKANE, WASHINGTON

Malignant tumors of the small intestine are encountered infrequently in the practice of surgery. They constitute 3 per cent of all gastrointestinal malignancies, with carcinoma being twice as frequent as sarcoma. This study was undertaken to collect and analyze the malignancies found at surgery in Spokane hospitals during the past several years. The review is limited to tumors distal to the ligament of Treitz.

The symptoms of small bowel malignancy are usually vague. Intermittant cramp-like pain is an early symptom and as the disease progresses the pain becomes more constant and is sometimes accompanied by nausea and vomiting. Another early symptom is unexplained anemia. In later stages of the disease, one may have gross hemorrhage. Other symptoms listed in the literature are weakness, fatigability, diarrhea or constipation, anorexia, flatulence and loss of weight. Perforation is not common.

Physical findings of the disease are few. A palpable mass is usually not found until late in the disease, when the tumor has increased in size and the patient has lost weight. In many of these cases no diagnosis is made until the tumor occludes the lumen and the patient is explored for bowel obstruction. In many cases the tumor grows outward into the mesentary and does not obstruct the lumen of the bowel until late in the disease.

Roentgen examination offers a high ratio of pre-operative diagnoses of small bowel tumor when the radiologist's attention is directed specifically to the small bowel, but the diagnosis is often missed by the radiologist on routine gastrointestinal x-rays. Kirklin states that 90 per cent of small bowel lesions may be suspected on the basis of adequate x-ray examination.[1] Roentgen criteria for diagnosis include filling defect at site of the lesion, alteration or obliteration of the mucosa at site of the lesion, and distention of the bowel proximal to the lesion. Lesions of the lower ileum may be revealed by reflux through the ileocecal valve during a barium enema.

The pathology has been classified as carcinoma—which is divided into adenocarcinomas and carcinoid tumors—and sarcomas which are divided into leiomyosarcoma and lymphosarcoma.[2] The carcinoids are similar in appearance to carcinoids of the appendix. Prognosis is worse and the possibility of recurrence is more likely. Carcinoid tumors are very low grade, but in from 20 to 50 per cent of cases they metastasize to regional lymph nodes and the liver.

The diagnosis of small bowel malignancies is not easily made and one must consider, in differential diagnosis, Meckel's diverticulum, simple ulcer, tuberculosis, and regional enteritis. Peptic ulcer, cholecystitis, appendicitis, ulcerative colitis and malignancy of the colon or stomach—all present fairly characteristic clinical pictures and seldom should be confused with small bowel malignancies.

Sixteen cases of small bowel malignancy were collected. There were 8 cases of carcinoma and 8 cases of sarcoma as classified in table 1.

Table 1. Pathology.

	Cases
I. Carcinoma	
Adenocarcinoma	3
Carcinoid	4
Squamous cell carcinoma	1
Total	8
II. Sarcoma	
Sarcoma—unclassified	1
Lymphosarcoma	4
Leiomyosarcoma	3
Total	8

Read before the Spokane Surgical Society Annual Meeting, Spokane, Washington, April 12, 1958.

The most prominent symptoms were nausea and vomiting, pain, diarrhea or constipation, and weakness. The frequency of these symptoms is shown in table 2.

Table 2. Symptoms in Sixteen Cases.

	Cases
Nausea and vomiting	9
Pain	7
Diarrhea and constipation	3
Weakness	2

The physical findings were not remarkable and were rather vague as recorded on these charts. There was a palpable mass in 3 of the 16 cases. There was some anemia in 10 of the 16 cases when first admitted to the hospital and anemia was severe (below 50 per cent) in 4 of these cases. X-ray examination was made of the gastrointestinal tract in 14 of the 16 cases. A positive x-ray diagnosis of tumor of the small bowel was made in 3 of 14 cases. X-rays were not done in 2 cases—one had a palpable tumor and the other was explored in the process of repairing a ventral hernia. A positive pre-operative diagnosis of small bowel tumor was made in 5 of the 16 cases. The pre-operative diagnosis in 11 cases was other than small bowel tumor as listed in table 3.

Table 3. Pre-Operative Diagnosis.

	Cases
Small bowel tumor	5
Bowel obstruction	4
Duodenal ulcer	3
Gallbladder disease	2
Small bowel fistula	1
Hiatus hernia	1
Total	16

All 16 cases were taken to surgery where the tumor was removed or a biopsy was done to establish the diagnosis. In the 8 cases of sarcoma no metastasis was noted. In 8 cases of carcinoma, spread of the tumor was noted in 5 cases—to the liver in 4 cases and to the lymph nodes in 1 case. There was spread in 3 of 4 cases of carcinoids, the spread being to the liver in each case. The operative procedure was a resection of the small bowel in 14 cases, enteroanastomosis in 1 case and biopsy only in 1 case.

The results with surgery in this collection of primary small bowel tumors leave something to be desired. In the first six months 8 patients died and 1 patient was living with metastasis. In the 6 to 12 month period 1 patient died and 1 patient was living and well. In the period of one to two years there was 1 death and 1 patient living with metastasis. There were 3 patients living more than two years after surgery; two of these were living and well six years following surgery and one patient was living with metastasis 8 years after surgery.

Table 4. Results of Surgery.

	Postoperative Period	
	Dead	Living
1-6 months	8	1
6-12 months	1	1
1-2 years	1	1
Over 2 years	0	3
Total	10	6

Conclusion

Sixteen cases of primary malignancy of the small bowel have been reviewed with symptoms and physical findings. X-rays were positive in only 3 of 14 cases and the diagnosis was made pre-operatively in only 5 of the 16 cases. The results of surgery are tabulated with only 3 patients alive two years postoperatively and one of these is living with liver metastasis. The diagnosis is difficult and, unfortunately, usually made late in small bowel malignancy. The surgical results are disappointing. Fortunately the disease is uncommon in surgical practice and does not often present a problem. •

Surgical Treatment of Oral Carcinoma

David E. Sullivan, M.D.
SPOKANE, WASHINGTON

Early in the present century, surgical excision of malignancies about the mouth and jaws was popularized by Butlin and other surgeons. However, mortality rates were high and many patients were left with gross deformities or impaired function. Consequently, surgical treatment of malignancies in this area fell into disuse and was largely replaced by radiation therapy. This trend was enhanced by various technical improvements in radiation technique, including the development and standardization of interstitial radon, improved intraoral cones, fractionating dosages, and more recently the development of super-voltage therapy machines, radiocobalt units and low-intensity radium needles. In more recent years the trend has again reversed itself. There is very definitely at present a revival of interest in surgical treatment. Improvements in endotracheal anesthesia, blood replacement, recovery wards, antibiotics, improved techniques and results of reconstruction have made the difference. All contribute to increased survival and improved function and appearance.

This situation is true of the country as a whole. It is not true of our own particular area. We are still behind the times in taking advantage of recent advances in surgical treatment of oral carcinoma. In this particular locality the vast majority of malignancies of the mouth and jaws are still being treated exclusively by radiation. Explanation for this lies in the fact that general practitioners, internists and dentists who first see most of these lesions have been schooled to refer them to radiologists for treatment. It is my strong conviction that members of the medical and dental professions should be made aware of the tremendous strides being made at present in curing oral cancer patients through surgery, and this without making them oral cripples or grotesque caricatures of human beings.

Radiation Therapy

It is only natural that radiologists stress the advantages and the more attractive features of radiation therapy of malignancies and have relatively little to say about the disadvantages. I should like to point out a few of these disadvantages.

Radiation is essentially a harmful, in fact destructive, form of energy. If sufficient dosage could be given, and limited sharply to the zone of the malignant tissue, we would all be happy to forget surgery and turn all malignancy patients over to the radiologists. Unfortunately this happy situation has not been achieved. Many tumors are notoriously radio-resistant, requiring huge dosage before the cells succumb to radiant energy. Other tumors, while radio-sensitive at first, rapidly develop radio-resistance during one or more courses of therapy. Despite constant efforts to reduce it to a minimum, damage to the surrounding normal tissues continues to be the major disadvantage of radiation therapy.

Most institutions report very low cure rates in advanced cases of oral carcinoma treated by radiation, particularly when the carcinoma has invaded bone. Most workers in this field agree that it is practically impossible to sterilize carcinoma in bone without causing osteoradionecrosis. Incidentally, x-ray evidence of invasion of bone by carcinoma is a late sign. Therefore a negative x-ray report is of little help in deciding whether or not bone has been invaded by nearby carcinoma.

Previous heavy radiation therapy, with its attendant destructive change in normal tissues, greatly complicates later surgical excision, to say nothing of reconstruction. Persistence or recurrence of malignancy following a full course of radiation should certainly signal the need for changing to surgical attack on the tumor, rather than stubbornly persisting with still more radiation.

We are beginning to hear of less common late complications of radiation therapy—e.g., radiation myelitis of the cervical spinal cord following intensive therapy of malignancies about the mouth and neck.

Despite all the foregoing no one can deny that radiation therapy does have a place in treatment of oral malignancies. It must be the method of choice for patients who refuse surgery or whose

Read before annual meeting of Spokane Surgical Society, Spokane, Wash., April 12, 1958.

general condition does not permit surgery. It remains a valuable tool in attacking malignancies in the less accessible areas, such as the base of the tongue and the hypopharynx. In the form of palliation there is no question that it often can prolong life and make patients comfortable for many months even though they are incurable. The point I am making is that radiation should not be the initial treatment in all, or even the majority, of malignant lesions of the oral cavity.

Surgical Excision

Wider local resection is the one change that offers most in the way of increased cures of oral malignancies. This is borne out by increasing numbers of favorable reports from various teaching centers. Hayes Martin, of the Memorial Center in New York, attributes to increased use of surgery the fact that cure rate in cancer in the floor of the mouth has risen to 40 per cent from 20 per cent in 1935. Reporting at a recent meeting of the American Cancer Society on 379 cases of cancer of the floor of the mouth treated at Memorial Hospital between 1934 and 1950, Martin stated there has been a marked trend at that institution away from radiation toward surgical management with higher cure rates, reduced suffering, and savings in both time and money. John Blady of Temple University, and Milton T. Edgerton, at Johns Hopkins, state that overall chance of survival in cancer of the oral cavity has increased from 25 per cent 20 years ago to 50 per cent at the present time.

Where applicable, combined resection of the oral tumor in continuity with the lymphatic drainage area, taking a portion of the mandible if necessary, offers the prospect of improved cure rates. These cure rates are slowly but steadily rising, while at the same time morbidity is being reduced.

Very few will argue with the claim that surgery is the only treatment to be seriously considered in the management of metastases to cervical lymph nodes. The present trend appears to be away from prophylactic neck dissections and toward therapeutic neck dissections. However, Slaughter and others continue to present arguments which strongly support prophylactic neck dissections. Certainly if the neck must be entered to permit complete excision of the primary lesion, a neck dissection should be added to the procedure. Radical neck dissection should really be radical, proceeding along the lines advocated by George W. Crile, a method which you all know. While speaking of neck dissections, I might mention one example of recent extension of limits of operability. Metastatic nodes adherent to the common or internal carotid artery formerly made a case inoperable. This is no longer true due to development and introduction of blood vessel grafts.

Reconstruction

One of the more encouraging aspects of modern treatment of oral cancer is in the field of reconstruction. End result of surgical treatment of oral cancer no longer need be mutilation and crippling. The trend is toward primary reconstruction completed, or at least started, at the time of initial resection. Exposure is optimal at this time. Contractures, distortion of tissues and fistulas, can often be prevented completely, thus avoiding secondary procedures and prolonged hospitalization. Increased understanding and application of the techniques of immediate reconstruction will encourage the tumor surgeon to extend his local resection. At the same time, application of immediate reconstruction will reduce both functional impairment and visible deformity.

In the final analysis there is one rule that none of us should forget—namely, that the person who first provides definitive treatment to a victim of cancer has the golden opportunity to cure that patient. Never again will the chance of cure be so favorable, regardless of whether the treatment administered be surgical excision, radiation or cancer paste. Therefore it behooves the practitioner who provides initial treatment to be certain that he is utilizing the best form of treatment for the particular case at hand, and is administering it in the wisest, most thorough manner possible.

Summary

In the past, radiation therapy has been favored over surgical excision in the treatment of malignancies of the oral cavity. This situation still obtains in our own community. However, there is now a definite trend toward wide local resection of the oral tumor, combined with immediate reconstruction. This change is made possible by improved anesthetic techniques, blood replacement, improved postoperative care and antibiotics. Better results are continually being reported in the form of increased cure rates, reduced morbidity and minimal impairment of both function and appearance.•

Relieves *Distress* *in* *smooth* *muscle* *spasm*

new

Pro-Banthine® *with* Dartal®

– for positive relief of cholinergic spasm.

– a new and safer agent for normalizing emotions.

PRO-BANTHINE WITH DARTAL offers you a new, specific and reliable control of visceral motor disorders, especially when these disorders are induced or aggravated by psychic tensions or anxiety.

Pro-Banthine has won wide clinical acceptance as the most effective drug for controlling gastrointestinal hypermotility and hypersecretion.

Dartal, a new phenothiazine congener, offers greater safety, flexibility and effectiveness in stabilizing emotional agitation.

The combination of each drug in fully effective doses in Pro-Banthine with Dartal gives a new means of approach to the medical management of functional gastrointestinal disorders mediated by the parasympathetic nervous system.

Specific Clinical Applications: Functional gastrointestinal disturbances, gastritis, pylorospasm, peptic ulcer, spastic colon (irritable bowel), biliary dyskinesia.

Dosage: One tablet three times a day.

Availability: Aqua-colored tablets containing 15 mg. of Pro-Banthine (brand of propantheline bromide) and 5 mg. of Dartal (brand of thiopropazate dihydrochloride).

Mazola® Corn Oil...a palatable food effective in the management and control of serum cholesterol levels

Extensive clinical tests show that when the diet contains an adequate amount of Mazola Corn Oil, serum cholesterol levels tend to be normal... high blood cholesterol levels are lowered, normal levels maintained.

Fortunately for both physician and patient, Mazola Corn Oil is not only rich in unsaturated fatty acids, it is also a delicious food. It becomes an enjoyable and normal part of the patient's daily meals—no complicated or special diet is required.

Here is a therapy easy for you to prescribe, easy and pleasant for your patients to follow.

Nutritional authorities generally recommend that fats should provide no more than 30% of the total calories. In cholesterol-lowering diets from one-third to one-half of these fats should be unsaturated, such as in Mazola Corn Oil.

IN COOKING OR SALADS

Mazola Corn Oil is a superlative cooking oil as well as a delicious salad oil. Adequate amounts can be eaten daily—in a wide variety of salad dressings and in a great number of fried and baked foods.

MOST EFFECTIVE

Pure, clear, bland and odorless. Mazola Corn Oil is stable and dependable, providing the full measure of cholesterol-lowering unsaturated fatty acids characteristic of corn oil.

ECONOMICAL

Mazola Corn Oil is sold in grocery stores throughout the country, is available everywhere. Its comparatively low cost makes it as economical as it is effective.

CORN PRODUCTS REFINING COMPANY

MAZOLA* CORN OIL is a rich source of unsaturated fatty acids. It can form a regular part of the diet without major changes in eating habits to provide an effective unsaturated oil as a part of the daily meals.

EACH TABLESPOONFUL OF MAZOLA CORN OIL PROVIDES NOT LESS THAN:

Linoleic Acid	7.4 Gm.
Sitosterols	130 mg.
Natural Tocopherols	15 mg.

TYPICAL AMOUNTS PER DIET

For a 3600 calorie diet	3 tablespoonsful
For a 3000 calorie diet	2.5 tablespoonsful
For a 2000 calorie diet	1.5 tablespoonsful

WITHIN SECONDS...

TRĪVA RELIEVES VAGINITIS SYMPTOMS!

Your vaginitis patients get relief from intense itching, burning and other symptoms within seconds...after their first Trīva douche.

And within 12 days, most cases of trichomonal and non-specific vaginitis are rendered organism-free (Monilia genus may require longer). Trīva has been used to treat more than 350,000 cases of vaginitis in the past five years. Reasons: "seconds-fast" effectiveness and high rate of success. Administration: Douche, b.i.d., for 12 days. Supplied: Package of 24 individual 3 Gm. packets. Composition: 35% Alkyl Aryl sulfonate (wetting agent and detergent); .5% Disodium ethylene bis-iminodiacetate (chelating agent); 53% Sodium sulphate; 2% Oxyquinoline sulfate; 9.5% dispersant.

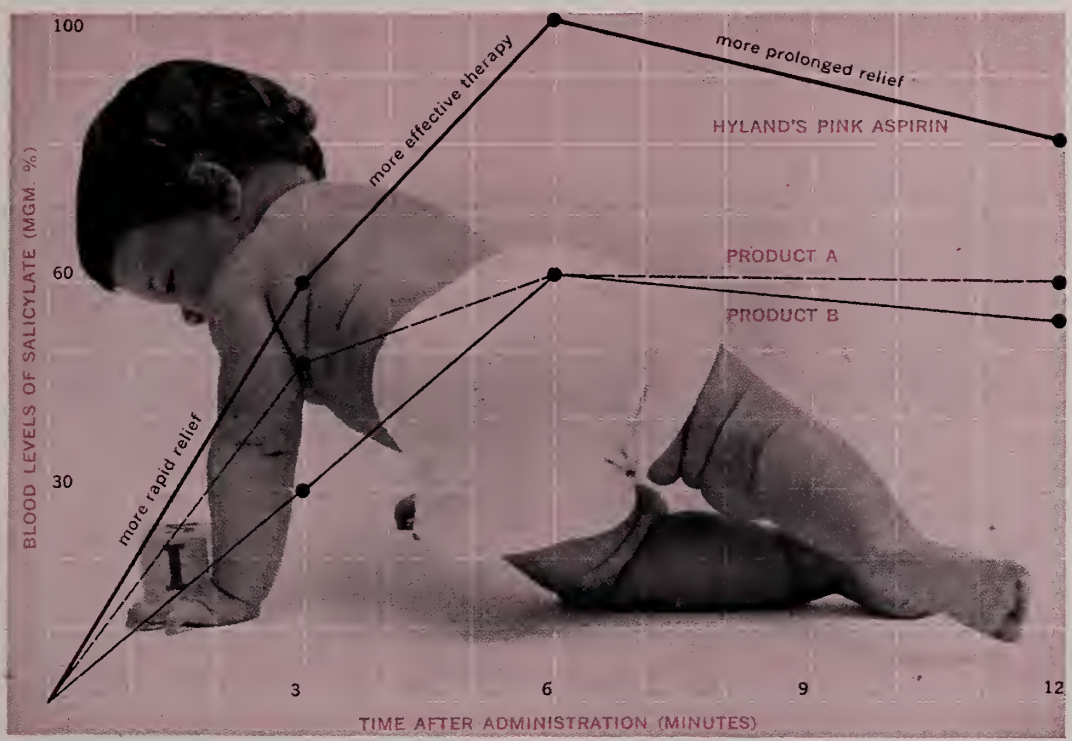
SINCE Haack 1908

HAACK LABORATORIES, INC. portland 1, oregon

Each Buff Scored Tablet Contains



Mephenesin NF . . . . . 6 grs.
Secobarbital Sodium USP . . . . . ½ gr.

Average adult dosage: 1 tablet every 4 hours, after meals. 1 to 2 tablets may be taken upon retiring.

Haxsen is supplied in bottles of 100 and 1000 tablets.

HYLAND'S PINK ASPIRIN FOR CHILDREN

Gives 27-56% higher blood levels of salicylate

THE ONLY ASPIRIN FORMULATED ESPECIALLY FOR INFANTS

In a recent test of three "infants' & children's" aspirin tablets*...results conclusively showed that Hyland's Pink Aspirin for Children produced blood levels of salicylate 27-56% higher than the other brands. • Here's why: Hyland's Pink Aspirin for Children is the only Triturate. Triturates, often used for injection, are absorbed more quickly...safely. Hyland's contains no starch or binder ...ingredients used in compressed tablets which retard assimilation. Controlled dosage for any age—no inaccurate breaking of adult-type tablets. • No "emotional trauma" for your infant patients...specify Hyland's Pink Aspirin for Children (they love the raspberry flavor)...the Triturate tablet that's specially formulated for them! *detailed report sent on request

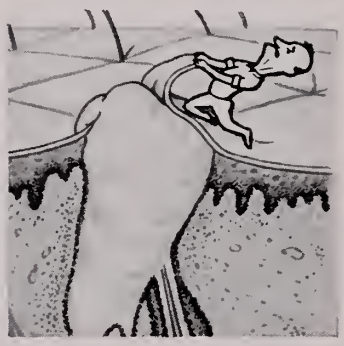
IN ACNE

Fostex® degreases the skin and helps remove blackheads



Fostex contains a combination of surface active agents (Sebulytic*) which:

◂ Completely emulsify excess oil so that it is quickly washed off the skin.

◂ Penetrate and soften comedones, unblocking the pores and facilitating removal of sebum plugs.

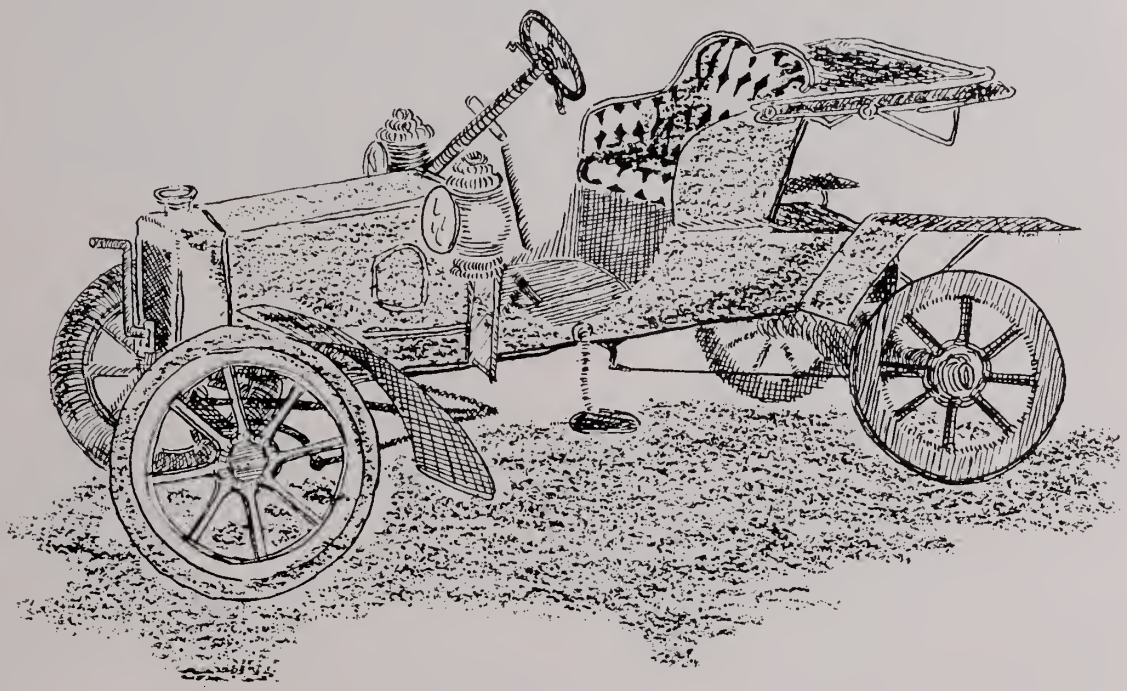
Fostex dries and peels the skin

◂ The Sebulytic base of Fostex dries and promotes peeling of the skin . . . actions enhanced by the keratolytic effects of micropulverized sulfur and salicylic acid.

*(Sodium lauryl sulfoacetate, sodium alkyl aryl polyether sulfonate, sodium dioctyl sulfosuccinate.)

FOSTEX CREAM
for therapeutic washing of skin in the initial phase of acne treatment, when maximum degreasing and peeling are desired.

FOSTEX CAKE
for maintenance therapy to keep skin dry and substantially free of comedones.



Fostex is easy for your patients to use

◂ Patients stop using soap on affected skin areas. Instead they use Fostex for therapeutic washing of the skin. The Fostex lather is massaged into the skin for 5 minutes—then rinse and dry.

Why Progress?

CHANCES ARE that if this car were new today it might serve the transportation needs of a portion of the community. Although the taunt of "Get a horse" might tend to produce a feeling of self-consciousness in the owner, he could still reply that it got him where he wanted to go. But such bare essentials could never satisfy the demands of our complex society today. Even the auto must keep pace with man's advancement toward perfection. This is progress. And it is more than a matter of tail fins and dual headlamps. It means a continual race to keep ahead of the ever expanding transportation field.

The true measure of progress is a yardstick composed of the height of man's dignity and the depth of his consideration for his fellows. It can be applied to his physical and mental health as well as to the car he drives. That is why an essential part of the Shadel operation is devoted to research into alcoholism. Caring for and treating those afflicted with alcoholism is meeting only the bare essentials which society requires. Progress demands that a cause be determined and a cure be developed. This, then, becomes the ultimate goal of Shadel Hospital.

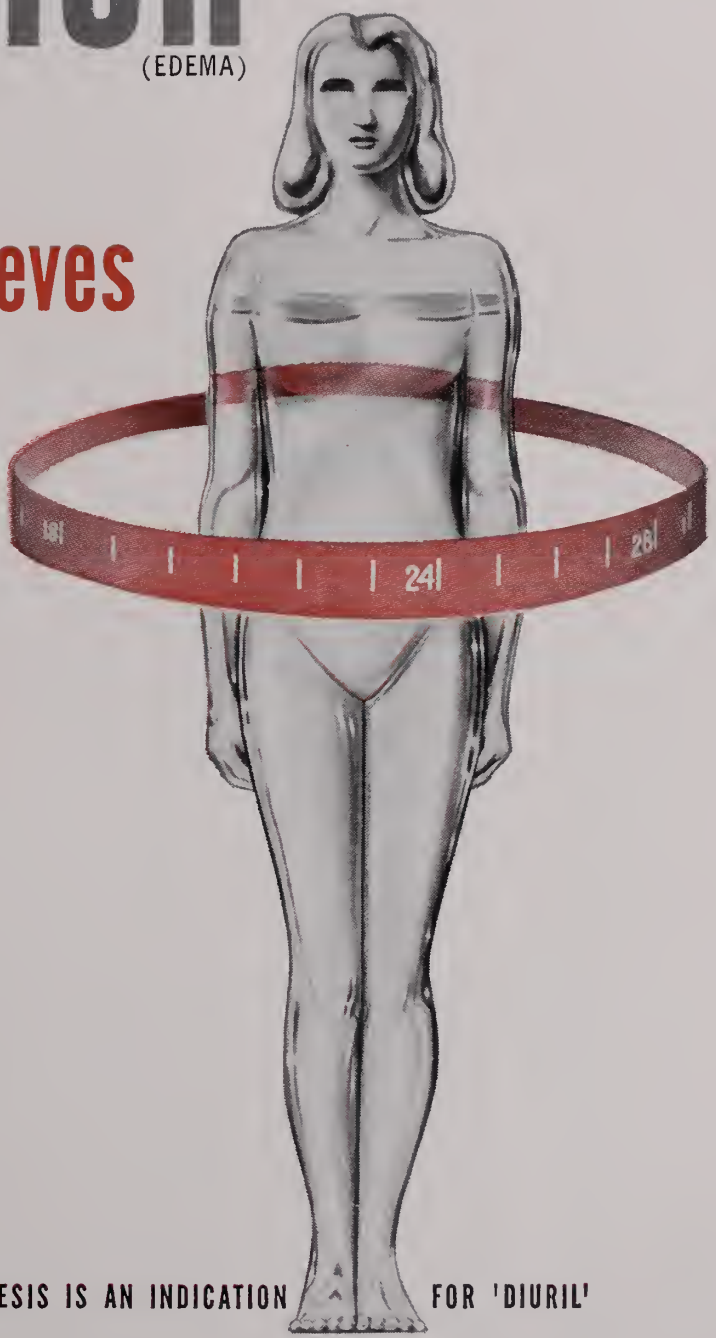
'DIURIL'

(CHLOROTHIAZIDE)

FORD, R. V., Rochelle, J.B.III, Handley, C. A., Moyer, J. H. and Spurr, C. L.: J.A.M.A. **166**:129, Jan. 11, 1958.

". . . in premenstrual edema, convenience of therapy points to the selection of chlorothiazide, since it is both potent and free from adverse electrolyte actions." In the vast majority of patients, 'DIURIL' relieves or prevents the fluid "build-up" of the premenstrual syndrome. The onset of relief often occurs within two hours following convenient, oral, once-a-day dosage. 'DIURIL' is well tolerated, does not interfere with hormonal balance and is continuously effective—even on continued daily administration.

DOSAGE: one 500 mg. tablet 'DIURIL' daily—beginning the first morning of symptoms and continuing until after onset of menses. For optimal therapy, dosage schedule should be adjusted to meet the needs of the individual patient.



SUPPLIED: 250 mg. and 500 mg. scored tablets 'DIURIL' (chlorothiazide); bottles of 100 and 1,000.

DIURIL is a trade-mark of Merck & Co., Inc.

ACHROMYCIN® V

Tetracycline and Citric Acid Lederle

A Decision of Physicians

When it comes to prescribing broad-spectrum antibiotics, physicians today most frequently specify ACHROMYCIN V.

The reason for this decided preference is simple.

For more than four years now, you and your colleagues have had many opportunities to observe and confirm the clinical efficacy of ACHROMYCIN tetracycline and, more recently, ACHROMYCIN V tetracycline and citric acid.

In patient after patient, in diseases caused by many invading organisms, ACHROMYCIN achieves prompt control of the infection—and with few significant side effects.

The next time your diagnosis calls for rapid antibiotic action, rely on ACHROMYCIN V—the choice of physicians in every field and specialty.

Oregon State Medical Society

September 3-5 1958
at Portland

Oregon State Medical Society

84th annual session

Sept. 3-5, 1958
Portland

Masonic Temple

Vern W. Miller, M.D., Salem

For the first time in many years the Society's Annual Session will be held early enough in the year to precede the hunting season and late enough to assure that most youngsters will have returned to school after the summer recess.

The Wednesday immediately following Labor Day was selected by your Council as the permanent opening day for our Annual Sessions when the meeting is held in Portland. Thus, the dates for the 1958 Session will be Wednesday, Thursday, Friday and Saturday, September 3-4-5-6.

A great deal has been said in previous years about the expansive postgraduate educational opportunities and the importance of the House of Delegates business meetings held during our one big medical conference. Efforts to single out these two activities may have resulted in a tendency to under-emphasize the high caliber of the Annual Session's growing scientific and technical exhibit section.

Scientific and technicol exhibitors were somewhot disappointed last year by o rother small physician visitation in the exhibit areo. This year some 70 technical ond 15 scientific exhibitors will bring displays to the Session. Their contribution represents a great deal of personal time and expense, and the excellence of these exhibits is worthy of your enthusiastic support.

The scientific and technical exhibits are just as much a port of the post-graduate educational aspects of our meeting as the lectures and ponel discussions presented at the scientific assembly.

Your Committee on Annual Session in cooperation with the Advisory Committee to the Sommer Memorial Lecture Fund is putting the finishing touches on another outstonding scientific program. As in the past the lectures will be presented in the Commondery Room on the second floor of the Masonic Temple. I might add that arrongements are being made to provide ample time during recess to visit the exhibit hall.

New and older members alike are invited to acquaint themselves with the business end of our Society affairs by attending daily breakfast sessions of the House of Delegotes which will be held in the Florentine Room of the Columbia Athletic Club, just o short walk from the Masonic Temple. Breakfast will be served at 7 A.M. on Wednesdoy, Thursday and Friday. You are invited to join the delegotes for breakfast or to just hove a cup of coffee and remain during deliberations of the House.

Something new has been added to the Society's annual dinner-dance which had a very successful debut last year. During the evening there will be a surprise announcement of Oregon's "Doctor of the Year." This progrom was inaugurated in 1957 by the Committee on Public Relotions and reached its climax at the Mid-Yeor Meeting that yeor when Archie D. McMurdo of Heppner was the first recipient of the award. When Oregon's "Doctor of the Year" is introduced we will be paying our respects to one of those among us who, through lasting contributions to civic improvement, has earned admiration and respect of fellow citizens for himself ond the profession.

While you ore participoting in the Society's scientific and business progrom, your wife will find the activities planned by the Woman's Auxiliary at the Hotel Multnomah to be filled with special events that ore sure to make her visit a most enjoyable one.

.As President of our fine Society it is my very pleasant responsibility to extend a sincere invitotion to oll members and wives and to our colleagues in the sister states of Idaho and Washington and the territory of Alaska to join us in Portlond on September 3-4-5-6 for the 84th Annual Session of the Oregon State Medical Society.

For the twenty-eighth time since 1941, Northwest physicians will have the appartunity af attending the outstanding lectures made possible through a fund left in perpetual endawment by the late Ernst August Sommer af Portland. Since 1948, twa series af the Sammer Memarial Lectures have been presented each year—the spring series which is given at the time of the University af Oregan Medical Schoal Alumni Associatian meeting and the fall series which is held in canjunction with the annual sessian of the State Society. Under the able guidance af the chairman and members of the Advisory Cammittee, pictured above, the current series has again been planned with thaughtful care to camply with Dr. Sommer's desire that discussions af problems arising in the general practice af medicine and surgery be presented. As envisianed by Dr. Sommer, the lecture series which bears his name does indeed serve mankind in advancing medical science.

GUEST SPEAKERS . . .

J. EDWIN WOOD, JR., M.D.

Charlottesville, Virginia
Professor of Medicine
University of Virginia Department of Medicine

1. Clinical Significance of Factors Influencing the Excretions of Salt and Water
2. Serum Glutamix Oxalo-Acetic Transaminase and Lactic Dehydrogenase Levels and Their Clinical Significance
3. Diet and Coronary Heart Disease

MICHAEL L. MASON, M.D.

Head, Department of Pediatrics
Tulane University of Louisiana School of Medicine

1. Prognosis for Meningitis in Infants
2. From the Mouth of Babes and Sucklings
3. Typical Facies and Postures

Annual Session Highlights

The Scientific Program at our Annual Session has become one of the Pacific Northwest's leading postgraduate education opportunities. Each year, in addition to our own members, many physicians from other states take advantage of our Session to visit Oregon. They come not only from our sister Western states but as well from numerous mid-west and eastern states. The Sommer Memorial Fund lecturers for this Session are of unusual excellence and will bring to us and our guests the newest advances in medicine and surgery.

The Exhibit will again include outstanding displays by firms serving our profession. On exhibit will be the latest drugs, instruments, modalities, books, office equipment and supplies and many other items vital to our practice. Equally noteworthy will be the scientific demonstrations of our own members. Do not miss this important part of the Session program.

The House of Delegates convenes each day of the Session beginning with breakfast at 7:00 A.M. in the Florentine Room of the Columbia Athletic Club. The House is the Society's major policy-forming body and all members of the Society are invited to attend and observe its deliberations on committee reports and many other matters of concern to the profession.

The Annual Banquet and Dance has become the social highlight of our Annual Sessions. The program is arranged so that nearly the entire evening can be devoted to the "light fantastic." So that our members and their guests may participate in the installation of our new President, this short but dignified ceremony will be conducted immediately following the dinner. The Banquet and Dance is scheduled for Thursday, September 4. Social Hour will be at 6:00 P.M. Dinner at 7—Installation of President at 8—and dancing at 8:30.

The Annual Oregon Medical Golf Tournament is to be held on Saturday morning, September 6, at 7:30, on the course of the Portland Golf Club. Be sure to get your handicap established and certified by your "pro." You will be asked for it with your entry blank.

Woman's Auxiliary to Oregon State Medical Society

Mrs. Merle Pennington, Sherwood
President, Woman's Auxiliary to OSMS

Business will be mixed with pleasure at the Annual Fall Planning Meeting of the Woman's Auxiliary ta the Oregon State Medical Society.

As in the past, the meeting will run cancurrently with the Annual Session of the State Society, which this year is being held in Portland on Wednesday, Thursday and Friday, September 3-4-5.

The Fall Planning Sessian offers the only oppartunity during each year when officers, cammittee chairmen and members from all compenent auxiliaries can exchange ideas and coordinate majar activities. Two activities expected ta be spatlighted during the sessian are Health Careers Harizons and support af the American Medical Education Foundatian.

Health Careers Horizons is designed to stimulate interest among qualified high school students to seek careers in medicine and ancillary fields such as x-ray, nursing and medical assistant.

Last year the Auxiliary made a major contribution ta the American Medical Education Faundation through the sale of Christmas cards. The Faundation, sponsored by the American Medical Association, receives cantributions to medical educatian from physicians throughout the United States and distributes the money "without strings" to approved medical schools. Donations may be made through AMEF to specific schools.

In addition ta the business meetings there will be a number of social events, and time for sightseeing and shapping.

The Background and Significance of Medical Ethics

HERMAN A. DICKEL, M.D.*
PORTLAND, OREGON

In arising to greet the new members of the Oregon State Medical Society and to comment on the background and the significance of medical ethics, one is at first inclined to feel a bit like apologizing for bringing up the subject of medical ethics at a time when an individual is but being initiated into this organization.

HERMAN A. DICKEL, M.D.

However, those of us who are in daily contact with the complexities and problems of organized medicine realize that it is most important, not only to pause to review the significance of medical ethics, but to spend a moment to look into the background that has led to the development of that code considered the very core of the medical profession—the truly last group who have significantly resisted every effort to reduce in status the codes we have lived by for almost longer than any major religious code.

In a recent issue of the *World Medical Association Newsletter* there was this following quotation: "A tough and unyielding barrier has been the pride in profession of a limited group who have made independence of government in their economic activities a political religion reminiscent of that of our Victorian grandfathers.

"This is an intended indictment of our profession expressed in an article by Professor J. Douglas Brown on The American Philosophy of Social Insurance and published in a recent issue of the *Bulletin of the International Social Security Association.*

"We think this is one of the most eloquent compliments ever tendered our profession. How rare today is such a thing as 'pride in profession!' How rare, too, is 'independence of government!' That our pride in our profession and our determination to be independent of government should be a fault in anyone's view is a sad commentary on the degree to which the world-wide drive to socialism has corrupted our sense of values.

"Let us keep up this 'tough and unyielding barrier'—by strengthening our county, state and national medical societies . . ."

With this sort of theme—a most thought-provoking note, I thought—I lead you on to comment on the background of medical ethics.

Characteristics of a Profession

Not too long ago it was necessary for me to speak before a group of nurses on What Constitutes a Profession and it was with pleasure that I read a quoted review by Professor Freeman Butts of Columbia University who has listed the following as characteristic of a profession.

1. Organization—full and complete organization within the group that completely serves all of the purposes of the group.
2. Mastery of a common body of knowledge and skills, and the mastery of which supervised study, learning and the practice have been attained on the university level.
3. Joint determination by the profession itself and the public it serves of the qualifications of those who may enter the profession.
4. Official recognition by the government.
5. Economic and social status sufficient to attract and hold persons with high intellectual and personal qualifications.
6. Effective working relationships with the group.
7. A Code of professional ethics.

It is noteworthy that the code that any profession is dedicated to follow is largely the one factor that determines the profession's significant status.

History of Medical Ethics

Some 2,100 years before the Birth of Christ, Hammurabi wrote out what is historically considered the original set of medical ethics. The then proud and revered leader of Babylonia verbalized for the first time the concept of the responsibility of the physician toward penal and civil acts. Those of you who have had an opportunity of reading these writings know the significance they have played through the years.

Hippocrates, three centuries before Christ, in less than 50 words established the foundation for all systems of ethics to follow and for all this intervening time no man and no writings of man have added to or subtracted from these tenets—

> **A physician should be an upright man, instructed in the art of healing, modest, sober, patient, prompt to do his whole duty without anxiety, pious without going so far as superstition, conducting himself with propriety in his profession and in the actions of his life.**

This has stood for 22 centuries!

In the 19th century medicine became of age, and in 1803, Thomas Percival had published his Principles of Medical Ethics, a most significant addition to the old field insofar as it interpreted the practice of medicine on a more modern basis than had been done previously.

In 1847 at the first real American Medical Association meeting, although this meeting had as its real objective medical education and the regulation of medical

(Continued on page 928)

Read at Second Annual New Member Institute, Oregon State Medical Society, Portland, Oregon, April 19, 1958.
*President-Elect, Oregon State Medical Society.

(Continued from page 927)

education for the practice of medicine, the founding fathers took time to write out the Code of Medical Ethics. It has been added to and subtracted from, at times, but nonetheless has remained for almost 110 years the foundation for the practice of medicine in the United States.

This first document had three chapters, namely:

a. Outlining the duties of physicians to their patients and of the obligations of patients to their physicians,
b. Outlining the duties of physicians to each other and to the profession at large, and
c. Outlining the duties of the profession to the public and the obligations of the public to the profession.

Actually, there was little change for a number of years, but in 1903 there was the elimination of the exclusive dogma clause which related to the voluntary professional association with cultists. Not until 1912 was this clause re-established. Then in 1934, one noted for the first time the inclusion of contract practice as it is used today in its present meaning. This was the first time that there was a real mentioning of some free choice of physicians, and not until 1937 was free choice of physicians actually defined.

Then, in 1947, there was revision of the language by which physicians will be compensated and in 1956, due to the pressures and the changes of society, and our economic and professional environment, the stage was set for the short abbreviated version of the Code of Ethics as adopted by the House of Delegates of the American Medical Association in June 1957.

AMA Principles of Medical Ethics

The Principles of Medical Ethics as adopted in June 1957 read as follows:

Preamble: These principles are intended to aid physicians individually and collectively in maintaining a high level of ethical conduct. They are not laws but standards by which a physician may determine the propriety of his conduct in his relationship with patients, with colleagues, with members of allied professions, and with the public.

Section 1—The principal objective of the medical profession is to render service to humanity with full respect for the dignity of man. Physicians should merit the confidence of patients entrusted to their care, rendering to each a full measure of service and devotion.

Section 2—Physicians should strive continually to improve medical knowledge and skill, and should make available to their patients and colleagues the benefits of their professional attainments.

Section 3—A physician should practice a method of healing founded on a scientific basis; and he should not voluntarily associate professionally with anyone who violates this principle.

Section 4—The medical profession should safeguard the public and itself against physicians deficient in moral character or professional competence. Physicians should observe all laws, uphold the dignity and honor of the profession and accept its self-imposed disciplines. They should expose, without hesitation, illegal or unethical conduct of fellow members of the profession.

Section 5—A physician may choose whom he will serve. In an emergency, however, he should render service to the best of his ability. Having undertaken the care of a patient, he may not neglect him; and unless he has been discharged he may discontinue his services only after giving adequate notice. He should not solicit patients.

Section 6—A physician should not dispose of his services under terms or conditions which tend to interfere with or impair the free and complete exercise of his medical judgment and skill or tend to cause a deterioration of the quality of medical care.

Section 7—In the practice of medicine a physician should limit the source of his professional income to medical services actually rendered by him, or under his supervision, to his patients. His fee should be commensurate with the services rendered and the patient's ability to pay. He should neither pay nor receive a commission for referral of patients. Drugs, remedies or appliances may be dispensed or supplied by the physician provided it is in the best interests of the patient.

Section 8—A physician should seek consultation upon request; in doubtful or difficult cases; or whenever it appears that the quality of medical service may be enhanced thereby.

Section 9—A physician may not reveal the confidences entrusted to him in the course of medical attendance, or the deficiencies he may observe in the character of patients, unless he is required to do so by law or unless it becomes necessary in order to protect the welfare of the individual or of the community.

Section 10—The honored ideals of the medical profession imply that the responsibilities of the physician extend not only to the individual, but also to society where these responsibilities deserve his interest and participation in activities which have the purpose of improving both the health and the well-being of the individual and the community.

It would seem that a word or two of explanation might be noted in regard to these several sections.

a. Section 1 is an outline of the aims of the whole field of medicine.

b. Section 2 is a demand for the continual striving for improvement of the physician and an urgent plea for the constant ready availability of all advancements that will be made by members of the medical profession.

c. Section 3 is devoted to pointing out the need for medicine to separate itself now and for always from the cultist.

d. Section 4 tries to delineate the obligations of the profession to the public and it points out the need for the physician's character, indicating in this respect the importance for the doctor to watch not only his own behavior pattern but that of his colleagues so that as an individual he is obligated to protect not only himself but his profession. This implies not only the ethical obligations of the doctor, but the importance for him to use some measure of etiquette.

e. Section 5 concerns the definition as to the freedom that the doctor has in handling his cases and the manner in which he shall be regulated in emergencies and in other situations involving his patients.

f. Section 6 defines and limits the practice of medicine on a corporate basis and explains to the physician how he shall handle his employment arrangements.

STEROSAN®
Hydrocortisone

Cream and Ointment (chlorquinaldol GEIGY with hydrocortisone)

The case illustrated below typifies the superior response produced by STEROSAN-Hydrocortisone. Combining potent antibacterial-antifungal action with a reliable anti-inflammatory and antipruritic effect, STEROSAN-Hydrocortisone is valuable in a wider range of infective or allergic dermatoses.

A severe infectious eczematoid dermatitis on foot of 15-year-old boy. Patient used STEROSAN-Hydrocortisone preparation 3 times a day for 23 days with a dramatic improvement as shown.*

(Continued from page 928)

It has been noted "that this is not perhaps too definitive but it is left for the State Medical Societies to define local conditions."

g. Section 7 is an explanation of those economic relationships that the physician will have, whereas

h. Section 8 takes into account the need for the physician to always have and exercise sound moral judgment and to share difficult cases with his colleagues.

i. Section 9 explains the attitude toward the confidential information that the physician is constantly handling, and

j. The last section implies that the physician is required to have a balance of conscience and a proper investment of emotion in civic capital.

Opinions of AMA Judicial Council Available

I would point out, to those of you who are unacquainted with the AMA, that there exists a Judicial Council which recently published a compilation of opinions, pronouncements, and interpretations of the Judicial Council of the AMA covering a period of over 50 years. This has been revised, abstracted and annotated in 1957 and a copy is in the hands of every secretary of every component medical society in the United States. These opinions and reports cover every conceivable situation, experience and problem that have or could arise in a physician's practice. It seems important to emphasize that every physician as he enters the practice of medicine, or becomes a member of a county or state medical society, should take enough of his time to ask the secretary of his organization for a copy of these opinions and reports so that he can spend a few hours some evening in reviewing some of the experience and the solutions of problems that other physicians and other organizations have had through the years.

International Code of Medical Ethics

I have stated that medical ethics has existed for over 4,000 years in some form or another and I have commented that there has recently been a revision in the Medical Ethics of the American Medical Association. But this country is not the only one that might think of revising the codes by which we practice. There is now a World Medical Association and they, too, early focused on the need for a Universal Code of Ethics. I would like at this time to read for you the International Code of Medical Ethics adopted by the Third General Assembly of the World Medical Association in London, England, October 1949.

International Code of Medical Ethics

DUTIES OF DOCTORS IN GENERAL

A DOCTOR must always maintain the highest standards of professional conduct.

A DOCTOR must not allow himself to be influenced merely by motives of profit.

The following practices are deemed unethical:

(a) Any self advertisement except such as is expressly authorized by the national code of medical ethics.

(b) Taking part in any plan of medical care in which the doctor does not have professional independence.

(c) To receive any money in connection with services rendered to a patient other than the acceptance of a proper professional fee, or to pay any money in the same circumstances without the knowledge of the patient.

Under no circumstances is a doctor permitted to do anything that would weaken the physical or mental resistance of a human being, except from strictly therapuetic or prophylactic indications imposed in the interest of the patient.

A DOCTOR is advised to use great caution in publishing discoveries. The same applies to methods of treatment whose value is not recognized by the profession. When a doctor is called upon to give evidence or a certificate he should only state that which he can verify.

DUTIES OF DOCTORS TO THE SICK

A DOCTOR must always bear in mind the importance of preserving human life from the time of conception until death.

A DOCTOR owes to his patient complete loyalty and all the resources of his science. Whenever an examination or treatment is beyond his capacity he should summon another doctor who has the necessary ability.

A DOCTOR owes his patient absolute secrecy on all which has been confided to him or which he knows because of the confidence entrusted to him.

A DOCTOR must give the necessary treatment in emergency, unless he is assured that it can and will be given by others.

DUTIES OF DOCTORS TO EACH OTHER

A DOCTOR ought to behave to his colleagues as he would have them behave to him.

A DOCTOR must not entice patients from his colleagues.

A DOCTOR must observe the principles of "The Declaration of Geneva" approved by the World Medical Association.

DECLARATION OF GENEVA

Adopted by the General Assembly of the World Medical Association at Geneva, Switzerland, September, 1948

At the time of being admitted as a member of the medical profession:—

I solemnly pledge myself to consecrate my life to the service of humanity.

I will give to my teachers the respect and gratitude which is their due;

I will practice my profession with conscience and dignity;

The health of my patient will be my first consideration;

I will respect the secrets which are confided to me;

I will maintain by all the means in my power, the honor and the noble traditions of the medical profession;

My colleagues will be my brothers;

I will not permit considerations of religion, nationality, race, party politics or social standing to intervene between my duty and my patient;

I will maintain the utmost respect for human life, from the time of conception. Even under threat, I will not use my medical knowledge contrary to the laws of humanity.

I make these promises solemnly, freely and upon my honor.

I never read the latter declaration without feeling added incentive to go forth and practice my profession a little bit better than I did a moment before. I sin-

cerely hope that the reading of these solemn words will in some way or another impart to you the very serious efforts your State Medical Society would make in being sure that you, new members of our organization, will follow to your best efforts the words noted above.

Conclusion

In concluding, I would like to read a part of the editorial page from the *Journal of the American Medical Association* of July 27, 1957:

> Despite the efforts devoted to drafting this 1957 edition of ethics of the American Medical Association and despite the full discussion of its intent and purposes, neither its length nor its language will insure observance of the principles it enunciates. At best the written principle of ethics is but the suggestion of the inexpressible. It is the effort to express truths which are known in conscience. As one's conscience is developed one knows these truths and as one follows a right conscience he acts ethically.
>
> It is not, then, the printed document which makes a doctor ethical; rather it is his observance of the dictates of his own enlightened conscience. The document which attempts to express ethical principles is only an aid, a symbol which may help keep ideals uppermost in mind and practice. The 1957 edition of the Principles, because it is concise; because it is limited to basic, ethical concepts; and because it is capable of being displayed prominently and with pride, possesses merit as a document which can aid the doctor maintain the tradition of his profession: To do good, selflessly, as he strives to improve the health of mankind.

The officers, the Council, the present membership of the Oregon State Medical Society, in greeting each of you new members, at the same time urges each of you to hold faithfully to and to follow these ethics, and to help those of us already members to improve our own use of these basic structures in our medical profession. •

Postgraduate Meeting To Coincide with Oregon-Oklahoma Football Game

Oregon physicians planning to attend the Oregon-Oklahoma football game Oct. 4, 1958, will have an opportunity the same weekend to take advantage of a postgraduate meeting at the University of Oklahoma Medical Center. Postgraduate sessions are scheduled for October 3 and 4.

Program of the two-day meeting is as follows: Friday, October 3—9:00 A.M. to 5:00 P.M., A combined scientific session; 7:30 P.M., Dinner at the Faculty Club for registrants and their ladies. Saturday, October 4—8.30 A.M. to 10:30 A.M., Choice of five pre-game breakfast round table conferences: Surgery, medicine, pediatrics, obstetrics, gynecology.

Those wishing additional information and final program are asked to write the Office of Postgraduate Education, University of Oklahoma Medical Center, 801 N.E. Thirteenth Street, Oklahoma City 4, Oklahoma. Tickets to the football game may be obtained by writing to University of Oklahoma Athletic Ticket Office, Norman, Oklahoma.

ANNUAL MEETING
Spokane
September 14-17, 1958

President, Milo T. Harris, M.D., Spokane Secretary, F. A. Tucker, M.D., Seattle Executive Secretary, Mr. R. W. Neill, Seattle

Register Now For Refresher Courses

At Your WSMA Convention in Spokane, September 14-17

Registration is now open for the 11 refresher courses to be conducted at the Davenport Hotel in Spokane, September 16 and 17 during the 1958 convention of the Washington State Medical Association.

The refresher courses deal with topics of current interest to both general practitioner and specialist, and the physician-instructors are outstanding in their fields. The courses and instructors are listed in the scientific program published in this section, which also shows the papers and speakers scheduled for the general scientific sessions. The complete convention program covering the dates of September 14-17, inclusive, will be published in the August issue of NORTHWEST MEDICINE.

Refresher courses are scheduled from 9:00 to 10:30 a.m. on Tuesday, September 16, and from 8:30 to 10:00 a.m. on Wednesday, September 17. A physician may attend a course each day or only one course. Each course will consist of an hour's lecture, plus a half hour of questions and answers. Like the rest of the scientific program at the convention, the courses will be granted Category II credit by the Washington Academy of General Practice.

Since attendance will be limited, advance reservations are required for the refresher courses. Physicians may register by filling out and returning the application blank below. There is no charge. On receipt of the application, a reservation card will be sent for each course selected. Applicants are urged to list first, second and third choices for each day of their attendance. Although every attempt will be made to give first choices to all registrants, physicians are urged to register immediately, since reservations will be made on the basis of "first come, first served."

Clip this coupon and mail today:

Deaner™

2-dimethylaminoethanol (deanol)

Advantages of 'Deaner'

- Effects come on gradually and are prolonged . . .
- *Without* causing hyperirritability, jitteriness or emotional tension . . .
- *Without* causing excess motor activity . . .
- *Without* causing loss of appetite . . .
- *Without* elevating blood pressure or heart rate . . .
- *Without* sudden letdown on discontinuance of therapy.

'Deaner' is supplied in 25 mg. scored tablets

Another Riker *First*
LOS ANGELES

Proved of value in that large contingent of patients with vague, undefined symptoms, who feel under par and lack energy or are mildly depressed. Failure to obtain adequate restoration from sleep is another indication.

Reports from Investigators

In medical student volunteers, 'Deaner' produced increased daytime energy and attentiveness at lectures, sounder sleep (with a reduction in the hours of sleep needed), better ability to concentrate, decreased apprehensiveness prior to and during examinations, a more affable mood and outspoken personality.

1. Murphree, H.B.Jr.; Jenney, E.H., and Pfeiffer, C.C.: Presented before Assoc. for Research in Nervous and Mental Disease, New York, Dec. 12-14, 1957. To be published.

In Exhaustion and Depression—In a study of over 100 patients suffering from various psychiatric disorders, especially exhaustion and mild depression, the clinical effect of 'Deaner' was to increase energy and to relieve depression in over 70%.

2. Lemere, F., and Lasater, J.H.: Am. J. Psychiat. *114*:655 (Jan.) 1958.

In Learning Problems—Some of the children with reading problems and other learning defects have improved markedly during their treatment with 'Deaner'.

3. Oettinger, L.: To be published.

Dosage: Initially, 1 tablet (25 mg.) daily in the morning. Maintenance dose, 1 to 3 tablets (25 to 75 mg.) for adults, ½ to 3 tablets daily for children. Full benefits may require two weeks or more of therapy.

U. W. Offers Postgraduate Course on Advances in Cancer Diagnosis

A postgraduate course, designed to acquaint the practitioner with the latest developments in the diagnosis of cancer, will be offered at the University of Washington School of Medicine, August 7, 8, and 9 (immediately preceding the Gold Cup Races during Seattle's Seafair Days). Outstanding leaders in the various diagnostic specialties will join the University of Washington faculty in the presentation of this course. Merrill C. Sosman, professor of radiology emeritus, Harvard Medical School; George E. Moore, director of the Roswell Park Memorial Institute, Buffalo; Eleanor M. Humphreys, professor of surgical pathology, University of Chicago, and Henry M. Lemon, associate professor of medicine, Boston University, will be among the guest faculty.

The program will begin Thursday afternoon, August 7, at 1:00 p.m., with a discussion of Office Diagnosis of Cancer. Friday morning, Diagnosis of Gastrointestinal Cancer will be covered and during the afternoon the topic will be Diagnosis of Gynecologic Cancer and Cancer of the Breast. Final session on Saturday morning will deal with Diagnosis of Cancer of the Lung. The program will end at 12 noon Saturday.

No tuition will be charged and attendance will be unlimited. For further information, contact the Division of Postgraduate Medical Education at the University of Washington School of Medicine.

U.W. Film To Have International Showing

The scientific film, Ovulation and Egg Transport in the Rat, made by Richard Blandau, assistant dean at the University of Washington School of Medicine, has been selected by the State Department for showing at the Venice Film Festival. It is the third teaching film which Dr. Blandau has made in cooperation with the motion picture unit of the department of medical illustration at the University, and will be entered in the scientific division of the international film show.

Seattle Physician on Cancer Council

Charles A. Evans, professor and executive officer of the department of microbiology at the University of Washington, has been named to a four year term on the National Advisory Cancer Council. His appointment becomes effective October 1, 1958.

Locations

Fred C. Klopfenstein has moved to Spokane from Pasco where he had practiced since 1944. Dr. Klopfenstein, a general practitioner, has joined the medical staff at Eastern State Hospital. He received his medical degree in 1928 from the College of Medical Evangelists, Loma Linda, Calif. Before locating in Pasco, Dr. Klopfenstein had practiced in San Diego and Boulder, Colo., part of the time at both places as a staff member at sanitariums.

Wesley F. Springer has opened offices in Seattle for general practice. Dr. Springer was graduated from the University of Nebraska Medical School in 1954 and took his internship at the University of Nebraska Hospital. He served his residency in general practice rotating at Permente Hospital, Vancouver, Washington, from 1955-56, and then served in the medical corps of the U.S. Air Force from 1956 to 1958.

Arthur W. Freidinger has entered into association with Ralph M. Stolzheise of Seattle for the practice of psychiatry. Dr. Freidinger received his medical education at Western Reserve University School of Medicine from which he was graduated in 1943. He formerly practiced in Westport, Connecticut.

Obituary

Dr. Matthew M. Patton, 79, Spokane pathologist for the last 49 years, died May 10 in a Spokane hospital from an appaerntly self-administered dose of poison. Dr. Patton received his medical degree in 1907 from Northwestern University Medical School. Before locating in Spokane in 1909, he was a general practitioner in Montana.

Subjects Announced for Heart Symposia

William E. Watts of Seattle, chairman of the Washington State Heart Association's series of symposia for county medical societies, has announced the topics for next year's series: Atherosclerosis—Present Concepts, Prevention and Treatment; Heart Surgery—Who Is Eligible, and Hypertension—Newer Drugs. Requests from medical societies for one or all of the sessions should be made to the State Heart Association at 3121 Arcade Building, Seattle.

RECEPTION HONORS MRS. UNDERWOOD—Clark County Medical Society gave a reception in Vancouver on Sunday, May 25, for Mrs. E. Arthur Underwood of Vancouver, president-elect of the Woman's Auxiliary to the American Medical Association. Mrs. Underwood took office in June at the San Francisco meeting of the AMA and the Auxiliary. Pictured above are some of the 200 guests who attended the reception. From left: Fig. 1. Gerald Turley, president, Clark County Medical Society; Mrs. Dennis H. Seacat, president, Woman's Auxiliary to Clark County Medical Society; Dennis H. Seacat, Vancouver; Mrs. Gerald Turley, Ridgefield; Mrs. Underwood; E. Arthur Underwood, Vancouver; and Miriam Luten, Portland, Oregon. Fig. 2. J. C. Woodward, Vancouver; Milo T. Harris, Spokane, president of Washington State Medical Association; and Mr. Ralph Neill, Seattle, executive secretary of WSMA. Fig. 3. I. C. Munger, Jr., Mrs. Eugene G. Cushing, Herbert Leiser and Mrs. Henry Wiswall, all of Vancouver. Fig. 4. Judge Frank Foley, Mrs. Frank Foley, Mrs. John Harrison and John Harrison, all of Vancouver.

First Appointee to Endowed Chair Named

First appointee to the new Robert L. King Chair of Cardiovascular Research at the University of Washington is Bernard M. Wagner, assistant professor of pathology at the University of Pennsylvania Medical School. Dr. Wagner, whose research interests are in rheumatic fever and other inflammatory diseases of the heart, will assume his duties August 1.

The Chair makes $15,000 per year available to the University on a permanent basis to employ a research scientist interested in heart disease and to help support his work. It is the first endowed chair to be established at the University and honors Robert L. King of Seattle, a past president of the Washington State and American Heart Associations.

Mrs. Donald Lynch, president of Woman's Auxiliary to Washington State Medical Association, attended the reception May 25 in Vancouver honoring Mrs. E. Arthur Underwood, at right, who took office last month as president of the Woman's Auxiliary to the American Medical Association.

Heart Association To Sponsor Bulletin

The American Heart Association in cooperation with the National Heart Institute of the U. S. Public Health Service and the American Academy of General Practice will sponsor the *Heart Bulletin,* bi-monthly journal on heart disease directed primarily to family physicians. The *Heart Bulletin* is the fourth publication made available to the medical profession through the Heart Association. The others are: *Modern Concepts of Cardiovascular Disease, Circulation* and *Circulation Research.*

Washington physicians may obtain the *Bulletin* through subscriptions purchased from the Washington State Medical Association or the State Heart Association.

Seattle Physician Named to Health Council

H. Stanley Bennett, professor and executive officer of the department of anatomy at the University of Washington School of Medicine, has been appointed to a four-year term on the National Advisory Health Council. As a member of the 12-man council, which is composed of six leaders from the field of science and six from education and public affairs, Dr. Bennett will advise the U. S. Surgeon General in awarding training grants.

John Jesseph in Athens, Greece, To Help Install Heart-Lung Machine

John Jesseph, University of Washington School of Medicine Alumni Association president, interrupted his surgical residency to leave May 15 for Athens, Greece. While in Athens, Dr. Jesseph will assist surgeons at the University of Athens in installing the first heart-lung machine in Greece.

Dr. Jesseph was invited to Greece by two Athens surgeons he met last fall while attending the convention of the International Society of Surgery at Mexico City. In addition to Dr. Jesseph's report on experiences with the University of Washington's heart-lung, Henry Harkins and Lloyd Nyhus of the Medical School staff also presented papers at the meeting.

Expenses for the two-month trip were provided by the University of Athens and by Greek-American societies interested in helping their medical school. Dr. and Mrs. Jesseph will spend a third month in sightseeing and in visiting various European clinical centers before returning to the United States.

State Heart Association Names Officers

Newly-elected officers of Washington State Heart Association are Dean K. Crystal, Seattle surgeon, president, and Joseph H. Low of Yakima, vice-president. Elections were held the first week of May in Seattle during a meeting at which the Association's tenth anniversary was observed.

Guide Available for the Cardiac Farmer

Physicians planning a safe work load for the cardiac farmer will find much helpful information in the guide, A Safe Work Load for Farmers with Heart Disease, which is now available. In addition to classifying many common jobs on the farm according to the amounts of energy they demand, the guide also contains a nine-point check list for guidance of the patient. Copies of the guide may be obtained from the Washington State Heart Association, 3121 Arcade Building, Seattle.

Grant Given Cardiology Division at U.W.

A grant of $9,000 from the General Life Company of America has been given to the Division of Cardiology in the University of Washington School of Medicine. The funds will be used by the Division in awarding fellowships to help young physicians start careers in academic medicine or research.

Mr. Willis L. Campbell, president of General American Corporation, the parent company, announced the grant which is in honor of the late Mr. Hawthorne K. Dent, company founder, who died of heart disease.

Joint Medical-Bar Meeting Held

Annual joint meeting of the Walla Walla Valley Medical Society, Dental Association and Walla Walla County Bar Association was held May 8 in Walla Walla. Guest speaker was George Stevens, dean of the University of Washington Law School.

The following books have been received. Publication of this acknowledgment is to be considered adequate return to the sender. Selected titles will be reviewed as space permits.

Anomalies of Infants and Children. By D. McCullagh Mayer, D.D.S., M.D., F.A.C.S., F.I.C.S., Associate Professor of Plastic Surgery, New York Medical College; Associate Attending Plastic Surgeon and Head of Plastic Surgery Service, Flower and Fifth Avenue Hospitals, New York; and Wilson A. Swanker, M.D., F.A.C.S., F.I.C.S., Professor of Plastic and Aesthetic Surgery, Ankara University, Turkey; Medical Director of Admiral Bristol Hospital, Istanbul; Associate, New York Medical College. 454 pp. Illustrated. Price $12.00. McGraw-Hill Book Co., Inc., The Blakiston Division, New York. 1958.

Carbon Dioxide Therapy: A Neurophysiological Treatment of Nervous Disorders. Ed. 2. Edited by L. J. Meduna, M.D., Professor of Psychiatry, University of Illinois School of Medicine, Chicago, Ill. 541 pp. Price $14.50. Charles C Thomas, Springfield, Ill. 1958.

A Textbook of Psychology. By Donald Olding Hebb, Professor and Chairman, Department of Psychology, McGill University. 276 pp. 78 figures. Price $4.50. W. B. Saunders Company, Philadelphia and London. 1958.

Rehabilitation of the Cardiovascular Patient. By Paul Dudley White, M.D., Massachusetts General Hospital, Boston; Howard A. Rusk, M.D., Professor and Chairman, Department of Physical Medicine and Rehabilitation, New York University-Bellevue Medical Center, New York; Philip R. Lee, M.D., Department of Internal Medicine, Palo Alto Clinic, Palo Alto, Calif.; and Bryan Williams, M.D., Clinical Instructor in Medicine, The University of Texas, Southwestern Medical School, Dallas. 176 pp. Illustrated. Price $7.00. McGraw-Hill Book Company, Inc., The Blakiston Division, New York. 1958.

Dietary Prevention and Treatment of Heart Disease. By John W. Gofman, Ph.D., M.D., Donner Laboratory, University of California, Berkeley; Alex V. Nichols, Ph.D., Donner Laboratory, University of California, Berkeley; and E. Virginia Dobbin, Senior Dietitian, E. V. Cowell Memorial Hospital, University of California, Berkeley. 256 pp. Price $3.95. G. P. Putnam's Sons, New York. 1958.

Anomalies of Intestinal Rotation and Fixation (Including Mesentericoparietal Hernias). By Roberto L. Estrada, B.Sc., M.D., C.M., D. Surg. (McGill), F.R.C.S. (C), F.A.C.S., Demonstrator in Surgery, McGill University, Montreal, Canada; Assistant Surgeon, The Montreal General Hospital, Montreal; Assistant Surgeon, Reddy Memorial Hospital, Westmount. 161 pp. Illustrated. Price $6.50. Charles C Thomas, Springfield, Ill. 1958.

Memoirs of a Golden Age. By Maurice Davidson. 140 pp. Illustrated. Price $3.75. Basil Blackwell, Oxford. 1958. Distributed by Charles C Thomas, Springfield, Ill.

Clinical Obstetrics and Gynecology.—A Quarterly Book Series—Vol. I, No. 1 (March 1958): Medical Problems in Pregnancy, edited by Curtis J. Lund, M.D.; and Management of Endocrine Problems, edited by Allan C. Barnes, M.D. 288 pp. Illustrated. $18.00 per year. Paul B. Hoeber, Inc., New York. 1958.

A Search for Man's Sanity—Selected Letters of Trigant Burrow with Biographical Notes. Prepared by the Editorial Committee of the Lifwynn Foundation, William E. Galt, Chairman. Foreword by Sir Herbert Read. 615 pp. Price $8.75. Oxford University Press, New York. 1958.

IN DIABETES

Blood Cholesterol Regulation Is Desirable

Frequently, diabetes mellitus is associated with excessive coronary atherosclerosis and heart disease. It is also well recognized that vascular disease manifests itself at an earlier age and progresses more rapidly in the diabetic . . . especially the diabetic female. The early onset and severe degree of atherosclerosis may be due to faulty lipid metabolism, with a concomitant elevation in blood cholesterol levels. Kinsell[1] reports that even in diabetics with extensive vascular disease it is possible to produce normal cholesterol levels with an essential fatty acid emulsion.

The consensus of opinion today is that elevated cholesterol levels should be reduced or prevented. This can be done very well by the addition of adequate amounts of linoleic acid and vitamin B_6 to the diet. In scores of diabetic patients, with extensive vascular disease, diets high in linoleic acid resulted in improvement.[2,3] Vitamin B_6 apparently is necessary to convert linoleic acid into the primary essential fatty acid, arachidonic acid. Thus the body is dependent on an intake of both linoleic acid and vitamin B_6 for normal cholesterol levels.[4,5]

This is why ARCOFAC (Armour Cholesterol Lowering Factor) provides *both* linoleic acid and vitamin B_6 in adequate amounts, thus allowing the patient to eat a balanced, nutritious and palatable diet. Prophylactic dosage is 1-2 tablespoonfuls daily; therapeutic—2-8 tablespoonfuls daily.

Each tablespoonful (15 ml.) of Arcofac emulsion contains:

Essential fatty acids†.....6.8 Gm.
(measured as linoleic) with 2.5 I.U. of Vitamin E*

Pyridoxine hydrochloride
(Vitamin B_6).....1.0 mg.

† Supplied by safflower oil which contains the highest concentration of polyunsaturated fatty acids of any commercially available vegetable oil.

*Added as Mixed Tocopherols Concentrate, N.F.

References 1-5 supplied on request.

Diagnostic Medical Parasitology. By Edward K. Markell, Ph.D., M.D., Assistant Professor of Infectious Diseases, Division of Parasitology and Tropic Diseases, Department of Infectious Diseases, School of Medicine, University of California, Los Angeles; and Mariette Voge, M.A., Ph.D., Assistant Professor of Infectious Diseases, Division of Parasitology and Tropic Diseases, Department of Infectious Diseases, School of Medicine, University of California, Los Angeles. 276 pp. 115 figures, 5 in color. Price $7.00. W. B. Saunders Co., Philadelphia and London. 1958.

Handbook of Treatment of Acute Poisoning. Ed. 2. By E. H. Bensley, M.B.E., B.A., M.D., F.A.C.P., Director, Department of Metabolism and Toxicology, The Montreal General Hospital; Associate Professor of Medicine and Lecturer in Toxicology, McGill University; and G. E. Joron, B.A., M.D., C.M., F.A.C.P., Assistant Physician, Department of Metabolism and Toxicology and Department of Medicine, The Montreal General Hospital; Demonstrator in Medicine, McGill University; Assistant Physician, St. Mary's Hospital, Montreal. 212 pp. Price $4.00. E. & S. Livingstone Ltd., Edinburgh & London. 1958. Distributed by Williams & Wilkins Co., Baltimore.

REVIEWS

Books reviewed in the columns of Northwest Medicine may be borrowed by any subscriber. Write Miss Ruth Harlomert, Librarian, King County Medical Society Library, Room 121, Cobb Bldg., Seattle 1, Wn. The library appreciates, but does not demand, reimbursement for postage.

PARAPSYCHOLOGY: FRONTIER SCIENCE OF THE MIND—A Survey of the Field, the Methods, and the Facts of ESP and PK Research. By J. B. Rhine and J. G. Pratt, Parapsychology Laboratory, Duke University, Durham, North Carolina. 220 pp. Price $4.75. Charles C Thomas, Springfield, Ill. 1957.

Mind action unexplainable by known scientific law immediately intrigues the intelligent reader. Perception and action beyond known sensory law have been evident through all ages and either revered or persecuted. Parapsychology is the collective label for the new science dealing with psi capacity as shown through ESP—extra sensory perception—and PK—psychokinesis. In this book on the Frontier Science of the Mind, the authors write interestingly, define terms, describe methods and summarize facts. For the casual reader they help clear the fog of present day fact and fiction, and for the professional they provide the basic techniques used in testing psi phenomena. They invite exploration and fact recognition. They also offer testing methods and statistical tables as a working manual for the research minded. The expression of psi in telepathy, clairvoyance, precognition, and psychokinesis is shown in relation to the fields of biology, physiology, medicine, education, philosophy and religion. One particularly challenging fact is the clear evidence that psi missing below the chance expectation is as common as psi hitting above chance levels. For the curious as well as for the informed reader, this work on parapsychology takes one to the source of present day understanding.

150,000
Physicians

use
the

BIRTCHER
HYFRECATOR

Time saving, easy-to-use. Invaluable for desiccation, fulguration or bi-active coagulation. Unrivalled for removal of surface and other growths with excellent cosmetic results.

A HYFRECATOR in every office • Many physicians now have HYFRECATORS in every examining and treatment room to save time and inconvenience for their patients. This time-proven method for the removal of moles, warts and other growths is used so frequently in the average practice, it's impractical *not* to have several HYFRECATORS!

Dermatology • General Practice
Gynecology • Urology • Proctology
Ophthalmology • E.E.N.T.

Physicians in virtually every field find the HYFRECATOR *an invaluable instrument.*

FREE 32-PAGE BOOKLET SYMPOSIUM ON ELECTRO-DESICCATION AND BI-ACTIVE COAGULATION and full color booklet with color progress photographs of technics and results sent on request without obligation.

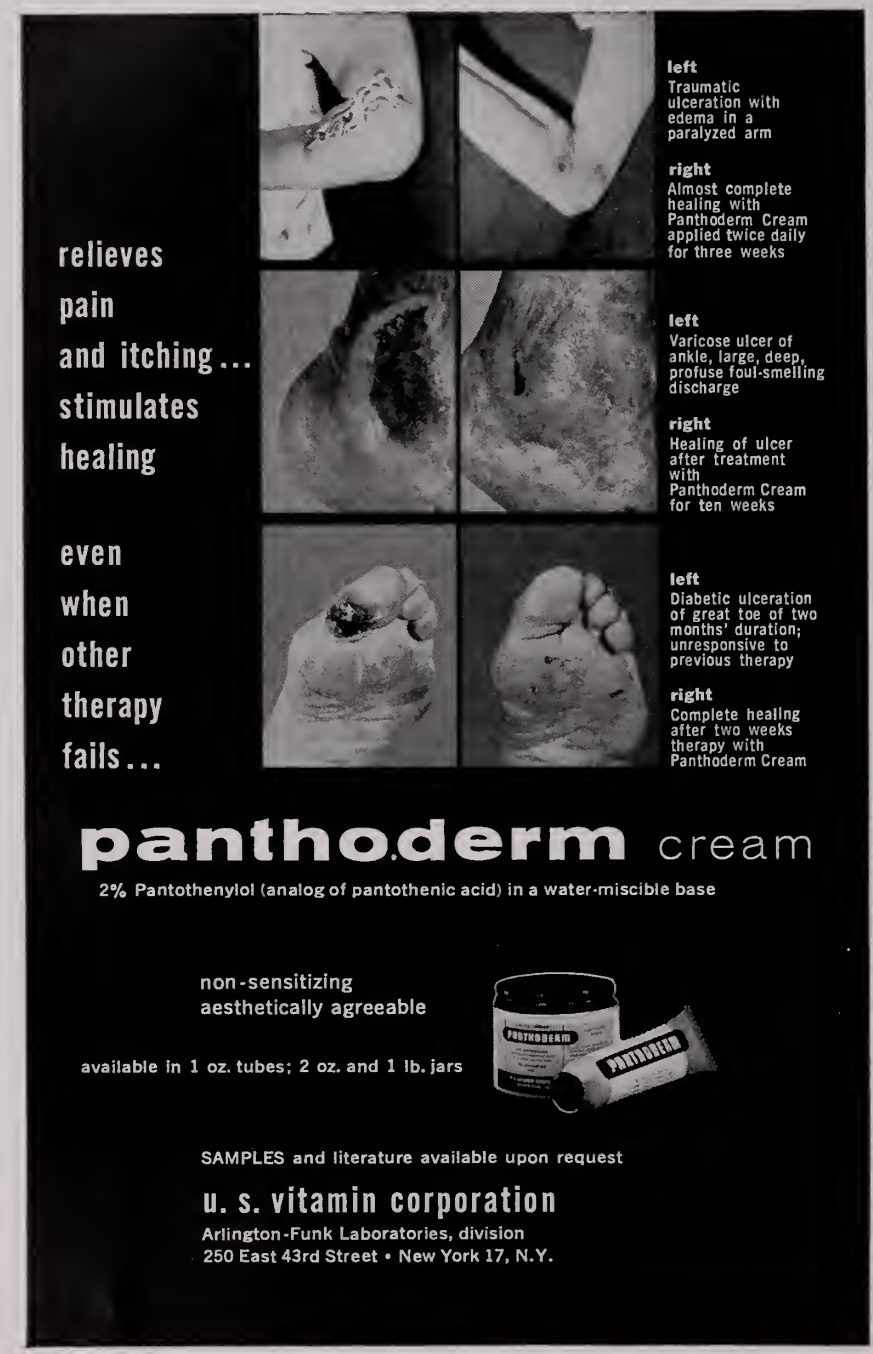
ROENTGENOLOGY OF THE CHEST. Sponsored by American College of Chest Physicians. Edited by Coleman B. Rabin, M.D., Assistant Clinical Professor of Medicine, College of Physicians and Surgeons, Columbia University. 484 pp. Illustrated. Price $19.50. Charles C Thomas, Springfield, Ill. 1958.

The stated purpose of the book is indeed a worthy one, "namely to present roentgenology of the chest to the roentgenologist from the clinical point of view and to the clinician from the radiological point of view." If in part only this goal could be considered to be achieved, this volume must be considered an outstanding success. In large measure it has.



This is a multi-authored book by 50 outstanding experts who comprise a veritable "who's who" on chest diseases, both clinicians and radiologists. The authors have evidently been carefully selected and each is an outstanding authority in that specialized branch of pulmonary pathology under discussion. Several prominent specialists from abroad as well as American authors have contributed.

The book is divided into 39 diversified chapters. It starts out with a theoretic discussion of the possibilities and limitations of x-ray diagnosis in diseases of the chest by Leo Rigler and follows through with a discussion of normal roentgen anatomy, mass fluorography, plus detailed dissertations on various pathologic entities. The newer knowledge of chest roentgenology plus their respective clinical implications are thoroughly covered. Of special interest to radiologists will be the informative chapters on special signs and shadows in chest roentgenology.

The book is an excellent reference text and is recommended to all physicians interested in this field.

In Asthma

MEDIHALER®

automatic measured-dose aerosol medication

For Ample Air Right Now!

NOTHING IS QUICKER • NOTHING IS MORE EFFECTIVE

Medihaler-EPI®

For quick relief of bronchospasm of any origin. More rapid than injected epinephrine in acute allergic attacks.

Epinephrine bitartrate, 7.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.15 mg. actual epinephrine.

Medihaler-ISO®

Unsurpassed for rapid relief of symptoms of asthma and emphysema.

Isoproterenol sulfate, 2.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.06 mg. actual isoproterenol.

Prescribe Medihaler medication with Oral Adapter on first prescription. Refills available without Oral Adapter.

Medihaler-Phen®

Automatic NASAL aerosol nebulization provides prompt, effective, prolonged, and nonirritating decongestion in head colds, allergic rhinitis, sinusitis, and nasopharyngitis. Vasoconstrictive, decongestive, anti-inflammatory, antibacterial. Combines actions of phenylephrine, phenylpropanolamine, neomycin, and hydrocortisone.

FOR KIDDIES TOO

Notably safe and effective for children. Nonbreakable, spillproof.

OFFICE GASTROENTEROLOGY. By Albert F. R. Andresen, M.D., Clinical Professor Emeritus of Medicine, State University of New York College of Medicine at New York City. 707 pp. Illustrated. Price $14.00. W. B. Saunders Co., Philadelphia. 1958.

Ivy and Grossman required over 1000 pages to discuss peptic ulcer and Palmer filled 550 pages about the esophagus. Thus over 1500 pages were necessary for comprehensive presentation of two relatively small segments of gastroenterology. When Andresen attempted to cover the entire field of gastroenterology in 700 pages it was inevitable that the resulting volume would be little more than a compend. Nevertheless, the book is remarkably complete and mentions all phases of gastroenterology, but does not say much about many of them. There is nothing particularly new in the text and it serves best as a means of going over, once lightly, the field of digestive diseases. The reader who expects complete exposition of any particular subject will be disappointed and forced to seek more detailed works. As might be expected, Andresen mentions allergy frequently and attributes such an etiology to divers disease states, an attitude with which many clinicians will not readily agree. For the student or general practitioner the volume serves as a handy reference source. It has but little to attract the attention of internist or gastroenteroolgist.

Walter L. Voegtlin, M.D.

CURRENT THERAPY 1958—Latest Approved Methods of Treatment for the Practicing Physician. Edited by Howard F. Conn, M.D., and 12 Consulting Editors. 827 pp. Price $12.00. W. B. Saunders Co., Philadelphia and London. 1958.

This compendium is particularly impressive to me because it discusses in excellent classification the diseases and defects that the human body is heir to, as well as making recommendations for their treatment. The information on treatment is remarkably current and differs from predecessors in this same series by emphasis on the newer antibiotics, the steroid drugs, cardiovascular aids and the tranquilizers.

This edition has a most remarkable list of contributors who, by their writings, indicate an acquaintance with the arts of medicine, as well as the scientific aspects, and many passages have allowed a touch of humor to intervene which is rare in medical texts but always welcome.

I feel that the present edition is a very worthy inclusion in any medical library. We will all agree that treatment must be individualized and not on a "cookbook" basis. Such a complete work as this lists nearly every aid, some of which might be otherwise overlooked in individual care.

The indexing and classification of diseases and treatment are excellent. The appendices, particularly the one on toxicology, are very complete.

The editor in chief, the consulting editors and each contributor are indeed to be congratulated. A tremendous amount of work, individually and collectively, is very apparent.

Robert B. Hunter, M.D.

NEW AND NONOFFICIAL DRUGS 1958. Containing descriptions of therapeutic, prophylactic and diagnostic agents evaluated by the Council on Drugs (formerly Council on Pharmacy and Chemistry) of the American Medical Association. An Annual Publication Issued Under Direction and Supervision of the Council. 645 pp. Price $3.35. J. B. Lippincott Co., Philadelphia and Montreal. 1958.

If you are tired of listening to the detail man and want unbiased information on drugs, you can use this authoritative volume. Drugs are listed in groups based on their properties, as local anesthetics, anti-

THE L-F BASALMETER
Self-Calculating
Basal Metabolism Apparatus

With this new, self-calculating, direct-reading BMR apparatus, you put in four factors (age, height, weight and sex) and the patient puts in the fifth—the time factor. The BasalMeteR does its own precise timing, computes all factors and gives you, as soon as test is concluded, an accurate basal metabolic rate. NO CHARTS! NO SLIDE RULES! NO OXYGEN TANKS!

No "wondering" about human error with the BasalMeteR. At conclusion of test, you press a button and read the result in terms of a plus or minus in percentage of normal. It's AUTOMATIC! Send for descriptive literature, without obligation, *today!*

MAIL THIS COUPON *today!*

histamines, anti-infectives to vitamins with a final chapter on miscellaneous preparations. They are listed under generic name; the chemical formula is given and structural formula is often included. Properties, action and uses, contraindications, and dosage are usually presented. Caution notes are included in some instances. Proprietary name is given at end of the discussion of the drug. Forty-eight new preparations have been listed this year and 13 have been dropped. Nine of the latter have been reported for 20 years and are well established. Four were excluded because no longer available. The index lists generic as well as proprietary names. This volume contains a great deal of information and in these days of high printing costs is a bargain at 645 pages for $3.35.

H. L. Hartley, M.D.

THE PRINCIPLES AND PRACTICE OF DIATHERMY. By Bryan O. Scott, M.R.C.S., L.R.C.P., D.Phys.Med., Consultant in Physical Medicine, The Radcliffe Infirmary and Cowley Road Hospital, Oxford, England; The Churchill Hospital, Headington, and the Oxford Regional Hospital Board. 193 pp. Illustrated. Price $5.00. Charles C Thomas, Springfield, Ill. 1957.

This 193 page monograph by a British author is a concise and practical presentation of short wave diathermy as a therapeutic agent. The first half of the book deals with basic electrophysics and the production of short wave currents, and the last half reviews biologic effects of short wave heating, indications and contraindications, prescription and technique of application.

The book is well illustrated and the information is basic and factual. There is probably greater emphasis on condenser application in contrast to induction technique than experiences in this country would indicate. There is no discussion of microwave diathermy.

Nevertheless this book is recommended reading for every one who prescribes or administers short wave diathermy. Certainly an understanding of the precise effects and potential hazard of this energy would go a long way to eliminate the empiricism with which it is so commonly used today.

Sherburne W. Heath, Jr., M.D.

THE HUMAN EAR CANAL. By Eldon T. Perry, M.D., Instructor in Dermatology, Wayne State University. 116 pp. Illustrated. Price $4.75. Charles C Thomas, Springfield, Ill. 1957.

There is probably no otologist alive who has not at some time wished for the skill or consultation of a dermatologist while treating an external otitis. This author has recognized that need and has done something about it.

In turn, Perry discusses comparative anatomy, embryology, gross and microscopic anatomy. Then follows a discussion of the too little understood physiology of the external ear canal with emphasis slanted to the skin.

Cerumen—its physical and chemical properties and its functions—is discussed at length.

In opening his discussion on otitis externa the author affirms a truism that points out why otologists have frequent difficulty with diseases of the external ear—that patients with the same diagnosis may present entirely different appearances. Then follows an account of the more common external ear conditions that can aid in differential diagnosis. Perry suggests that idiopathic pruritus of the external ear may be a low grade contact dermatitis which can be confirmed by a biopsy revealing spongiosis or microvesiculation of the hair follicles or by patch tests of probable allergens. It has an allergic basis and is distinct from primary irritant

(Continued on page 950)

COSA

an entirely new concept
in broad-spectrum therapy

WHAT IS COSA—Cosa identifies Pfizer preparations containing glucosamine, a basic substance older than man himself, found throughout the human body and in the whole spectrum of nature—lobster shells . . . mother's milk . . . eggs . . . gastric mucin. Glucosamine achieved new importance when Pfizer scientists discovered that this interesting compound provides significant advantages when added to antibiotics such as Tetracyn® (tetracycline) and Terramycin® (oxytetracycline).

ADVANTAGES OF COSA ANTIBIOTICS:

1. Higher, faster antibiotic blood levels[1]
2. More consistently elevated antibiotic blood levels[2]
3. Effective, well-tolerated broad-spectrum therapy[3,4,5]
4. Safe, physiological potentiation with glucosamine, a nontoxic human metabolite[6,7,8]

*TRADEMARK

(Continued from page 948)
dermatitis which is caused by a substance that can produce a dermatitis on almost anyone.

It is shown that while an otitis can be caused by single factors as above, it is usually a combination of factors, such as moisture, high temperature, trauma, infection or change in the lipids of the skin surface.

The diagnostic approach and principles of treatment of external otitis are treated briefly in conclusion. The book is principally of use to otoligists.

E. B. Parmelee, M.D.

CLINICAL ELECTROCARDIOGRAPHY—The Spatial Vector Approach. By Robert P. Grant, M.D., National Heart Institute, National Institutes of Health, Bethesda, Maryland. 225 pp. Illustrated. Price $7.50. Blakiston Division, McGraw-Hill Book Company, Inc., New York. 1957.

This book should be read by everyone interested in electrocardiography. Most of us have been aware that the cathode-tube oscilloscope has been used for recording cardiac electrical forces. We have also been aware that while some information may be gained from this which the usual electrocardiographic tracing does not give, the expense and availability of this type of instrument has limited its clinical usefulness. This book helps us to appreciate cardiac vectors and shows us how they may easily be obtained from the usual electrocardiogram.

The usefulness of integrating these tracings into their vectors might be likened to a variety of quotations on a given stock market issue. If we were presented with a group of figures indicating that a stock had fluctuated, these would have little value unless they could be presented on a two dimensional plot showing magnitude and time. Grant shows us how electrocardiographic complexes from various areas of the body surface can be presented on a three dimensional plot.

The material presented in this book is quite easily understood by anyone who has had even slight experience with electrocardiograms. Familiarity with the book and with the methods involved will make the usual twelve lead electrocardiogram much clearer. In particular, QRS conduction defects and left axis deviation are placed on a more rational basis. Peri-infarction block is a concept which the author has introduced and which helps to explain a heretofore puzzling group of tracings.

This book should have a particularly wide acceptance in this area since the author recently presented a course at the King County Hospital in Seattle which covered the material in this book. All those who attended can vouch for Grant's exceptional ability as a teacher. The book follows the same clear presentation and organization which characterized his lectures here. It cannot be recommended too highly to anyone interested in electrocardiography.

John D. Collins, M.D.

BRITISH MEDICAL BULLETIN: ANAESTHESIA, Vol. 14, January 1958. 72 pp. Price $3.25. Medical Department of The British Council, London.

The symposium of papers presented cover some of the newer concepts and techniques which lead to a better understanding of the pharmacology and physiology of anesthesia, and their implications in clinical practice.

The 16 authoratative articles presented are fairly equally divided between the theoretic aspects, and the practicalities of anesthesia. Of particular value are the papers upon "Biochemical Disturbances in Anaesthesia," and "Carbon-Dioxide Homeostasis in Anaesthesia;" These often neglected subjects are dealt with succinctly, and with lucidity. A review of the principles, technique, and interpretation of

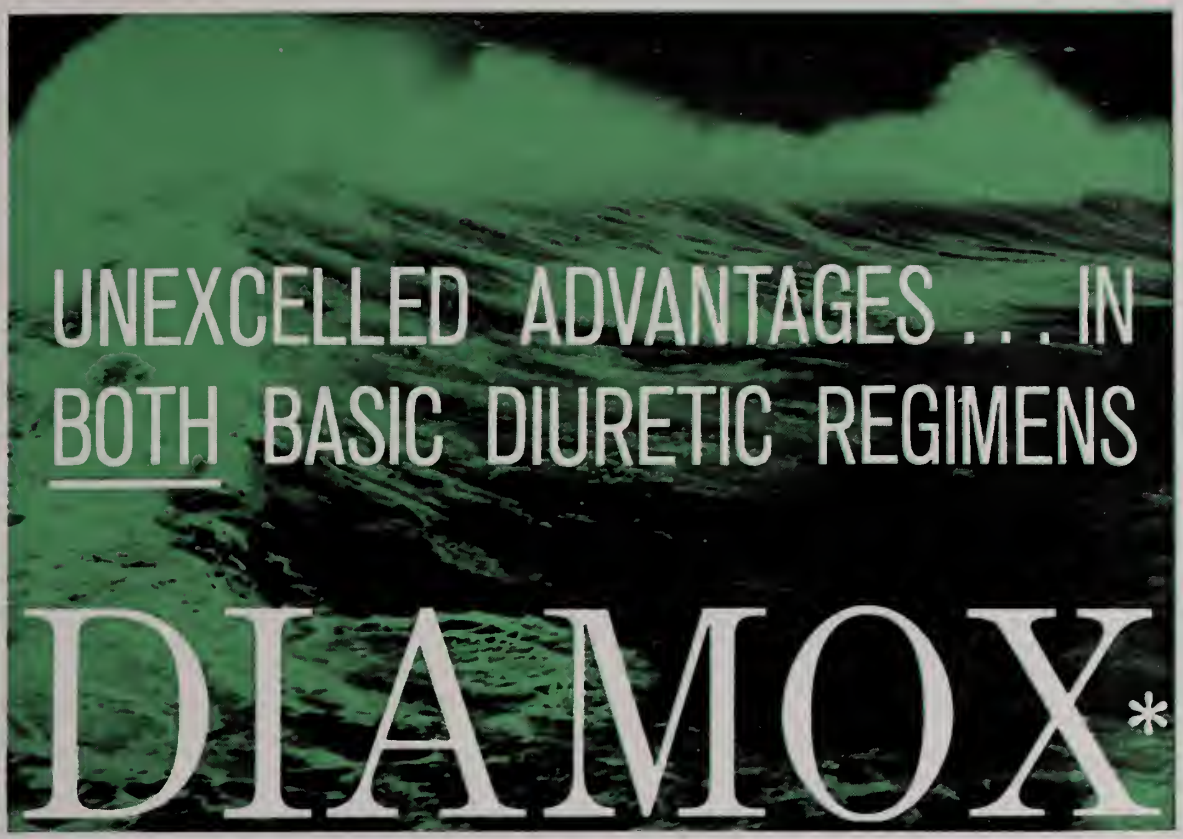
LIVERMORE SANITARIUM



This facility provides an informal atmosphere seldom found in hospitals elsewhere. A sound and scientific approach to emotional problems is provided with careful deliberation, with the patients' best interests given every consideration. Our approach is eclectic with emphasis along the lines of dynamic and psychobiologic psychiatry. Every recent therapy is available.

Individual services are amply provided for; in individual cottages if desired, so that the patient's every need is considered.

All diagnostic and ancillary consultative services are available.

Information upon request.

bicarbonate-regulating diuretic

Acetazolamide Lederle

HOW DIURETICS ACT

Primarily by regulation of bicarbonate transport	DIAMOX acetazolamide
Primarily by regulation of chloride transport	mercurials chlorothiazide

1

Advantages of DIAMOX in single-drug diuresis

DIAMOX — operating through the well-understood mechanism of *bicarbonate* transport regulation—provides ample, prolonged diuresis in the great majority of patients.

DIAMOX is virtually nontoxic . . . has not caused renal or gastric irritation . . . has no pronounced effect on blood pressure. It is rapidly excreted, does not accumulate in the body, permits convenient dosage adjustment, allows unbroken sleep. Small, tasteless, easy-to-take tablets . . . usual dosage, only one a day.

- CARDIAC EDEMA
- PREMENSTRUAL TENSION
- EDEMA OF PREGNANCY
- OBESITY

2

Advantages of DIAMOX in intensive, two-drug diuresis

When intensive diuresis must be maintained, DIAMOX, alternated with an agent for regulation of *chloride* transport, has proved a regimen of choice. Through dual *bicarbonate-chloride* regulation, it produces maximal sodium-water excretion with minimal distortion of serum electrolyte patterns, greater patient comfort, lessened risk of induced drug resistance.

- ADVANCED CONGESTIVE HEART FAILURE
- REFRACTORY TOXEMIA OF PREGNANCY

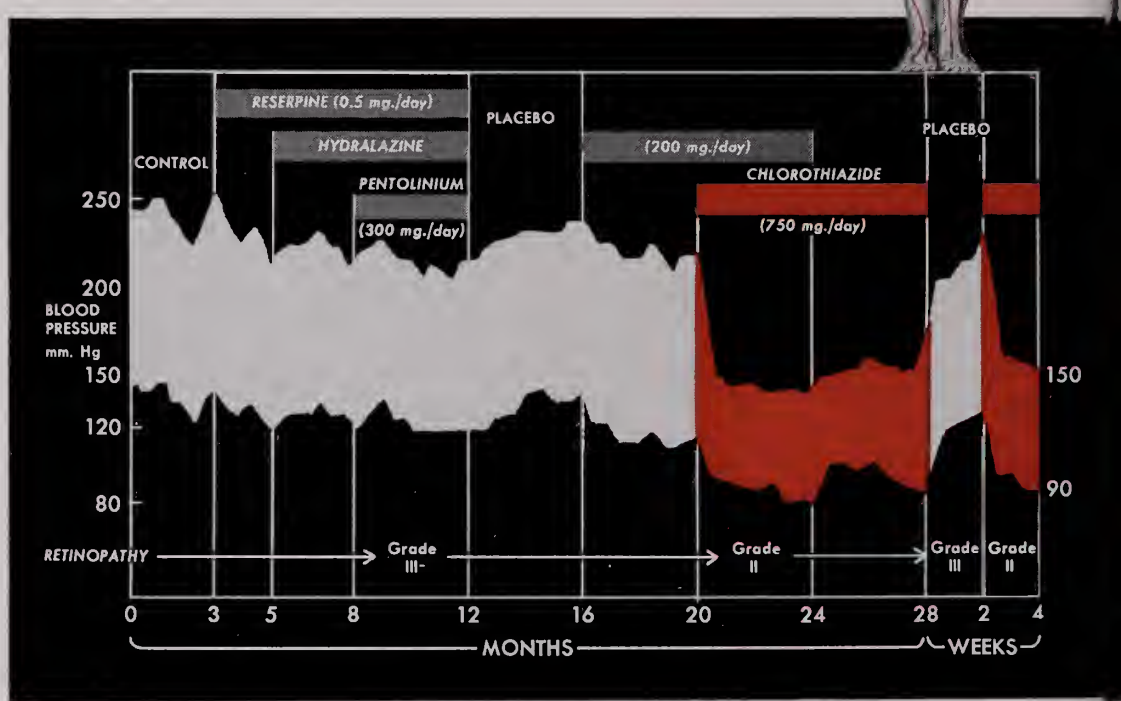
Investigator

after investigator reports



Wilkins, R. W.: New England J. Med. **257**:1026, Nov. 21, 1957.

"Chlorothiazide added to other antihypertensive drugs reduced the blood pressure in 19 of 23 hypertensive patients." "All of 11 hypertension subjects in whom splanchnicectomy had been performed had a striking blood pressure response to oral administration of chlorothiazide." ". . . it is not hypotensive in normotensive patients with congestive heart failure, in whom it is markedly diuretic; it is hypotensive in both compensated and decompensated hypertensive patients (in the former without congestive heart failure, it is not markedly diuretic, whereas in the latter in congestive heart failure, it is markedly diuretic). . . ."

Freis, E. D., Wanko, A., Wilson, I. H. and Parrish, A. E.: J.A.M.A. **166**:137, Jan. 11, 1958.

"Chlorothiazide (maintenance dose, 0.5 Gm. twice daily) added to the regimen of 73 ambulatory hypertensive patients who were receiving other antihypertensive drugs as well caused an additional reduction [16%] of blood pressure." "The advantages of chlorothiazide were (1) significant antihypertensive effect in a high percentage of patients, particularly when combined with other agents, (2) absence of significant side effects or toxicity in the dosages used, (3) absence of tolerance (at least thus far), and (4) effectiveness with simple 'rule of thumb' oral dosage schedules."

In "Chlorothiazide: A New Type of Drug for the Treatment of Arterial Hypertension," Hollander, W. and Wilkins, R. W.: Boston Med. Quart. **8**: 1, September, 1957.

MERCK SHARP & DOHME Division of MERCK & CO., Inc., Philadelphia 1, Pa. MSD

the effectiveness of 'DIURIL' (CHLOROTHIAZIDE) in Hypertension

as simple as 1-2-3

1 **INITIATE THERAPY WITH 'DIURIL'.** 'DIURIL' is given in a dosage range of from 250 mg. twice a day to 500 mg. three times a day.

2 **ADJUST DOSAGE OF OTHER AGENTS.** The dosage of other antihypertensive medication (reserpine, veratrum, hydralazine, etc.) is adjusted as indicated by patient response. If the patient is established on a ganglionic blocking agent (e.g., 'INVERSINE') this should be continued, but the total daily dose should be immediately reduced by as much as 25 to 50 per cent. This will reduce the serious side effects often observed with ganglionic blockade.

3 **ADJUST DOSAGE OF ALL MEDICATION.** The patient must be frequently observed and careful adjustment of all agents should be made to determine optimal maintenance dosage.

SUPPLIED: 250 mg. and 500 mg. scored tablets 'DIURIL' (chlorothiazide); bottles of 100 and 1,000.

'DIURIL' is a trade-mark of Merck & Co., Inc.

Smooth, more trouble-free management of hypertension with 'DIURIL'

COOK COUNTY GRADUATE SCHOOL OF MEDICINE

INTENSIVE POSTGRADUATE COURSES
STARTING DATES—FALL, 1958

SURGERY—Surgical Technic, Two Weeks, August 18, September 15.
Surgery of Colon and Rectum, One Week, September 22, October 27.
Basic Principles in General Surgery, Two Weeks, October 13.
Esophageal Surgery, One Week, September 15.
Thoracic Surgery, One Week, September 22.
Gallbladder Surgery, Three Days, November 3.
Surgery of Hernia, Three Days, November 6
General Surgery, Two Weeks, November 10; One Week, October 27.
Fractures & Traumatic Surgery, Two Weeks, October 20.
Treatment of Varicose Veins, Two Days, September 15
American Board Review Course, Two Weeks, November 10.
Blood Vessel Surgery, One Week, October 20.

GYNECOLOGY & OBSTETRICS—
Office & Operative Gynecology, Two Weeks, September 8
Vaginal Approach to Pelvic Surgery, One Week, October
General & Surgical Obstetrics, Two Weeks, September 22.

MEDICINE—General Review Course, Two Weeks, October 20.
Electrocardiography, Two-Week Basic Course, October 6.
Gastroscopy & Gastroenterology, Two Weeks November 3.
American Board Review Course, One Week, September 29. (For Part I Candidates Only)

DERMATOLOGY—Clinical & Didactic Course, Two Weeks, November 3.

RADIOLOGY—Diagnostic X-Ray, Two Weeks, September 22
Clinical Uses of Radioisotopes, Two Weeks, September 29.

UROLOGY—Two-Week Intensive Course, October 13.
Ten-day Practical Course in Cystoscopy by appointment.

TEACHING FACULTY—ATTENDING STAFF OF COOK COUNTY HOSPITAL

ADDRESS: Registrar, 707 South Wood Street, Chicago 12, Ill.

(Continued from page 950)

the E.E.G. is included, together with an indication of its usefulness as a monitoring device in anesthesia. The physics involved in the design of inhalers is dealt wiht by Dr. Epstein, with particular emphasis upon the series of machines which have emanated from his laboratories.

Articles are included upon hypothermia, neonatal anesthesia, obstetric anesthesia, and induced hypotension, the latter being treated in an unusual and interesting manner. The larger part played by general anesthesia in England, and the consequently lesser role of local procedures, is well illustrated in Dr. Crawford's article on obstetric anesthesia.

Although by no means a comprehensive review, the Bulletin covers a surprisingly large area of anesthesia.

Stanley A. Feldman, M.B.B.S.

HOW TO WRITE SCIENTIFIC AND TECHNICAL PAPERS. By Sam F. Trelease, Ph.D., Columbia University. 184 pp. Price $3.50. The Williams & Wilkins Co., Baltimore. 1958.

Streamlined might be the best word to apply to this small manual on writing. The information needed is in the book but the author wastes little time or printers ink in making it available. Trelease starts with suggestions on selecting the subject, tells how to utilize previously published material, gives excellent suggestions on outlining and writing the paper and then goes on to discuss form and usage. He even includes a brief chapter on the statistical method. He tells how to use tables, references and illustrations, and gives explicit directions for the manner in which they should be submitted to the publisher. Of the several recent books on writing, this appears to be the most concise. In spite of its compactness it is remarkably complete. Application of its rules would help almost any manuscript.

AN INTRODUCTION TO FUNCTIONAL ANATOMY. By David Sinclair, M.A. (Oxford), M.D. (St. Andrews), Professor of Anatomy, University of Western Australia; Late University Demonstrator in Anatomy, University of Oxford; Late Lecturer in Anatomy and Physiology, Dorset House School of Occupational Therapy, Oxford. 426 pp. Illustrated. Price $8.50. Charles C Thomas, Springfield, Ill. 1957.

This book is an excellent treatise on the fundamentals of anatomy. It is designed as a reference volume for those interested in physical and occupational therapy and presents a well organized, concise review of essential embryology, histology and physiology, as well as structural, topographical and functional anatomy.

The author intended this book for those of ancillary specialties whose needs in a reference book differ considerably from medical practitioners, medical students, and nurses. As would be expected, the physiology and anatomy of the musculoskeletal system receives far more attention than irrelevant systems, such as the urologic or alimentary.

The subject matter is written in a style that is simple and interesting, and the book should be a valuable reference text for those to whom it is directed.

Matthew H. Evoy, M.D.

ADVANCES IN RADIOLOGY: PROCEEDINGS OF THE FIFTH INTERNATIONAL CONFERENCE ON RADIOLOGY HELD IN STOCKHOLM on 15th-19th August, 1956. Edited by George Carl de Hevesy, Arne Gunnar Forssberg, and John D. Abbatt. 503 pp. Illustrated. Price $15.00. Charles C Thomas, Springfield, Ill. 1957.

This book is a report of the Fifth International Conference on Radiology in Stockholm in August 1956. The papers presented are basic in nature yet, nevertheless, have more than casual interest for the physician interested in radiology and the effects of radiation. The reports of outstanding investigators show the lines of approach to the study of irradiation effects at all levels; molecules, enzymes, cells, organs and whole body. Several articles on modification of irradiation effects by S. H. compounds (cysteine and others), temperature, hibernation, and other factors, are extremely interesting. Current interest in marrow transfusions is represented by animal work in this field. Time and tensity and premature aging experience are also reported. Several participants discuss the relation of irradiation to human leukemia and leukemia in animals. The final section is concerned with genetics and mutations—their causes and doses involved. Each report is followed by a brief discussion of several participants reflecting on their own work.

This book is of value both for browsing and for reference.

LABORATORY DIAGNOSIS

Professional Classified

PRACTICE OPPORTUNITIES

OPPORTUNITY FOR GENERAL PRACTICE

Well-established general practice available in Eastern Washington. Write Box 53-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

GENERAL PRACTICE OPPORTUNITY

Lucrative, well-established general practice and equipment in Longview-Kelso area for sale. Excellent opportunity for ambitious man. Liberal terms. Spacious office in excellent location. Leaving to specialize. Write Box 57-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

GP, INTERNIST OR PEDIATRICIAN WANTED

Group in large Northwest city is interested in adding to well-rounded staff. Please write, in complete confidence, giving details of experience and accreditation. Washington license required. Write Box 43-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

OPPORTUNITY FOR GENERAL PRACTITIONER

Lucrative practice, with some surgery, for sale in Tacoma, Wash. Best location, appointments transferable to a qualified party. Write Box 58-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

OFFICE SPACE

NEW OFFICE BUILDING FOR SPECIALISTS

Limited amount of space available in new building for specialty practices—to be completed on or about Jan. 1, 1959, in Seattle suburb. Excellent drawing area and referrals for the following: urologist, ENT, orthopedic surgeon, dermatologist, psychiatrist and a general practitioner. Write Box 55-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

MEDICAL SPACE FOR LEASE

Office space available in established Medical Dental Building, Lake City (suburb of Seattle). Ideal for specialist. Separate or common waiting room available. Off-street parking. Call Seattle, EMerson 2-6608.

FIVE-ROOM SUITE FOR LEASE

Good opportunity for young GP in Des Moines, Wash. Five rooms, including lab and x-ray. Phone TRinity 8-8111 or write Box 68, Des Moines, Wash.

SPACE FOR OPHTHALMOLOGIST

Established ophthalmologist over crowded. Will revert overflow. Space available approximately Dec. 20, 1958, in new clinic building in fastest growing suburb in Seattle. Write Box 54-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

REAL ESTATE INVESTMENT

Commercial building, excellent national tenant, 8½ yr. lease, 8 per cent net after taxes and insurance. Price $45,000; mortgage $26,500 at 4½ per cent. Owner Mr. Jack A. Benaroya, 408 Joseph Vance Bldg., MUtual 2-3750 or PArkway 3-2401, Seattle, Wash.

LOCATIONS DESIRED

ADMINISTRATOR FOR HOSPITAL OR CLINIC

M.S. Degree in Hospital Administration, B.S. Degree in Business Administration. Married, 39 years old. Experience in 50-bed hospital as administrator-anesthetist 5½ years; 8½ years total administrative experience. Considerable experience in planning, equipping and staffing new hospitals. Prefer combination administrator-anesthesia position of 30- to 50-bed hospital or business manager-anesthetist of clinic. Send inquiries to Box 47-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

PHYSICAL THERAPIST DESIRES LOCATION

Registered physical therapist wishes to locate in the Northwest. University of Kansas graduate, 7 years clinical experience. References. Write Box 56-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

EQUIPMENT FOR SALE

CADUCEUS FOR CLINIC BUILDING

Solid brass, 16 inches high, with 21 inch "wingspread." Weight 11 lbs. Permanent lacquer finish. Easy to mount. $38.50 F.O.B. Seattle. Call LAkeview 2-4221.

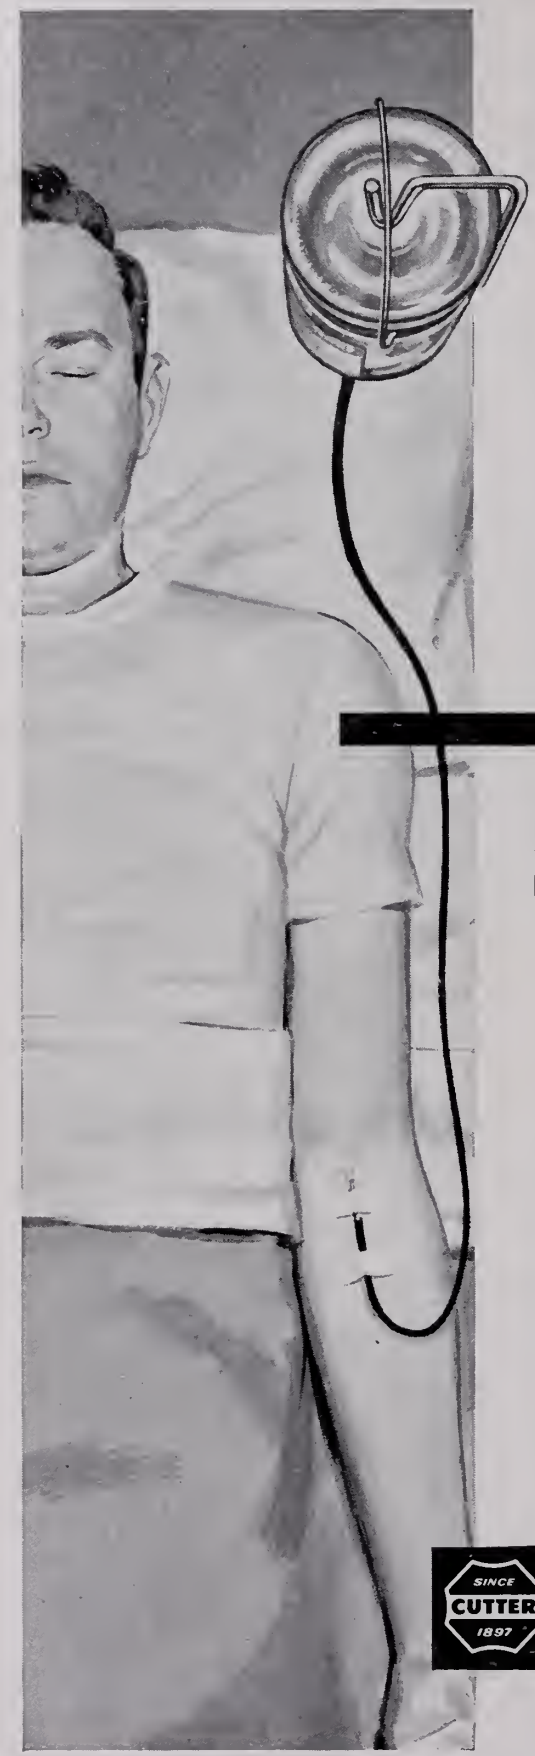
Disipal®*

Brand of Orphenadrine HCl

Relieves Spasm, Pain, and Depression too

Patients with muscle spasm of the usual types demand relief first. Disipal fills this need. In sprains, strains, fibrositis, noninflammatory arthritic states and other musculoskeletal disorders, Disipal not only relieves the spasm, but alleviates the depression which so often accompanies pain of any type.

Dosage: 1 tablet (50 mg.) t.i.d.



IN PARKINSONISM

Highly selective action...energizing against weakness, fatigue, adynamia and akinesia...potent against sialorrhea, diaphoresis, oculogyria and blepharospasm...lessens rigidity and tremor...alleviates depression...safe ...even in glaucoma.

Dartal® dihydrochloride

brand of thiopropazate hydrochloride

• effective and potent tranquilizer • consistent in effects • well tolerated • proved under everyday conditions of office practice • effective at low dosage: one 2-mg. tablet q.i.d. or one 5-mg. tablet t.i.d. in psychoneuroses; one 10-mg. tablet t.i.d. in psychoses.

for depression

▲Deprol▲†

Clinically confirmed in over 1,200 documented case histories[1,2]

CONFIRMED EFFICACY

Deprol ► acts promptly to control depression *without* stimulation

► restores natural sleep

► reduces depressive rumination and crying

DOCUMENTED SAFETY

Deprol is unlike amine-oxidase inhibitors

► does not adversely affect blood pressure or sexual function

► causes no excessive elation

► produces no liver toxicity

► does not interfere with other drug therapies

Deprol is unlike central nervous stimulants

► does not cause insomnia

► produces no amphetamine-like jitteriness

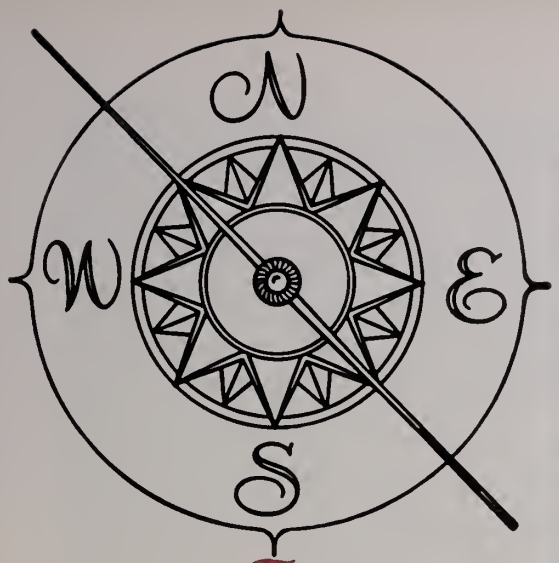
► does not depress appetite

► has no depression-producing aftereffects

► can be used freely in hypertension and in unstable personalities

Dosage: Usual starting dose is 1 tablet q.i.d. When necessary, this dose may be gradually increased up to 3 tablets q.i.d.

Composition: Each tablet contains 400 mg. meprobamate and 1 mg. 2-diethylaminoethyl benzilate hydrochloride (benactyzine HCl).



Supplied: Bottles of 50 scored tablets.

1. Alexander, L.: Chemotherapy of depression—Use of meprobamate combined with benactyzine (2-diethylaminoethyl benzilate) hydrochloride. J.A.M.A. **166**:1019, March 1, 1958. 2. Current personal communications; in the files of Wallace Laboratories.

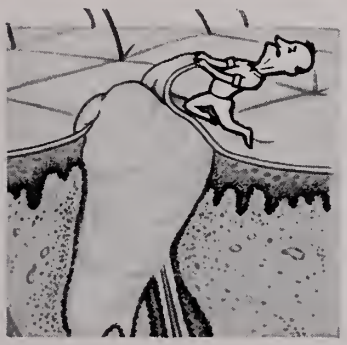
Fostex® degreases the skin and helps remove blackheads



Fostex contains a combination of surface active agents (Sebulytic*) which:

◄ Completely emulsify excess oil so that it is quickly washed off the skin.

◄ Penetrate and soften comedones, unblocking the pores and facilitating removal of sebum plugs.

Fostex dries and peels the skin

◄ The Sebulytic base of Fostex dries and promotes peeling of the skin . . . actions enhanced by the keratolytic effects of micropulverized sulfur and salicylic acid.

*(Sodium lauryl sulfoacetate, sodium alkyl aryl polyether sulfonate, sodium dioctyl sulfosuccinate.)

FOSTEX CREAM
for therapeutic washing af skin in the initial phase af acne treatment, when maximum degreasing and peeling are desired.

FOSTEX CAKE
for maintenance therapy ta keep skin dry and substantially free of comedones.

Fostex is easy for your patients to use

◄ Patients stop using soap on affected skin areas. Instead they use Fostex for therapeutic washing of the skin. The Fostex lather is massaged into the skin for 5 minutes—then rinse and dry.

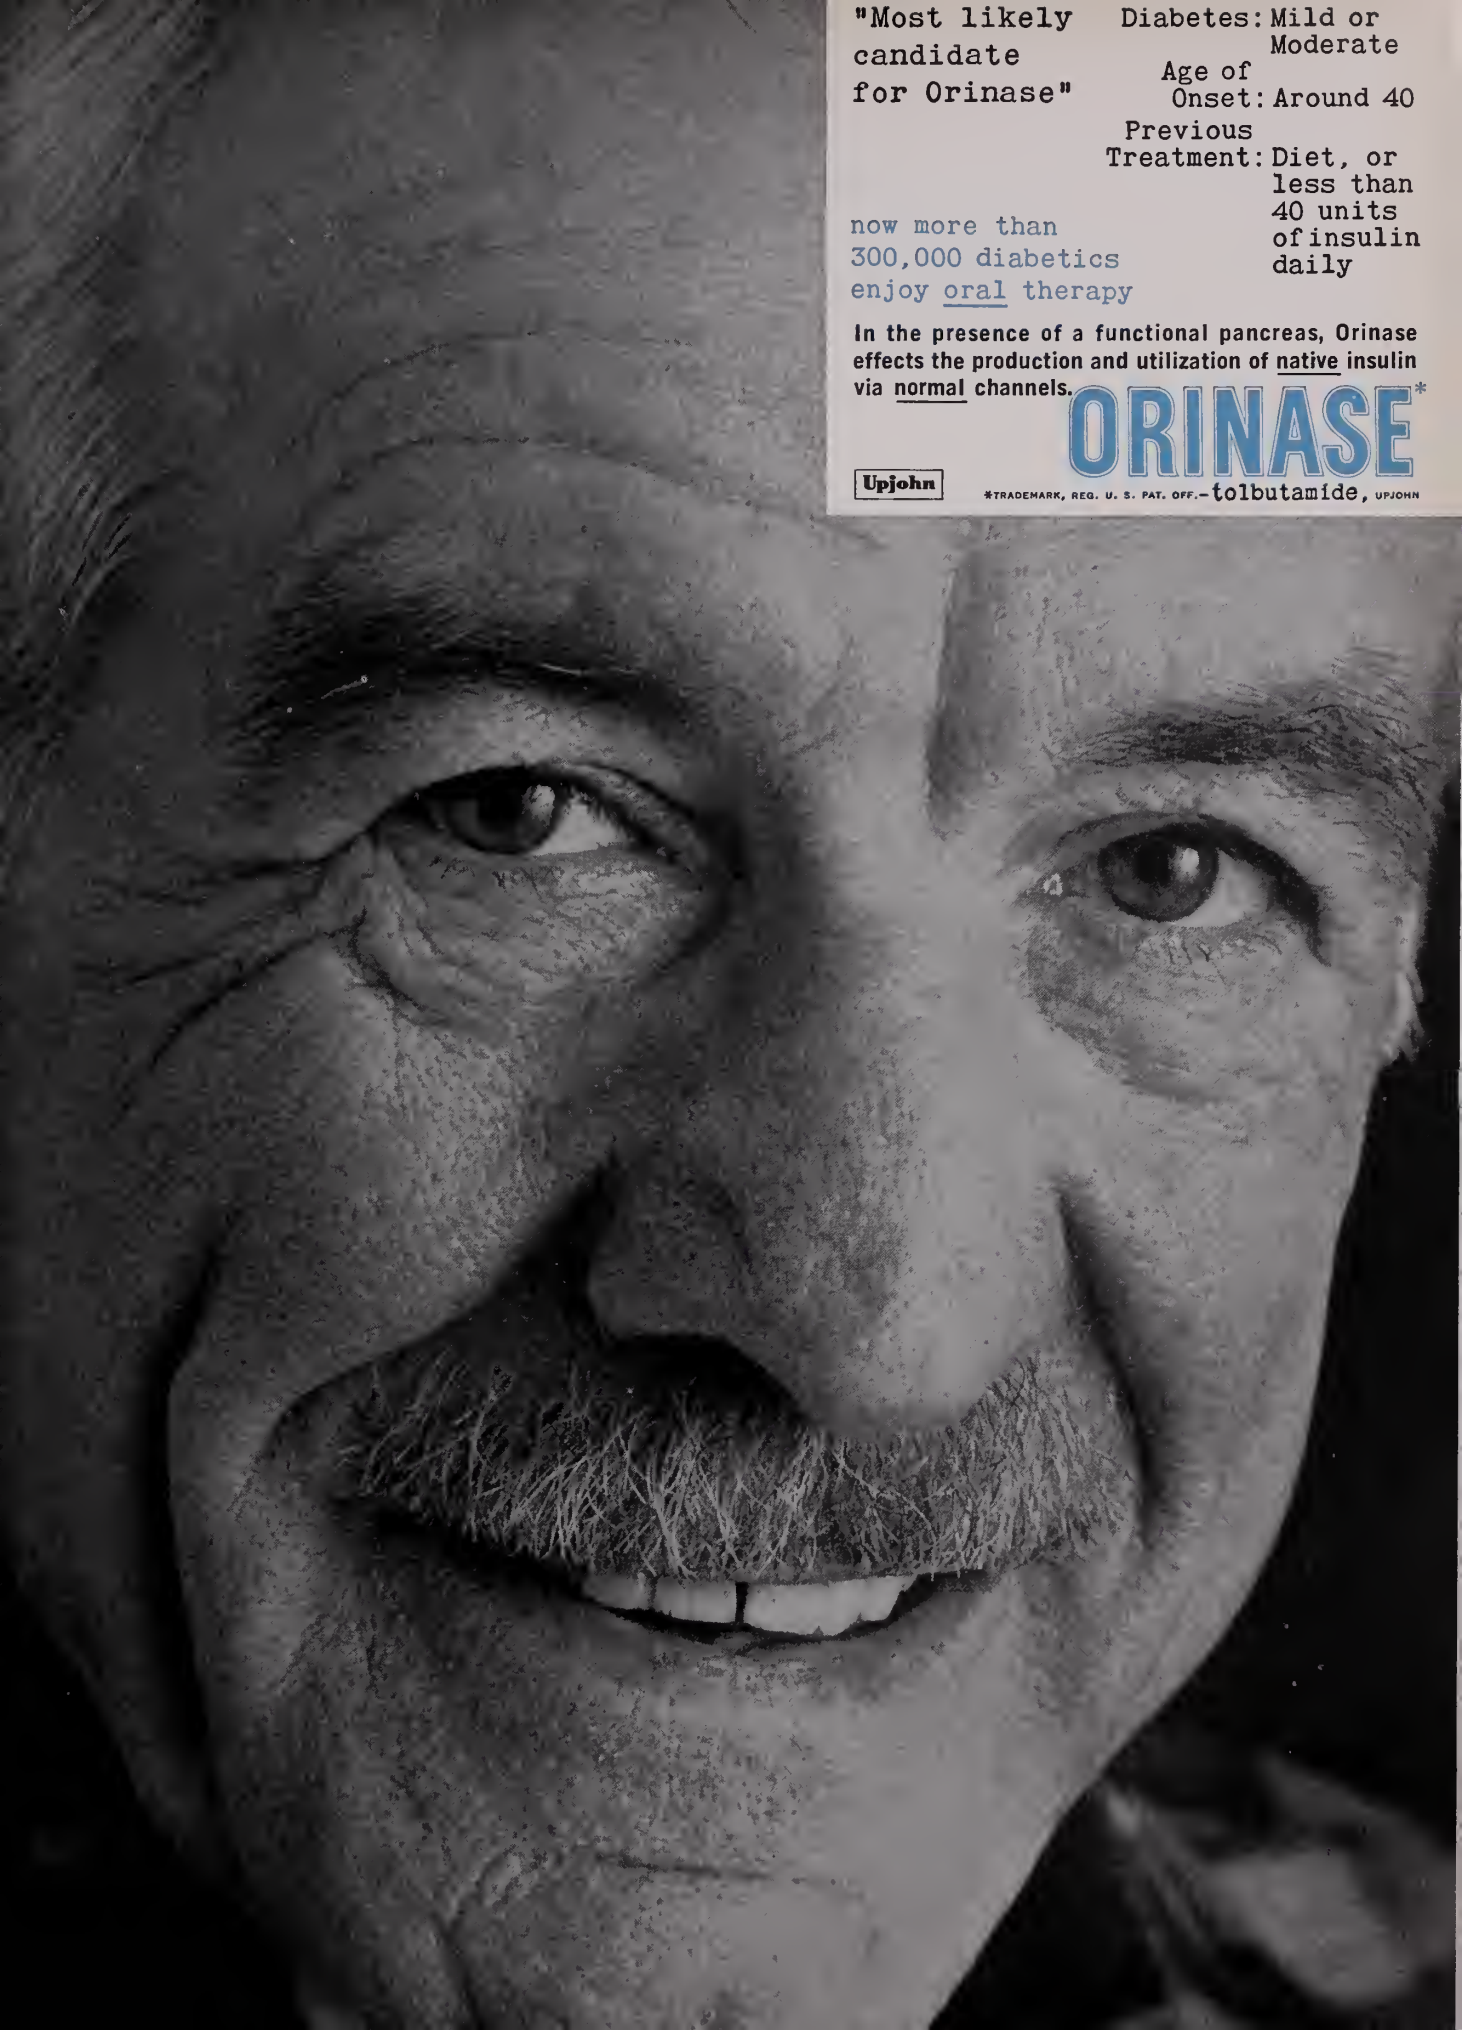
TUUMEST

The Romans had a word for it. "It's up to you," they said. The sage philosophy of the ages changes no more than does the value placed by mankind on the integrity of the individual. The keen insight of a discerning generation can be measured by the interest and care it places in the integrity of its members. Alcoholism is an insidious disease, seeking to destroy its victims. The extent of its damage is just now being appreciated by the medical profession and the public. But the interest generated in no way approaches the measure of care required.



Full appreciation of such a problem can come only with time. And only time will yield the funds necessary to equalize and overcome the cost burden placed upon society by the ravages of this disease. But, first and foremost, you the physician have the opportunity to perform a service for your patients – and society. You can perform that service by recognizing the problem and then seeking the best possible care for it. *Tuum est* – It's up to you.

THE JOURNAL of the American Medical Association

"In the author's clinical experience, methocarbamol has afforded greater relief of muscle spasm and pain for a longer period of time without undesirable side effects or toxic reactions than any other commonly used relaxants . . ."[2]

THE JOURNAL of the American Medical Association

"An excellent result, following methocarbamol administration, was obtained in all patients with acute skeletal muscle spasm."[5]

THE JOURNAL of the American Medical Association

"In no instance was there any significant reduction in voluntary strength or intensity of simple reflexes."[6]

Southern Medical Journal

"This study has demonstrated that methocarbamol (Robaxin) is a superior skeletal muscle relaxant in acute orthopedic conditions."[1]

Hospital practice of infant feeding

Standard one-formula mixture

Normal infant nutrition requires approximately 50 calories per pound of weight. Caloric distribution should be about 15% from protein, 50% from carbohydrates and 35% from fat as formulated for the mixtures in the tables below.

For young infants, a favorable hospital formula consists of a milk and Karo Syrup mixture, isocaloric with human milk, e.g. 20 calories per ounce.

WHOLE MILK FORMULA

FORMULA	OZ.	TOTAL CALORIES	CARB. CAL.	FAT CAL.	PROT. CAL.
Whole milk	24	480	5%	36%	14%
Water	22	—	—	—	—
Karo Syrup	1½	180	45%	—	—

EVAPORATED MILK FORMULA

FORMULA	OZ.	TOTAL CALORIES	CARB. CAL.	FAT CAL.	PROT. CAL.
Evaporated milk	11	484	5%	36%	14%
Water	22	—	—	—	—
Karo Syrup	1½	180	45%	—	—

An infant will usually take 2 to 3 ounces more than his *age in months* at 3 to 4 hour intervals to satisfy his appetite and nutritional needs. It is psychologically unwise to force prescribed amounts. Normally, the gain in weight of 6 to 8 ounces a week during the earlier months gradually diminishes to 3 to 4 ounces a week by the end of the first year. The standard one-formula mixture not only provides adequate nutrition when vitamin supplements are added; it also provides educational opportunities to prevent feeding problems.

ADVANTAGES OF KARO® SYRUP IN INFANT FEEDING

Composition: Karo Syrup is a superior dextrin-maltose-dextrose mixture because the dextrins are nonfermentable and the maltose is rapidly transformed into dextrose which requires no digestion.

Concentration: Volume for volume Karo Syrup furnishes twice as many calories as similar milk modifiers in powdered form.

Purity: Karo Syrup is processed at sterilizing temperatures, sealed for complete hygienic protection and devoid of pathogenic organisms.

Low Cost: Karo Syrup costs 1/5 as much as expensive milk modifiers and is available at all food stores.

Free to Physicians—Book of Infant Feeding Formulas with convenient schedule pads. Write: Karo Infant Feeding Guide, Box 280, New York 46, N. Y.

SANDOZ

CORRESPONDENCE

Place for All

Mount Vernon, Wash.

EDITOR, NORTHWEST MEDICINE:

In your June issue some unknown writer (I assume he holds a medical degree) wrote a letter and, I feel, said some very unkind and untrue things about the general practitioner. This is so true that I was not able to recognize this terribly incompetent doctor he talks about.

If I could make a suggestion to this unknown person it would be that he familiarize himself with the standards of medical care being provided in this state. I believe he would find that large numbers of sick people are pretty well taken care of these days by these lowly fellows.

Another suggestion that might be worth-while would be for him to attend a few of the meetings held by the American Academy of General Practice. I would venture the thought that he might find a pearl of wisdom or two.

In my book there is a very definite place in the practice of medicine for both the general man and the specialist. It is my feeling that neither one can replace the other and the death of the general practitioner would be a serious blow to the welfare of our people.

People who make serious accusations should have the courage to stand up and be counted. It is very difficult to defend yourself against an unknown foe who hides behind anonymity.

Sincerely,
H. J. Greer, M.D.

The letter referred to was published on page 709, under title, In Praise of Group Practice. The fact that it was not anonymous was indicated in the editor's note appended. The man whose name was not published is in active practice as a member of a group. He holds an important position in the constituent medical association of which he is a member. Although he and the editor are the best of friends, they seldom agree on anything except the fact that disagreement is always stimulating and frequently constructive. Permission to publish the letter was sought because it expressed disagreement with the April editorial. Ed.

Weed-Killer Information Sought

U. S. Public Health Service
Communicable Disease Center

Hill-Burton Study

The Hospital Surgery and Construction Act of 1946, better known as the Hill-Burton Act, has been under study by an AMA committee for two years as result of request from the Board of Trustees to the Council on Medical Service. The report and recommendations given to the delegates at the San Francisco meeting drew generous praise from the reference committee and approval from the House. Incorporated in the report is a review of the general problem of federal grants-in-aid which in 1902 accounted for expenditure of $3,000,000 and by 1957 had grown to 1,424 times that figure. Last year the federal government spent $4,270,000,000 through grants-in-aid in all fields.

The AMA committee found that administration of the act had been satisfactory and that waste due to governmental inefficiency had not been excessive. By June 30, 1957, 3,514 projects had been approved. Total cost was $2,874,587,085 with the federal share, $902,894,163. General hospitals took the major portion (82 per cent) with expenditure of $2,352,846,000 and gain of 121,456 beds. Other facilities benefiting were tuberculosis hospitals, mental hospitals, chronic disease hospitals, nursing homes, public health centers, diagnostic and treatment centers, rehabilitation facilities and state health laboratories. Grants to general hospitals were considered most effective.

What had been considered unmet needs when the program was started in 1946 appear to have been materially reduced in the general hospital field. This is particularly true in rural areas, now less urgently in need of hospital beds than urban and suburban areas. Need for beds in tuberculosis hospitals appears to have been met in view of changes in method of treatment and consequent decline in demand.

Basis used for determining bed needs came under some criticism. Present standard is 4.5 general hospital beds per thousand persons but the committee found that, in some states, 3 beds per thousand would be ample. There is some evidence that ill advised construction may result from rigid application of the ratio demanded by the act.

Similarly the committee finds that grants are not now being applied to the most critical needs. There is general lack of facilities for long-term care and requirements of the present legislation are interfering with construction of hospitals in suburban areas, now generally inadequate. A factor in these maladjustments is lack of sufficient freedom of the states in applying grants. Rigidity in assignment of funds to certain types of projects has forced some states to abandon plans for improvement.

The committee finds that needs for rehabilitation facilities have not been met but that grants for diagnostic and treatment centers should be discontinued. Neither should grants for public health centers be continued since most states have now made adequate provisions through use of local funds. Mental hospitals and nursing homes should have more aid.

In transmitting report of its subcommittee to the House, the Council on Medical Service made a number of recommendations. Continuation of the Hospital Survey and Construction program

is approved but its objectives should be redefined and certain changes should be made to make it more effective. States should be given greater latitude to permit more emphasis on suburban fringe areas and to stimulate modernization of existing hospitals. States should be permitted to establish their own priorities in accord with local needs and categorical grants should be eliminated.

The Council recommends that the terms *diagnostic and treatment center* and *public health center* be eliminated from the act. There is much confusion over the meaning of the first of these terms and little need has been demonstrated. Local and state taxes have provided enough to permit omission of the second from the federal law.

A program of federally guaranteed long-term loans is urged to provide low cost financing for construction and renovation of hospitals and nursing homes.

The Council recommends that a physician in private practice be named to the Federal Hospital Council. Recognition of the practicing profession has, so far, been denied. It seems strange that this has not been done since the physician in practice remains the key figure in care of the sick. His advice should be helpful in a program of providing facilities for their care.

Finally, the Council urges state medical associations to seek representation on state hospital advisory councils. The profession was notably inactive in the program in a number of states.•

Schemes to Save Schemes

No one seems to know how much medical care people ought to have. The question would never have arisen had medical care continued to be provided on a basis of individual responsibility of the individual physician to the individual patient. That responsibility and reciprocal responsibility of the patient to pay a reasonable fee would have provided all the adjustments necessary.

Prepayment schemes seem to have made adjustment much more difficult. When the patient pays the bills, his determination of his own need is usually fairly accurate. When the plan administrator pays the bills, he is quite apt to think that he should determine the amount of care his subscribers need. The trouble with his assumption is that when his ideas and those of his subscribers do not seem to coincide, he never questions the system he is trying to operate but blames the physician for not making it work. Witness the following, printed in the interests of the Blue Cross, Blue Shield plans in Iowa, by the *Journal of the Iowa State Medical Society* in the April, 1958 issue.

Claim Costs Continue to Rise

Increased costs of hospitalization and medical-surgical care have caused all rates for prepayment coverage to rise. Ironically, the increases in premium rates are largely due to the fact that more people are using hospitals and medical facilities more frequently. The rate of hospital admissions per 1,000 persons insured continues its upward climb.

Surgical procedures performed in physicians' offices have increased markedly during the past two or three years. The claims for those operations are usually rather small, dollarwise, but now it seems that everyone is running to a doctor's office for attention after minor accidents that heretofore were treated at home by a member of the family. From a medical standpoint, that is fine, but it is bad news for the men who are trying to keep prepayment rates reasonable.

People complain vigorously about the rising costs of prepayment insurance plans, yet individually they utilize the coverage at the slightest opportunity, apparently with the intention of getting their money back each year—with a good rate of interest, if possible.

The physician's office is the health-control center for the community, and the hospital is the physician's workshop, where the more definitive sorts of treatment can be administered. The physician controls the hospital inpatient rate, and he has a responsibility to his community to guard against abuse of insurance plans.

A family unit in which there are three children and a net take-home pay of less than $300 monthly doesn't have much money left for food if it must pay $15 to $20 per month for health-care benefits, either as prepayment or as recompense for services already received.

If the medical profession fails to cooperate in eliminating abuses in doctors' offices and in local hospitals, many of our citizens will be priced out of the insurance market, and the mass of voters will demand government subsidy for adequate health care.

This is not an isolated or unique complaint. Most plan administrators are looking for a scheme to save the scheme. Although the plans were set up so that people could have more medical care, the plan administrators think they should have less. And if the physicians will not "cooperate" they can probably be brought into line by the threat of governmental control.

Mr. Harry Becker had something to say about the matter a few years ago. He said that if the plans operated successfully and enrolled most of the population, politicians would find it expedient to take over. If the plans failed to provide what someone thought people needed, it would be necessary for the government to provide medical care.

Best solution of the problem would seem to be to put a little bit more emphasis on individual responsibility, but in a country as socialized as the United States, that may be an unwelcome suggestion.•

Colorado Code Attacked

Two physicians associated with the United Mine Workers' Welfare Fund in Colorado have attacked the Code of Ethics of the Colorado State Medical Association, one in public address and the other in lawsuit. Conflict in Colorado may seem remote but no one should be lulled into a false sense of security simply by distance. Basic issues are involved.

William Dorsey, medical administrator for the United Mine Workers at Denver, addressed the National Conference on Labor Health Services at Washington, D. C., June 18. The following sentences are from a copy of his remarks provided by the news service of the Conference:

> The perennial conflict between medical care plans and organized medicine has recently culminated in an intensive nation-wide effort on the part of organized medicine to prevent medical care plans from engaging in any form of physician selection. Medical care plans, if they are to provide a good quality of care at a justifiable cost, have no alternative but to designate the physician who will provide the services. Organized medicine, on the other hand, in its effort to preserve the traditional fee-for-service solo practice system, has no alternative but to insist that each patient have the privilege of choosing his own physician. This is the basic conflict of interest. ••• We hear much of the sanctity of the patient-physician relationship ••• but in all too many cases this confidence is blind or misplaced.••• Private practitioners are in the enviable position of selling their services to those who are unable to judge their quality. Organized medicine resents the intervention of a third party because they wish to preserve this immunity from professional scrutiny of their work.••• It is not our impression that anything like the majority of practicing physicians really believe in free choice, or are at sympathy with the tactics being used by their medical societies.••• There is some question whether organized medicine can prevent its members from participating in plans which deny free choice, without violating the antitrust laws. A close watch should be kept on the activities of medical societies, and prompt redress in the courts should be sought whenever they engage in illegal activities. ••• We should work toward repeal of legislation which restricts the operation of consumer or lay-sponsored medical plans. We should work toward a realistic revision of medical licensing laws.

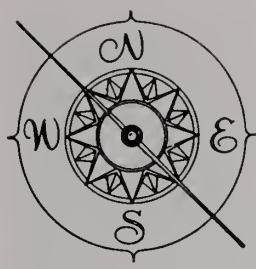
The other attack is much more direct. It is a lawsuit filed, June 19, 1958, in the District Court for the City and County of Denver by William D. Broxon of Trinidad, Colorado, against the Colorado State Medical Association. Dr. Broxon is a physician approved by the United Mine Workers' Fund. His attack is based on the fact that the Colorado Society, on May 13, 1957, issued an official opinion interpreting certain sections of the Principles of Medical Ethics of the American Medical Association. The Opinion, and the AMA code which it includes, have become a part of the Colorado Society's code of ethics and, as stated by Dr. Broxon, a part of its bylaws. He claims that the Official Opinion is contrary to the interests of public health and welfare of the people of the State of Colorado, that it prevents efficient and effective dispensing of competent medical and hospital services, lowers the quality of care, raises the cost and tends to destroy competition. He prays the Court for judgment and decree in the following respects:

> 1. Declaring that said Official Opinion and the Supplement thereto are in violation of the Articles of Incorporation, Constitution and By-Laws of the defendant Society; are oppressive and injurious to the public interest; are unnecessary, unwarranted and unlawful interferences with the freedom and right of plaintiff to pursue his professional trade; are contracts in restraint of trade, contrary to the common law, public policy, and the laws of Colorado; and are, therefore, unlawful, void and unenforceable.
>
> 2. A decree permanently restraining and enjoining the defendant Society from in any manner enforcing said Official Opinion and the Supplement thereto.
>
> 3. For such other, further and different relief as the Court deems meet and proper in the premises. •

. . . acts fast to provide unusually long-lasting relief

'Co-Pyronil' combines a long-acting and a short-acting antihistamine with a synergistic sympathomimetic. It usually begins to combat symptoms within fifteen to thirty minutes and eliminates them for as long as twelve hours. Thus you can give your hay-fever patients and other allergy victims remarkably complete relief on a dosage of only 2 or 3 pulvules daily.

Prescribe 'Co-Pyronil' in attractive green-and-yellow pulvules for adults; in tiny red pediatric pulvules or tasty suspension for children.



Each Pulvule 'Co-Pyronil' provides:

'Pyronil' (Pyrrobutamine, Lilly)	15 mg.
'Histadyl' (Thenylpyramine, Lilly) . .	25 mg.
'Clopane Hydrochloride' (Cyclopentamine Hydrochloride, Lilly)	12.5 mg.

*'Co-Pyronil' (Pyrrobutamine Compound, Lilly)

Functional Uterine Haemorrhage

JOHN STALLWORTHY, F.R.C.S., F.A.C.S. (HON.)
OXFORD, ENGLAND

Most difficult aspect of this problem is its apparent simplicity, a misconception for which drug house propaganda and textbooks must share responsibility. Though a common gynaecologic disorder, it is not mentioned in some books and receives little attention in others.

Functional uterine haemorrhage may be defined as bleeding due to imbalance of those hormonal and other factors normally controlling menstruation.

It is important to note, at the outset, that it may occur either in association with, or in the absence of, organic pelvic disease. The practical significance of this fact will become evident later. Descriptions given of this syndrome, for syndrome it is rather than clinical entity, tend to over-simplify it. Forty years ago the diagnoses of subinvolution and fibrosis uteri were commonplace, but from this clinical and pathologic junk heap Schroder identified metropathia haemorrhagica. His description was clear. The pathologic findings of failure to ovulate, cystic ovary, and endometrial hyperplasia were correlated with clinical evidence of amenorrhoae followed by irregular or prolonged bleeding. Many patients fitted neatly into this category and the explanation of functional uterine bleeding seemed established.

Figure 1, familiar to all, illustrates the difference between the normal menstrual pattern and the abnormality described by Schroder in which the primary disharmony of the glandular orchestra controlling menstruation is a failure to ovu-

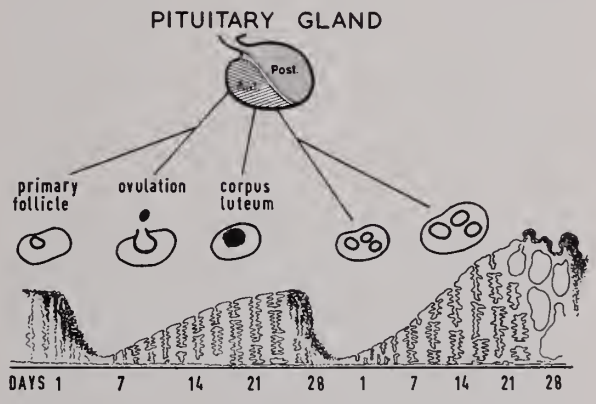

Fig. 1. Normal and abnormal hormonal pattern.

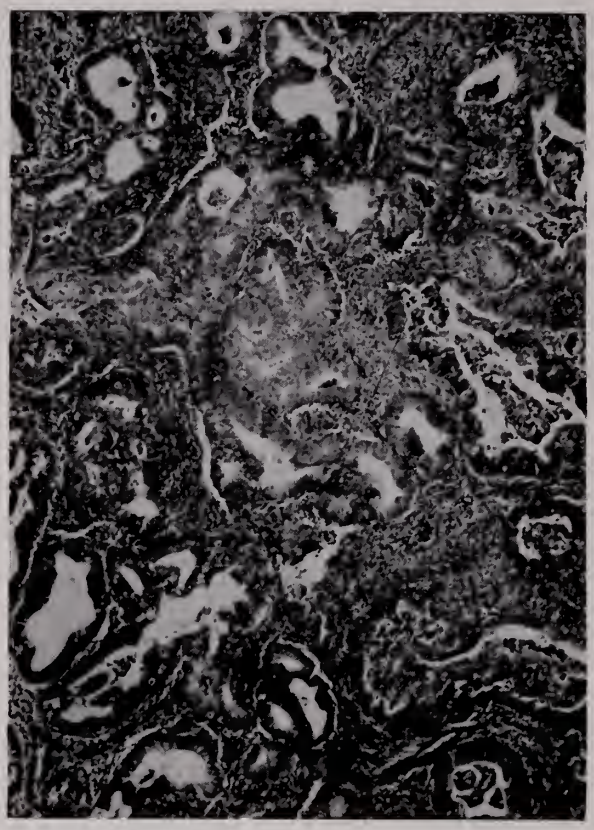
late. The result is excessive follicle stimulation and response. This point is important, for stimulation and response are not always coordinated as revealed by several clinical facts. Most women have phases of anovulatory bleeding. These come and go for no apparent reason, cause little or no disturbance of the menstrual pattern, and are discovered accidentally when biopsy or curettage is performed, as in the investigation of infertility. In an analysis of 1,000 consecutive infertile couples, I found anovulatory cycles in

Sommer Memorial Lecture presented at the 43rd Annual Meeting of the University of Oregon Medical School Alumni Association, Portland, Oregon, April 18, 1958.

26 per cent of women at the first examination, but functional bleeding was not a complaint. Many other observers have published similar results. When irregular bleeding associated with anovulation occurs, the ovarian disease has in common an absence of corpus luteum, but varies from the typical microcystic ovary of puberty bleeding to the large follicular cysts typical of menopausal metropathia. Despite the many variations in all age groups, if the basic fault in functional bleeding were always failure to ovulate the rational therapeutic approach would be an attempt to promote ovulation, however ineffective this might prove in practice. Failing this, treatment would aim at inducing typical endometrial changes by administering progesterone if by so doing a hyperplastic endometrium could be restored to normal function.

The clinical fact is that the simple pattern illustrated in figure 1 is not a constant finding in functional uterine bleeding, for not more than 50 per cent of patients have this imbalance to explain their symptoms. This further complicates the problem. In the last 120 hysterectomies performed in the Oxford Department for functional bleeding after more conservative measures had failed, only 15—that is, 12.5 per cent—had hyperplastic, non-secretory endometrium characteristic of metropathia. Most of these women were under 40 and none had demonstrable pelvic disease to explain the bleeding. In 69, or 57.5 per cent, ovulation had occurred as revealed by secretory endometrium. If operation had always been performed in the pre-menstrual phase, this percentage would almost certainly have been greater. The clinical problem, therefore, is that functional uterine bleeding may occur either in the presence or absence of ovulation, and from an endometrium that is histologically normal, hyperplastic, or even atrophic. Just as the ovarian response to gonadotrophins is not constant, so the endometrial reaction to ovarian stimulation varies. Different portions of the same endometrium may react differently in the same cycle to produce local areas of hyperplasia (Fig. 2), and even when this does not occur the growth effect of oestrogenic hormone is not always correlated with its influence on uterine bleeding. Thus a well developed endometrium may be associated with scanty periods whereas a relatively atrophic endometrium can be the source of profuse menorrhagia. This may sound academic but is important for two reasons. It demonstrates that an apparently simple problem is basically extremely complex, and secondly that no single therapeutic measure could be expected to prove beneficial in all cases. Disappointing though the results of conservative treatment often are, it is surprising that they should appear effective as frequently as they do.



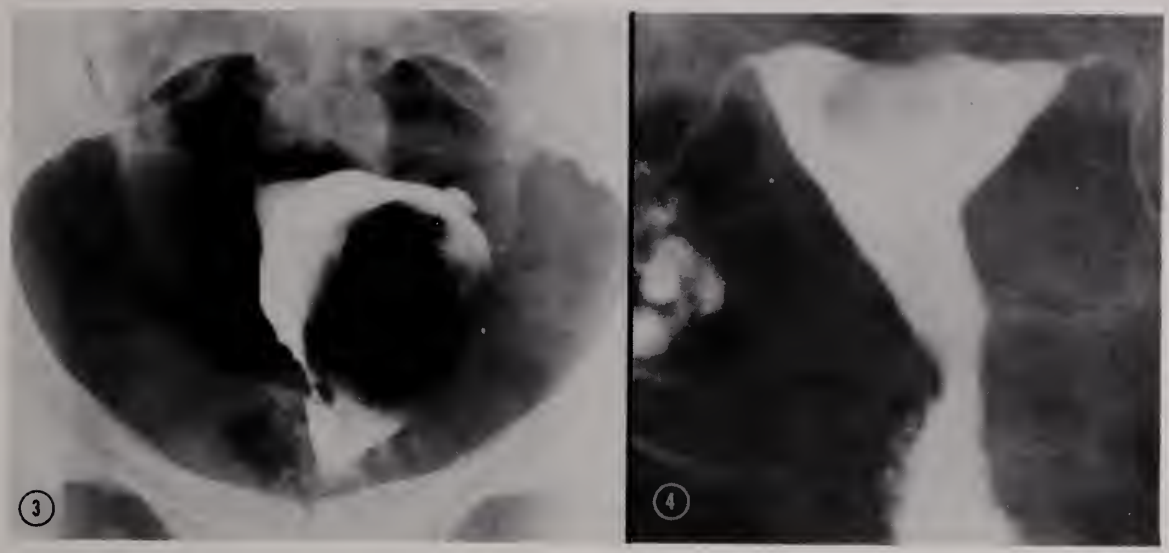


Fig. 2. Local hyperplasia in normal endometrium.

With these considerations as a background, the more important clinical aspects of the syndrome can be reviewed with better understanding. It is easy to teach a medical student that the treatment of acute appendicitis is appendectomy but the practical problems associated with its accurate diagnosis are not so easily learned. The theoretic approach to differential diagnosis may be given in lecture or textbook but final wisdom comes only on the path of experience, and passing years bring both success and failure. In like manner, before the therapeutic problems of functional uterine bleeding can be assessed, certain clinical pitfalls must be recognized.

My definition referred to a disturbance of hormonal and other factors *either in the presence or absence* of organic pelvic disease. This is in contrast to the more common definition that functional uterine bleeding is due to imbalance

Figs. 3 and 4. Submucous fibroid.

in the *absence* of organic disease. The wording was deliberately chosen to emphasize an important point. Many a patient with fibroids or endometriosis or retroversion or uterine tuberculosis has no menstrual disorder. Others with similar diseases have gross disturbances but it must be remembered that though abnormal bleeding will be due to the disease in some, in others it will be functional as defined above. An illustration emphasizes the practical importance of this. Fibroids, particularly when submucous, frequently cause menorrhagia but are seldom responsible for the irregular bleeding characteristic of functional uterine haemorrhage and the two conditions frequently co-exist. Myomectomy will cure the one, but disappoint the patient and bring the surgeon into disrepute in the other. Conversely, hormone therapy will be expensively futile in treating bleeding incorrectly attributed to hormonal disfunction when in fact it is due to submucous fibroids.

Importance of Diagnosis

Oxford is much nearer than Portland to the clinics of continental Europe and, as many know, the doctors of some countries are keener than their colleagues elsewhere on endocrine therapy. When the profession becomes so specialized that there are medical gynaecologists, surgical gynaecologists, and obstetricians, the first group can be relied upon to use more than their quota of hormones. So it is that from time to time women are seen with profound anaemia after lengthy and expensive endocrine treatment for what was thought to be functional uterine haemorrhage when in fact an unsuspected submucous fibroid was the hidden enemy. We can all make this mistake which a hysterogram can prevent and its value should be remembered in doubtful cases (Figs. 3, 4).

In Britain probably more than in America another source of error sometimes revealed by the biopsy curette is endometrial tuberculosis (Fig. 5), or even carcinoma of the corpus in a young woman. The fact that 140 cases of tuberculosis have been treated in the department in the last 20 years demonstrates the need for constant vigilance. Other diagnostic errors to trap the unwary are blood dyscrasias, such as thrombocytopenic purpura, leukaemia, agranulocystosis and, rarely, polycythaemia. Thyroid dysfunction sufficient to cause severe and prolonged bleeding can be missed unless its possible role in these cases is kept constantly in mind.

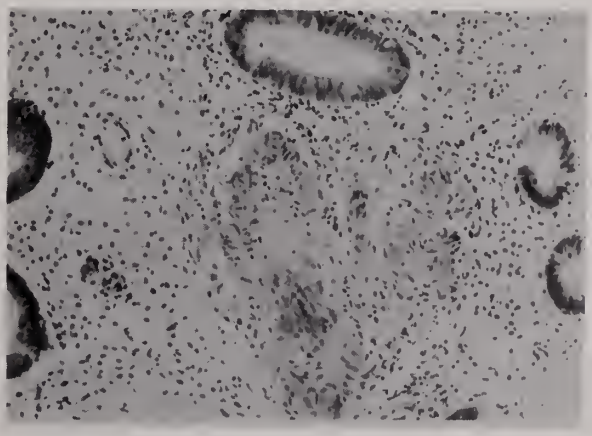

Fig. 5. Endometrial tuberculosis.

Even more important, because it is more frequent, is functional bleeding associated with

anxiety states and emotional conflicts. Many a woman has been subjected to hysterectomy for recurring meno-metrorrhagia when what she required was sensible contraceptive advice or guidance with an intimate problem which the doctor ignored. Whatever method of treatment is favoured for the syndrome, results will be unsatisfactory and may be disastrous without accurate diagnosis. A priest will sometimes render more help than a drug-house and treatment effective for metropathia could be disastrous for carcinoma.

Hormone Therapy

It has been requested that this lecture emphasise the hormonal aspects of functional bleeding. In busy practice neither the patient nor the doctor can always afford the money or the time necessary to establish a precise diagnosis before commencing treatment, but diagnosis before treatment is as sound in principle as cocktails before dinner, and much more important. Endometrial biopsy or curettage should, as a rule, precede hormone therapy. Failing this, cervical cytology is an added precaution in a mature woman but if for any reason the diagnosis is not established before treatment it should be firmly accepted that *hormones should not be administered more than an absolute maximum of three months without curettage unless normal rhythm is restored and cytology is negative.* If puberty bleeding is not severe, one can temporise longer with safety. But, even so, the possible ill-effect of admitting a teenager to hospital for curettage has to be weighed against the psychologic trauma of continuous or irregular bleeding. If the therapeutic response is not rapid, examination under anaesthesia and curettage is necessary. When transfusion is necessary to replace blood loss in these young patients, the value of fresh, Rh matched blood from a pregnant woman with its high hormone content should be remembered.

Treatment

If the imbalance indicated in figure 1 were the explanation of this syndrome as is commonly assumed, treatment would aim at restoring ovulation, or, failing this, at changing the endometrium to a more normal pattern by substitution therapy. After repeated trials with both proprietory preparations and stronger solutions prepared for research, we have had no success in inducing ovulation by hormone therapy in the human. Some workers have claimed success but that has not been our experience and we have abandoned this line of treatment.

Restoration of a more normal endometrial pattern with at least temporary relief of symptoms is usually much easier and there is no need to make it a complicated and expensive procedure. Oestrogens are cheaper than progesterone and in most cases cyclical oestrogen therapy is effective. The theoretic need for both hormones correctly balanced is attractive but it must be remembered that most women with anovulatory cycles menstruate regularly and apparently normally. The interaction of both hormones is obviously not a necessity. Moreover, the correct balance for the administration of oestrogens and progesterone, even if both were necessary, is not known. In any series of cases of functional uterine bleeding there is at least a 50 per cent chance that ovulation is occurring with resultant progesterone influence of the endometrium. So-called physiologic curettage by progesterone administration is unsound and expensive unless easier methods have failed and biopsy has confirmed the metropathic picture.

Stilbestrol

A reasonable and usually effective treatment plan, applicable to most cases, consists of giving stilbestrol 1 mg., or its equivalent, for 18 days commencing when bleeding ceases. It is then stopped until after the next episode of bleeding when the same routine is repeated. This is continued for three monhs by which time, in a substantial proportion of patients, regular cycles are instituted. If the loss is continuous or heavy it may be curtailed by larger doses of oestrogens, such as stilbestrol 5 to 10 mg. daily. When bleeding ceases, this dose is slowly reduced over a period of days to 1 mg., which is continued until the end of the 18 day interval previously described. This simple routine should not be continued for longer than three months and, if it fails, curettage is indicated. In the event of recurrent irregularity the case should be assessed at consultant level. No reference has been made to androgens or to the use of pellet implantation or other forms of depot therapy as these are best reserved for the relatively few selected cases in which simpler measures have failed and the endometrium has been studied histologically. To describe them in more detail here would complicate the general picture. One is reminded of the words of Sir Anthony Carlisle written in 1824: "In your ideas of the powers of remedies

do not be too sanguine, for you are liable to continued disappointment."

In addition to these measures a valuable therapeutic weapon, not as widely known as it should be, is the administration of liver, as described by Wiles and Maurer, Curtis, and Sutherland. In the liver treatment of pernicious anaemia it was observed that menorrhagia was controlled. Clinical trials demonstrated that the less purified preparations of liver fat contained a saponification-stable substance which was called the antimenorrhagic factor. Curtis found concentrated liver extract, 8 to 16 cc. daily, effective whereas capsules prepared for treatment of pernicious anaemia were not. This factor has been marketed by Armour under the name of Amfac Glanules. In his first series of 46 cases of functional uterine bleeding, Sutherland gave 2 glanules three times daily during active bleeding, and 1 to 2 glanules three times daily one week before a period for three months. No alternative treatment was given and 60 per cent of his patients were completely cured, and 8 per cent were materially improved. The shortest treatment given in his series lasted for 2 months and the longest for 10.5 months. The treatment was most effective in the younger age group and less successful at the menopause. Nausea, due to intolerance, was rare. We have used this preparation with encouraging results, but research is still in progress and it will be some time before detailed analyses are available. An interesting point is that some patients with functional uterine bleeding have capillary disease in the skin vessels as demonstrated by the capillary microscope. It may be that similar changes occur in the endometrial vessels, but more work must be done to investigate this. The effect of liver treatment on the capillaries is being studied at Oxford.

The general treatment of these patients is important. Reassurance is of the greatest importance when no pathologic lesion is found. As already explained, anxiety can itself be a casual agent. Anaemia must be treated but a practical point often overlooked is that some women lose more heavily when taking iron during a period. For this reason it is wise to stop taking iron on the eve of and during menstruation.

Hysterectomy

However enthusiastic one may be concerning hormone therapy, and I frankly admit that I believe its place is limited, the fact remains that in refractory cases, particularly at the menopause, surgery can restore the patient to health and activity while at the same time removing a real threat to her future. The emancipation of a woman whose life and social activities have been planned round the all too few estimated clear days of the month has to be seen to be believed. Curettage will restore 30 to 50 per cent to normal, at least temporarily, but if recurrence fails to respond to cyclical hormone therapy we advise hysterectomy and usually perform it by the vaginal route.

A further comment on functional bleeding and the role of surgery as it is practised in the Oxford Department is given by the following results. Of 160 hysterectomies performed at the Radcliffe Infirmary on women under 40 in the last 5 years, 83 (52 per cent) were for functional bleeding which had not responded to the methods of treatment outlined in this address (Fig. 6).

HYSTERECTOMY under 40

Indications		Number	Percentage
Functional Bleeding		83	52%
Carcinoma :			
a. Cervix (Post-radiation Wertheim)	17)		
b. Cervix Stage O	6)	25	15.6%
c. Corpus	1)		
d. Ovary	1)		
Fibroids		20	12.5%
Endometriosis		13	8%
Miscellaneous		19	11.9%
Total		160	100%

Fig. 6. Hysterectomy on women under 40 performed in five years (1952-1957) from approximately 11,000 consecutive inpatient operative cases.

Another aspect of this problem is revealed by an analysis of 78 hysterectomies following a previous pelvic floor repair. It is significant that 25 of these (32 per cent) had the repair operation at the age of 40 or over, and subsequently required a hysterectomy for bleeding. It is also interesting to note that of the total series, hysterectomy was performed on 25 for subsequent functional bleeding, and of these only 2 had the typical metropathic picture. Thirteen had non-secretory endometrium and 10 had histologically normal secretory type. There were 2 cases of bleeding associated with ovarian thecomas.

The moral of this is that when a pelvic floor repair is necessary in a woman of 40 or over, it is doubly important to assess carefully the whole

clinical picture and if at that stage there is indication of functional bleeding, it is a wise plan to combine vaginal hysterectomy with the repair.

In a consecutive series of over 1,400 vaginal hysterectomies performed on women of all ages, including many poor surgical risks and women over 70, there has been 1 death. This occurred from cardiac failure on the third day after operation. Comparable results can be obtained by the total abdominal operation as shown by no operative deaths in 1,514 cases in the years 1951-1957. (There was one postoperative death from pulmonary embolism in a patient with heart disease.) As Moynihan once said, "surgery has been made safe for the patient and now the patient must be made safe for surgery." If this is attended to, the risk of major surgical procedures is now slight indeed. It should be remembered, moreover, that the dangers of carcinoma of the corpus developing in women with functional bleeding at 50 or over is definitely increased, and for this reason there is a strong case against hormonal therapy and in favor of surgery for women in this category.

Summary

Functional uterine bleeding is a complex syndrome as yet imperfectly understood. Accurate diagnosis is essential to eliminate blood dyscrasias, polypi, infections and even carcinoma. Curettage is advisable, both as a diagnostic and therapeutic measure, and cures of approximately 30 per cent can be expected. Liver preparations are valuable and cyclical oestrogen therapy is cheap, easy to control, and effective in a sufficient proportion to make it justifiable as the first line of attack when endocrine therapy is chosen. More elaborate and expensive hormone therapy with androgens and progesterone should be reserved for selected cases in which the endometrial pattern has been studied. Functional menopausal bleeding should not be treated conservatively too long, and if recurrent or associated with a menopause delayed to 50 or over, hysterectomy offers immediate cure and future safety. •

85 Banbury Road.

AMA Pamphlet on Driver Fitness

Before taking the wheel, every driver should check to make sure that he is fit to drive. Under certain circumstances—outlined in a new American Medical Association pamphlet—a driver can be a dangerous hazard on the road. "Are You Fit to Drive?" urges drivers to contact their physicians if they are in doubt about their fitness. Prepared by the AMA's Committee on Medical Aspects of Automobile Injuries and Deaths in cooperation with the Center for Safety Education at New York University, the booklet contains information about those conditions that can adversely affect driving skills—emotional upsets, driver attitudes, sleepiness, medicines, faulty vision, certain nerve and heart disorders, diabetes, old age and drinking.

For distribution through physicians' offices, the booklet currently is available from the Association of Casualty and Surety Companies, 60 John Street, New York 38, N.Y. Price is $4.60 per 100 copies, regardless of quantity.

Rehabilitation

G. N. Aagaard, M.D.*
SEATTLE, WASHINGTON

First, I wish to thank Dr. Erickson and the Oregon State Board of Health for permitting the allocation of your unencumbered Rehabilitation Construction funds. These funds have been of great significance in the construction of our Rehabilitation Unit in the University of Washingtgon Teaching and Research Hospital. We deeply appreciate your action.

In any discussion of rehabilitation it is wise first to agree on a few fundamental definitions. Rehabilitation is the process through which the person with a major handicap is helped to achieve his maximum potential on the physical, social, emotional, and vocational spheres of life. In our consideration today we will think of individuals with major handicaps as those kept from their normal activities by disability for a period in excess of six months.

There are, of course, definitions of rehabilitation which are quite broad and include every aspect of health care. The physician and nurse in treating any patient with an acute illness are practicing rehabilitation in an effort to restore the sick person to normal function at the earliest possible moment. In this presentation, however, I will confine my discussion to restoration of the individual with the major handicap to his maximum functioning capacity.

The Problem

How much of a rehabilitation job is there for us to do here in these United States? How many individuals are there among us with major handicaps? It has been estimated that at present there are some 40,000,000 people in the United States who have some chronic disease or impairment. Of these, 5,300,000 have a long-term disability which, for a period of at least six months, makes it impossible for them to work or carry on other normal activities on a regular basis. Between 2,000,000 and 2,250,000 individuals are estimated to be disabled at the present time and to have been disabled for a period of 12 months or longer. Of the 5,300,000 disabled people mentioned above, about 1,200,000 are institutionalized in mental, turerculosis, and other hospitals whereas 4,100,000 are not in institutions. Rusk has estimated that 12 per cent of the people in the United States have disabilities which would require prosthetic devices, special surgery, special treatment, or special vocational training and placement if they were to be made self-sufficient.

What are the diseases which cause these major disabilities? Distribution in any given institution varies depending upon the age group, occupations, and other factors in the population served. Hilleboe and others reporting on a series of patients in the New York Rehabilitation Hospital found that 20 per cent of their patients had arthritis, 20 per cent had hemaplegia, 17 per cent had paraplegia or quadriplegia, 13 per cent had malunited fractures, 11 per cent were victims of multiple sclerosis, 3 per cent had had amputations and 16 per cent were in a miscellaneous group most of whom had various neurologic diagnoses. Cardiovascular renal disease, neurologic disorders, arthritis and related conditions, tuberculosis, and blindness are almost always among the most significant diseases causing major disability.

Diagnosis of Disability

As in all of medicine, rehabilitation must begin with an accurate diagnosis. We must know precisely what disease or diseases the patient has. But the rehabilitation diagnosis does not stop with a simple cataloging of the ills which beset the patient. Diagnosis must be extended into evaluation. You must know not only what disease or what injury the patient has but what this disease has done to the patient and what the patient can do with the disease. You must know to what extent the illness has disabled the individual and his potentiality for restoration of physical, emotional, social and vocational functions. It has been stated repeatedly and with truth that the rehabilitation process is a team program.

* Dean of the University of Washington School of Medicine, Seattle, Washington.

Read before Conference on Rehabilitation, University of Oregon Medical School, Feb. 27, 1958, Portland, Oregon.

This teamwork begins in the diagnosis and evaluation phase. Cardiologist, neurologist, orthopedic surgeon, neurosurgeon, physiatrist, psychiatrist, psychologist, social worker, nurse, physical therapist, occupational therapist, vocational counselor—all of these and more may be needed for the proper diagnosis and evaluation of the patient with a major handicap.

Treatment

Treatment in the rehabilitation program follows diagnosis and evaluation and is similarly a team process. Obviously, the team needs a leader but the rehabilitation effort is fundamentally one to which individuals from different disciplines must contribute if the desired result is to be obtained. The rehabilitation process may begin and should begin at the earliest possible moment if the degree of disability is to be minimized and return to maximum function speeded. Participation of the key members in a rehabilitation program for any given patient may vary from time to time according to the progress he makes. At one stage it may be the physiatrist and the physical therapist who carry the responsibility. Later the psychiatrist and the social worker may take over if the patient experiences a period of depression or deep discouragement. The orthopedic surgeon may carry major responsibility during the period when surgical restoration is required. The clinical psychologist and the vocational counselor may carry responsibility to a major extent during the final stages of the rehabilitation process for some individuals. Many different specialists may be needed in consultation for brief or prolonged observation of the patient.

Results

What are the results of a rehabilitation program dealing with patients with chronic major disabilities? Obviously, the results will depend to a large extent upon the type of patients and the types of disabilities under consideration. Hilleboe's study, previously referred to, reported on 100 welfare patients with major disabilities. Eighty per cent of these patients had had disabilities for more than one year and in 48 per cent, disabilities had been present for five years or more. These 100 patients had a total of 120 handicaps in addition to the disabilities for which they were admitted. Thirty-two patients showed abnormal mental conditions, such as mental deterioration, mental retardation, depression, psychoneurosis, and chronic alcoholism. Nineteen patients had cardiovascular complications. Certainly they were not selected as easy cases.

What were the results? On admission 48 per cent required custodial care. At the time of discharge only 23 per cent required custodial care. At the time of admission 42 per cent were ambulatory with or without aids. At the time of discharge 67 per cent were ambulatory with or without aids. On admission 60 per cent were considered to have no potentiality for employment but on discharge only 36 per cent were considered unemployable. In August, 1957, Rusk reported on 31 patients with spinal cord injuries who were sent from Georgia to the New York University, Bellevue Rehabilitation Unit. Twenty-nine had paraplegia and 2 had quadriplegia. On admission 10 were bed-bound. On discharge none were confined to bed. On admission 17 were capable of ambulation and of these, 8 were able to step up a curb or a step. On discharge 27 were capable of ambulation and could use steps. One year later, 24 were still capable of ambulation and none were confined to bed, indicating that most of the rehabilitation gains had been maintained. On admission 7 of the 31 patients had been employed, but one year after discharge from the rehabilitation center 14 were employed and 10 were in training for employment and appeared certain to be employed.

Permanence

The question may be asked, do these people stay rehabilitated? The Rusk study referred to above gives some indication of this in the figures cited during the observations made at least one year after discharge. Bruehl reviewed a series of patients who received services through the Division of Rehabilitation in the State of Washington. These patients were reviewed from 30 to 42 months after they had been declared rehabilitated. Purpose of the study was to see how effective rehabilitation services had been in helping people with physical handicaps to become productive and self-supporting members of society. Ability to remain self-supporting was the chief criterion of effectiveness. Ninety-two per cent of the patients followed were found to be self-supporting either as wage earners or as housewives. Only 2.8 per cent of the patients followed were receiving public assistance at the time of follow-up. Fifty-three per cent had been receiving public assistance at the time that they

were accepted for rehabilitation services. Eighty-five per cent had received wage increases since they had resumed employment and in one-half of the cases these increases had amounted to more than $1,000 per year.

How effective are rehabilitated patients as workers in the industrial world? During World War II, 83 per cent of our nation's industries employed handicapped workers. These industries reported that among the handicapped workers there was a smaller labor turnover, less absenteeism, fewer accidents, and equal or higher rates of production. If these people are placed in jobs within their capabilities they may actually have advantages over able-bodied workers.

Costs of Disability

What are the dollars and cents of rehabilitation? Many of you are probably familiar with the data supplied by the Office of Vocational Rehabilitation concerning 44,000 people who received vocational and physical rehabilitation under that agency in 1944. Twenty-two per cent, or more than 10,000 had never been gainfully employed and nearly 90 per cent were not employed at the time that they started their rehabilitation program. The annual average wage of the entire group prior to rehabilitation was $148. After rehabilitation the average annual wage had increased to $1,768. Total earnings of the entire group rose from $6,510,000 to $77,786,000. Prior to rehabilitation the majority of these persons relied on general public assistance not only for themselves but also for their families. Annual cost to the taxpayer for this assistance varied from $300 to $500 per case. Total cost of rehabilitation averaged only $300 per case.

Bakst has pointed out that disability is disadvantageous economically in the following ways: 1. It reduces the purchasing power of the individual. 2. It increases taxation. 3. It decreases tax payments. 4. It gives a generally lower social tone to society. The rehabilitation process reverses all four of these disadvantages.

Further Results

Perhaps the most important gain from the rehabilitation program is the restoration of the individual's morale, the upbuilding of his dignity and self assurance. This is well illustrated by a patient under my care during World War II. This middle-aged man with hypertension had had a cerebral vascular accident and was unable to continue the vigorous type of work which he had pursued previously. Because his savings were soon spent, he and his family found themselves on relief. Under my care the patient had received a low salt diet together with other medications which I was at this time attempting to evaluate in the treatment of hypertension. As his general condition improved and he regained the function of his partially paralized arm and hand, he asked if he might do some wood work at his carpenter's bench at home. He was encouraged to do this.

As his physical improvement continued he began to cut out attractive wooden figures. He decorated them with gay paints, and placed them as ornaments in his garden. Several months after his stroke had occurred and when the rehabilitation process was moving along nicely, I noted that his blood pressure had dropped very significantly. In fact, this drop occurred at a time when I had stopped the active medication which I had been testing and had given him a placebo. The drop in blood pressure had been much more striking than any which had occurred on low salt or any other form of treatment to which he had been subjected. This was a matter of considerable interest so I asked various questions and encouraged him to tell me what change had taken place since he had last visited me in the hypertension clinic.

With considerable emotion and satisfaction he told me that since his last visit, his new business, the creation of wooden garden ornaments, had increased to such a point that he had been able to go off the public assistance roles. Then he told me how much concern and even shame he had felt that he and his family had found it necessary to become public assistance clients. He spoke with great feeling of his joy at being able to take himself off the relief roles. Here was an influence more potent, as far as his blood pressure was concerned, than any diet or medication which I had been able to prescribe up to that time. Without a doubt, the spiritual and emotional values of rehabilitation not only for the patient but for his family are the most significant although incalculable.

Costs of Rehabilitation

Costs of rehabilitation vary of course with the degree of disability, the complications which have occurred, and the type of facility in which the program is carried out. Rusk and his col-

leagues estimated that the cost for rehabilitation of the patients with paraplegia or quadriplegia referred to previously was $1,794 if there were no medical or surgical complications. However, if medical or surgical complications had occurred before admission to the rehabilitation center, the cost of rehabilitation for each patient was increased to an average of $4,467. This illustrates the tremendous importance of instituting proper care early in the course of the illness, in order to prevent unnecessary disability and medical and surgical complications.

Planning

How can one start a rehabilitation program and what should one do to make available this important service? I am aware, of course, of the fine work already going on at your Portland Rehabilitation Center and here on the campus of the University of Oregon Medical School. Certainly, first one should look at the community to see who is interested in rehabilitation. In a typical community of some size, one will find that there are many people with major handicaps. Fortunately there are many voluntary and governmental agencies interested in helping these individuals. Mobilizing this interest and potential assistance is a challenge, the meeting of which brings great rewards. Although a number of agencies may be interested primarily in a limited phase of rehabilitation or in assisting patients with a particular type of handicap, it should be emphasized that a comprehensive rehabilitation center should be the primary objective. There should be one place where any individual, no matter what his disability, can get thorough diagnosis and evaluation and begin the rehabilitation process. The comprehensive center should be the initial effort because it is economical from the standpoint of both facilities and personnel. As you well know, we are at the present time suffering from a great shortage of many of the health personnel needed in rehabilitation programs. Physical therapists, occupational therapists, physiatrists, and clinical psychologists are in short supply and their services must be utilized wisely to meet the needs of the handicapped individuals. This can best be done through providing these services in a comprehensive unit.

Hospital Cooperation

The comprehensive rehabilitation center should have close relationship to a general hospital. It has already been pointed out that the rehabilitation process for any given patient may from time to time call upon a wide variety of health specialists. Similarly, the special facilities of the hospital laboratory or x-ray department or other special equipment for medical or surgical procedures may be of the utmost importance to the patient benefitting from the rehabilitation program. In fact, for the person with an acute major injury, like a spinal cord injury, members of the rehabilitation team should see the patient as early as possible after the acute injury and contribute to his care at the earliest possible time. In this way complications and unnecessary disability can be prevented.

Program at University of Washington

Our rehabilitation program at the University of Washington Medical School and Hospital will not be large as far as physical facilities are concerned but we are confident that it will have a large impact on the health picture in our state and in the Northwest. Although our major objective is the education of members of the health team for work in the rehabilitation field, we will give a very significant amount of service. Although the beds assigned to the rehabilitation service itself will be few in number the rehabilitation team will also serve patients on many other services of the University Hospital. In addition, the rehabilitation unit will evaluate and treat a much larger number of ambulant patients. Our services will include medical and the related specialties—physical and occupational therapy, psychological testing, social service, and vocational counseling. We do not expect to provide actual vocational training within the University Hospital but we will work very closely with the staff of the Office of Vocational Rehabilitation and with sheltered workshops and other vocational training units. We are looking forward to the full scale opening of this program in the fall of 1959, because we know that it will make a major contribution to our program of teaching and research and to our contribution to the health care of our people.

In conclusion, rehabilitation offers an opportunity to invest talent, energy, and funds in an enterprise which gives unparalleled dividends in human and economic values. From the inception of the program through diagnosis, evaluation and treatment, cooperation and teamwork are the watchwords.•

Ruptured Abdominal Aneurysm

Lucius D. Hill, M.D.
SEATTLE, WASHINGTON

Less than a decade ago, ruptured aneurysm at any site was considered a hopeless situation. Early attempts at correction of this serious condition almost consistently met with failure. These earlier methods included proximal ligation of the abdominal aorta, wiring and electrocoagulation, wrapping or re-enforcement, and combinations of these procedures. In addition, Matas[1] utilized ligation and obliterative endoaneurysmorrhaphy successfully in one case. This apparently was the first recorded instance of cure of an aneurysm of the abdominal aorta by ligation. Since the introduction of resection and replacement by grafting of abdominal aneurysms, this treatment for these lesions has become quite successful. However, the number of successfully treated ruptured aortic aneurysms is still quite small—in fact, I have not seen a report of a successful case from the Northwest area.

Seriousness of aneurysms was recognized by Szilagyi,[2] who found that 61.6 per cent of patients with aortic aneurysm died from its effects. The study of Estes[3] further supports the fact that most patients with abdominal aortic aneurysm succumb from the direct effects of this lesion. He noted that 63 per cent of individuals with aneurysms died from rupture of the dilated vessel.

My experience corroborates the seriousness of this lesion. Preceding the time of successful treatment of aortic aneurysms, many instances of rupture of these lesions were seen in the Virginia Mason Hospital.

It is unusual for patients to die of ruptured aneurysm without preceding warning in the form of persistent lower abdominal pain, which often radiates into the back. The presence of a large pulsating abdominal mass may cause the patient to feel as though he has a "second heart" in the abdomen. To the physician, the large pulsating abdominal mass is an obvious sign of abdominal aneurysm, and when accompanied by pain the prognosis is grave unless corrective measures are taken. Since the introduction of homografts and synthetic prostheses, a number of abdominal aneurysms have been repaired successfully in this hospital by elective operation.

The case presented here illustrates that ruptured aneurysm is not a hopeless condition, but is today a salvageable surgical emergency.

CASE REPORT

The patient, a 54 year old man, was in good health until about one week prior to admission to the hospital. During this week he had noted a nagging distress in his lower back, particularly when sitting up and especially when driving. He was returning home from a trip when he was suddenly seized by severe pain in his low back and lower abdomen. With the onset of severe pain he became ashen grey in color and developed nausea and vomiting, was forced to stop the car, and had a loose bowel movement. His wife who was with him, drove him to the nearest town and he was seen shortly afterward by a physician and a surgeon. During the careful examination it was noted that he had an abdominal mass to the left of the midline, which was vague in outline and was thought to be pulsatile. The patient was somewhat overweight, making abdominal palpation exceedingly difficult. Palpation was complicated also by the presence of some abdominal spasm. There was tenderness, particularly in the right flank, and a sense of resistance over the entire right side of the abdomen. There were no bowel sounds in the right flank. An x-ray of the abdomen showed gas to be present in loops of bowel in the left upper quadrant, but no loops of bowel were present in the right lower quadrant. His hemoglobin when first seen was 11 Gm., blood pressure 110/70, and pulse 72, but these were apparently labile. His temperature was 98.6 F. An I.V. pyelogram done with the patient in bed, shortly after he was brought into the hospital, revealed the right kidney to be somewhat transverse and pushed upward out of position. The psoas shadow on the right was obliterated. It was concluded that the patient had an abdominal aneurysm, and he was

sent by ambulance to the Virginia Mason Hospital. On admission the patient was in acute distress. He was pale, sweating and complaining of severe lower abdominal pain radiating into the back and into the right flank. On abdominal examination the entire right side of the abdomen was doughy, and exquisitely tender. There were no bowel sounds in the right flank or right side of the abdomen. Femoral pulsus were present but weak. Further examination revealed a vaguely outlined, pulsatile mass extending to the left of the midline. I.V. pyelogram showed the right kidney to be pushed upward out of position. The ureters appeared normal. An electrocardiogram showed an abnormal tracing, consistent with coronary insufficiency. His hemoglobin was 9 Gm. on admission contrasted with 11 Gm. obtained several hours earlier.

It was felt that this patient had a ruptured aneurysm which was temporarily occluded by clot, and that surgery was mandatory in spite of the abnormal electrocardiogram, in order to save the patient from extravasation.

The patient was taken to the operating room and a long left paramedian incision was made from the xiphoid to the symphysis pubis. Immediately on entering the abdomen, a large mass of clotted blood was seen in the retroperitoneal area of the right flank, covering the entire right side of the posterior abdominal wall. Every effort was made not to disturb this huge clot. As soon as the incision had been made and these findings noted, the upper extent of the aneurysm was exposed without disturbing the hematoma, and a clamp was placed on the aorta, following which a clamp was quickly placed on each iliac artery (Fig. 1). This maneuver offset the possibility of further leakage into the flank. Following this, the huge clot in the right retroperitoneal area was evacuated. The aneurysm was then excised, and an Edward-Tapp nylon bifurcation graft was sutured in place (Fig. 2). Inspection of the aneurysm showed a rupture of the right anterior lateral wall through which two fingers could be placed. After graft was sutured in place, the clamps on the aorta and the iliac arteries were slowly released while the patient's blood volume was replaced with 4,000 cc. of whole blood. At termination of the procedure the patient's condition appeared to be good.

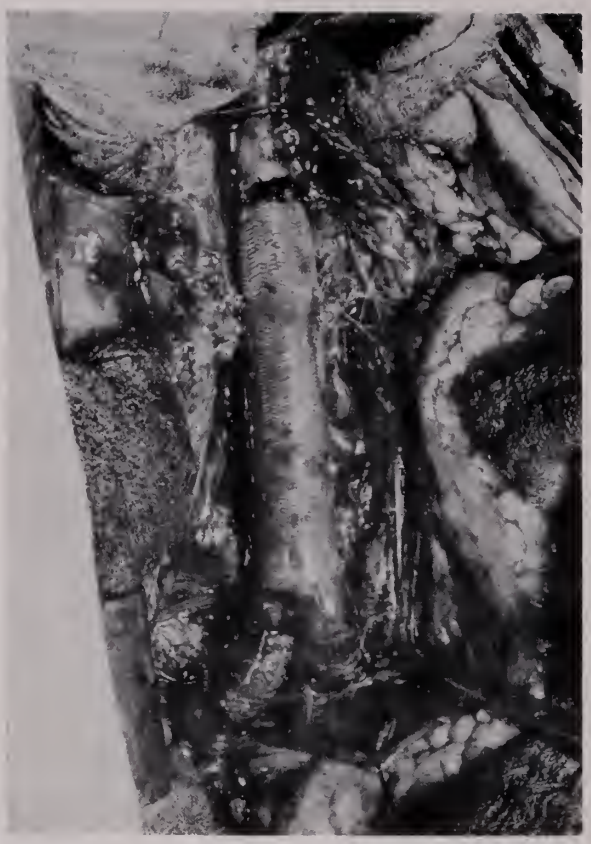

Fig. 2. Graft replacing resected aneurysm.

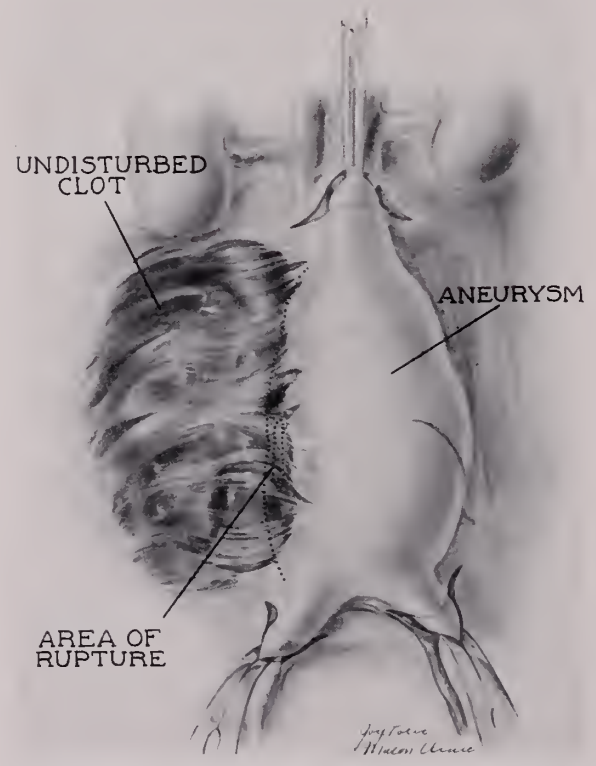

Fig. 1. Clamps placed on aorta and iliac vessel controlling further hemorrhage before clot is touched.

The patient's postoperative course was smooth until the twelfth postoperative day, when he suffered a myocardial infarction. He also developed necrosis of the wound edges, later accompanied by separation of the wound. The wound was treated conservatively because of the patient's infarction. He gradually improved from both the wound complication and the myocardial infarction, and was discharged approximately four weeks after operation. Since discharge the wound has healed in completely and, although there is some weakness of the wound, is not symptomatic. Electrocardiograms showed progressive improvement, and the patient returned to work at an executive job, eight hours a day. He has been followed as an out-patient for 10 months, and his condition continues to improve to the point where he leads an essentially normal life.

Discussion

Recognition of the presence of an abdominal aneurysm prior to rupture and treatment of the aneurysm by resection and graft is obviously the

ideal form of therapy for this serious lesion. Presence of lower abdominal pain and a pulsating abdominal mass should alert the physician to a very grave situation, indicating that rupture of an abdominal aneurysm is imminent. The physician should by no means consider this a hopeless situation. Instead, surgery should be recommended at the earliest possible time.

The case presented here indicates that the physician who recognizes the possibility of abdominal aneurysm and, in particular, leaking or ruptured abdominal aneurysm may render the patient a life-saving service by advising immediate operative treatment. From the operative standpoint, the most important maneuver is to control the leaking abdominal aneurysm by placement of clamps proximal and distal to the aneurysm as soon as the incision has been made. Exploration of the aneurysm itself, with no controlling clamps, will obviously disturb the only defense the patient has—namely, the clot which is occluding the tear in the aorta—and the patient may be lost by uncontrollable hemorrhage. In operations for ruptured aneurysm, the mortality rate will obviously be high under the best circumstances. De Bakey[4] reports operative mortality of 33 per cent in 27 cases of ruptured abdominal aneurysms. This is by far the largest series reported in the world literature. In my experience with operative treatment for unruptured aneurysms there have been 3 postoperative deaths in 18 operations. This includes an 83 year old patient who died of renal failure. I have had no additional operative experience with ruptured aneurysm. Since the patient's prognosis is otherwise hopeless, operation in this situation is mandatory despite the high operative mortality.

Summary

A 54 year old patient with a ruptured abdominal aortic aneurysm is presented. Resection of the ruptured aneurysm and replacement of the aorta with a bifurcation graft was accomplished successfully. The patient has been followed for 10 months and is in excellent condition at the present time. An aortic aneurysm, whether ruptured or unruptured, represents a grave condition with a poor prognosis. Recent surgical developments have transformed ruptured aneurysm from a hopeless condition to a salvageable surgical emergency.•

Doctors Often Neglect Their Own Health

Like the proverbial shoemaker's children without shoes, physicians often neglect their own health, it was pointed out yesterday.

Charles E. McArthur of Olympia, Wash., reviewed the results of physical examinations given to doctors at the last three A.M.A. meetings by the Section on General Practice, of which he is chairman.

Of the first 3,228 electrocardiograms made, 18 per cent were found to be either "definitely abnormal or borderline." Of 2,749 chest photofluorograms, 18 per cent showed suspected or definite abnormalities including tuberculosis, chest neoplasms, and cardiovascular abnormalities.

Previous studies of physicians' health have indicated similar percentages of difficulties and also have shown a higher annual death rate, especially from diseases of the heart and the coronary arteries, for physicians than for the public at large.

The reasons why physicians as a group have a higher mortality rate from heart disease than the general population probably are nervous tension, insufficient exercise, inadequate or incorrect diets and lack of attention to their own health.

Interestingly, specialists were found to have a much lower death rate than general practitioners. Dr. McArthur said the probable reasons for this difference were that specialists are concentrated in urban centers where they have the advantage of large hospital facilities and also have the opportunity to consult a man who is a relative stranger.

Intestinal Polyps in Children

Robert R. Burt, M.D.
TACOMA, WASHINGTON

Intestinal polyps are relatively rare in children. This was affirmed by review of the records of the past ten years at three local hospitals in which only nine cases were treated surgically. Incidence of approximately 0.07 per cent has been reported in pediatric admissions in some of the larger institutions.

Polyp is a gross anatomic diagnosis and may be any pedunculated structure protruding from a mucous surface without regard to histological structure. It may include fibroma, myoma, lipoma, angioma, lymphadenoma and pseudopolyp as well as adenoma.

The present discussion is concerned with the adenomatous polyp which is defined as a proliferation of the structures of the glands of Lieberkühn which produces sessile or pedunculated growths that tend to become malignant. Girls and boys are afflicted in approximately equal numbers.

Age

Kerr[1] reports the average age as 3.4 years and other authors also confirm the finding that the greatest incidence of polyps in children is between two and six years, with a sharp drop in the second decade. This is explained, at least in part, by the phenomenon of spontaneous amputation. Leichtling and LeCaille[2] reported a 3 cm. polyp having been passed, and Kerr reported 18 out of 100 cases that passed polyps spontaneously. Ninety-eight of the 100 cases were under 11 years of age.

It is postulated that repeated traction on the polyp by the fecal stream develops a long pedicle which may become twisted. The result is gangrene of the mass and spontaneous separation.

Read before annual meeting of Tacoma Surgical Club, Tacoma, Wash., May 3, 1958.

Signs and Symptoms

Blood in the stool is the cardinal sign of polyp, being present as bloody mucous mixed with the stool or streaked on the outside with massive hemorrhage occurring occasionally. Protrustion of a fleshy mass from the anus may be observed by the mother. Diarrhea is a symptom in approximately 20 per cent, being more common in the presence of multiple polyps.

Abdominal cramps of varying severity may be prominent in the symptoms, from mild, intermittent abdominal discomfort to the severe picture of intussusception, where a polyp is the leading point, located usually in the ileum. Unusual distribution of melanin pigmented spots on the oral mucosa, lips and digits may suggest intestinal polyposis.

Hemoglobin is usually normal in spite of the repeated small blood losses. Other laboratory findings are usually unaltered.

Diagnosis

The most valuable diagnostic procedure is sigmoidoscopy. In children over two years of age the standard 2 cm. diameter, 26 cm. length instrument may be used. Approximately 75 per cent of the colonic polyps may be visualized in the lower 25 cm. of the large bowel. Needless to say, a gentle, skillful aproach is necessary even in a cooperative child. General anesthesia should be resorted to in an uncooperative or frightened child as instrumental perforation is a real hazard.

Roentgenologic examination of the colon, using air contrast study, also taxes the patience and skill of the radiologist. About 25 per cent of colonic polyps will be found above the lower 25 cm. of colon. Careful preparation, preferably with castor oil, results in the most satisfactory examination. X-ray investigation should be car-

ried out in all cases, not only to search for polyps above reach of the sigmoidoscope when sigmoidoscopy is normal, but to identify multiple polyps which will be present in about 13 per cent.

Pathology

Size varies from a 1 mm. elevation to a 5 cm. mass. The majority of polyps over 1 cm. in diameter occur on a pedicle. Pedicles vary in length from a millimeter or two to several centimeters. At times the presence of a long pedicle makes a polyp very elusive and adds to the difficulties of definite localization. The pedicle is nearly always of normal mucosa and is thought to be the result of traction from peristaltic action.

In children below the age of puberty, almost all polyps are benign histologically. An occasional adenoma will be diagnosed as carcinoma in situ or grade 1 adenocarcinoma, but invasive carcinoma is rare. From 100 cases of colonic polyps, Kerr reported one case of adenocarcinoma of the rectum in a boy of 12 whose stools had shown bloody mucous since age 3. Gordon and others reporting on 104 cases had 9 with carcinoma in situ, none with invasive carcinoma.[3]

For purposes of formulating a plan of treatment, it is convenient to classify adenomatous polyps into several groups according to number, position and heredito-familial tendencies.

The first is the Jegher's Peutz syndrome, in which there is a diffuse gastro-intestinal polyposis, associated with pigmented spots of the oral mucosa, lips and digits. This has a definite familio-hereditary tendency and is quite rare. Melanin spots apparently are present from birth or early childhood. There is extensive scattered polyposis with the most common site being the small bowel, but also showing polyps in the colon and often in the stomach. They occur singly or in groups of two to several, to diffuse involvement.

Secondly are those with gastro-intestinal polyposis similar to the above group but without the melanin pigmentation or familio-hereditary component.

The third group is that of familial polyposis confined to the colon which seems to be a separate entity. It is thought to be due to a gene mutation inherited as a Mendelian dominant characteristic which may be transmitted by either sex. Polyps are confined to the colon and may range in number from eight or ten to literally hundreds. Size varies from a few millimeters to several centimeters. The more numerous polyps tend to occur in the older age group, most extensively being present in young adults. Various authors have pointed out the potential seriousness of this disease by showing the development of carcinoma in the young adult. Dockerty states that 50 per cent of these patients will be dead by age 30 years and nearly all by age 50 years from carcinoma of the colon, if untreated.[4] However, the development of carcinoma before puberty is very rare.

Other members of the family should be examined for the disease whenever any of the above forms of diffuse polyposis are encountered.

Much more commonly encountered are single or few polyps, setting an arbitrary number of under 10.

Treatment

Removal of polyps is advised to alleviate symptoms of bleeding, diarrhea and cramps, and to remove a potential malignancy. The latter, while not emergent in the young child, becomes more urgent as puberty is approached.

All polyps within reach of the sigmoidoscope should be destroyed. Polyps 1 cm. in size or larger may be removed in several ways. If in the lower rectum and pedunculated, they may be pulled down, the base ligated and amputated. The electric snare may be used similarly or through the sigmoidoscope. Most authors advise confining the use of the electric snare to the area below the peritoneal reflection for fear of perforation. Fulguration with the mono-polar electrical unit is most satisfactory for all small lesions and lesions above the peritoneal reflection.

For colonic polyps lying above the reach of sigmoidoscope, laparotomy is necessary. Because of the low incidence of carcinomatous degeneration of adenomas in children, it is felt that in isolated, pedunculated polyps, transcolonic polypectomy is adequate.

The sessile polyp with its broad base and uncertain central histologic growth pattern requires segmental resection of that part of the bowel bearing the neoplasm.

It is difficult to draw an arbitrary line between occasional multiple polyps and the early phases of diffuse polyposis. Therefore, in order to avoid repeated operation or unnecessarily extensive surgery in a child with polyps above the reach of the sigmoidoscope and yet where a definite diagnosis between isolated polyps and diffuse polyposis cannot be made, it may be wise to

defer operation for a few years. If more extensive polyposis should develop during this period of repeated examination, the diagnosis would be clarified. Other symptoms, such as bleeding, pain and diarrhea, may favor earlier intervention, but in any case these patients should be operated by age 12 years.

In both types of gastro-intestinal polyposis, preferred treatment is removal of polyps located within reach of the sigmoidoscope by fulguration or electric snare. For growths above the reach of the sigmoidoscope, in the colon, small bowel, or stomach, laparotomy with trans-enteric removal of isolated polyps is used. Resection of the polyp bearing area is best if several are present.

If the patient has extensive, diffuse polyposis of the entire gastro-intestinal tract with few symptoms, it is best to manage conservatively, meeting the problem presented by symptoms as they arise.

Colectomy

Diffuse polyposis coli, the third group with diffuse lesions mentioned above, requires colectomy. Colonic resection may be carried out whenever the diagnosis is definitely made. Growth and development after colectomy have been reported as normal even at age of five or six years. Because of the extent of colonic and rectal involvement, good argument for total colectomy and establishment of an ileostomy can be made. However, to avoid the disability and morbidity associated with ileostomy, many authors have advised subtotal colectomy with establishment of an ileo-rectostomy. This, I believe to be the preferred treatment. Destruction and removal of polyps of the rectum by fulguration prior to subtotal colectomy is favored. End-to-end ileo-rectostomy, leaving approximately the lower 3/4 of rectum so that subsequently the remaining portion of the rectum may be easily visualized through the sigmoidoscope, is very important. The parents of these patients, and the patients themselves as they become responsible, must be impressed with the necessity of repeated sigmoidoscopic examinations at six month intervals to identify and destroy any new polyps that may occur. Without this cooperation, the risk of developing carcinoma of the rectum is a real threat.

At the time of exposure of the colon, careful search should be made for undetected polyps. In a well-prepared bowel these may be palpable through the colonic wall, but a further aid is the introduction of a sterile sigmoidoscope into the colotomy wound and visualization of the interior of the bowel. On one occasion, when the sigmoidoscope light burned out during such a procedure, the examination was completed after darkening the room except for a spotlight on the field. The interior of the bowel, as seen through the sigmoidoscope, was trans-illuminated. The result was very pleasing in that polyps, because of their increased density, were easily visualized and identified.

Whatever the stimulus was that produced an adenoma, it can be assumed to still be present in the patient after the growths have been removed. Yates has reported that new polyps occur in 10 per cent of cases.[5] Therefore yearly follow-up examinations are advised.

Summary

It behooves all of us to search diligently for possible polyps in any child with blood in the stool, diarrhea, recurrent abdominal cramps or history of mass prolapsing from the anus. In addition to ordinary history and physical examination, sigmoidoscopy and contrast air study of the colon are necessary.

Some polyps will be passed spontaneously; this may account for inability to find a polyp even though symptoms suggested its presence. However, only after repeated examinations should this assumption be made.

Isolated polyps within reach of the sigmoidoscope should be removed, when identified. The young child with several polyps in the colon above this level and with minimal symptoms may be observed for a year or so to determine if diffuse polyposis will develop requiring total colectomy rather than polypectomy.

Incidence of malignancy in adenomas increases at puberty. Therefore, definitive operation should be carried out before this age is approached. •

Tetany

John T. Brunn, M.D.
Meridian, Idaho

Tetany is a disorder characterized by neuromuscular hyper-excitability on the basis of decreased ionized calcium in the blood. It may be latent, in which case it may be demonstrable only by mechanical or electrical stimulation. There may be no symptoms, although restlessness, numbness or tingling in the extremities, or other paresthesias may be present. The condition may gradually progress through its own potentiality or under stimulation of emotional, environmental, or physiologic change. Acute infection, especially if accompanied by a high fever, may easily precipitate manifest tetany. The most characteristic signs are carpopedal spasm, laryngospasm, and convulsions.

Ordinarily the signs of tetany are so characteristic that they may rarely be mistaken for any other condition. Perhaps the most important factor in the diagnosis is for the examiner to think of it.

Signs

Suspected tetany may be confirmed clinically by the presence of a positive Chvostek's sign. This consists of contraction of the facial muscles when the area over the facial nerve is tapped just anterior to the external auditory meatus, or in the middle of the cheek. This sign may be positive in a newborn infant but, if it occurs after the age of 2 months, it is almost pathognomonic of tetany. The peroneal sign has the same significance as the Chvostek sign, and it may be elicited, even in the crying child, by tapping the peroneal nerve just below the head of the fibula. A positive peroneal sign consists of flexion of the toes and adduction of the foot.

Trousseau's sign is frequently absent in tetany but, when present, is pathognomonic. It consists of typical position of carpospasm when the upper extremity is constricted by a blood pressure cuff, or of pedalspasm when the lower extremity is similarly constricted.

Erb's sign is less frequently used but is, perhaps, the most reliable clinical sign of tetany. It consists of increased sensitivity of the nerves to electrical stimulation. Apparatus consists of a source of direct current (several dry cells in series), a rheostat, and a 10 milliampere meter, suitably calibrated, connected in series. A large electrode moistened with salt water is placed on the abdomen, and the stimulating electrode is placed over the nerve to be tested (usually the peroneal). In the normal individual the cathodal opening current required to produce reaction is more than 6 milliamperes, whereas the response in an individual having tetany may be obtained with less than 5 milliamperes.

Symptoms

Symptoms of manifest tetany are similar in all age groups, though certain symptoms, such as laryngospasm and convulsions, are much more common in children less than 2 years of age. Symptoms are also the same regardless of the type or etiology of tetany.

Typical symptoms are carpopedal spasm, laryngospasm, and convulsions. Carpopedal spasm is typical and striking. The hands are usually affected first. The phalanges are extended, and the fingers are flexed at the metacarpophalangeal joints. The thumbs are adducted and the wrists are flexed. The feet are dorsiflexed; the toes are flexed at the metatarsophalangeal joints; and the phalanges are extended. Occasionally the muscles of the legs, thighs, trunk, or arms may be involved. There may be twitching or fibrillation of the muscles of the face. Spasms may be accompanied by varying degrees of pain. Carpopedal spasm may not always occur but, if present, is pathognomonic.

Laryngospasm is frequent, especially in children. The typical crowing inspiration occurs with partial obstruction of the larynx. This sound may be identical to that heard in whooping cough, which must be considered in the differential diagnosis. Other causes of respiratory ob-

struction, such as croup, laryngitis, foreign body, and breath holding, must be searched for and ruled out. With greater degrees of obstruction, cyanosis occurs, and the child may lose consciousness.

Convulsions may occur in any age group, but are seen much more frequently in children under 2 years of age and especially in those less than 1 year old. Convulsions may be the only symptom of tetany. It is extremely important that a thorough search for other causes for convulsions be made. The physician must consider particularly tetanus, poisoning, and encephalitis, but he must not forget the acute infections, meningitis, intracranial lesions or hemorrhages. Occasionally a convulsion will be precipitated in a child who has latent tetany by a relatively benign stimulus, such as overeating. This reaction has been seen several times in my practice, particularly if the latent tetany was on the basis of gastro-intestinal disease. One very striking example was seen in a 6 year old child who had an untreated fibrocystic pancreatitis and who developed a severe and prolonged convulsion after eating several ears of corn.

Most often the family physician may see the patient in the home, or in the office, where there may be no facilities for elaborate diagnostic studies. In these circumstances he must rapidly care for the serious complications, such as respiratory obstruction or convulsions. Knowing the circumstances under which the patient lives, and knowing the general health of the patient, as he usually does, the family physician may rule out immediately certain etiologic factors underlying the disorder. The history and general observation may, almost certainly, pin-point the type or cause, but frequently more information is needed.

Since successful treatment should be preceded by the most accurate diagnosis possible, a brief résumé of the etiologic factors will be presented.

Etiology

Primarily, tetany is due to decrease of ionized calcium in the blood. This decrease may occur for a number of reasons:

1. *Inadequate intake or absorption of calcium* —As a rule, sufficient calcium in the diet from the ingestion of milk will preclude the development of tetany, but in the case of phosphate retention tetany (as shall be seen), an excess of milk may precipitate the disorder because it contains a relatively large amount of phosphorus. Inadequate absorption of calcium is characteristic of rickets. Importance of adequate vitamin D intake need not be discussed at this time. Steatorrhea or pancreatitis is associated with the faulty digestion of fats. The undigested fat particles or the fatty acids produced by the digestion of tissue fat, as in pancreatitis, combine with the calcium to form soaps which are insoluble and thus are not absorbed.

2. *Excessive excretion of calcium* may occur as a result of frequent or prolonged lactation. Nephrosis is associated with excretion of large amounts of protein, and calcium may be lost in the form of calcium proteinate. As shall be noted, there may be sufficient ionized calcium present in this condition to prevent tetany even though total blood calcium may be low.

3. *Increased phosphorus retention* is seen in hypoparathyroidism, nephritis, renal insufficiency, or when there is excessive phosphorus intake. The acidosis occurring in the renal conditions is usually associated with rather mild tetany, however, because acidosis favors ionization of calcium. Because of the reciprocal relationship between blood calcium and blood phosphorus, the calcium level is reduced when the phosphorus level is elevated.

4. *Alkalosis* may foster development of tetany by depressing ionization of calcium in the blood. In the presence of alkalosis, insoluble calcium salts are more easily formed in the intestine, making absorption of calcium difficult. Alkalosis may be caused by excessive intake of alkaline salts, such as sodium bicarbonate, or by excessive excretion of acid. Hyperventilation, usually occurring in cases of hysteria or encephalitis but seen also in crying babies, may lead to the loss of carbonic acid by carbon dioxide excretion through the lungs (respiratory tetany). Excessive loss of gastric acidity because of vomiting, continual gastric suction, or excessive gastric lavage may lead to the so-called gastric tetany.

If the patient is seen first in the home, it is necessary to administer any emergency care which might be necessary, especially where there is obstruction of the respiratory tract or if convulsions are present. Usually it is possible to develop, within a relatively short time, a high index of suspicion as to the etiology of the condi-

tion. If the condition does not appear to be particularly serious, it frequently suffices to offer suggestions as to diet, to offer a mild sedative (except in children with respiratory involvement), to prescribe an acidifying salt, such as ammonium chloride, or to give an oral calcium preparation until such time as the patient is able to come into the office, laboratory, or hospital for further study. It is felt that a urine sample should be taken before the administration of calcium in order to estimate the calcium level by means of the Sulkowitch test which may be performed easily at the office.

If the patient is first seen at home, he is advised to come to the office for a complete examination, including the proper laboratory examinations. Hospitalization is rarely necessary unless convulsions, laryngospasm or other serious complications cannot be controlled readily.

Laboratory Findings

A simple estimation of the serum calcium level may be inferred from the urine calcium levels measured by means of the Sulkowitch test. This test is made as follows:

To 3-5 cc. of fasting urine add an equal amount of Sulkowitch reagent (2.5 Gm. oxalic acid, 2.5 Gm. ammonium oxalate, 5 cc. glacial acetic acid and distilled water, q.s. ad 150 cc.). Let this preparation stand 3 to 5 minutes before reading. No precipitate means that the serum calcium level is probably between 5 and 7.5 mg. per cent; a faint precipitate implies a normal serum calcium level, and a heavy precipitate is probably associated with a greatly elevated calcium level.

In tetany the serum calcium level is reduced to from 5 to 7.5 mg. per 100 cc. This finding is so constant that the diagnosis may be questioned if it is not present. The concentration of phosphorus may be low, normal, or high, except in parathyroid tetany in which it is regularly increased. The level of the serum calcium at which tetany occurs is influenced by the phosphorus level—i.e., tetany may occur at a serum calcium level of 7 if the phosphorus level is normal or low, but it may occur at a calcium level of 8 if the phosphorus level is high.

It is important to check the level of the total blood protein. About 50 per cent of the circulating calcium is bound to protein as a calcium proteinate. Therefore, it is possible in hypoproteinemia to have enough ionized calcium available to prevent tetany even though the total serum calcium is below the critical level. Other laboratory findings may be the prolongation of the Q-T interval, flattening of the S-T segments, and occasional other irregularities in the EKG. The electroencephalogram may show two to three slow waves per second. X-ray study may reveal a slight decrease in bone density and, occasionally, calcification of soft tissue.

Clinical Types and Treatment

There are several clinical types of tetany, the treatment of which may be somewhat different. Infantile (or rachitic) tetany includes the majority of cases seen in childhood, is associated with rickets, and develops under the same conditions. More than 80 per cent of the cases develop during the first two years of life, and the incidence after the third year is relatively low. Clinical or x-ray evidence of rickets may be demonstrated in almost all cases of infantile tetany; however, a relatively small percentage of children with rickets develop tetany. The treatment should be that for the underlying rickets. It is important that active antirachitic therapy be deferred until the child has been given adequate calcium therapy for at least 24 to 48 hours in order to prevent aggravation of the tetany. Calcium therapy may be given orally in the form of calcium chloride. Being an acid salt, it also benefits by increasing the ionization of calcium. However, it is occasionally irritating to the gastrointestinal tract. Calcium lactate or gluconate may be used. Doses of 1 to 2 Gm. every four hours for two or three days are followed by the same doses given twice daily. If the tetany is severe or if convulsions are frequent, calcium gluconate is given intravenously. The dose is 5 to 20 cc. of a 10 per cent solution given by vein slowly and repeated two or three times if necessary.

Gastric and respiratory tetany are best handled by treating the underlying disorder. Vomiting must be controlled and the electrolyte balance re-established. This procedure may require hospitalization. In the meantime, intravenous calcium gluconate, given slowly, will control the symptoms of tetany. The symptoms of the respiratory form of tetany may usually be controlled by re-breathing carbon dioxide from a paper bag. If encephalitis is causing hyperventilation, the

patient should be hospitalized where better observation and treatment are available.

Tetany of the newborn is apparently on the basis of a physiologic decrease in the function of the parathyroid glands compensatory to the hyperparathyroidism of the mother seen occasionally during the last trimester of pregnancy. The condition is found more commonly in the artificially fed baby because of the higher percentage of phosphorus in cow's milk. Oral calcium is generally sufficient to control symptoms though, occasionally, intravenous calcium gluconate is necessary. Dilute solutions are given by gavage. It is occasionally necessary to intubate the trachea to combat laryngospasm. Vitamin D is given, and dihydrotachysterol (Hytakerol) may be considered if the patient's response is not prompt. Milk preparations which simulate the phosphorus content of mother's milk should be fed to the baby rather than cow's milk.

Parathyroid tetany is usually caused by the inadvertent removal of the parathyroid glands during surgery, or because of their injury.

Treatment of parathyroid tetany must include immediate care of the convulsive seizures and laryngospasm. Specific therapy includes the slow administration of soluble calcium salts, such as calcium gluconate, in doses of 10 to 20 cc. of a 10 per cent solution. Oral calcium should be given in a form which contains little or no phosphorus. Calcium gluconate, lactate, or chloride are used most commonly though there are many other available preparations. Calcium chloride might produce gastrointestinal irritation. Calcium gluconate or lactate is given in doses of 4 Gm. three or four times daily. Occasionally, higher doses may be necessary. It is helpful at times to administer dilute hydrochloric acid in order to promote absorption of calcium. Magnesium sulfate may be given slowly, intravenously, in extreme cases as an emergency measure.

Effective Therapeutic Preparations

Parathyroid hormone may be administered as a temporary measure—usually in postoperative tetany—but this preparation should be reserved as a final measure in most cases because its effects diminish as a result of the formation of antihormones by the body. It is given subcutaneously in doses of from 10 to 100 U.S.P. units daily in single or divided doses.

Dihydrotachysterol (A.T. 10, Hytakerol) is an effective synthetic, having properties resembling those of the parathyroid hormone. It raises and maintains blood calcium levels and stimulates renal excretion of phosphorus. Unlike the parathyroid hormone, its efficiency is not decreased by prolonged use. The dosage must be carefully controlled by determinations of the blood and urine calcium levels. Initial doses are 3 to 10 cc. or from 6 to 20 capsules daily for several days, followed by maintenance doses of from 1 to 7 cc., or 2 to 14 capsules per week depending on the blood and urine calcium levels.

Vitamin D therapy is quite effective and somewhat less expensive for the patient than is dihydrotachysterol. Vitamin D increases intestinal absorption of both calcium and phosphorus, but it also stimulates renal excretion of phosphorus. The dose is 50,000 units given in capsule form one to three times daily. Occasionally, much higher doses are necessary.

Aluminum hydroxide in doses of 0.5 to 1.5 ounces given three times daily after meals has the effect of binding dietary phosphorus and thus decreasing its absorption.

Thyroid (desiccated) is of particular value in post thyroidectomy tetany. When hypothyroidism is present, desiccated thyroid has an effect upon the absorption of calcium from the intestinal tract. Usually 1 or 2 grains of thyroid daily (60 to 120 mg.) will suffice.

Probenecid (Benamid) is said to assist in promoting renal excretion of phosphorus, and may be useful in treatment. It may be given in doses of from 1 to 4 tablets daily.

Dietary management consists of the restriction of foods containing phosphate. These foods include dairy products primarily.

Determination of blood calcium should be done several times a year if control is satisfactory, and more frequently if control is difficult. The patient may be taught to test urinary calcium levels by means of the Sulkowitch test.

The prognosis is good in well controlled patients in whom serum calcium can be maintained within normal limits. In patients with long-standing disease, and especially in poorly controlled patients, trophic changes may occur. These changes include thickening of the skin; thinning and loss of hair; brittleness, furrowing, or loss of the nails; furrows, staining, and defective enamel of the teeth; mental retardation; and the frequent occurrence of lenticular cataracts. •

Use of Anorexigenic Agent in a Weight Reduction Clinic

Robert H. Barnes, M.D.
SEATTLE, WASHINGTON

During the past year, an obesity clinic has been developed in the outpatient department of King County Hospital, Seattle, to establish a complete program for treatment of problem obesity cases referred by other specialty clinics. Such a clinic permits clinical evaluation of weight reduction techniques of which anorexigenic agents are a part. The majority of patients are studied in a general medical clinic prior to referral, so that patients with metabolic disorders such as Cushing's disease and myxedema are screened out prior to entering the obesity clinic. In addition to treatment of the obesity problem, all medical complications such as arthritis, hypertension, diabetes and heart disease are treated concurrently in the over-all program.

Program

During the year, one physician (the author) treated and followed all the patients reported in this study. The concept developed and conveyed to the patient is that obesity is a medical disorder which can be controlled but not cured by known medical methods. A four-point program of weight control is offered to each patient. (See figure 1.)

1. Food Plan. An overweight patient seldom

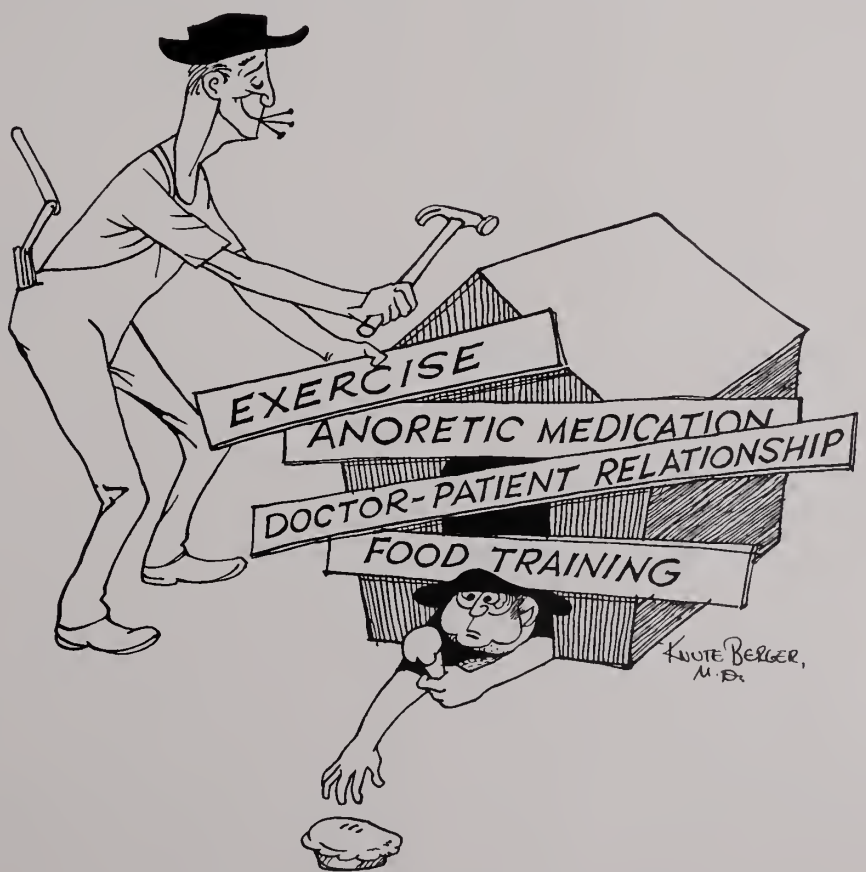

Fig. 1. Tools the doctor has at his disposal for weight control.

seeks a physician primarily to obtain advice concerning food. He knows he has to eat less to reduce; yet he hopes the doctor has an extra "ace up his sleeve" which will permit weight reduction without the pangs of semi-starvation. Thus, if the physician approaches the food problem simply by saying, "Don't eat too much" or if he chastises the patient for being a glutton and warns him of the great danger to his health, he only creates a sense of guilt in the patient and accomplishes nothing.

It has been my policy to tell the patient at the very beginning that the weight reduction program does not include a starvation regimen, but rather a return to a normal way of eating. This includes three meals a day with instructions to save snacks from lunch and dinner to satisfy hunger peaks during late afternoon and night, if necessary. Further, the patient is reassured that, while adjusting to a new way of eating, he will be given a medication which is safe and will help him adhere to his food plan by suppressing his appetite. With these preliminary remarks, the eating habits are explored. If, during the history-taking, the patient states that he eats practically nothing or only half as much as other members of the family, the physician must not act dumbfounded and question the patient's honesty. At subsequent visits when the doctor-patient relationship is more firmly established, details of dietary indiscretions will usually appear. For example, one woman who was failing to lose subsequently stated that she always ate three to four apples a day but didn't count them in her food plan because she had always been told how good they were for her health!

The Food-Exchange System was used exclusively and explained to the patient using the illustrated pamphlet entitled, "Meal Planning with Exchange Lists" available through the American Dietetic Association.* Since this plan gives a wide variety of food choices without calorie counting, most patients like it. In general, the diets varied between 800 and 1100 calories per day, high in protein and low in carbohydrate and fat. The usual fat content per day was approximately 40 Gm.

2. *Exercise.* Increase in energy output, if physically possible, is a basic principle in weight reduction.[1] Each patient is advised to take a one-half hour walk twice a day. In addition, in the younger age group, muscle training exercises are prescribed. Improvement in posture is stressed for its cosmetic effects to overcome the rounded shoulders, lumbar lordosis and prominent buttocks of the obese person.

3. *Doctor-Patient Relationship.* Regular visits to the clinic every two to four weeks are insisted upon. The role of the physician as counselor, advisor and friend cannot be over-emphasized. The overweight patient needs the continuing support of his physician. During these regular visits, weight and general body measurements are recorded and a graph sheet of the patient's progress is kept up-to-date. General health problems are resolved, dosage of medications adjusted, and a dietician is revisted from time to time. The encouragement and moral support through these regular follow-up visits must be underscored as probably the most important phase of a successful weight reduction program.

4. *Medication.* The overweight patient, who seeks a physician's advice, consciously or unconsciously hopes to obtain two things. First, he seeks the discipline and sympathetic understanding which a physician can render. He does not wish to be treated as a behavior problem or to be ridiculed or frightened by his plight. Second, most hope to obtain a medication which will be safe while magically accomplishing weight reduction. Of course, there is no such thing as a magic medication available.

If a medication is used to suppress appetite, it must be explained to the patient at the outset that it is only an adjuvant in the total weight reduction program and not, in itself, the answer to his problem. Despite statements to the contrary, anorexic agents *do* have a place in the total weight reduction program. In a majority of patients, amphetamine consistently taken in proper doses will result in greater weight losses than occur when such medications are omitted. There are limitations to the usefulness of anorexigenic drugs, however. For example, anorexigenic agents are of practically no value in the markedly compulsive eater who eats whether he is hungry or not. For this latter group, there is at present no consistently successful treatment.

The purpose of any medication in a weight reduction program is to offset the symptoms so common following food withdrawal. These are anxiety, fatigue, depression, hunger, lack of energy and irritability. An effective anorexigenic agent should offset these symptoms in the majority of patients, and at the same time have a minimum of side reactions. Thus, if the agent is effective, the patient should be better able to

*620 North Michigan Avenue, Chicago 11, Illinois.

consume a lower caloric intake and feel well at the same time. The medication selected for use and study in the clinic was Ambar.** It is supplied in two forms: compressed tablets and extended action tablets. The tablet contains 3.33 mg. of methamphetamine hydrochloride and 21.6 mg. of phenobarbital. The extended action tablets contain 10.0 mg. of methamphetamine hydrochloride and 64.8 mg. of phenobarbital.

Method of Study

For the first six months the anorexic agent was studied by the double blind technique. Neither the physician nor the patient was aware of whether the real medication or placebo was being taken at any given time. Even-numbered patients were given a placebo and odd-numbered patients were given the preparation by the pharmacist. The records were kept in the pharmacy. Every fourth week, the pharmacist, by previous agreement, automatically switched from one to the other. Forty-one patients, averaging 52 lb. overweight were studied by this method; they ranged from 11 to a maximum of 147 lb. overweight. The usual dose during the double blind study was one extended action tablet before breakfast and one compressed tablet at 4 p.m. The patients were followed for a minimum of 4 weeks on the medication and 4 weeks on placebo with a maximum of 12 weeks on each.

Results of Double Blind Study

Forty-one patients were studied and, of this number, 27 patients, or 65.8 per cent, averaged a loss of 1.36 lb. per week while taking Ambar. The same 27 patients lost 0.60 lb. per week while on placebo. Thus, 65.8 per cent of the patients studied on the double blind technique lost more than twice as much weight per week while on the medication as on placebo. Fourteen patients either gained weight while on medication or lost more weight while on placebo.

Since it is difficult to manipulate dosage in a double blind study, it was decided to continue the investigation for a second period of six months. During this period, the Ambar doses were increased for those patients who were failing to lose weight on the initial dosage. The medication was timed by the patient and taken at specific times of day to offset hunger peaks. Dosage was thus individualized according to the patient's response.

**Preparations used were supplied by the A. H. Robins Company, Richmond, Virginia.

Of the 41 patients studied with the double blind technique, 11 were continued into this phase of the investigation with the addition of 39 new patients, for a total of 50 patients. This group was studied for a minimum of 4 weeks to a maximum of 32 weeks. Of these 50 patients, 3 either failed to lose weight, or gained, and 3 patients stopped the program because of adverse side reactions to the medication, which will be described subsequently. The 44 patients who successfully lost weight lost a total of 800 lb., or 18.4 lb. per patient. They averaged 1.16 lb. per week weight loss. Seventeen patients lost from 1 to 10 lb., 10 patients from 11 to 20 lb., 7 patients from 21 to 30 lb., 6 of the patients from 31 to 40 lb., 2 patients from 41 to 50 lb., 1 patient 55 lb., and 1 patient 67 lb. (Fig. 2).

The usual starting dosage was 1 extended action tablet before breakfast and 1 plain tablet at 4 p.m. Nine of the successfully reducing patients stayed on this dosage. For 16 patients, the dosage was increased to one extended action tablet in mid-morning and one in mid-afternoon. This seemed to be the most popular dosage for control of appetite. Six patients took 1 extended action tablet before each meal, and 4 patients took between 4 and 6 per day without any unusual side effects. Seven patients took one plain tablet before each meal.

Ambar is particularly free of serious side effects in the large majority of patients but, as can be seen from the wide spread in dosage, the doctor must manipulate the dosage according to individual response. It seems that the majority of patients require more than 1 extended action tablet and 1 plain tablet a day, since the majority took 1 extended action tablet two or three times a day to control hunger and appetite.

Side Reactions

Only 4 patients out of the total of 80 treated during both the double blind study and the subsequent study stopped the medication because of adverse reactions. One patient, who had angina pectoris, after some weeks on Ambar began to complain of diarrhea, heart flutter, and abdominal pains occurring within a half-hour after taking an extended action tablet and refused to take any more. A 73-year old woman stopped medication within 1 month because of nausea and increased nervousness. A 30-year old woman complained of persistent indigestion and nausea on 1 plain tablet, three times a day. An 18-year old woman stated that her appetite

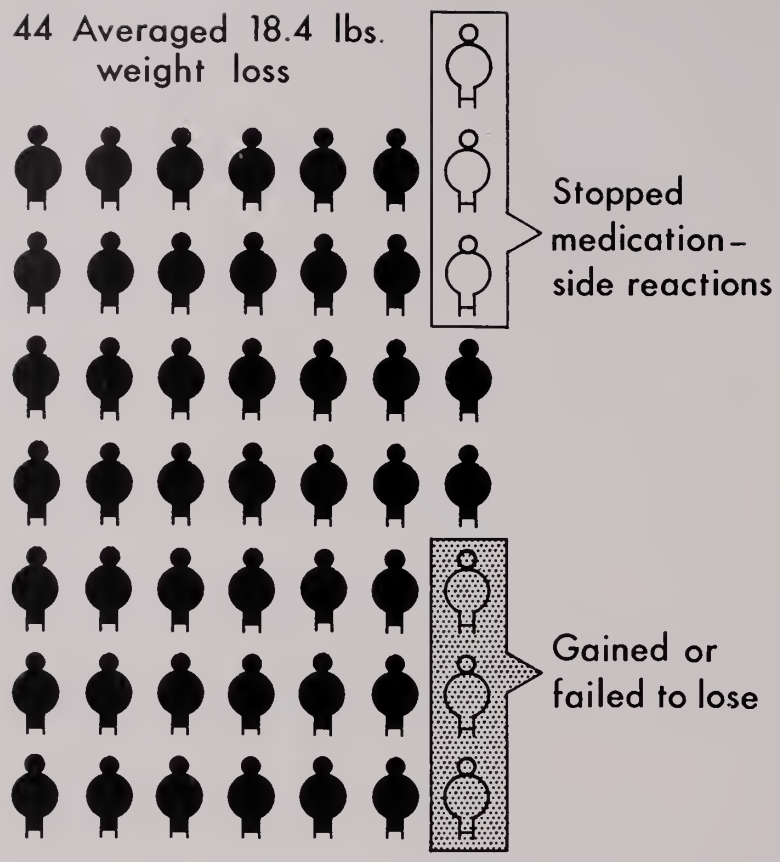

Fig. 2. Summary of weight control program in 50 patients in whom Ambar dosage was individualized. Side reaction rate for the total 80 patients studied was only 5 per cent.

was stimulated and that she was less hungry without medication. Thus, of the 80 patients who were treated both on the double blind studies and on the subsequent studies, only 4 stopped because of adverse reactions which is 5 per cent of the total patients observed.

Hypertension

The most common co-existing disease state in these obese patients was hypertension. Twenty-seven of the 50 patients studied had hypertension of significant degree. Parenthetically, there was no particular correlation between successful weight reduction and reduction in hypertension, that is, 14 of the 27 patients who had hypertension had no appreciable reduction in blood pressure while under this study. In no instance was there an *adverse* effect on hypertension while taking Ambar. Four patients had diabetes, and, as would be expected, there was improvement in the diabetic state as result of weight reduction. One patient with a duodenal ulcer tolerated medication very well. Three patients with cholelithiasis reduced weight successfully while on the program and subsequently underwent cholecystectomy.

Follow-up Care

Obesity, like diabetes, is not cured, but controlled. Thus, after attaining normal weight, the patient must be taught how to maintain it. It is unusual for him to lose his excessive desire or compulsion to eat just because he has been on a weight reduction program. The person who tends to gain weight never loses the tendency. Only rarely does a patient who has successfully reduced say: "I no longer have the desire to eat that I used to." Those patients whose appetite is successfully suppressed by an anorexigenic agent often wish to continue taking it intermittently even after normal weight has been attained. They particularly desire to use it when under nervous strain. It is during such a period that the compulsion to eat seems to be greatest.

With these things in mind, the following principles have been established in follow-up care:

(1) The food plan, high protein, low fat, low carbohydrate, and calorically adjusted to individual needs, must be life-long.

(2) The patient must maintain his enthusiasm for normal weight by continuing to be weight-conscious. He should weigh once weekly.

(3) He must see the physician at intervals of every three months for at least a year after normal weight has been maintained.

(4) An anorexigenic agent may be prescribed intermittently to help control appetite. It should be taken during periods of stress or when the patient notices weight beginning to creep up again. Saturdays, Sundays and holidays particularly seem to encourage over-eating.

(5) Physical activity should be maintained just as during the weight reduction program.

Summary

A four-point weight reduction program in a hospital out-patient clinic includes the food plan, medication, exercise and doctor-patient relationship.

In a double blind study with Ambar, the average weekly weight loss on the medication was more than twice that for a placebo (1.36 as compared to 0.6 lb.).

Fifty patients were studied subsequent to the double blind test, and during the period of observation from 4 to 32 weeks, 44 of the 50 patients lost a total of 800 lb., or 18.4 lb. per patient with a maximum of 65 lb. in one patient. The average weight loss per week with these patients was 1.16 lb.

Dosage must be manipulated to suit the individual patient. The most frequent dosage was one extended action tablet at 10 a.m. and one at 3 p.m.

Only four patients (5 per cent) out of the total of 80 patients studied had to stop the medication because of adverse side reactions.

Patients with hypertension show no elevation of blood pressure related to the ingestion of the medication. •

The Right To Defend

We often hear that government—a collective linked to a police force—has the function of doing for individuals that which they cannot do for themselves. This is correct in a sense, but is open to easy misconstruction. The individual cannot protect himself against pirates or mobs or organized thievery or countless other forms of destructive actions. Government should do for all of us *that which we have a right to do,* but cannot do, for ourselves.

However, we have no right as individuals to use [police] power against the productive or creative actions of others for the purpose of feathering our own or anyone else's nest. By the same token, we have no rights collectively to use [police] power for these purposes. To use a not too far-fetched example: At this juncture in our develpoment we probably would not freely donate enough funds to build a missile that would photograph the other side of the moon. There are among us some persons who want this done. They lack the resources to do it themselves. Therefore, they call on the constabulary to forcibly take the fruits of the labor of others in order to gratify their wish. All subsidies and all federal grants-in-aid, whether to farmers or business or to communities or to foreign countries, fall into this category—a misconstruction of the idea that government should do for us that which we are unable or unwilling to do for ourselves.

By Leonard E. Read in The Freeman, June 1958, Volume 8, pp. 8-9.

Newborn Infant Surviving Perforated Duodenal Ulcer

GERALD V. SNARR, M.D.
SEATTLE, WASHINGTON

Occurrence of peptic ulcers in infancy and childhood has been recognized for over a century. An increasing number of reports appearing in the literature, however, suggest that this lesion and its attended complications are not rare clinical entities.[1]

In an infant, peptic ulceration may be the cause of an acute abdominal emergency when perforation occurs. This publication has been prepared to illustrate the fact that perforation can occur in the first forty-eight hours of life and that prompt action by physician and surgeon can prevent fatal complications.

CASE REPORT

HISTORY. The infant was born spontaneously after normal gestation and uncomplicated 14½ hour labor at King County Hospital, Seattle, Wash., Sept. 4, 1956, the third child of a 27 year old white multipara. She weighed 6 pounds 14 ounces, was normal on physical examination, and required no resuscitation.

Oral feedings were started at fifteen hours of age. She suckled eagerly, but at 10 p.m. on Sept. 6, feeding was taken sluggishly, and she regurgitated the major portion. Some abdominal distention was noted. One meconium stool had been passed the previous day but none subsequently. At fifty hours of age, the patient was in obvious distress.

PHYSICAL EXAMINATION. She was irritable, with a shrill weak cry, and had rectal temperature of 102 F. A blotchy erythematous rash was present over the trunk and extremities, but no cyanosis was observed. Her respirations were 60 per minute, and grunting in character, but without visible retractions of the thorax. The lung fields were clear. The abdomen was tensely distended and superficial veins were prominent. Irregular surface contours over the abdomen suggested underlying distended loops of bowel, but there was no visible peristalsis. Palpation, though difficult because of generalized muscle spasm, revealed no focal guarding. The abdominal percussion note was not tympanitic. Hypoactive bowel tones were present. No obstructing masses were noted on rectal examination, but there was marked sphincter spasm. Moro and grasp reflexes were present. There were no apparent signs of dehydration or salt depletion.

Fig. 1. Roentgenogram of 2-day old infant demonstrating pneumoperitoneum.

DIAGNOSTIC STUDY. A rectal tube was passed to 8 cm. with no change in the degree of abdominal distention. Upright and A-P films of the abdomen were obtained which demonstrated large pneumoperitoneum on the upright film (figure 1). Abdominal paracentesis yielded 80 cc. of yellow milky fluid which contained bile. Microscopic examination of the fluid showed amorphous material, rare mesothelial cells, and gram positive cocci in chains. No pus cells were seen. Cultures of this fluid subsequently grew out non-hemolytic streptococci and Pseudomonas. Preoperatively the WBC was 11,400 with Hgb. 22.5 Gm.

SURGICAL PROCEDURE. After receiving parenteral aque-

ous penicillin, 150,000 units, procaine penicillin, 150,000 units, and streptomycin, 150 mg., the patient was taken to the operating room at 4:30 a.m. and anesthetized with ether. Cut down was done on the right saphenous vein, and infusion of glucose water started. The abdomen was opened through a midline incision revealing bile stained milky fluid in the abdominal cavity. Surfaces of parietal and visceral peritoneum were extensively covered with a thin friable membranous exudate which peeled easily. On the anterior aspect of the first portion of the duodenum a 1 x 1.5 cm. perforated ulcer was discovered. No other abnormalities were detected.

The duodenal perforation was repaired, and the peritoneal surfaces debrided of exudate and copiously irrigated with normal saline. The abdominal wound was then closed in layers after a drainage tube had been placed in the retroduodenal space.

Specimens of the peritoneal exudate submitted for pathologic examination showed bacteria, nondescript bile stained debris compatible with spilled gastrointestinal contents, and reactive inflammation. At the close of the operative procedure the patient received 60 cc. of whole blood.

POSTOPERATIVE COURSE. Following surgery she was placed in an Isolette with oxygen, nasogastric suction was started, and quantitative parenteral fluid balance regimen was instituted. Procaine penicillin, 150,000 units, and streptomycin, 150 mg., were given daily, parenterally, for a total of seven and twelve days respectively.

Bowel tones returned forty hours after operation, and oral feedings of electrolyte-glucose water were started through the nasogastric tube. She began passing stools by the second postoperative day. Nasogastric tube was clamped between feedings, the intravenous fluids were discontinued, and the drainage tube was removed.

Dilute evaporated milk formula was begun on the third postoperative day. Initially, vomiting occurred after each feeding. For this reason fluids were withheld for six hours. Alternate gavage feedings of electrolyte-glucose water and dilute skim milk were resumed and retained. The next day the infant seemed improved and began taking regular formula by nipple. Progressive gain in weight and strength was noted thereafter.

Guaiac tests of the stools, intermittently positive for occult blood following surgery, were negative after thirteen days. She was discharged October 4, weighing 7 pounds 8 ounces.

CONVALESCENCE AND FOLLOW-UP. Examination at six weeks of age showed her to be making a satisfactory recovery except for delayed healing of the abdominal incision. She was readmitted to the hospital at nine weeks of age because of superficial dehiscence of the laparotomy scar. Serous discharge was present. Probing revealed remnants of subcuticular sutures giving rise to a granulomatous foreign body reaction. Following removal of the sutures, the wound was debrided and cauterized.

Upper G.I. series at this time showed normal stomach and esophagus. The duodenal bulb, however, was deformed, irritable, and did not fill well with contrast medium. No ulcer crater was demonstrated. Physical examination being otherwise normal, she was discharged home the following day.

When examined January, 1957, the abdominal wound was well healed. At present the patient is twenty months old and in good health.

Discussion

Gastrointestinal ulceration in childhood has been receiving an increasing amount of attention. Although the etiology remains as obscure in infants and children as in adults, it is thought to be related to factors promoting increased secretion of acid and pepsin by the gastric mucosa associated with increased susceptibility of the gastric and intestinal mucosa to autodigestion.

Kiesewetter,[2] reviewing the literature, has called attention to the work of Cushing and others which suggests relationship between central nervous system dysfunction and the occurrence of gastrointestinal ulceration or perforation. Intracranial disorders resulting from trauma or anoxia, neoplasms, and phychic stresses are all factors which have been implicated. The exact mechanism by which they contribute to ulcer formation is still not clearly understood.

Alexander[3] cites literature which suggests that vascular occlusion or spasm from birth trauma and the effects of bacterial toxins may have a role in ulcer production. Local factors also have received consideration. Russell[4] felt that hydrostatic pressure or direct physical forces upon the intestine at the time of birth could cause spontaneous rupture. Perforation can also occur when a congenital defect in the gut musculature exists, and Herbut,[5] in 1943, first described such a lesion in the stomach of a newborn infant. Other lesions of this type have been reported subsequently.

Gastric acidity in early infancy was studied by Miller.[6] The data showed that values equal to those of adults are reached within twenty-four hours after birth. Acid secretion then decreased for about nine days, rising gradually thereafter. At the end of the first month, acidity had stabilized at a level below that of the adult. Such a study lends credence to the concept that the pathologic mechanisms operating in adults may also be implicated in children.

The relationship between emotional disturbances and peptic ulcers in children has been studied by Chapman and associates.[7] They found that the common denominator in their cases seemed to be conflict over unmet dependency needs. Maternal rejection was described. The children they reported, ages nine to twelve years, tended to be passive, subnormally assertive, and unable to be comfortable in expressing feelings of hostility or aggression. An endless need for affection and approval was evidenced by their being obliging and servile.

Goldberg,[8] studying twenty children with duodenal ulcers between the ages of seven and fifteen years, found that death of the father and worry over school examinations were significant precipitating stresses. Aye,[9] also, was impressed by the emotional difficulties present in the cases which he reported.

Engel and associates[10] studied an infant girl in whom a gastric fistula was established on the

fourth day of life. Though discouraging interpretive generalization, they report an interesting correlation between hydrochloric acid secretion and the behavioral state of the infant.

Bird and co-workers[11] reported a comprehensive study of peptic ulcers in 243 infants and children, thirty-eight of which were newborns. They emphasized that ulcers in the newborn period have certain special characteristics. The onset is mostly precipitous without recognizable premonitory symptoms. A majority are heralded by the sudden, fulminating appearance of hemorrhage, perforation, or both, and are usually fatal. With few exceptions the lesions are acute and without cellular reaction or bacterial invasion. In newborns, duodenal ulcers outnumber gastric ulcers in a ratio of 2:1, with males slightly outnumbering females.

Beyond the newborn period the disease becomes less fulminating in character, often with recognizable prodromata, and tends to follow a more benign course. Tudor[12] has reported a five month old male infant in whom an ulcer involving the superior distal portion of the duodenum was diagnosed by clinical symptoms and confirmed by roentgenograms. Successful treatment with conservative measures was possible.

The younger the infant, the more obscure are the clinical manifestations. Diagnosis in the newborn often depends upon a high index of suspicion. In general, non-specific indications of severe intra-abdominal disease are present. Early findings are fussiness and disinterest in feedings. Vomiting, painful crying, and abdominal distention follow. Respirations frequently become labored and grunting in character with cyanosis often present. Pallor and lethargy may signal that perforation or hemorrhage has occurred. In the latter instance the intra-abdominal fluid is often detected by percussion. Rectal examination is usually normal, although the stool guaiac test may be positive. Fever and leucocytosis may be absent. Shock, peritonitis, and serious disturbances in fluid and electrolyte balance may rapidly follow.

Whittico,[13] Lichtenstein,[14] and Stotts,[15] reporting perforated duodenal ulcers in newborn infants, emphasize that the most important diagnostic procedure is the roentgenographic demonstration of a pneumoperitoneum. In the surviving cases the upright x-ray of the abdomen served as the basis for initiating prompt surgical intervention. Bansmer[16] has called attention to the value of abdominal paracentesis as an additional diagnostic aid. There is common agreement that a perforated viscus in an infant is a surgical emergency requiring prompt exploratory laparotomy to establish the location of the lesion and close the defect.

Survival of the patient is attributed to the following factors: 1) early recognition of disease confirmed by approximate x-ray studies; 2) prompt surgical intervention with closure of the defect; 3) inspection of the abdominal organs to rule out multiple ulcers or other defects; 4) careful debridement of foreign material and irrigation of peritoneal surfaces before closure of the abdomen, and 5) attention to supportive measures including blood replacement, antibiotics, and careful administration of fluids and electrolytes.

Summary

A female infant, delivered normally by multiparous mother, developed signs of intra-abdominal disease at 50 hours. Roentgenogram showed pneumoperitoneum. Closure of perforated duodenal ulcer was accomplished at operation six hours after onset of symptoms. X-ray examination six weeks after surgery indicated irritability of duodenum. The patient was in good health at 20 months. •

IN DEBILITATING DISEASE

Patients receiving

NILEVAR®

Eat more...
Feel better...
Recover faster

Compared to control patients, those receiving Nilevar (brand of norethandrolone) have repeatedly demonstrated more rapid and more complete recovery from serious acute illness and increased comfort and well-being in chronic illness.

A multitude of case histories are now adding individual clinical color to the earlier controlled investigations which defined the actions of Nilevar as an effective aid in reversing negative nitrogen balance and in building protein tissue.

In typical case reports such gratifying comments as these appear:

Underweight —"Appetite considerably increased within one week. Sense of well-being and vigor increased along with increased appetite."

Prematurity (Birth weight: 2 pounds, 4 ounces) — "Gradual improvement in appetite and capacity for formula. . . . Excellent progress and weight gain for a very immature infant."

Carcinoma of the Uterus —"Within four days appetite became excellent, took full diet. . . . More ambition while on Nilevar. Enjoys life. Takes part in church and other social affairs."

Third Degree Burn —". . . soon began eating all that was offered. . . . Began to show signs of hope for recovery. . . . Perhaps one of the greatest changes was in the appearance of his wounds which were so very much improved."

The dosage is 25 to 50 mg. daily for adults. For children the daily dosage is 1 mg. per kilogram of body weight; this dosage should be reduced to 0.5 mg. daily if given to prepuberal children for more than ten days.

Nilevar is supplied in tablets of 10 mg. and ampuls of 25 mg. (1 cc.).

SEARLE

A NEW
therapeutic principle
based on induced rhythmic motion

This is Metabol'aid—a new precision mechanical apparatus that gently induces scientifically-measured rhythmic motion into any prescribed area or areas of the body.

Clinical studies conducted in major hospitals and medical schools demonstrate that scientifically-measured motion induced into the patient can be of value in the treatment of:

Diabetes—Statistically significant reduction of blood sugars in many patients.

Arthritis—Early symptomatic relief in degenerative and osteoarthritis.

Hypertension—Marked lowering of blood pressure in most patients.

Obesity—Up to 12 pounds loss in 10 weeks (7 1/3 pounds average) without dietary restriction.

The device used in clinical studies of this new therapeutic principle—"motion in medicine"—was Metabol'aid.

Years of research and clinical studies lie behind Metabol'aid, which is already in use in hospitals, clinics, M.D. offices, and patients' homes.

Your prescription is required for Metabol'aid, which is primarily designed for regular daily use by your patients in their homes.

UPON YOUR REQUEST, a detailed brochure on Metabol'aid—with clinical reports and complete bibliography—will be provided. Just jot "Metabol'aid" on your Rx blank and mail to Metabol'aid, Dept. NM-6, 911 Seneca, Seattle, Washington.

bicarbonate-regulating diuretic

Acetazolamide Lederle

HOW DIURETICS ACT

Primarily by regulation of bicarbonate transport	DIAMOX acetazolamide
Primarily by regulation of chloride transport	mercurials chlorothiazide

1

Advantages of DIAMOX in single-drug diuresis

DIAMOX — operating through the well-understood mechanism of *bicarbonate* transport regulation—provides ample, prolonged diuresis in the great majority of patients.

DIAMOX is virtually nontoxic . . . has not caused renal or gastric irritation . . . has no pronounced effect on blood pressure. It is rapidly excreted, does not accumulate in the body, permits convenient dosage adjustment, allows unbroken sleep. Small, tasteless, easy-to-take tablets . . . usual dosage, only one a day.

- CARDIAC EDEMA
- PREMENSTRUAL TENSION
- EDEMA OF PREGNANCY
- OBESITY

2

Advantages of DIAMOX in intensive, two-drug diuresis

When intensive diuresis must be maintained, DIAMOX, alternated with an agent for regulation of *chloride* transport, has proved a regimen of choice. Through dual *bicarbonate-chloride* regulation, it produces maximal sodium-water excretion with minimal distortion of serum electrolyte patterns, greater patient comfort, lessened risk of induced drug resistance.

- ADVANCED CONGESTIVE HEART FAILURE
- REFRACTORY TOXEMIA OF PREGNANCY

OREGON STATE MEDICAL SOCIETY
1115 S. W. Taylor Street
Portland 5, Oregon

ANNUAL MEETING
September 3-5, 1958
Portland

President, Vern W. Miller, M.D., Salem
Secretary-Treasurer, Max H. Parrott, M.D., Portland
Executive Secretary, Mr. Roscoe Miller, Portland

Raymond M. McKeown Re-elected AMA Trustee

The Oregon State Medical Society was highly elated when the House of Delegates of the American Medical Association, at its 1958 Annual Session held in San Francisco June 23-27, re-elected Raymond M. McKeown of Coos Bay to the Board of Trustees for a five year term expiring 1963. Dr. McKeown was elected trustee in 1957 to complete the unexpired term of Gunnar Gundersen who had been elevated to the office of president-elect.

Dr. McKeown's capabilities became well recognized during the more than ten years he represented the Oregon State Medical Society in the AMA House of Delegates. He was appointed to the Association's Commitee on Medical and Related Facilities, the Committee on Lay Sponsored Prepaid Medical Care Plans, and to the Medical Advisory Board of the Sears Roebuck Foundation. As a member of the House of Delegates he was called upon regularly to serve on many reference committees. Still another indication of the respect and confidence which was placed in him was his election to the Council on Medical Service in 1956.

During his first year as trustee Dr. McKeown's responsibilities were greatly expanded. He was made chairman of the Committee on Medical Rating of the Physically Handicapped which produced a report—A Guide to the Evaluation of Permanent Impairment of the Extremities and Back—the first of 11 reports to be made by this Committee. He was also named chairman of the Committee on Paramedical Services and to the Commitee on the Study of AMA Objectives and Basic Problems. In addition to these responsibilities Dr. McKeown was asked to serve as one of the incorporators and secretary-treasurer of the American Medical Research Foundation and to be the Board of Trustees' liaison member to the Council on Medical Service.

OSMS is justifiably proud that Dr. McKeown has been re-elected to this high office in American medicine.

John F. Abele Named to Joint Committee on School Health

John F. Abele of Portland has been named by the Board of Trustees of the American Medical Association to hte AMA and National Education Association's Joint Committee on Health Problems in Education. Dr. Abele succeeds Carl A. Wilzbach of Cincinnati, Ohio and will serve for a term of five years.

Dr. Abele's appointment comes in recognition of his work as Chairman of the Society's Committee on Child Health; as the Society's representative on the Advisory Committee to the Joint Staff Committee of the State Department of Education, the State Board of Health and the State System of Higher Education; and his contributions to the Biennial Conference on Physicians and Schools sponsored by AMA. Dr. Abele was Chairman of the Committee on School Health of the Multnomah County Medical Society from 1952 through 1954 at the time that committee conducted an extensive survey of the school health activities in the Portland public schools, a project which attracted nation-wide attention.

The Joint Committee has been in existence for nearly half a century and has made valuable contributions to solving health problems in schools. The many books and pamphlets relating to all phases of school health which have been published under its direction have been used widely as guides by both schools and medical societies.

AMA Annual Session Sidelight: At left, Vern W. Miller, president of Oregon State Medical Society, presents a certificate to Gunnar Gundersen, president of the American Medical Association, during the 1958 session at San Francisco. The citation declares Dr. Gundersen to be an "Ambassador At Large" of the State of Oregon and invites him to attend the Oregon Centennial Exposition at Portland, June 10 to September 17, 1959. Similar certificates were presented to all officers and trustees of AMA.

NOW... an advanced ACTH

SIGNIFICANTLY IMPROVED

CORTROPHIN®-ZINC

(Corticotropin-Alpha Zinc Hydroxide)

A unique electrolytic process* of manufacture gives a fine, easily resuspended aqueous suspension of Cortrophin-Zinc with these therapeutic advantages:

★ **VIRTUALLY PAINLESS** . . Unsurpassed patient acceptance.

★ **HIGH PURITY** . . . . . Virtually pure ACTH with fewer mg. of foreign protein per injection.

★ **RAPID ACTION** . . . . . New form stimulates peak adrenal output within two hours.

★ **LONG ACTION** . . . . . Provides ACTH activity for several days.

★ **ECONOMICAL** . . . . . Lower total ACTH dosage and fewer injections required.

Cortrophin-Zinc is indicated in the treatment of more than 100 diseases, including rheumatoid arthritis, bronchial asthma, allergies and hypersensitivities, bursitis, serum sickness, conjunctivitis and other eye diseases, ulcerative colitis, atopic dermatitis and other skin diseases.

★ **Ask your Organon representative or write for clinical and experimental reports substantiating these claims.**

SUPPLIED: 5-cc vials containing 40 and 20 U.S.P. units of corticatropin per cc; 1-cc ampuls cantaining 40 and 20 U.S.P. units of corticatrapin, with sterile dispasable syringes.

Pat. Pending
Availoble in other countries as Cartrophine-Z.

84th Annual Meeting, Oregon State Medical Society

Masonic Temple, Portland, September 3-4-5, 1958

SCIENTIFIC PROGRAM

(All sessions will be held in the Comandery Room, Masonic Temple)

WEDNESDAY, SEPTEMBER 3

9:00 Registration

MORNING SESSION

10:00 Sommer Memorial Lecture: Diet and Coronary Heart Disease
J. Edwin Wood, Jr., M.D., Charlottesville, Va.

11:00 Diagnosis and Treatment of Ruptured Aneurysms of Circle of Willis
George M. Austin, M.D., Portland

11:30 Practical Office Tests for Estimating Kidney Function
Oscar T. Heyerman, M.D., Medford

AFTERNOON SESSION

1:00 Sommer Memorial Lecture: Tumors of the Hand
Michael L. Mason, M.D., Chicago, Ill.

2:00 Panel Discussion: Preoperative and Operative Anesthesia—Including Problems of Oxygen Therapy
(Discussion to be based on questions submitted in advance. Submit questions at the registration desk prior to the close of the morning session.)
Panel Members—Frederick P. Haugen, M.D., Portland, Moderator; Theodore P. Barss, M.D., Medford; John O. Branford, M.D., Portland; T. F. Brinton, M.D., Eugene; and Raymond A. Schneider, M.D., Salem

3:00 Recess to Visit Exhibits

3:30 Some Common Foot Problems and What to Do About Them
Donald B. Slocum, M.D., Eugene

4:00 Sommer Memorial Lecture: Typical Facies and Postures
Ralph V. Platou, M.D., New Orleans, La.

THURSDAY, SEPTEMBER 4

MORNING SESSION

9:00 Sommer Memorial Lecture: From the Mouths of Babes and Sucklings
Ralph V. Platou, M.D.

10:00 Diabetes of Twenty-Five or More Years in Duration: Causes and Effects
Blair Holcomb, M.D. and Wayne R. Rogers, M.D., Portland

10:30 Recess to Visit Exhibits

11:00 Special Guest Lecture: Problems of Public Health in Relation to Inorganic Fluorides
Robert A. Kehoe, M.D., Cincinatti, Ohio

AFTERNOON SESSION

1:00 Sommer Memorial Lecture: Serum Glutanix Oxalo-Acetic Transaminase and Lactic Dehydrogenose Levels and Their Clinical Significance
J. Edwin Wood, Jr., M.D.

(Thursday, Afternoon Session Con't.)

2:00 Diagnosis of Chest Diseases by Scalene Node Biopsy
J. Karl Poppe, M.D., Portland

2:30 Acute Prostatitis Versus Acute Pyelonephritis: Its Diagnosis and Management
Thomas R. Montgomery, M.D., and Gerald F. Whitlock, M.D., Portland

3:00 Recess to Visit Exhibits

3:30 Rupture of the Uterus
Raphael B. Durfee, M.D., Portland

4:00 Sommer Memorial Lecture: The Management of Burns
Michael L. Mason, M.D.

6:00 Annual Society Dinner Dance, Rose Bowl, Hotel Multnomah *(Formal Dress Optional)*

FRIDAY, SEPTEMBER 5

MORNING SESSION

9:15 Annual Business Meeting and Election of Officers

9:45 Sommer Memorial Lecture: Primary and Delayed Tendon Repair of the Hand
Michael L. Mason, M.D.

10:40 Recess to Visit Exhibits

11:10 Special Guest Lecture: What the Practitioner of Medicine Should Know About Radiation Problems
James H. Sterner, M.D., Rochester, N. Y.

AFTERNOON SESSION

1:00 Sommer Memorial Lecture: The Prognosis for Meningitis in Infants
Ralph V. Platou, M.D.

2:00 Panel Discussion: What Can Be Done for Crippling Pulmonary Disorders
(Discussion to be based on questions submitted in advance. Submit questions at the registration desk prior to the close of the morning session.)
Panel Members—John E. Tuhy, M.D., Portland, Moderator; William Cohen, M.D., Portland; Donald M. Pitcairn, M.D., Portland; and Charles S. Campbell, M.D., Salem

3:00 Recess to Visit Exhibits

3:30 Some Observances on 850 Patients Operated on for Lumbar Protruded Intervertebral Disc
John E. Raaf, M.D., Portland

4:00 Sommer Memorial Lecture: The Clinical Significance of Factors Influencing the Excretions of Salt and Water
J. Edwin Wood, Jr., M.D.

Northwest Association of Occupational Medicine Annual Meeting Sept. 7

The Northwest Association of Occupational Medicine will hold its 1958 Annual Meeting on Sunday, September 7, 1958 just preceding the Fifth Pacific Northwest Industrial Health Conference. The following program will be presented at Hotel Multnomah, Portland.

9:00 Registration *(No registration fee)*

9:30 Nurse-Physician Teamwork in American Industry
MELVIN NEWQUIST, M.D., *Medical Director, The Texas Co.*

10:00 Business Meeting

10:30 Close Your Wounds
DAVID E. SULLIVAN, M.D., *Spokane, Wash.*

11:00 Psychiatry for All Our People
GEORGE SASLOW, M.D., *Professor of Psychiatry, University of Oregon Medical School, Portland*

11:30 Treatment of Grave Electric Injury
JAMES I. ROBERTS, M.D., Medical Director, New *England Power Service Company, Boston, Mass.*

12:00 Recess

1:30 Educational Preparation for Industrial Health Service
JEAN S. FELTON, M.D., *Professor of Preventive Medicine (Occupational Health), University of Oklahoma, Oklahoma City*

2:00 Oregon At Work—The Human Story
THE HONORABLE ROBERT HOLMES, *Governor of State of Oregon*

2:30 What's Eating on Him?
REV. JAMES B. MCGOLDRICK, S.J., *Head, Department of Education, Seattle University, Seattle, Wash.*

3:00 Life in Tranquilized Industry
R. G. BELL, M.D., *Bell Clinic on Alcoholism and Addiction, Toronto, Canada*

3:30 Demonstration of Radioactive Energy Sources
G. VICTOR BEARD, *Theoretical Physicist, Chief, Health Protective Branch, Division of Biology and Medicine, Atomic Energy Commission, Washington, D.C.*

4:30 Reception Honoring Speakers. All in Attendance Invited.

Oregon Physician on Far East Medical Team

John G. P. Cleland of Oregon City was included in a team of physicians which departed from San Francisco on June 24 for the Far East and Africa. The team is part of a volunteer mission project created last year by the Baptist Church. The group, which also includes Robert A. Hingson of Cleveland, Ohio and Eugene H. Dibble, Jr., of Tuskegee, Alabama, will be in the Far East and Africa for three months investigating health conditions.

State Board To Meet in September

Next regular meeting of the State Board of Medical Examiners will be held September 26 and 27 at 609 Failing Building, Portland.

NEWLY ELECTED OFFICERS OF SOUTHERN OREGON MEDICAL SOCIETY—*left to right*: Harvey A. Woods, Ashland, member of Board of Censors; Thomas H. Emmens, Medford, president; and Lawrence W. Buonocore, Medford, secretary-treasurer.

Southern Oregon Medical Society Holds 67th Annual Meeting

Southern Oregon Medical Society held its 67th annual meeting Saturday, May 24, 1958 at Zottola's Country Club. Approximately 35 physicians from southern Oregon counties attended.

Officers elected for the coming year were: Thomas H. Emmens, Medford, president; Lawrence W. Buonocore, Medford, secretary-treasurer; Harvey A. Woods, Ashland, member of the Board of Censors. Robert M. Turner of Ashland is vice-president.

Program highlight was the presentation of papers on kidney stones and artificial kidneys by Milton L. Rosenberg, assistant clinical professor of surgery at Stanford University School of Medicine; and John V. Young, clinical instructor in medicine at the Stanford University hospital, Palo Alto, California. A round-table discussion followed the lectures. Specific cases of medical interest were analyzed and questions answered.

Delegates enjoyed a noon-day luncheon at the club, at which time a musical program was presented by Anne and Sally Mackie.

On the same day, the local medical auxiliary met at the Oregon Inn. Mrs. Rosenberg discussed the Oregon auxiliary's project to support a summer camp for handicapped children.

House of Delegates to Meet At Aero Club

Blair J. Henningsgaard of Astoria, speaker of the House of Delegates, announces that the House will hold its regular meetings in the Aerodrome of the Aero Club of Portland, S.W. Taylor Street at Park Avenue. The Aerodrome is located on the third floor. Elevator service is available.

The House of Delegates will meet each day of the Session beginning with breakfast at 7:00 a.m.

Arrangements have been made to accommodate reference committee meetings at the Heathman Hotel in the Castilian and French Rooms. A third room will be announced at the meeting.

Dr. Henningsgaard asks delegates to be on time so that business can begin promptly.

Industrial Health Conference Slated for September 8-9

For the fifth consecutive year the Portland Chamber of Commerce, in cooperation with the Oregon State Medical Society, the Multnomah County Medical Society and twenty-five other Oregon official and voluntary health agencies and professional societies, is sponsoring a Pacific Northwest Industrial Health Conference to be held September 8 and 9, 1958 at the Hotel Multnomah in Portland.

JEAN S. FELTON, M.D.

The program will include presentations by nine leaders outstanding in the field of industrial health and numerous panel discussions of vital industrial health problems.

An important sidelight of this year's conference will be the presence of the members of the Council on Industrial Health of the American Medical Association. The Council has decided to hold one of its regular meetings during the conference. The program in abridged form is printed below. Complete programs are available on request to the Oregon State Medical Society, Medical-Dental Bldg., Portland 5.

MONDAY, SEPTEMBER 8

8:00 Registration in the Lobby. *(Registration desk also open Sunday, Sept. 7 from 3 p.m. to 9 p.m.)*

9:15 Alcoholism and other Addiction in Industry—Identification and Solution of the Problem
Management Aspects: HENRY MIELCAREK, Manager of Personnel Service Dept., Allis-Chalmers Manufacturing Co., Milwaukee, Wis.
Medical Aspects: R. GORDON BELL, M.D., Medical Director, The Bell Clinic, Willowdale, Ontario, Canada

10:30 Panel Discussion

12:00 Luncheon Session *(Joint Meeting with Portland Chamber of Commerce).* Problem of Retirement
CARL H. HAGEMAN, Vice President, Industrial Relations, Union Carbide, New York City

2:00 Proper Utilization of Industrial Nurses
SARA P. WAGNER, R.N., Director of Nurses, Standard Oil Company of New Jersey

3:30 Health Problems of the Utilities Industry—Including Those Conected with Nuclear Power
JAMES I. ROBERTS, M.D., Medical Director, New England Power Service Co., Boston

TUESDAY, SEPTEMBER 9

9:00 Health Education in Industry—Practical Consideration of Actual Programs in Industry
S. S. LIFSON, Director of Health Education, National Tuberculosis Association, New York

10:45 Physical and Emotional Health in Accident Causation and Prevention
JEAN S. FELTON, M.D., Professor of Preventive Medicine, University of Oklahoma School of Medicine, Oklahoma City

12:00 Luncheon Session—Toxic Chemicals in Industry—How to Live and Work Safely with Them
LEMUEL G. MCGEE, M.D., Medical Director, Hercules Powder Company, Wilmington, Del.

2:00 Measuring Manpower Potential: Value and Limitations of Testing Prcoedures
GEORGE W. EBEY, PH.D., Vice President, Consolidated Freightways Corp., Menlo Park, Calif.

2:30 Panel Discussion

LEMUEL G. McGEE, M.D. MR. CARL H. HAGEMAN

MR. HENRY MIELCAREK MR. S. S. LIFSON

STEROSAN®
Hydrocortisone

Cream and Ointment (chlorquinaldol GEIGY with hydrocortisone)

The case illustrated below typifies the superior response produced by STEROSAN-Hydrocortisone. Combining potent antibacterial-antifungal action with a reliable anti-inflammatory and antipruritic effect, STEROSAN-Hydrocortisone is valuable in a wider range of infective or allergic dermatoses.

A severe infectious eczematoid dermatitis on foot of 15-year-old boy. Patient used STEROSAN-Hydrocortisone preparation 3 times a day for 23 days with a dramatic improvement as shown.*

For Speedier Return to Normal Nutrition

Meat...

in Inflammatory Conditions of the Colon

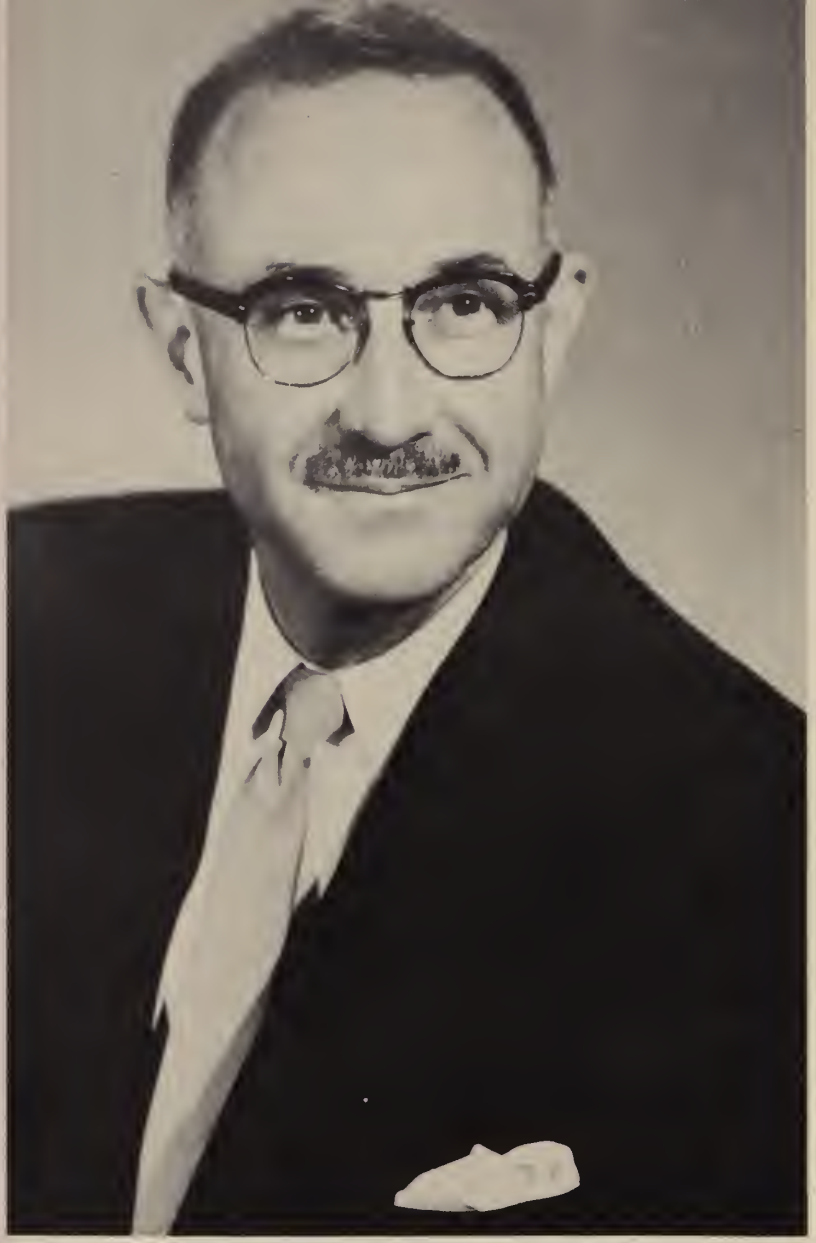
The physiologic depletion accompanying acute infectious and inflammatory conditions of the bowel makes replacement therapy the key to nutritional rehabilitation.

In addition to the loss of important electrolytes, such as potassium and sodium, large amounts of protein are lost in the fluid, blood and exudate from the bowel. In the acute state of such affections, utilization of what protein can be ingested is further affected by increased protein catabolism and by impairment of certain hepatic functions.

Dietary rehabilitation must be carried out within the framework of a diet restricted in fiber and in irritating substances. Foods allowed must be easily digested and appetizingly and attractively prepared to encourage eating.

Tender lean meats—finely ground in the initial diet and later served in a wide variety of appealing ways—can be an important source of the protein and minerals required by the convalescing patient.

Meat fits admirably into the requirements of the permitted diet not only because of its taste, digestibility, and physical characteristics, but also because of its contribution of high quality protein, the minerals potassium, iron, phosphorus, sodium, and magnesium, and all the known B vitamins.



The nutritional statements made in this advertisement have been reviewed by the Council on Foods and Nutrition of the American Medical Association and found consistent with current authoritative medical opinion.

MILO. T. HARRIS, M.D., Spokane
President, WSMA

President's Invitation

As president of the Washington State Medical Association, it is my pleasure to invite physicians of the Northwest to our 69th Annual Convention in the friendly and beautiful city of Spokane September 14-17.

Our convention committees have arranged an excellent program, featuring top-flight speakers and a well-balanced schedule of scientific, non-scientific, business, social and sports events. An innovation this year is a series of refresher courses which will be of interest and practical value to both the general practitioner and the specialist.

I invite your close attention to the program on the following pages and feel sure your attendance will be enjoyable and rewarding.

Milo T. Harris, M.D.

69th Annual Convention

WASHINGTON STATE MEDICAL ASSOCIATION

Davenport Hotel, Spokane

September 14-17, 1958

General Convention Program

SATURDAY, SEPTEMBER 13

9:00 to 12:00 a.m. — Finance and Defense Fund Committee Meetings, Signet Room

1:30 p.m. — Board of Trustees Meeting, East Banquet Room

1:30 p.m. — Bureau Managers' Meeting, Coronet Room

6:00 p.m. — President's Banquet for Board of Trustees, Mandarin and East Banquet Rooms

SUNDAY, SEPTEMBER 14

9:00 to 12:00 a.m. — WPS Stockvoters' Breakfast and Meeting, Isabella Room

10:00 a.m. to 5:00 p.m. — Registration . . . Mezzanine

1:30 p.m. — House of Delegates (First Session), Isabella Room

6:30 p.m. — Refreshments . . . Isabella Room

7:15 p.m. — No-Host Banquet Honoring 50-Year Practitioners (Music and Entertainment), Marie Antoinette Room—Everybody Welcome

MONDAY, SEPTEMBER 15

All Day — Registration . . . Mezzanine

All Day — Fishing Derby—Priest Lake, Idaho (Transportation leaves hotel, 6:00 a.m.)

All Day — Golf Tournament—Spokane Country Club (Tee-off, 7:30 a.m.)

9:00 a.m. to 5:00 p.m. — Scientific Films . . . Isabella Room

4:30 to 6:30 p.m. — Reception for Exhibitors (Doctors Welcome), Marie Antoinette Room

6:30 p.m. — Fishermen's Banquet and Prize Awards, Linger Longer Lodge—Priest Lake, Idaho

6:30 p.m. — Golfers' Banquet and Prize Awards, Spokane Country Club

TUESDAY, SEPTEMBER 16

All Day — Registration . . . Mezzanine

All Day — Reference Committee Meetings, Rooms to be Announced

7:00 a.m. — Past Presidents' Breakfast, Room to be Announced

7:30 a.m. — Breakfast, Refresher Course Instructors, Signet Room

9:00 to 10:30 a.m. — Refresher Courses (See Scientific Program)

9:00 a.m. to 4:30 p.m. — Health Officers' Association Meeting, Room to be Announced

TUESDAY, SEPTEMBER 16 (Cont.)

10:30 to 11:00 a.m. — Recess to Visit Exhibits

11:00 to 12:00 a.m. — GENERAL ASSEMBLY, Marie Antoinette Room
E. L. Calhoun, President-Elect, Presiding
President's Message—Milo T. Harris
Address—Gunnar Gundersen, President, AMA

12 Noon — Luncheon Meetings
E.E.N.T. Section, Coronet Room
Health Officers' Association, Gothic Room
Internal Medicine Section, Nile Room, Desert Hotel
Washington Academy of General Practice, Isabella Room
Washington Chapter, American College of Surgeons, East Banquet Room
Washington State Allergy Society, Mandarin Room

2:00 to 5:00 p.m. — General Scientific Session (See Scientific Program), Marie Antointete Room

6:30 to 12:00 p.m. — Annual Banquet and Dance (Dress Optional)

6:30 p.m. — Reception for National and State Officers, Isabella Room

7:15 p.m. — Annual Banquet (Music and Entertainment), Marie Antoinette Room

9:00 p.m. — Dance (Hal Eastburg's Orchestra), Isabella Room

WEDNESDAY, SEPTEMBER 17

All Day — Registration . . . Mezzanine

7:30 a.m. — Breakfast, Refresher Course Instructors, Signet Room

7:30 a.m. — Breakfast, King County Delegates and Alternates . . . Early Birds Club

8:30 to 10:00 a.m. — Refresher Courses (See Scientific Program)

9 a.m. to 4:30 p.m. — Health Officers' Association Meeting, Room to be Announced

10:00 to 10:30 a.m. — Recess to Visit Exhibits

10:30 to 12:00 a.m. — General Scientific Session (See Scientific Program), Isabella Room

12 Noon — PUBLIC RELATIONS LUNCHEON, Marie Antoinette Room
President Milo T. Harris, Presiding
Address—Governor Albert D. Rosellini

1:30 p.m — House of Delegates (Second Session), Marie Antoinette Room
Committee Reports
Election of Officers
Installation of New President, Emmett L. Calhoun

2:00 to 5:00 p.m. — General Scientific Session (See Scientific Program), Isabella Room

Emmett L. Calhoun, Aberdeen, WSMA
Mrs. Clarence L. Lyon, Spokane, Woman's Auxiliary

Gunnar Gundersen, M.D.

Gov. Albert D. Rosellini

AMA President Gundersen, Governor Rosellini featured in Non-Scientific Program

President Gunnar Gundersen of the American Medical Association and the Honorable Albert D. Rosellini, Governor of the State of Washington, will be featured speakers in the non-scientific program of the Convention.

The top AMA official will appear with President Milo T. Harris of the Washington State Medical Association in the General Assembly at 11:00 a.m. Tuesday, September 16. Everyone is welcome. Dr. Gundersen will draw upon his intimate knowledge of professional activities and medical practice to present an inspiring message to the physicians of the state. Prior to his installation as AMA president at San Francisco in June, Dr. Gundersen was a member of the AMA Board of Trustees since 1948, and served two years as chairman.

Governor Rosellini will address the Public Relations Luncheon at 12 o'clock noon Wednesday, September 17. He will discuss state issues of concern to the medical profession. An attorney, Governor Rosellini was a member of the State Senate for 17 years prior to his election as governor in 1956. While in the Senate, he introduced the bill which created the University of Washington School of Medicine in 1945.

Admission to the Public Relations Luncheon will be $1.00 per person, with the balance of the cost of the luncheon borne by the State Medical Association.

Social Events

For the relaxation and enjoyment of doctors and their wives, a pleasurable calendar of social events and entertainment will be interspersed with the serious business of the Convention.

The outstanding social attraction will be the Annual Banquet and Dance Tuesday evening, September 16, for which dress will be optional. Preceding the banquet will be a reception for national and state officers, at which refreshments will be served. There will be music and entertainment during the banquet, followed by dancing to Hal Eastburg's orchestra. Tickets to this and other convention social events will be available by mail.

Members who have practiced medicine for 50 years or more will be honored at the informal, no-host Sunday evening banquet September 14. Music and entertainment are also in store for this event. Refreshments will precede the banquet.

Final social event of the Convention will be the Presidents' Reception Wednesday evening, September 17. The reception will honor the incoming presidents of the State Association and Auxiliary, Emmett L. Calhoun of Aberdeen and Mrs. Clarence L. Lyon of Spokane. The State Association will be host and everyone is welcome.

Guest Scientific Speakers

John Caffey, M.D.

New York City
Professor of Radiology, Columbia University
Radiologist to Babies Hospital, Presbyterian Hospital and Vanderbilt Clinic

Local Host: E. Finch Parsons, M.D.

Walter A. Fansler, M.D.

Minneapolis, Minnesota
Clinical Professor and Director, Division of Proctology
University of Minnesota Medical School

Local Host: Everett B. Coulter, M.D.

William S. Middleton, M.D.

Washington, D. C.
Chief Medical Director
Veterans Administration

Local Host: George H. Anderson, M.D.

R. A. Murray, M.D.

Temple, Texas
Chief of Department of Orthopedic Surgery
Scott and White Clinic and Scott and White Memorial Hospital

Local Host: Geroge T. Wallace, M.D

Eugene F. Poutasse, M.D.

Cleveland, Ohio
Staff Urologist, Cleveland Clinic Foundation and Frank E. Bunts Institute

Local Host: Alfred E. Dodson, M.D.

Lucian A. Smith, M.D.

Rochester, Minnesota
Associate Professor of Medicine, Mayo Foundation, Head, Section on Internal Medicine, Mayo Clinic

Hypertension and Renal Artery Disease
H. P. Lee, R. E. Jensen, T. E. Canning and A. E. Dodson, Spokane

Current Use of the Tuberculin Test in General Practice
Cedric Northrop, Seattle

Significance of Polyps of Colon and Rectum, Importance of Early Detection and Proper Therapy
G. Edward Schnug and Charles R. Cavanagh, Spokane

Stinging Insects—Taxonomy-Ecology; Antigenic Analyses; Desensitization Results
Robert A. Stier, Robert F. E. Stier and Edward L. Foubert, Jr., Ph.D., Spokane

Sports Events

R. McC. O'Brien, M.D.
Spokane, Chairman
Golf Tournament

O. Charles Olson, M.D.
Spokane, Chairman
Fishing Derby

Fishing and golfing will provide competitian and recreation for sparts enthusiasts attending the Convention. The Trout Fishing Derby and the Annual Tournament of the Washington State Medical Golf Association are scheduled far Monday, September 15.

The Fishing Derby will be held at Priest Lake, Idaho, with headquarters at Linger Longer Lodge. Bus transpartation will be provided from the Davenport Hotel ta the lake and back. Busses will leave the hotel at 6:00 a.m.

The Golf Tournament will be held at the Spokane Country Club, with tee-off at 7:30 a.m. Low gross score at 18 holes will decide the championship. All other competitian, in sections and divisians, will be on handicap. Four-man county teams will campete far the Shaw Trophy.

Climaxing the sports pragram will be stag banquets and prize awards, at Priest Lake for fishermen, and at the Spokane Cauntry Club for golfers. Entry blanks and further information will be sent to prospective golfers and fishermen in ample time for the competition.

Mrs. Underwood Featured in Woman's Auxiliary Convention In Spokane, September 14-17

With one of its own members in the limelight as national president, the Woman's Auxiliary to Washington State Medical Association will hold its 27th annual convention in Spokane September 14-17, inclusive. The Hotel Ridpath will be convention headquarters and center of activities.

Mrs. E. Arthur Underwood of Vancouver, Washington, president of the Woman's Auxiliary to the American Medical Association, will have a prominent part in the convention program, and she will be honored with Mrs. E. Donald Lynch of Yakima, State Auxiliary president, at a dinner and fashion show Monday evening, September 15.

Mrs. Underwood will address the Auxiliary at its annual luncheon honoring past presidents Tuesday noon, September 16. Gunnar Gundersen of LaCrosse, Wisconsin, president of the American Medical Association, will speak during the same program. Luncheon guests will include Mrs. Roscoe Mosiman of Seattle, past president of the AMA Auxiliary, Mrs. Morris Hecht of Bellingham, junior past president of the State Auxiliary, and the president and president-elect of the Washington State Medical Association, Milo T. Harris of Spokane and Emmett L. Calhoun of Aberdeen.

Mrs. Lynch will give her presidential report at the convention's first general session, which will be held from 2:00 to 4:30 p.m. Monday, September 15. This session also will include a report on the national Auxiliary convention by the president-elect of the State Auxiliary, Mrs. Clarence L. Lyon of Spokane, and reports of officers and county Auxiliary presidents.

Tuesday's general session will open at 9:00 a.m. with greetings from Dr. Calhoun, WSMA president-elect. That afternoon, following reports of the Resolutions and Nominating Committees, officers will be elected for the coming year, and the new officers will be installed by Mrs. Underwood.

Mrs. E. D. Lynch
Yakima, President
WSMA Woman's Auxiliary

Mrs. C. L. Lyon
Spokane, President
WSMA Woman's Auxiliary

Mrs. E. A. Underwood, *Vancouver*
President, Woman's Auxiliary to AMA

The Auxiliary's annual golf tournament and luncheon will be held at the Manito Golf and Country Club on Monday, September 15. Golf trophy awards will be presented that evening at the Spokane Club, following the dinner and fashion show honoring Mrs. Underwood and Mrs. Lynch.

Also scheduled for Monday is a workshop for new county Auxiliary presidents, presidents-elect, treasurers, organization chairmen and state committee members. The workshop will be held in the Hotel Ridpath beginning at 9:00 a.m.

Other convention attractions are events planned for physicians and their wives in conjunction with the convention of the Washington State Medical Association. These include the no-host banquet honoring 50-year practitioners Sunday evening, the Annual Banquet and Dance Tuesday evening, the Public Relations Luncheon Wednesday noon, and the reception honoring the new presidents of the Association and Auxiliary Wednesday evening.

Pre-convention events and registration will begin Sunday at 2:00 p.m. There will be meetings of the State Auxiliary Board, Revisions Committee and Nominating Committee that afternoon.

Mrs. James M. Patton of Spokane is chairman of the Convention Committee. Other members of the committee, all of Spokane, are Mrs. Harry Lee, Mrs. Rudolph Stuart, Mrs. R. McC. O'Brien, Mrs. D. W. Robinson, Mrs. R. P. Shanewise, Mrs. Carroll Smith, Mrs. J. H. Delaney, Mrs. Arch Logan, Mrs. Robert Albi, and Mrs. Edward Johnston. •

Newest Techniques in Laboratory Diagnosis To Be Described at Public Health Conference

Newest laboratory techniques for detection of diptheria and other communicable diseases will be described by two U. S. Public Health Service specialists September 29 at 1 p.m. in the Chinook Hotel, Yakima. Herman C. Mason, head of the public health laboratories of the State Health Department, urges physicians, pathologists, and medical and hospital laboratory personnel to attend this laboratory program which will be presented as part of the 23rd annual Washington State Public Health Association conference.

Specialists appearing on the program are Elberton Tiffany, chief of the laboratory and training program, Communicable Disease Center, Chamblce, Ga., and Miss Genevieve Stout, serologic consultant, Venereal Disease Research Laboratory, Chamblee. Among the important developments to be described is the recent advance of fluorescent antibody techniques in detection of disease-producing organisms.

Reservists Train at Fort Ord Hospital

Reservists of the 50th General Hospital, commanded by Colonel Frederick F. Ackerman of Seattle, recently spent their two weeks of annual summer training at the U.S. Army Hospital, Fort Ord, Calif. The unit participated in parallel training with Regular Army personnel at the Hospital. The 50th General Hospital, consisting of 123 officers, nurses and enlisted personnel from the Seattle area, is the largest and oldest Medical Reserve unit in the U.S. Army Corps command.

PRELIMINARY PLANS for the S. Maimon Samuels Institute for Heart and Cancer Research have been approved by the University of Washington Board of Regents. To be built attached to the south wing of the University's Teaching and Research Hospital, the three-story building will be devoted entirely to heart and cancer research laboratories, with the exception of an entrance and waiting room. A major portion of the cost, estimated at $800,000, was a gift of Dr. and Mrs. S. Maimon Samuels of Seattle. Construction is scheduled to start within a year.

Dr. and Mrs. Hoyt B. Woolley of Idaho Falls. During the past year, Mrs. Woolley was president of the Woman's Auxiliary to the Idaho State Medical Association and Dr. Woolley was the prexy of ISMA.

The Sun Valley Meeting

Idaho's 66th annual session at Sun Valley last month demonstrated that, between them, the Idaho Association and Sun Valley retain a firm grip on Amalthaea's horn. Idaho's meetings have an abundance of everything anyone planning such an affair might desire. Approval was expressed in its most convincing form when registration figures broke all previous records.

Main purpose for a medical meeting is the provision of opportunity for members to advance their knowledge of medicine. This purpose has been fulfilled richly in Idaho by establishing the annual meeting as a fine postgraduate session. The program this year was presented by a surgeon, Carl A. Moyer of St. Louis; an orthopedist, Don H. O'Donoghue of Oklahoma City; an urologist, C. Donald Creevy of Minneapolis; a gynecologist, Ralph C. Benson of Portland and an internist, H. Corwin Hinshaw, Sr., of San Francisco. The program published in the May issue of this journal was followed.

Attendance at the scientific sessions was very good, with a high percentage of those registered attending all lectures. Enjoyment was enhanced by the excellent facilities provided plus the fact that afternoons are left free for sports, recreational activity or just plain loafing, in which one may indulge at Sun Valley without feeling guilty about it.

Exhibit tent was expanded this year with two tents joined to make a very satisfactory, if informal, exhibit hall. Coffee service at the mid-morning break was provided under canvas this year, rather than on the lawn in front of the Opera House. The change was appreciated by physicians and exhibitors alike and stimulated visits to the booths.

Another popular change was made in the program for the first day when the party usually held at the Harriman Cottage was converted to an open house. This turned out to be an overflow event and much enjoyed by all who attended.

Unanticipated fillip was given the Trail Creek party when members of an organization of retired airline hostesses joined in the fun. Meeting at Sun Valley at the same time, they demonstrated that, although retired, they had lost none

(Continued on page 1048)

(Continued from page 1047)

of the ready charm which an airline hostess is supposed to possess.

Traditional Stag Dinner and Ladies Dinner on Tuesday evening were followed by an hour long show on Sun Valley's famous outdoor rink. This was one of the best offered the Idaho group in recent years and featured some specialty numbers worthy of the best of the travelling shows.

House of Delegates

The House of Delegates opened its important business sessions at 1:00 p.m. Sunday. Numerous committee reports were considered and resolutions were presented. Reference committees met Monday forenoon and their reports were heard at breakfast meetings on Tuesday and Wednesday.

The House conducted its business expeditiously this year due to good organization of reference committee work plus excellent guidance from President Woolley. During the three sessions the House:

Approved a recommendation that members increase protective insurance to a minimum of $100,000-$300,000.

Refused to set an effective date for resolution K, adopted in 1956 and amended in 1957.

Heard preliminary report that rehabilitation laws are under study.

Condemned use of fluoroscope in fitting children's shoes.

Recommended that requirements for annual chest x-ray of teachers be dropped but that adequate pre-employment examination be made requisite to employment in any school system.

Recommended that serologic tests for food handlers be discontinued.

Approved encouragement of wider use of poliomyelitis vaccine and urging of all under age 40 to be vaccinated.

Adopted an outline of principles for physician-lawyer relationships.

Moved to invite delegates from the Association of American Medical Colleges and the Council on Medical Education and Hospitals to study Idaho resources for possible establishment of a two year medical school.

Gov. Robert Smiley of Idaho and Mrs. Alexander Barclay, Jr.

Reaffirmed support of the Western Interstate Compact which permits a state without a medical school to pay certain costs incurred when its residents study medicine in another state.

Adopted a resolution asking life insurance companies to pay fee of $15 for medical examination of insurance purchaser.

Referred back to the study committee a 1957 resolution calling for preparation of a pamphlet on prepayment. The House ordered publication of the pamphlet which is to be distributed to the public through physicians' offices.

Heard that reserves in the medical student loan fund are adequate and that current usage is 40 per cent.

Heard discussion on rehabilitation efforts under the state government. Currently available funds are not all being applied because the law provides that 7 per cent of available money can be devoted to salaries. Limitation of personnel reduces the amount of work which can be done. Four councilors now employed are seriously overloaded. Some misunderstandings have been resolved and it is anticipated program will enlarge.

Heard proposal from Mr. James Perry offering

an improved accident and disability policy to members of the Association. Details of the proposal will be distributed in a forthcoming Newsletter from the Central Office.

Installed Donald K. Worden as President.

Elected Quentin W. Mack, President Elect, Max D. Gudmundsen, Secretary-Treasurer, Fred E. Wallber, Councilor—District Four, Richard D. Simonton, Councilor—District Two and Melvin M. Graves, Trustee—Northwest Medicine.

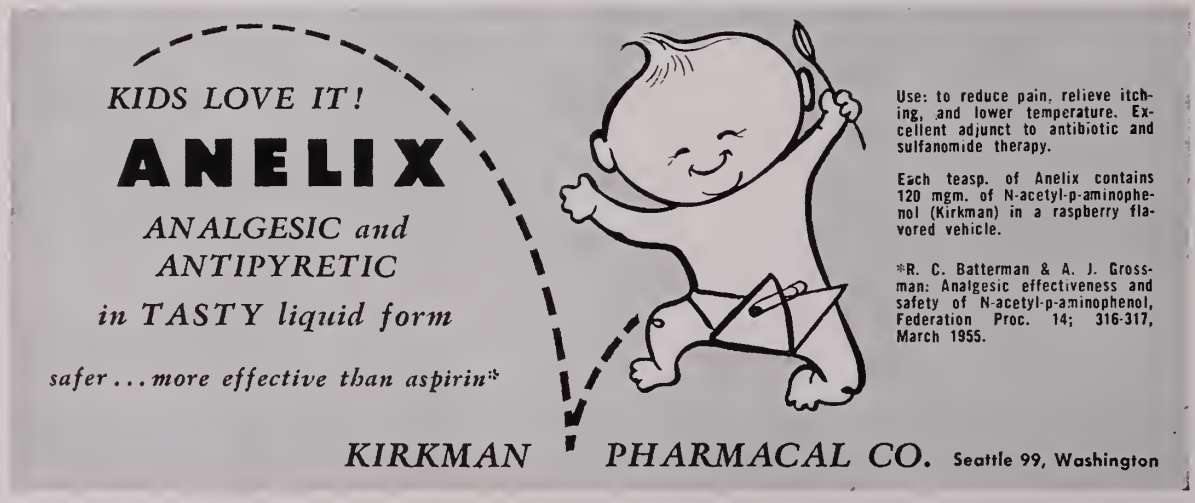
Woman's Auxiliary

Guest of honor at the session was Gladys Underwood of Vancouver, Washington, President-Elect of the Woman's Auxiliary to the American Medical Association.

Following are the officers for the current year:

Mrs. E. R. W. Fox, Coeur d'Alene, President.

Mrs. Max Bell, Boise, President-Elect.



Mrs. V. Ellis Knight, Kimberly, First Vice-President.

Mrs. P. Blair Ellsworth, Idaho Falls, Second Vice-President.

Mrs. Richard K. Gorton, Pocatello, Third Vice-President.

Mrs. Glenn M. Whitesel, Kellogg, Treasurer.

Mrs. O. D. Hoffman, Rexburg, Secretary.

HE NEEDN'T BE HIGH-STRUNG

WEIGHT REDUCTION: Obese patients may resist dieting because they fear losing the emotional security often involved in overeating. AMBAR helps them hold the diet line by giving them a more alert, brighter outlook. WITHOUT JITTERS: Methamphetamine, a potent CNS augmenter, produces less cardiovascular effect than amphetamine. In AMBAR it is combined with just enough phenobarbital to prevent overstimulation. AMBAR EXTENTABS provide 10-12 hours of appetite suppression in one controlled-release, extended-action tablet: methamphetamine hydrochloride, 10.0 mg.; phenobarbital (1 gr.) 64.8 mg. AMBAR TABLETS for conventional dosage or intermittent therapy contain methamphetamine hydrochloride, 3.33 mg.; phenobarbital (⅓ gr.) 21.6 mg. A. H. ROBINS COMPANY, INC., Richmond, Virginia, Ethical Pharmaceuticals of Merit Since 1878

Workshop on Improved Laboratory Procedures Hospital Pathologists Conduct

A workshop in improved laboratory procedures, sponsored by the Southeastern Council of the Idaho Hospital Association, was held at the Idaho Falls Hospital on May 17 from 1 p.m. to 7 p.m. Forty medical technologists from Eastern Idaho attended the workshop which considered the medical technologist's and laboratory worker's role in the overall operation of the laboratory, including inter-departmental relationships, technical problems and new developments in laboratory equipment and techniques.

Major emphasis was given to a discussion of thyroid uptake (its relation to BMR, cholesterol and P.B.I.). Other subjects included in the program were: blood banking (factors, pitfalls, replacement problems); bacteriology (routine procedures for initial specimen culture); total base, chlorides and bicarbonate levels (rapid method for determination, significance, interpretation); osmoler clearance; cholesterol (new quick method using p-toluene sulfonic acid) and transaminase (principle, application, significance). In addition, the film entitled Cytotechnologist was shown to the workshop participants.

Pathologists conducting the workshop were J. A. Williams, Sacred Heart Hospital, Idaho Falls; J. W. Creed, Magic Valley Memorial Hospital, Twin Falls; Ed Webb, Bannock Memorial Hospital, Pocatello, and Bland Giddings, host and chairman, Idaho Falls Hospital, Idaho Falls.

Obituary

Dr. Roy Campbell Crosby, 41-year-old Boise internist, died of injuries received when his airplane crashed near Marlboro, Mass., on July 20. Three of Dr. Crosby's sons were injured in the crash. Born in Framingham, Mass., Dr. Crosby graduated from Tufts College of Medicine, Boston, 1944, and had practiced in Boise since 1949.

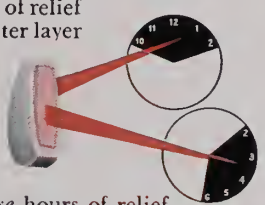
Coming Meetings

North Pacific Pediatric Society will meet in Sun Valley, September 15-16. Guest speakers will be John Caffey, New York; Harold Palmer, Denver; Gunnar Stickler, Rochester, Minn. Loy T. Swinehart of Boise is program chairman.

Combined meeting of the Idaho Society of Internal Medicine and regional session, American College of Physicians, will be held at Sun Valley, September 26-27. Speakers for this session will include Chester Keefer, Boston, Mass., and Frank McGlone, Denver.

running noses . . .

and other hay fever symptoms



TRIAMINIC stops rhinorrhea, congestion and other distressing symptoms of summer allergies, including hay fever. Running nose, watery eyes and sneezing are best relieved by antihistamine *plus* decongestant action – systemically – with TRIAMINIC.

This new approach frequently succeeds where less complete therapy has failed. It is not enough merely to use histamine antagonists; ideally, therapy must be aimed also at the congestion of the nasal mucosa. Triaminic provides such effective combined therapy in a single timed-release tablet.

TRIAMINIC brings relief in minutes–lasts for hours. Running noses stop, congested noses open–and stay open for 6 to 8 hours.

Triaminic provides around-the-clock freedom from allergic congestion with just one tablet t.i.d. because of the special timed-release design.

first–3 to 4 hours of relief from the outer layer

then–3 to 4 *more* hours of relief from the inner core

Dosage: One tablet in the morning, mid-afternoon and at bedtime. In postnasal drip, one tablet at bedtime is usually sufficient.

Each timed-release TRIAMINIC Tablet contains:

Phenylpropanolamine HCl	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

TRIAMINIC FOR THE PEDIATRIC PATIENT

TRIAMINIC Juvelets*, providing easy-to-swallow half-dosages for the 6- to 12-year-old child, with the timed-release construction for prolonged relief.

*Trademark

TRIAMINIC Syrup, for those children and adults who prefer a liquid medication. Each 5 ml. teaspoonful is equivalent to ¼ Triaminic Tablet or ½ Triaminic Juvelet.

AMA at San Francisco

Attempting to cover all aspects of any meeting of the American Medical Association is apt to give one a sense of frustration somewhat akin to that of a humming bird trying to incubate an ostrich egg. It is impossible to do more than pay attention to one small spot at one time.

This was particularly true at San Francisco, June 22-27, where sessions of the House of Delegates were held at the Sheraton Palace Hotel, the Scientific Exhibit in the Civic Auditorium, the Technical Exhibit in adjoining new underground space and the scientific meetings in a variety of halls. Three rooms were utilized in the Civic Auditorium, three in the Masonic Temple, one in the Mark Hopkins Hotel, one in the Fairmont Hotel, one in the Veterans War Memorial, and one in the High School of Commerce. These and other segments of the session were announced in the official program. In addition, as usual, there were innumerable special meetings, committee sessions, social events and hospitality rooms.

The New Exhibit Hall

Irreverent and irrepressible San Francisco newspaper men have a knack for picking names that stick. Several years ago one of them wrote his story about the huge agricultural hall which stands on that city's near south side. He called it a palace for cows and Cow Palace it has remained in spite of official remonstrance and efforts to attach a less pungent title. Another, no less imaginative scribe, took one look at the new subterranean hall attached to the Civic Auditorium and impolitely dubbed it Mole Hall. It was supposed to be "The New Plaza Exhibit Hall" but that dignified designation seems destined for short life. Mole Hall it is.

Regardless of the sobriquet, the new space was of great benefit to the 107th meeting of AMA and was a tremendous improvement over the tent set above ground at the same spot, used to house technical exhibits at the 1954 meeting (see photograph page 810 in Northwest Medicine, August 1954). The new and attractive exhibit space was enjoyed by exhibitors and physicians alike. The meeting attracted more than 13,000 physicians, 1,000 over registration of the 1954 meeting and nearly 3,000 more than were

registered in 1950. *AMA Daily Bulletin* reported 216 from Oregon, 305 from Washington, 38 from Idaho and 7 from Alaska.

Northwest Participation

Many physicians from the Northwest participated in the meeting. The following information comes from the official program:

"Is Heat Sterilization of Drugs and Equipment for Regional Block Anesthesia a Necessity?", L. Donald Bridenbaugh, Seattle.

"The Place of Regional Anesthesia in Surgical Practice," John J. Bonica, Tacoma.

"Allergy and the Tonsil Problem in Children," Norman W. Clein, Seattle.

"Results of Desensitization with Stinging Insect Antigens," Robert A. Stier and Robert F. E. Stier, Spokane.

"Experimental Studies of the Psychiatric Interview," George Saslow, J. D. Matarazzo, R. G. Matarazzo and J. S. Phillips, Portland.

"Two-Year Experience with Chemopallidectomy," Harold D. Paxton and Robert S. Dow, Portland.

"Calcium Metabolism in Poliomyelitis," Fred Plum, Seattle.

"Electromyographic Studies on Patients with Chronic Headaches," Herman A. Dickel and Henry H. Dixon, Portland.

"The Use of Posterior and Anterior Colpotomy in Gynecology," Raphael B. Durfee, Portland.

"The Physiologic Basis for Hormone Therapy in the Female," Russell R. de Alvarez and Elizabeth K. Smith, Seattle.

Frank Krusen of the Mayo Foundation was awarded the AMA's 1958 Distinguished Service Award for his work in physical medicine. Gunnar Gundersen (at right), AMA president, admires his gold medal award.

The Billings Gold Medal Award, presented for correlation of facts and presentation, was won by C. H. Hodgson, J. A. Callahan, A. J. Bruwer and A. H. Bulbulian of the Mayo Clinic and Mayo Foundation for their exhibit on Misleading Thoracic Roentgenograms.

"Clinical and Laboratory Experience with Virac, a Bactericidal, Fungicidal, and Viricidal Agent," John E. Harris, Peter R. Rowell and Olive Beaudreau, Portland.

"Radioelectrophoretic Patterns of Aqueous and Plasma After Intravenous Injection of I^{131} Labeled Insulin into Normal and Diabetic Rabbits," Kenneth M. Giles and John E. Harris, Portland.

"The Influence of Methylene Blue and Other Dyes on the Cation and Water Balance of the Lens," John E. Harris, Louise Gruber and Gertrude Hoskinson, Portland.

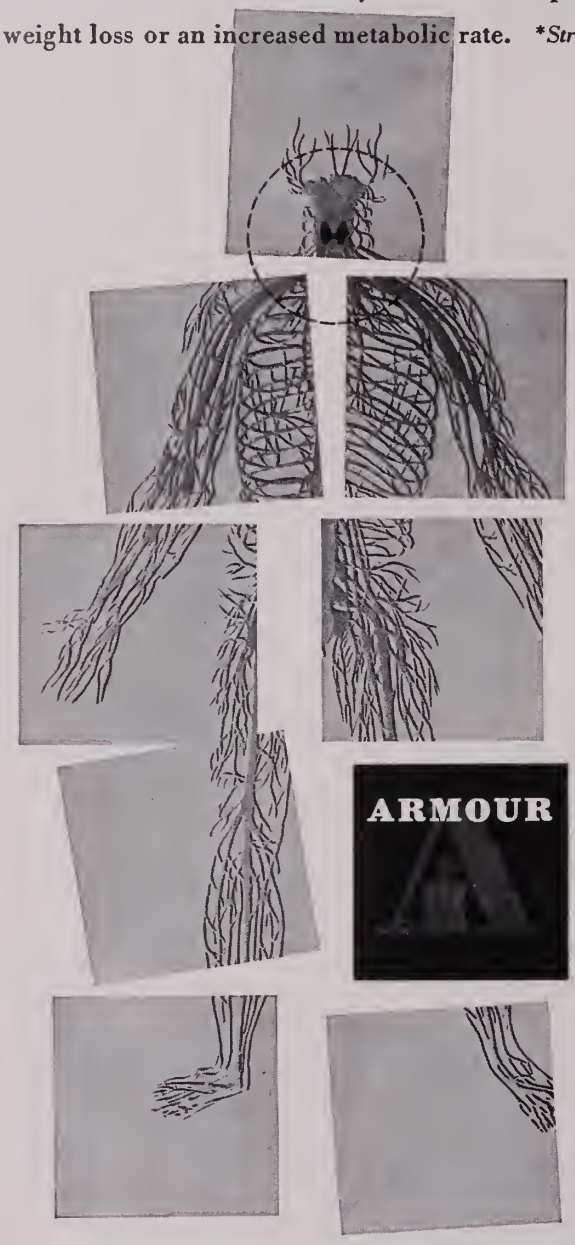
"Ocular Changes Induced by Polysaccharides: II. Detection of Hyaluronic Acid Sulfate After Injection into Ocular Tissues," Ellen Talman, John E. Harris and Louise Gruber, Portland.

"Pain in the Shoulder from the Standpoint of the Internist," Edward H. Morgan, Seattle.

"The Pathologic Manifestations of Stromal Endometriosis of the Uterus," Warren C. Hunter, Portland.

"Antibiotic Prophylaxis in Pediatrics," Robert A. Tidwell, Seattle.

"The Use of Ultrasonic Diathermy in the Presence of Surgical Metallic Implants," Justus F. Lehmann, Katherine E. Lane, Jack W. Bell and George D. Brunner, Seattle.



"An Evaluation of the Jejunal Interposition Operation for Certain Disorders Involving the Cardioesophageal Junction," George I. Thomas and K. Alvin Merindino, Seattle.

Panels

Symposium and panel discussion on "Pruritus Ani et Vulvae and Other Dermatoses of the Anogenital Area," William M. Wilson, Portland.

(Continued on page 1062)

Serum lipids and thyroid medication Recognition of the significant relation between serum lipids and atherosclerosis has resulted in a new interest in the role of hormones in this picture. Desiccated thyroid may reduce serum lipid levels remarkably in many patients without appreciable weight change, as reported by Strisower and co-workers.* Daily dosage ranged approximately from 3 to 5 grains. The authors conclude that treatment with desiccated thyroid need not produce adverse effects such as undesired weight loss or an increased metabolic rate. **Strisower, B., et al.: Lancet 1:120, 1957.*

makes 'cardiography practical ... *anywhere*

$625 delivered, continental U.S.A.

THE SANBORN model 300 VISETTE

Electrocardiography no longer has to be limited to the office or laboratory. With the recently developed Sanborn Visette electrocardiograph, 'cardiography can now be brought *to* your patients, making this diagnostic technique a practical procedure in virtually *any* examination — whether at the patient's home, in the hospital, in the clinic of an industrial plant, or in some other location. You — or your nurse — can pick up a Visette (complete with its electrodes, Redux paste and other accessories) as easily as your bag; its 18 pounds and brief-case size have made ECG portability a long-awaited reality. And this true portability has been achieved without loss of accuracy or dependability. Modern electronics contributes greater reliability, as well as added convenience, to Visette design; transistors, special ruggedized tubes, printed wiring, pushbutton grounding, fully automatic amplifier stabilization between lead changes, "double-check" calibration signals — help assure continued accuracy after miles of Visette traveling "on call."

Ask your local Sanborn Branch Office or Service Agency man to show you — firsthand — this modern, portable ECG. See why the Visette is the *only* instrument that can add the advantage of 'cardiography to *any* of your examinations, so easily.

The familiar Model 51 Viso-Cardiette — in use today throughout the world — is available as always. This larger, 34 lb. instrument is the "affice standard" in thousands of practices. Price $785 del.

Panel discussion on "Management of Complications of Duodenal Ulcer," Joel W. Baker, Seattle.

Panel on "Hemolytic Anemias-Mechanisms and Management," Arno G. Motulsky, Seattle.

Panel discussion on "Noise: Is it a Health Problem?", Thrift G. Hanks, Seattle.

Panel discussion on "Deafness in Children, Etiology, Diagnosis and Management," moderated by John F. Tolan, Seattle.

Panel on "Asthma," Paul Van Arsdel, Seattle.

Panel on "Carcinoma of the Lower Urinary Tract," Franz J. Buschke, Seattle.

Panel on "Surgery Cases: Ventral Hernia; Radical Breast; Gastric Resection," Allen M. Boyden, Portland.

Pediatric Clinic, Robert A. Aldrich, Seattle.

Diagnostic Problem Clinic, Howard P. Lewis, Portland.

Special Discussions

The Northwest provides three officers of sections. Dean Parker of Seattle is Vice-Chairman of the Section on Urology, Dan Moore of Seattle is Secretary of the Section on Anesthesiology and Charles McArthur of Olympia is Chairman of the Section on General Practice. Dr. McArthur presented the Chairman's Address, "The Physician Himself," in which he urged physicians to pay more attention to their own health.

Another special presentation was that of a guest of honor. This was presented to the Section on Laryngology, Otology and Rhinology by Guy L. Boyden of Portland.

Only two films came from this area. Joel T. Baker and John H. Walker of Seattle presented a film on "Cholecystectomy and Operative Cholangiography." The other was on "Bilateral Upper Extremity Amputation" by Francis M. Brink and David E. Sullivan, both of Spokane.

A number participated in discussion of papers. The following discussants and topics were listed in the program:

Robert Bruce, Seattle, commissurotomy; George Saslow, Portland, lysergic acid; Fred Plum, Seattle, single seizure; Karl Martzloff, Portland, carcinoma of cervix, in situ; Ronald P. Neilson, Portland, premarital examination; Raphael B. Durfee and Vinton D. Sneeden of Portland, stromal endometriosis; Donald F. McDonald, Seattle, urinary stone analysis; Franz J. Buschke, Seattle, irradiation cystitis.

Exhibits

The Northwest was well represented in the Scientific Exhibit. Perennially popular exhibit on fractures listed Thomas Angland, Yakima, Robert Florence, Tacoma and James Miller, Seattle. Demonstrations in fresh tissue pathology were conducted by Vincent Sneeden, Portland, Jeff Minckler, Portland and Charles Larson, Tacoma. Robert Bruce, Seattle, participated in demonstration at a special exhibit on pulmonary function.

Scientific exhibits were:

"Left Heart Catheterization," G. H. Lawrence and R. M. Paine, Seattle.

"Chloroquine Therapy in Rheumatoid Arthritis," Robert E. Rinehart, Wheeler.

"Allergy to Stinging Insects," Robert A. Stier and Robert F. E. Stier, Spokane.

"Obstructing Bronchiolitis: A Medical Emergency," E. H. Morgan, H. L. Wilson and H. R. Pearsall, Seattle.

"The Evolution of Orbital Implants," Wood Lyda and J. L. Hargiss, Seattle.

"Comparison of Myelography and Discography in Diagnosis of Low Back Disability," Norman M. Harris, Donald deF. Bauer and Anthony J. Smith, Coos Bay.

"Cow's Milk Allergy in Infants," Norman W. Clein, Seattle.

House of Delegates

Sessions of the House of Delegates were quite well attended by non-seated members of AMA, medical society executives, newspaper reporters and guests. At this meeting it appeared that the number of those sitting outside the delegate area

(Continued on page 1065)

at least equaled and may have surpassed the number of seated delegates. Such attendance has been growing in recent years and represents growing interest of AMA members in affairs of their organization. It is a highly desirable trend and needs to be encouraged although increasing demand for seats in the visitors' section may tax facilities of hotels without ample balcony space to care for overflow from the floor.

The usual committee reports, supplementary reports of the Board of Trustees and 64 resolutions were handled with dispatch by the House. Two flurries of debate were touched off as reference committees made their reports. One, as anticipated, concerned trouble with the Welfare Fund of the United Mine Workers.

This has been the subject of a great deal of discussion at meetings of AMA and within the medical associations of states in mining regions. Conflict has been most acute in Pennsylvania and Colorado. The Fund has been accused of dictating medical practice through a closed panel system of providing care for its beneficiaries and practitioners have been accused of padding bills, doing unnecessary surgery and otherwise causing excessive costs. Medical Director of the Fund, Warren Draper, has incurred the wrath of a number of medical society officers who believe that most of his charges against private practitioners are unfounded.

Debate at San Francisco grew out of consideration of a Board of Trustees supplemental report which, in turn, was a development from two resolutions presented at the Philadelphia meeting, December, 1957. They called for presentation of medicine's side of the controversy to the profession and subsequently to the public. Joint committee of the Council on Medical Service and the Council on Industrial Health studied the problem and reported to the Board that more study should be undertaken before implementing the directives in the resolutions. There was some question about the scope of campaign to be undertaken, since one of the resolutions mentioned "all third party mechanisms." There was question about definition of the term *free choice.* There was some feeling that the campaign should be conducted by state associations rather than the national organization because of differences in local conditions.

All of these ideas were taken into consideration by the reference committee which brought in a report merely asking the Board of Trustees to consider a campaign. Sawyer of Colorado made a vigorous appeal for immediate action, stating that the problem is national, not local,

and citing two suits in Colorado, one seeking permanent injunction against enforcement of the Colorado Association's code of ethics. He moved an amendment relieving the Council on Medical Service from further responsibility and directing the Board of Trustees to order immediate action to carry out provisions of the 1957 resolution. Part of that resolution read as follows:

"Resolved, that this House of Delegates condemns the current attitude and method of operation of the UMWA Welfare and Retirement Fund as tending to lower the quality and availability of medical and hospital care to its beneficiaries;"

After discussion by twelve additional delegates, most of whom supported Sawyer, his amendment to the reference committee report was carried, 110 for, 72 against.

Health Agencies

The second flurry of debate was somewhat more surprising. It arose when the Reference Committee on Hygiene, Public Health and Industrial Health made its report on three resolutions all dealing with voluntary health agencies. Gist of the three was that AMA should support the principle of voluntary agencies and approve their independent fund raising campaigns. The reference committee offered a substitute resolution suggesting a top level conference between the United Funds, the voluntary agencies and American Medical Research Foundation.

McClendon of California immediately proposed an amendment reiterating previously voiced support of the voluntary agencies, incorporating belief that these agencies should be free to conduct their own business without hindrance and asking that the American Medical Research Foundation not hinder the voluntary agencies.

The subject was discussed by several, including two former AMA presidents, Elmer Hess and John Cline. United Funds were criticized severely for interference and even for exertion of pressure against officials and laymen who supported the voluntary agencies.

Motion to table the report was lost in an unmistakable register of desire to take position on the issue. The amendment carried easily.

Other business of the House was conducted with little controversy on the floor although several of the reference committees listened to lengthy discussion during their open sessions. (Some members of AMA may not realize that they are welcome to present views to any reference committee and thus have direct influence on policy formulation by the House. Without unanimous consent, however, one not seated in the House cannot address that body while fully convened and in conduct of its business. Privilege of appearing before reference committees is in addition to that of exerting influence through regular channels of county and state organizations. Delegates may be given specific directives by state organizations if there is sufficient interest in any proposal.)

Social Security

Resolutions on social security may be expected at any session. Seven were presented at San Francisco. Four of these were from the Medical Society of the State of New York, indicating desire of majority of members in that state to be included in the social security scheme.

Two of the New York resolutions called on the House to abandon previously taken position in opposition to compulsory inclusion of self employed physicians in social security. These were rejected unanimously. Two of the resolutions asked for poll of membership, one of them suggesting that delegates had acted in a paternal manner in making the 1957 decision against social security. The reference committee was of the opinion that delegates were sufficiently well informed to represent the views of American physicians on the subject. The House concurred by voting not to approve the resolutions.

One from the Connecticut State Medical Society was rejected for another reason. This resolution intimated that delegates might vote in accord with their personal views and not necessarily as their constituents might wish. The Connecticut Society, therefore, asked for a nationwide referendum. The request was not approved because there is no provision in AMA Constitution of Bylaws for referendum procedure.

The Connecticut Delegation presented another resolution, likewise rejected by the

House. Citing the fact that Connecticut physicians had voted overwhelmingly for social security coverage, the resolution called for endorsement of state-by-state participation under Title II of the Social Security Act.

TAKE A NEW LOOK AT FOOD ALLERGENS* TAKE A LOOK AT NEW DIMETANE

DIMETANE Extentabs (12 mg. each, coated) provide antihistamine effects daylong or nightlong for 10-12 hours. Tablets (4 mg. each, scored) or pleasant-tasting Elixir (2 mg./5 cc.) may be prescribed t.i.d. or q.i.d., or as supplementary dosage to Extentabs in acute allergic situations. A. H. ROBINS CO., INC., Richmond 20, Virginia. Ethical Pharmaceuticals of Merit Since 1878.

*Sea food—source of highly potent allergens. Typical are: lobster; tuna; sturgeon roe; fish oil used to prepare leather, chamois, soaps; cuttlefish bone for polishing material and tooth powder; glues made from fish products.

A resolution from the Texas Delegation expressed hearty dislike for compulsion and strong opposition to socialization of the profession through social security. This resolution was modified by the reference committee and adopted by the House with the following conclusion:

"Resolved, that the House of Delegates of the American Medical Association unequivocally opposes the compulsory inclusion of self employed physicians in the Social Security System."

Oregon Resolution Adopted

A resolution presented by the Oregon Delegation received favorable comment by the reference committee and was adopted by the House. It directs the Board of Trustees to petition Congress to amend Section 6 of Public Law 85-316 to control, in the interest of the public health and welfare, admission of children with severe communicable disease.

The law referred to permits American families to adopt alien children. The Oregon resolution pointed out that children admitted for such adoption have not been required to meet immigration restrictions relating to communicable disease and that a number of Korean children brought in for adoption have been found to be infected with severe communicable disease, including tuberculosis. It also stated that children found to be suffering from severe communicable disease should be given immediate care and treatment. The reference committee commended those who have opened their homes to Korean children and approved the resolution.

The Hektoen Gold Medal Award, presented for original investigation, was presented to Alvin L. Watne, Stuart S. Roberts, Ruth G. McGrath, Elizabeth A. McGrew and Warren H. Cole of the University of Illinois for their exhibit on Cancer Cells in the Circulating Blood.

Veterans Administration

veterans with non-service-connected disabilities was once more condemned. Final form of the resolution adopted was:

"Whereas, According to special report 85-3 of the Washington Office of the AMA, the Federal government spent $619,614,000 on hospitalized medical care of veterans in VA hospitals in 1957 of which about 75 per cent had non-service connected disabilities; and

"Whereas, Ways and means of obtaining economy in Federal government are allegedly being sought by Congress at this time; therefore be it

Louis M. Orr (1) of Orlando, Fla., receives congratulations on becoming president-elect of AMA from F. J. L. Blasingame, executive vice-president of AMA.

"*Resolved,* That the House of Delegates of the American Medical Association urge congressional action to restrict hospitalization of veterans at VA hospitals to those with service connected disabilities; and be it further

"*Resolved,* That the American Medical Association suggest to the Dean's committees that they restrict their activities to Veterans Administration hospitals admitting only patients with service-connected disabiliies."

Hypnosis

Report from the Council on Mental Health on Hypnosis was transmitted to the House through the Board of Trustees. Its approval puts AMA on record as supporting medical use of hypnosis, approving participation by members of the medical and dental professions in high level research into unknown aspects of hypnosis and as vigorously condemning use of hypnosis for entertainment purposes. The report is result of extensive investigation and study by the Council on Mental Health which for this purpose constituted itself as a committee of the whole. Complete report of the Council is to be published in the *Journal of the American Medical Association.*

Officers

A number of changes occurred in official position, some in the normal course of succession and

some as result of the reorganization initiated last year. Gunnar Gundersen of Wisconsin was installed as president and Louis M. Orr of Florida won unanimous election to succeed him as president-elect. Dr. Orr has been popular as vice-speaker for several years.

W. Linwood Ball of Virginia was named vice-president, E. Vincent Askey of California was reelected speaker and Norman A. Welch of Massachusetts was chosen as vice-speaker.

Raymond McKeown of Oregon was unopposed to succeed himself as trustee. His election last year was to fill one year of an unexpired term. This recognition of his numerous contributions places him on the Board for a normal five-year term. Others elected were Warren Fury of Illinois, also unopposed and R. B. Robins, Arkansas who won handily over two other nominees. Robins is to serve for the unexpired term of F. J. L. Blasingame. Leonard Larson of North Dakota was chosen by the Board of Trustees as its chairman.

George A. Woodhouse was reelected to the Judicial Council, John Z. Bowers of Wisconsin and Leland S. McKittrick of Massachusetts were named to the Council on Medical Education and Hospitals, the latter to succeed himself. R. B. Chrisman of Florida and J. F. Burton of Oklahoma were returned to the Council on Medical Service. R. B. Roth of Pennsylvania was also placed on that Council. William Stovall of Wisconsin, William Hyland of Michigan and Walter Bornemier of Illinois were elected to the Council on Constitution and Bylaws.

A handsome etched Oath of Hippocrates, a gift of the physicians of Oklahoma, was presented to F. J. L. Blasingame as a complement to his office in Chicago as general manager of AMA. E. C. Mohler, president of Oklahoma State Medical Association, offered his congratulations to Dr. Blasingame, at right, who assumed the AMA general managership January 1.

McKeown Is Secretary-Treasurer

Reorganization placed F. J. L. Blasingame as general manager and permitted the Board to elect Raymond McKeown to the newly created office of secretary-treasurer. George Lull becomes executive vice-president and E. B. Howard, assistant executive vice-president.

The House voted to schedule Miami Beach as site for the 1960 annual session. Chicago has been selected previously but will be unable to accommodate the organization properly due to delay in construction of a proposed new lakeside convention hall. The 1961 session will be held in New York but site for the 1962 meeting has not been selected. •

Northwest breakfast at the Sheraton-Palace Hotel. This meeting of representatives of the three Northwest states has become a valuable part of AMA meetings. It was started in New York at the 1957 meeting and provides an opportunity for the three states to exchange views on problems of mutual interest.

Present were Drs. Harris, Cleland, Berge, Young, Miller, White, McKeown, Baum, Pitman, Chuinard, Hartley, Calhoun, Read, Jared, Tucker and Woolley, and Messrs. Miller, Lapsley, Bird, McKeown, Layton, LaFray, Ramsey, Neill and Steen.

RECEIVED

The following books hove been received. Publicotion of this ocknowledgment is to be considered odequote return to the sender. Selected titles will be reviewed os spoce permits.

A Manual on Cardiac Resuscitation. Ed 2. By Robert M. Hosler, M.D., F.A.C.S., Cleveland, Ohio. 208 pp. Price $5.50. Charles C Thomas, Springfield, Ill. 1958.

Mould Fungi and Bronchial Asthma: A Mycological and Clinical Study. Vol. I. By P. J. Van Der Werff, Head of Amsterdam Clinic for Allergic Diseases. Foreword by Prof. Dr. Johanna Westerdijk, Director of Centraalbureau voor Schimmelcultures (the Mould Culture Center) Baarn, Netherlands. 174 pp. Illustrated. Price $7.50. Charles C Thmoas, Springfield, Ill. 1958.

Ego Structure in Paranoid Schizophrenia—A New Method of Evaluating Projective Material. By Luise J. Zucker, Ph.D. 186 pp. Price $5.50. Charles C Thomas, Springfield, Ill. 1958.

Religious Doctrine and Medical Practice. By Richard Thomas Barton, M.B., B.S., M.D., F.A.C.S., Associate Consultant, Unviersity of California. Foreword by Raymond B. Allen, M.D., Chancellor, University of Calfiornia at Los Angeles. 94 pp. Price $3.75. Charles C Thomas, Springfield, Ill. 1958.

A Primer of Cerebral Palsy. By Joseph D. Russ, M.B., M.D., F.A.A.P., F.A.A.C.P., Assistant Professor of Pediatrics, Tulane University School of Medicine; Senior Pediatrician, Touro Infirmary; Medical Director, Cerebral Palsy Center of Greater New Orleans; and Hyman R. Soboloff, B.A., M.B., M.D., F.A.A.O.S., F.A.A.C.P., Asssitant Professor of Orthopedics, Tulane University School of Medicine; Medical Director, Louisiana State Cerebral Center. 77 pp. Illustrated. Price $4.00. Charles C Thomas, Springfield, Ill. 1958.

Electrocardiography. By Michael Bernreiter, M.D., F.A.C.P., Assistant Clinical Professor of Medicine, University of Kansas Medical School; Chief of Electrocardiography, St. Mary's Hospital, Kansas City, Missouri; Fellow of American College of Cardiology and Fellow of American College of Chest Physicians. 134 pp. Illustrated. Price $5.00. J. B. Lippincott Co., Philadelphia and Montreal. 1958.

Fifty Years of Neurosurgery—A Personal Story. By Ernest Sachs, M.D. 186 pp. Price $3.50. Vantage Press, Inc., New York. 1958.

Memoirs of a G.P. By Otis Marshall, M.D. 155 pp. Price $3.50. Vantage Press, Inc., New York. 1958.

Cancer and the Atomic Age. By Clement A. Tavares, M.D. 198 pp. Price $3.50. Vantage Press, Inc., New York. 1958.

Objective Approaches to Treatment in Psychiatry. By Leo Alexander, M.D., Director, Neurobiologist Unit, Division of Psychiatric Research, Boston State Hospital; Clinical Instructor in Psychiatry, Tufts University Medical School, Boston, Mass. 139 pp. Price $4.50. Charles C Thomas, Springfield, Ill. 1958.

Biology of Neuroglia. Compiled and edited by William F. Windle, Ph.D., Sc.D., Chief of Laboratory of Neuroanatomical Sciences, National Institute of Neurological Diseases and Blindness, National Institutes of Health, Public Health Service, Department of Health, Education and Welfare, Bethesda, Maryland. 340 pp. Illustrated. Price $8.50. Charles C Thomas, Springfield, Ill. 1958.

Medical Sociology: Theory, Scope and Method. By Norman G. Hawkins, B.Ed., Ph.D., Assistant Professor of Medical Sociology, University of Texas Medical Branch. 290 pp. Price $6.75. Charles C Thomas, Springfield, Ill. 1958.

Fundamentals In Cardiology. By John B. Wild, M.D., Assistant Professor, Department of Internal Medicine, Member of the Cardiovascular Laboratory, University Hospital, Iowa City, Iowa. 83 pp. Illustrated. Price $4.50. Charles C. Thomas, Springfield, Ill. 1958.

Signs, Symptoms and Treatment of Certain Acute Intoxications. Ed. 2. By William B. Deichmann, Ph.D., Professor and Chairman, Department of Pharmacology, University of Miami, School of Medicine, Coral Gables, Florida; and Horace W. Gerarde, M.D., Ph.D., Head Toxicologist, Esso Research and Engineering Co., Medical Research Division, Linden, New Jersey and The Bureau of Biological Research, Rutgers, The State University, New Brunswick, New Jersey. 154 pp. Price $3.75. Charles C Thomas, Springfield, Ill. 1958.

The Management of Childhood Asthma. By Frederic Speer, M.D., Assistant Clinical Professor of Pediatrics, The University of Kansas School of Medicine; Director of Pediatric Allergy Clinic; The University of Kansas Medical Center; Director of Allergy Clinic, Children's Mercy Hospital; Attending Pediatrician, Bethany Hospital, Providence Hospital and St. Margaret's Hospital, Kansas City; Fellow of American Academy of Pediatrics and American College of Allergists. 116 pp. Price $4.75. Charles C Thomas, Springfield, Ill. 1958.

Electrocardiographic Analysis, Vol. I: Biophysical Principles of Electrocardiography. By Robert H. Bayley, M.D., Professor of Internal Medicine, Director of Heart Station, University of Oklahoma School of Medicine and University Hospitals, Oklahoma City. 237 pp. Illustrated. Price $8.00. Paul B. Hoeber, Inc. 1958.

Aids to Medical Diagnosis. Ed. 8. By G. E. Frederick Sutton, M.C., M.D. (Lond.), F.R.C.P., Consultant Physician, United Bristol Hospitals; Consultant Physician to Bristol Regional Hospital Board; Consultant Cardiologist to Ministry of Pensions; Teacher in Clinical Medicine, University of Bristol. 399 pp. Price $3.50. Bailliere, Tindall and Cox, London. 1958. Distributed by The Williams & Wilkins Co., Baltimore.

In Biliary Distress

ZANCHOL®

Improves Flow and Color of Bile

Zanchol (brand of florantyrone), a distinct chemical entity unrelated to the bile salts, provides the medical profession with a new and potent hydrocholeretic for treating disorders of the biliary tract.

The high degree of therapeutic activity of this new compound and its negligible side reactions yield distinct clinical advantages.

- Zanchol produces a bile low in sediment.
- Zanchol enhances the abstergent quality of bile.
- Zanchol produces a deep, brilliant green bile, regardless of its original color, suggesting improved hepatic function.
- Zanchol improves the flow and quantity of bile without increasing total bile solids.

Bile with these qualities minimizes biliary stasis, reduces sediment and debris in the bile ducts and discourages the ascent of infection.

For these reasons ZANCHOL has shown itself to be a highly valuable agent in chronic cholecystitis, cholangitis and care of patients following cholecystectomy.

Administration: One tablet three or four times a day. Zanchol is supplied in tablets of 250 mg. each. G. D. Searle & Co., Chicago 80, Illinois. Research in the Service of Medicine.

Price $17.50. Lea & Febiger, Philadelphia. 1958.

REVIEWS

Books reviewed in the columns of Northwest Medicine may be borrowed by any subscriber. Write Miss Ruth Harlamert, Librarian, King County Medical Society Library, Room 121, Cobb Bldg., Seattle 1, Wn. The library appreciates, but does not demand, reimbursement for postage.

THROMBELASTOGRAPHY. By Pietro de Nicola, M.D., Associate Professor, Department of Medicine, University of Pavia, Italy. 110 pp. Illustrated. Price $5.50. Charles C Thomas, Springfield, Ill. 1957.

This brief monograph describes the author's results of extensive investigations on thrombelastography, which graphically measures the changes in viscosity and elastic properties of blood as it clots. Detailed description of the apparatus and methods for performing the tests are given. The time of clotting and the rate and degree of retraction are recorded on a moving kymograph. First introduced by Hartert in Germany 15 years ago, this technique has been studied mainly by European coagulationists. To me the procedure is a quantitative and a more refined method of measuring whole blood clotting time and clot retraction. Unfortunately no comparison is made with the latter test which is widely used as a quantitative test for platelet function in this country. Many European workers feel that thrombelastography describes functioning clotting characteristics of whole blood within the intact vascular system.

The method does not define basic etiologic abnormalities in the formation of thromboplastin or pro-

thrombin conversion. The author's studies reveal that in some cases with normal platelet counts, clot formation is abnormal due presumably to altered platelet function, as is found in patients receiving Dextran and in several post-splenectomized patients with previous immune type thrombocytopenia. Cortisone administered to patients and fribrinogen added in vitro in high concentration consistently resulted in greater elasticity of the clot. These findings may explain the benefit of these two substances in patients with severe hemorrhage due to thrombocytopenia.

Unfortunately the method yields primarily descriptive results from which little new knowledge can be added to the field of coagulation. No mention is made of decreased PTC levels in patients receiving Dicumarol or Dicumarol-like drugs. Some graphs are inadequately explained. The English is well chosen but the book is not easy reading because of a profusion of detailed tests.

The monograph is recommended only to coagulationists and to physiologists. The latter may find the method useful in screening the effects of drugs on blood coagulation.

J. R. Hartman, M.D.

CORTISONE THERAPY MAINLY APPLIED TO RHEUMATIC DISEASES. By J. H. Glyn, M.A. (Cantab.), M.D., M.R.C.P., D. Phys. Med., Consultant in Physical Medicine to Prince of Wales and Tottenham Group of Hospitals. 162 pp. Price $10.00. Philosophical Library, Inc., New York. 1957.

This is a most comprehensive, complete and factual review of laboratory and clinical applications of this interesting group of compounds. Historical aspects and changing theoretical concepts are clearly presented. Every practicing physician and medical student should have a copy for study and reference. Indications for use of cortical steroids in rheumatic diseases as listed are too lenient but, in general, conform to safe practice; unfortunately the author fails to outline the entire concept and relegate steroids to their proper minor position in these diseases. The section on intraarticular injection is especially well done, the recommended dose being higher and perhaps more satisfactory than usually given in this country. It is unfortunate that the foreword to this work was written by "Cohen of Birkenhead," Britain's prime exponent of socialized medicine. Gleams of this are noted in the book.

R. E. Rinehart, M.D.

THERAPY FOR ANXIETY TENSION REACTIONS. By Gerhard B. Haugen, M.D., Assistant Clinical Professor of Psychiatry, University of Oregon Medical School, Portland; Henry H. Dixon, M.D., Clinical Professor and Head of Department of Psychiatry, University of Oregon Medical School; and Herman A. Dickel, M.D., Associate Clinical Professor, University of Oregon Medical School. 110 pp. Price $3.50. The MacMillan Co., New York. 1958.

The three authors address their monograph primarily to the nonpsychiatric physician. In a very readable, although occasionally folksy style, they describe the treatment of anxiety tension reactions with the muscle relaxation training originally devised by Edmund Jacobson. They assert that an office nurse can effectively accomplish this in approximately 20 sessions of 10 to 15 minutes duration each. Muscle relaxation is fortified by simple psychotherapeutic suggestions and reassurance. The treatment is extended over a period of 8 or 12 weeks with an additional observation time of several months during which the patient is seen only sporadically. The authors do not indicate precise treatment results but hint at a high and dramatic level of effectiveness.

In an attempt at a neurophysiologic explanation they suggest that "the muscle tensing comes first;

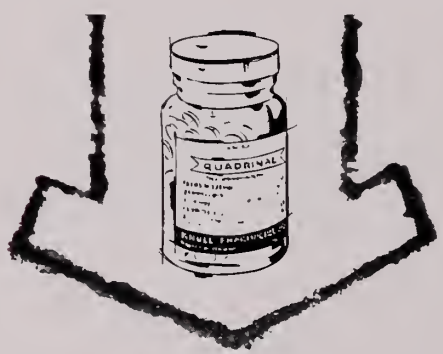
(Continued from page 1079)

the anxiety follows as a part of the general homeostasis." Reversing the traditional sequence of alarming cause and motor effect, they postulate "that when the brain gets messages informing it that the muscles are all tensed, it looks around to see what there is to be disturbed about; this is anxiety." It follows that the ability of muscle relaxation will abate the "habit of bracing and getting set for things to a point of overreaction." The cerebral cortex will no longer be bombarded by the excessively strong stimuli from the overly active striated musculature and hence no longer reflexly generate apprehension and fear. When the patient —including the doctor who must have experienced the method on himself before he can successfully teach it to others—has finally mastered the art of loosening his muscles "he can handle all his affairs without an occasional slip" and, should he so desire, join lustily in the author's proficient—however relaxed—polemics against various forms of psychotherapy, especially the arch-enemy—psychoanalysis.

Gert Heilbrunn, M.D.

GYNECOLOGIC AND OBSTETRIC PATHOLOGY; with Clinical and Endocrine Relations. Ed. 4. Emil Novak, M.D., D.Sc. (Hon., Trinity College, Dublin; Tulane), F.A.C.S., F.R.C.O.G. (Hon.), Late Assistant Professor Emeritus of Gynecology, The Johns Hopkins Medical School; and Edmund R. Novak, M.D., Assistant Professor of Gynecology, The Johns Hopkins Medical School. 650 pp. Illustrated. Price $14.00. W. B. Saunders Co., Philadelphia. 1958.



It is now 18 years since the first edition of this outstanding text made its original appearance. The current fourth edition reveals many changes, all of which are not textual. For example, this has now become most appropriately a father and son effort in the course of which the famous senior author died (1957). From a 496 page book with 427 illustrations originally, it has now grown to 650 pages with 683 illustrations without, however, sacrificing its compact, handy size. The paper and illustrations continue to be excellent while the red buckram binding provides a most attractive jacket. The printing, spacing and type impress me as being a distinct improvement over the previous editions.

The senior author has long been recognized as an outstanding authority in this field. Although the text contains an excellently selected bibliography which reflects current authoritative opinion, one also recognizes that it reflects the author's tremendous active personal experience in a field to which he had made numerous contributions. Additionally, it is gratifying to know that this text will be perpetuated by the well qualified junior author, a surgeon and clinician, who has figuratively grown up alongside a microscope in the atmosphere of gynecologic pathology and by James D. Woodruff in charge of the gynecological laboratory at Johns Hopkins.

The section dealing with breast pathology in the previous edition has been deleted from this one. This appears as an acceptable, in fact, a desirable change in no way lessening the value of the current revision, particularly, since it has been replaced by a chapter on exfoliative cytopathology by John K. Frost. Also completely new are the two chapters on the placenta by Robert Nesbitt, Jr.

As in previous editions a natural attractive narrative style makes for pleasant, interesting reading. One does not have to be highly conversant with pathology in order to enjoy and understand this text which is still confined to thirty-five chapters. It is a tribute to the authors' selectivity of material and their style that so much pertinent information is compressed into such limited space without giving it the apparent brevity and encyclopedic monotony of a compendium.

Just as the first edition filled a longstanding need for an authoritative, readable text in the English

QUADRINAL

language, succeeding editions have continued this important function. In fact the book has been termed the pathologists' vade mecum of gynecologic pathology.

Each new edition has been well revised and up dated without becoming involved in distracting debate. One of its tremendous assets has always been its discussion and description of normal physiologic anatomic mechanism and lucid presentation of normal anatomy and embryology as introductions to sections where a discussion of their abnormalities follows. It is the observance of such excellent pedagogic principles that adds immeasurably to the book's interest, even to the point one dislikes to lay it aside.

A systematic review chapter by chapter is hardly required since this has been done with earlier editions. However one feels impelled to call attention to certain specific features. Two illustrations on opposing pages which immediately arrest attention depict, with unforgettable contrast, Bowen's disease and Paget's disease of the vulva.

The discussion of the problem encountered in diagnosing and differentiating early cancer of the cervix from other, at times confusing, non malignant histologic changes, is well and realistically presented. It is, however, difficult for the reviewer to go along with the authors when they state that (page 79-80) "the clinical history" is of great auxilliary importance to the pathologist when asked to pass on the question of malignancy and non malignancy. It is my belief the authors are merely being kind. It is difficult for me to see how history, unless perchance there is a pregnancy, gross appearance of the lesion, etc., can or should influence the pathologist in arriving at a diagnosis, for it is the histology of the lesion which alone will identify as non malignant a benign lesion that gives a history and gross appearance suggestive of cancer—i.e., tuberculosis, venereal granuloma, marked cervicitis.

Carcinoma in situ is well discussed. It is a difficult subject to present fully without leaving the reader somewhat confused. This is understandable since the literature on the subject, unless it is critically analyzed, is confusing. The authors have performed a difficult task of presenting briefly, but adequately, the various prevailing opinions without committing themselves to any one view. However, it would help the guidance seeking reader if the authors would state that, so far, all cases reported as representing instances of cancer in situ that later developed into cancer were never studied in such a way as to initially eliminate, with reasonable certainty, the possible presence of a coexisting but unrecognized cancer. This of course reports the view of a biased reviewer.

On page 136 it would help if the legend under figure 152 would state that the authors' diagnosis of ths section is "proliferative hyperplasia." This is stated on the next page in the text.

Chapters 7 to 10 inclusive concern the endometrium, are excellently done and worth the time needed for review. This is no accident, for one of the first books written by the senior author was a monograph on menstruation and its disorders. The authors clearly point out the difficulties involved in interpreting some of the complicated histologic appearances occasionally encountered.

Chapters 11 to 14 discuss tumors of the uterus. On page 208 a comparatively new term in gynecological pathology "hemangiopericytoma" is introduced and briefly described. It would be helpful for the general pathologist if a little more space were given to the discussion of this somewhat argumentative matter and if a higher power photomicrograph were used. Figure 262 of a uterine sarcoma is a most unusual and excellent illustration.

The brevity, conciseness and clarity which generally characterize this text are well illustrated in the discussion of stromal adenomyosis. This, in common

(Continued from page 1081)

with many other different conditions which are discussed in a text such as this, has been, for some, a highly argumentative subject. I agree with the authors that when the endometrial invasion of the myometrium is predominately interglandular stroma which shows malignant change, then the condition may properly be regarded as an endometrial sarcoma and the addition of another trem "stromal sarcoma" hardly serves a necessary purpose. However, sound argument is the stone that sharpens the wit. As a puzzled reviewer, I still do not know why "adenomyosis uteri," a term which obviously has its place, has become so all inclusive as to displace such highly descriptive terms as "endometriosis interna" or "myometrial endometriosis."

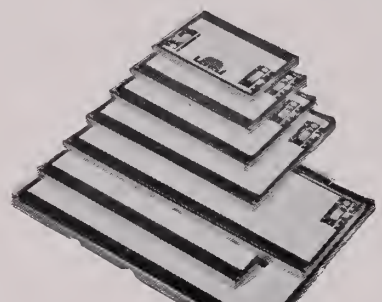
Discussion of the fallopian tubes begins with Chapter 15, while Chapter 18 is the first of twelve chapters given over to a thoroughly comprehensive presentation of ovarian anatomy, physiology and pathology. Here again the authors have been in the vanguard of those who have popularized our knowledge about the rarer and intriguing ovarian tumors.

Chapter 30 on ectopic pregnancy is one of the larger chapters. It is excellent and beautifully illustrated as is chapter 31 on plevic endometriosis. The next 3 chapters have to do with the physiological and pathological anatomy of the uterus and related structures in response to pregnancy. Chapters 32 and 34 have been rewritten and excellently so by Robert Nesbitt, Jr., while Chapter 33 on chorioma reflects the views of the author as an authority on the subject.

The final chapter by John Frost on exfoliative cytopathology is brief, concise and explicit. It is a logical and desirable addition to this outstanding text. A book of this calibre so excellently written and illustrated is a privilege to review and a pleasure to recommend.

Karl H. Martzloff, M.D.

ATOMIC ENERGY IN MEDICINE. By K. E. Halnan. 157 pp. Price $6.00. Philosophical Library, Inc., New York. 1957.



The medical uses of nuclear radiation increase almost daily, and are advocated and lauded by the professional and public press. At the same time, the same media raise a hue and cry about the hazards of these radiations. This little volume satisfactorily covers both aspects of atomic energy, and serves to put it in proper perspective. The doctor, technician, nurse, and others with only limited knowledge of physics and chemistry will find here a readable and reasonably complete introduction to the subject. The basic physics are briefly covered and the uses of isotopes in medical research, diagnosis and treatment are discussed, as well as the radiation hazard problem. The book is not designed for the more knowledgeable worker in the field.

J. Richard Raines, M.D.

THE STORY BEHIND THE WORD—Some Interesting Origins of Medical Terms. By Harry Wain, A.A., B.S.M., M.D. (cum laude), M.S.P.H., Diplomate, American Board of Preventive Medicine; Fellow, American College of Preventive Medicine; Fellow, American Public Health Association; Member, Royal Society of Health, London, England; Member, American Medical Association; Health Commissioner, Mansfield-Richland County, Ohio. 342 pp. Price $8.50. Charles C Thomas, Springfield, Ill. 1958.

Title and fly leaf blurb would lead you to anticipate an exciting experience within the covers of this book. Unfortunately I am not able to find the linguistic adventure mentioned by the publisher. Wain does not seem able to keep my interest from waning. I felt the same way about the column he used to conduct in the *Ohio State Medical Journal* in which most of this material has appeared. To be sure, there is information on derivation and meaning of several thousand words in this not too bulky

G-E molded cassettes cost less— last far longer!

Molded-rubber frame cushions jolts, keeps front and back of cassette in *true alignment*. Built-in glass-fiber pad gently squeezes screens and film for uniform contact always. volume. The work is undeniably accurate. But it is neither exciting nor complete. Most medical dictionaries carry at least as much information as Wain includes in his brief biographies of great medical personalities. If you have available also a copy of Webster's New International Dictionary, Second Edition, Unabridge, you have just as much information on derivations and sometimes more on meaning. I must admit, however, that the modest price tag for Wain does considerably less damage to the pocketbook than does the Webster. Perhaps if you are looking for plain information about the words we use nearly every day and you do not require an emotional experience in getting it, Wain will win you.

Herbert L. Hartley, M.D.

SPINAL ANESTHESIA. By John B. Dillon, M.S., M.D., Professor of Surgery and Chief of Division of Anesthesia, Department of Surgery, University of California Medical Center, Los Angeles. 61 pp. Illustrated. Price $3.00. Charles C Thomas, Springfield, Ill. 1958.

The beginning anesthesiology resident and the obstetrician or surgeon administering spinals would find this monograph a useful introduction to the study of the subject. It is brief, consisting of 61 small pages, which include a selected bibliography at the end of each of 11 chapters. This booklet is clearly and simply written, and is properly conservative. Some anesthesiologists are more conservative than the author regarding intrathecal vasopressors, but there are several articles and considerable cumulative experience substantiating his viewpoint.

It is refreshing to see instructions in spinal anesthesia presented from California where litigation-minded people have partially obstructed its usefulness.

L. F. Turnbull, M.D.

CLINICAL HEART DISEASE. Ed. 5. By Samuel A. Levine, M.D., Clinical Professor of Medicine, Harvard Medical School. 673 pp. Illustrated. Price $9.50. W. B. Saunders Company, Philadelphia. 1958.

This fifth edition maintains the high standard and the easy readability of the previous four. It has been brought up-to-date with a good discussion of the place of surgery in cardiac disease and of the use of the newer anti-hypertensive drugs. The section on electrocardiography forms a monograph in itself. Vectocardiography and ballistocardiography are briefly discussed. The book is certainly among the best on the subject and offers itself as a very handy and prompt reference to both the generalist and the internist. There is enough new material in this edition to make the fourth one moderately obsolete.

Giacomo Pirzio-Biroli, M.D.

HEART DISEASE—Cause, Prevention and Recovery. By Philip S. Chen, Ph.D., Professor of Chemistry and Chairman of Division of Natural Sciences, Atlantic Union College; with assistance on Part I of Philip S. Chen, Jr., Ph.D., National Heart Institute. 189 pp. Illustrated. Price $3.00. Chemical Elements, South Lancaster, Mass. 1958.

This interesting book is divided into three parts. The first part discusses anatomy and pathology on a layman level. The second part conmmences with a discussion of athersclerosis and its relation to cholesterol and lipoproteins. A reference source is quoted with nearly every paragraph which ranges from the *Journal of Clinical Nutrition* to the *Worcester Evening Gazette.*

It is Dr. Chen's discussion of fats and oils, phospholipids and sitosterols that makes this book worthwhile reading for the physician. It is a good concise

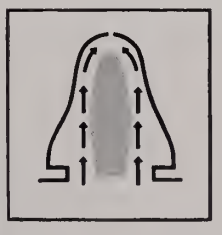
At last—a nipple that new-born babies will take



New Curity* Rib Nipple (PATENTED)

reduces air swallowing

Scientifically designed to fit baby's mouth—new hollow side ribs provide continuous flow of formula

When to recommend this nipple:

1. For new babies
2. For supplemental feedings of water and orange juice to breast-fed babies
3. For converting breast-fed babies to bottle
4. For problem feeders

Hollow side ribs make feeding easier because:

- they provide continuous flow despite biting
- they fit the mouth, reducing air intake
- they permit use of noturally pliable rubber

(Continued from page 1083)

review written by a Doctor of Chemistry who presents this material in an authoratative manner. This and his discussion of soybeans, on which he is an authority, are excellent.

Other portions of the book draw conclusions and make statements which are certainly questionable and serve to detract from the aforementioned good presentations. In brief, this is a short, interesting book on heart disease of interest to the physician from the nutrition standpoint with an excellent discussion of the soybean. Another blow to the dairy industry.

Russell N. Anderson, M.D.

CIBA FOUNDATION SYMPOSIUM ON THE CHEMISTRY AND BIOLOGY OF MUCOPOLYSACCHARIDES. Edited by G. E. W. Wolstenholme, O.B.E., M.A., M.B., B.Ch.; and Maeve O'Connor, B.A. 323 pp. 48 illustrations. Price $8.50. Little, Brown & Co., Boston. 1958.

The chemist who first ventured into the unknown to prove that common salt was the result of reaction between chlorine and sodium undoubtedly thought his research problem complicated and difficult. Perhaps it was. He had nothing to go on but what he could prove for himself. Those who followed him to discover the structure of carbon-hydrogen chains probably thought his problem trivial. With these and other milestones in the background, what must we think about those who are now digging out the secrets of the mucopolysaccharides, substances which may be a link between molecules and cells?

A wide variety of substances are included under the term. They are carbohydrate-amino acid complexes which cannot yet be described in exact terms. Primary structure of the mucopolysaccharides is not fully known and even less is known about the macromolecules they form. Reactions between these substances and protein are the subject of much speculation as well as investigation. Neutral mucopolysaccharides seem to be covalently bound to proteins whereas acid mucopolysaccharides are usually more loosely associated with proteins in the tissues. These substances occur widely in nature, not only in animal tissue but also in plants and bacteria. They enter into a variety of biologic and biochemical reactions. Their significance has just begun to be appreciated.

This report of one of the Ciba Symposia on fundamentals is highly interesting but it does not have much application, as yet, to bedside practice. It is an entertaining informal presentation of discussion by a group of explorers into one of the highly complex areas of today's unknown. Obviously, they had a thoroughly enjoyable three days and interchanged a great store of new information. If you would like to look into what very likely will be common knowledge among medical students 50 years from now, you may enjoy reading it as much as they enjoyed their meeting.

Herbert L. Hartley, M.D.

CEREBRAL LIPIDOSES: A Symposium convened in Antwerp, Belgium, July 1955. Chairman, L. van Bogaert, M.D., Director, Department of Neurology and Neuropathology, Institut Bunge, Antwerp. Edited by J. N. Cumings, M.D., F.R.C.P., Clinical Pathologist, The National Hospital; Director, Department of Biochemical Research, Institute of Neurology, London; and A. Lwenthal, M.D., Department of Neurology and Neuro-chemical Research, Institut Bunge, Antwerp. 212 pp. Illustrated. Charles C Thomas, Springfield, Ill. 1957.

This book, edited by J. N. Cumings who is Clinical Pathologist to The National Hospital in London, England, is made up of a group of papers presented at a symposium in Antwerp, Belgium, on July 26 and 27, 1955. At this meeting, papers were presented by eminent neurologists from many parts of the world who are interested in this particular subject.

The book is of interest to research workers who are concerned with this field and the field of histo-

chemistry, and to pediatricians, hematologists, and neurologists. The book contains much material of a fine research nature regarding the lipidoses and the leucodystrophies. It deals not only with the histochemic approach to the study of these diseases but also to the biochemic aspects of their study.

The book does not contain any startling revelations as far as conclusions are concerned which might lead to immediate improvement in the treatment of any of the disorders discussed. The presentations, in general, would certainly appear to me to add much valuable factual data to the medical literature on this subject, and to point up the fact that certainly this field holds great promise for the future as one needing a lot of good work to understand further the conditions discussed. The discussions concerning the histochemic and the biochemic knowledge in regard to these diseases appear to emphasize the fact that the knowledge is in an early stage of its development.

I believe that the book is well worth-while for the specialty groups mentioned in the first paragraph, and I believe it emphasizes the good that can be derived from the dissemination of information concerning a very highly specialized group of diseases, which is brought together in symposia of this type.

W. W. Lindahl, M.D.

THE HANDICAPPED AND THEIR REHABILITATION. Edited by Harry A. Pattison, M.D. 944 pp. Illustrated. Price $14.75. Charles C Thomas, Springfield, Ill. 1957.

Rehabilitation has grown amazingly, as is illustrated by the remarkable extent of this compendium on the subject. The size of the list of contributors to this volume, and their widely varied specialties, will impress the reader of this very complete volume with the breadth of this new approach to the problems of the handicapped. The treatment of the subject is so complete as to render the book an essential in any library of medical sciences for all rehabilitation centers and every physiatrist.

The subject is treated in four major divisions dealing with: foundations, the disabilities in which rehabilitation techniques are most applicable and necessary, the rehabilitation team, and special problems and procedures. The last part covers a variety of subjects ranging from fatigue and home economics to employment procedures and agencies and laws which apply to the handicapped.

The thoughtful physician and surgeon will find much in this book to challenge his thinking about his own approach to care for the handicapped and chronically ill, and also about the entry of a large number and variety of para-medical personnel into the work of restoration of the handicapped to useful places in society. There is a challenge inherent in the detailed text which should cause all members of our profession to consider what more doctors may do toward direction of this wide-spreading medical discipline.

Arthur C. Jones, M.D.

CHILD PSYCHIATRY, ed. 3. By Leo Kanner, M.D., Professor of Child Psychiatry, The Johns Hopkins University, Baltimore. Prefaces by John C. Whitehorn, M.D., Henry Phipps Professor of Psychiatry, The Johns Hopkins University, Baltimore; Adolf Meyer, M.D., LL.D., Henry Phipps Professor Emeritus of Psychiatry, The Johns Hopkins University, Baltimore; and Edwards A. Park, M.D., Professor Emeritus of Pediatrics, The Johns Hopkins University. 777 pp. Price $8.50. Charles C Thomas, Springfield, Ill. 1957.

This third edition of the basic text in child psychiatry contains the prefaces of the first and second editions and a short preface by Dr. Kanner himself to this, the third edition.

It is difficult to add any more emphasis to the importance of this work as a basic text in the doctor's reference library to the accounts already given to the

(Continued from page 1085)

first and second editions. However, Dr. Kanner with his thoroughness has enlarged on those areas of child psychiatry where progress in research, clinical thought and experience have offered new ways of thinking and practicing in this field, not only by child psychiatrists but by the general practitioner and pediatrician as well.

The text contains, as did its predecessors, not only pure medical psychology in the consideration of behavior problems of children but chapters 22 through 26, a total of almost a hundred pages, are devoted to discussion of the organic factors. Also, it is important to point out that, as Dr. Kanner talks of the various system phenomena, he never forgets the somatic problems all child psychiatricts must face and his discussion of the importance of the organic always tends to shake up those of us who get too interwoven in the purely psychologic.

He has always been interested in the problems of speech and speech correction and he has brought this chapter up-to-date. An attempt is made to incorporate all of the latest works in delinquency and hospitalism, but in a text of this nature it is obvious that much of the quantity of literature and research results must be omitted.

As usual, those of us who search for greater understanding of dynamic etiology in the behavior problems of children cannot find what we are looking for in Dr. Kanner's texts but this is a small criticism.

Once more, one can only say that if a practicing physician who sees children, regardless of his specialty, does not have Child Psychiatry by Dr. Kanner in his library, the third edition of this text will adequately fill that void.

S. Harvard Kaufman, M.D.

INHALATION ANALGESIA IN CHILDBIRTH. By E. H. Seward, M.A., D.M. (Oxon.) F.F.A.R.C.S., D. Obst., R.C.O.G., Consultant Anaesthestist, High Wycombe Group of Hospitals; and R. Bryce-Smith, M.A., D.M. (Oxon.), F.F.A.R.C.S., First Assistant, Nuffield Department of Anaesthetics, University of Oxford; Formerly Assistant Professor of Anaesthesia, Western Reserve University, Cleveland, Ohio. 58 pp. Price $1.50. Charles C Thomas, Springfield, Ill. 1957.

This little volume is intended primarily for the instruction of English midwives in the restricted use of inhalation anesthetics without loss of consciousness. As such it will have very limited value in this country.

As it reviews the nature of pain of labor, factors in pain relief, and analgesic properties of nitrous oxide and trichlorethylene (Trilene), it will be of some interest to obstetric nurses, many of whom assume some of the duties of the midwife in certain areas of the U.S.

The monograph's chief value to anesthesiologists is the clarity of diagrams of various English apparatus of ingenious design for analgesia with nitrous oxide and or trichlorethylene and air.

LIVERMORE SANITARIUM

This facility provides an informal atmosphere seldom found in hospitals elsewhere. A sound and scientific approach to emotional problems is provided with careful deliberation, with the patients' best interests given every consideration. Our approach is eclectic with emphasis along the lines of dynamic and psychobiologic psychiatry. Every recent therapy is available.

Individual services are amply provided for; in individual cottages if desired, so that the patient's every need is considered.

All diagnostic and ancillary consultative services are available.

Information upon request.

PRACTICE OPPORTUNITIES

OPPORTUNITY FOR GENERAL PRACTICE

Well-established general practice available in Eastern Washington. Write Box 53-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

OB-GYN ASSOCIATE

OB-GYN desired within six months to share growing practice in attractive Washington city. Integrity and personality prime requirements. Board or board eligible. Assured future for the right man. Contact John A. Duff, M.D., Bellingham Medical Center, Bellingham, Wash.

EENT PRACTICE FOR SALE

Well established EENT practice available in Eastern Washington. Take over 6 yr. lease and modern equipped offices. Be able to refract and do minor ENT office work. Reliable guild optician in area to help in dispensing. Liberal terms. Write Box 60-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

OPPORTUNITY FOR GENERAL PRACTICE

Well established general practice available in Longview, Wash. Leaving to specialize January 1959. Write Box 61-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

OPPORTUNITY FOR GENERAL PRACTICE

Tenino, Washington needs physician badly. Population 3,500; 9 small towns and communities without a physician tributary. Contact F. W. Wickman, M.D., Box 158, Tenino, Wash.

INSTITUTIONAL POSITIONS AVAILABLE

The rapidly expanding treatment program in Washington State institutions has created a number of new positions for physicians.

Staff, specialty and administrative personnel are urgently needed in nearly all areas of the State. Specialty and administrative personnel (Physician II, $11,916-$14,220) are required to have four years of experience in the practice of medicine or two years of supervisory medical experience, or two years of approved residency training, or four years in the practice of a specialty. Staff physicians (Physician I, $10,908-$13,020) need only to have licenses to practice in the State of Washington. For further information regarding these positions, contact the State Personnel Board, 212 General Administration Bldg., Olympia, Wash.

LOCATIONS DESIRED

ADMINISTRATOR FOR HOSPITAL OR CLINIC

M.S. Degree in Hospital Administration, B.S. Degree in Business Administration. Married, 39 years old. Experience in 50-bed hospital as administrator-anesthetist 5½ years; 8½ years total administrative experience. Considerable experience in planning, equipping and staffing new hospitals. Prefer combination administrator-anesthesia position of 30- to 50-bed hospital or business manager-anesthetist of clinic. Send inquiries to Box 47-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

PLACEMENT BUREAUS

PHYSICIANS AND SURGEONS REGISTRY

If interested in re-locating, joining a group or in disposing of equipment and practice, contact us. Services strictly confidential. Continental Medical Bureau, 510 West 6th Street, Los Angeles 14, or Pacific Coast Medical Bureau, 703 Market Street, Room 1404, San Francisco 3.

OFFICE SPACE

MEDICAL-DENTAL CLINIC

Will build to specifications Medical-Dental Clinic just outside northwest city limits of Seattle on corner junction for Innes Ardens, Woodway Park and thickly populated area. Spacious parking. Contact Adair Realty, EMerson 2-6345, 14820 Westminster Way, Seattle, Wash.

OFFICE SPACE IN OLYMPIA, WASHINGTON

Office space in new prestige building. Five room suite, 500 sq. ft. available. Excellent opportunity. Olympia Medical-Dental Building, 108 W. 22nd St. Contact Mr. Roy C. Moen, 519 Washington St., Olympia, Wash., or Western Medical Centers Mgt., Inc., 9034 Sunset Blvd., Los Angeles 46, Calif., Telephone CRestview 5-5108.

MEDICAL SPACE FOR LEASE

Office space available in established Medical Dental Building, Lake City (suburb of Seattle). Ideal for specialist. Separate or common waiting room available. Off-street parking. Call Seattle, EMerson 2-6606.

OFFICE SPACE IN SUNNYSIDE, WASHINGTON

Physicians urgently needed in Sunnyside, Wash. New suite immediately available. Will subsidize new physician. Contact Mr. J. C. Copeland, 9034 Sunset Blvd., Los Angeles 46, Calif., Telephone CRestview 5-5108.

REAL ESTATE INVESTMENT

Commercial building, excellent national tenant, 8½ yr. lease, 8 per cent net after taxes and insurance. Price $45,000; mortgage $26,500 at 4½ per cent. Owner Mr. Jack A. Benaroya, 408 Joseph Vance Bldg., MUtual 2-3750 or PArkway 3-2401, Seattle, Wash.

EQUIPMENT FOR SALE

ENT INSTRUMENTS FOR SALE

One complete set of ear, nose and throat instruments consisting of one mastoid set; one tonsil set; one tracheotomy set; one set of nasal operating and examining instruments and one set of tuning forks. All in excellent condition and at a low price. Contact L. C. Knight, M.D., 8320 Bothell Way, Seattle, Wash.

MEDICAL EQUIPMENT FOR SALE

Retiring generalist will sell equipment, instruments and office furniture $300; also residence if desired. A good location in Western Washington with hospital and three nursing homes available. Write Box 59-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

CADUCEUS FOR CLINIC BUILDING

Solid brass, 16 inches high, with 21 inch "wingspread." Weight 11 lbs. Permanent lacquer finish. Easy to mount. $68.50 F.O.B. Seattle. Call LAkeview 2-4221.

Alseroxylon less toxic than reserpine

"...alseroxylon is an antihypertensive agent of equal therapeutic efficacy to reserpine in the treatment of hypertension, but with significantly less toxicity."

Ford, R.V., and Moyer, J.H.: Rauwolfia Toxicity in the Treatment of Hypertension: Some Observations on Comparative Toxicity of Reserpine, a Single Alkaloid, and Alseroxylon, a Compound Containing Multiple Alkaloids, Postgrad. Med., January, 1958.

Rauwiloid® + Hexamethonium
alseroxylon 1 mg. and hexamethonium chloride dihydrate 250 mg.
in severe, otherwise intractable hypertension.
Initial dose ½ tablet q.i.d.

Both combinations in convenient single-tablet form.

now you can protect

older children  **teen-agers**  **and adults** 

against diphtheria-tetanus without serious reactions

Library,
College of Phy. of Phila.
19 South 22nd Street,
Philadelphia 3, Pa.

Adult **DIP-TET*** Alhydrox®

CUTTER

...mmunizing patients from 8 to 80

Booster injection... through the teen years and into adulthood may be provided without fear of serious reactions. Routine active immunity can be established in all your patients.

Adult Dip-Tet is adsorbed on Alhydrox (aluminum hydroxide) which slows absorption of the diphtheria toxoid thus reducing reactions. The tetanus toxoid component has been purified and the high purification of the diphtheria toxoid permits a reduction in the amount used, further minimizing reactions.

This type of vaccine was developed by the Armed Forces and is now used by them for routine immunizations. It is specifically recommended for children over 8 years of age, teenagers and adults.

*T. M.

Easily administered ½ cc. injections

Both booster and basic immunization require only 0.5 cc. of vaccine per injection. Adult Dip-Tet is easily administered subcutaneously or intramuscularly. Primary immunization: 2 injections of 0.5 cc. each given 4 to 6 weeks apart. Routine booster: 1 injection of 0.5 cc. 6 to 12 months after initial series followed by 0.5 cc. every 3 to 4 years. Booster following injury or exposure to diphtheria: 1 injection of 0.5 cc. if previously immunized.

For complete descriptive literature, dosage information and a supply of wollet-sized immunizotion record cards for your potients, ***ask your Cutter man*** or write to Dept. 7-H

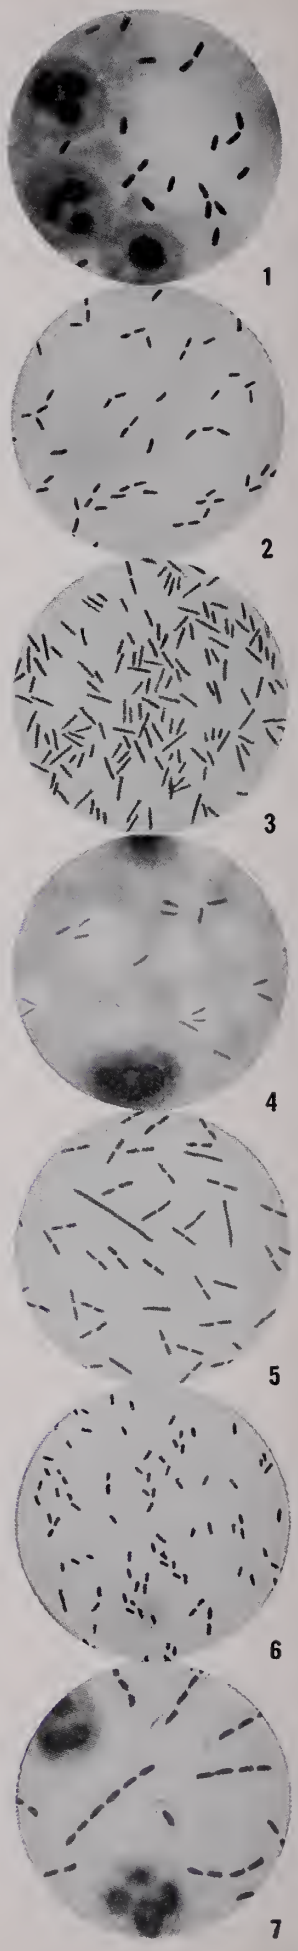
POSITIVE RESULTS AGAINST MANY GRAM-NEGATIVE INVADERS

CHLOROMYCETIN®

COMBATS MOST CLINICALLY IMPORTANT PATHOGENS

Gram-negative organisms, involved in many stubborn infections, demonstrate high *in vitro* sensitivity to CHLOROMYCETIN.[1-8]

The efficacy of CHLOROMYCETIN against these troublesome invaders is borne out *in vivo* in such infections as infantile gastroenteritis,[9] urinary tract infections,[10] the septicemic and focal forms of salmonellosis,[11] and Friedländer's pneumonia.[12]



CHLOROMYCETIN is available in a variety of forms, including Kapseals,® of 250 mg., bottles of 16 and 100.

CHLOROMYCETIN (chloramphenicol, Parke-Davis) is a potent therapeutic agent and, because certain blood dyscrasias have been associated with its administration, it should not be used indiscriminately or for minor infections. Furthermore, as with certain other drugs, adequate blood studies should be made when the patient requires prolonged or intermittent therapy.

Controls ***Stress***

Relieves ***Distress*** *in smooth muscle spasm*

new Pro-Banthine® *with* Dartal®

– for positive relief of cholinergic spasm.

– a new and safer agent for normalizing emotions.

PRO-BANTHINE WITH DARTAL offers you a new, specific and reliable control of visceral motor disorders, especially when these disorders are induced or aggravated by psychic tensions or anxiety.

Pro-Banthine has won wide clinical acceptance as the most effective drug for controlling gastrointestinal hypermotility and hypersecretion.

Dartal, a new phenothiazine congener, offers greater safety, flexibility and effectiveness in stabilizing emotional agitation.

The combination of each drug in fully effective doses in Pro-Banthine with Dartal gives a new means of approach to the medical management of functional gastrointestinal disorders mediated by the parasympathetic nervous system.

Specific Clinical Applications: Functional gastrointestinal disturbances, gastritis, pylorospasm, peptic ulcer, spastic colon (irritable bowel), biliary dyskinesia.

Dosage: One tablet three times a day.

Availability: Aqua-colored tablets containing 15 mg. of Pro-Banthine (brand of propantheline bromide) and 5 mg. of Dartal (brand of thiopropazate dihydrochloride).

Research in the Service of Medicine.

SEARLE

for depression

Deprol†

Clinically confirmed in over 1,200 documented case histories[1,2]

CONFIRMED EFFICACY

Deprol ► acts promptly to control depression *without* stimulation

► restores natural sleep

► reduces depressive rumination and crying

DOCUMENTED SAFETY

Deprol is unlike amine-oxidase inhibitors

► does not adversely affect blood pressure or sexual function

► causes no excessive elation

► produces no liver toxicity

► does not interfere with other drug therapies

Deprol is unlike central nervous stimulants

► does not cause insomnia

► produces no amphetamine-like jitteriness

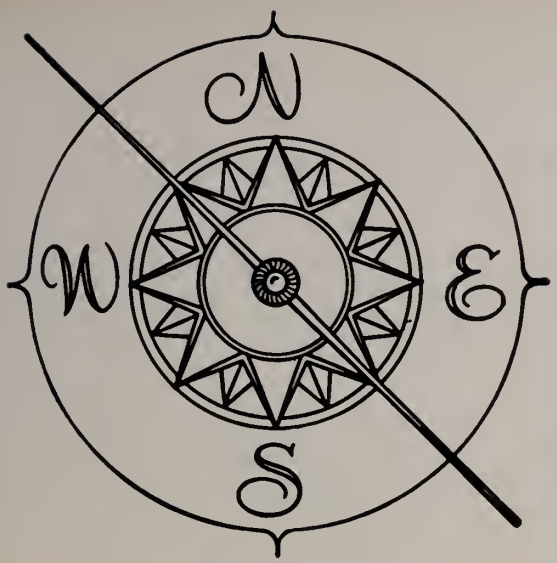
► does not depress appetite

► has no depression-producing aftereffects

► can be used freely in hypertension and in unstable personalities

Dosage: Usual starting dose is 1 tablet q.i.d. When necessary, this dose may be gradually increased up to 3 tablets q.i.d.

Composition: Each tablet contains 400 mg. meprobamate and 1 mg. 2-diethylaminoethyl benzilate hydrochloride (benactyzine HCl).



Supplied: Bottles of 50 scored tablets.

1. Alexander, L.: Chemotherapy of depression—Use of meprobamate combined with benactyzine (2-diethylaminoethyl benzilate) hydrochloride. J.A.M.A. 166:1019, March 1, 1958. 2. Current personal communications; in the files of Wallace Laboratories.

A Summary Report on

CORTROPHIN®-ZINC

(Corticotropin-Alpha Zinc Hydroxide)

Description: A unique patented electrolytic process (developed by Organon research) produces a complex of *alpha* zinc hydroxide and corticotropin. This complex offers considerable advantages for practical ACTH therapy.

Characteristics: New Cortrophin-Zinc provides corticotropin of unsurpassed purity with low foreign protein content. This reduces the risk of sensitization reactions.

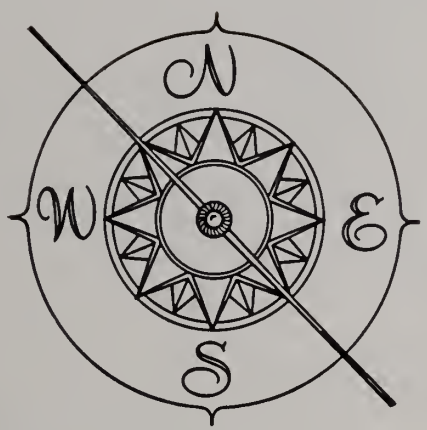
Since about 5% of the corticotropin is uncombined, onset of clinical response is rapid. But the balance, present as a complex of alpha zinc hydroxide, provides a prolonged action so that the effective time span of a single dose is usually several days. Injection of the new electrolytic Cortrophin-Zinc is virtually painless.

Pharmacology: A potent stimulator of cortical activity, Cortrophin-Zinc *does not depress* functioning of the suprarenal glands. Unlike the corticosteroids, adrenocorticotropic hormone arouses the adrenal glands to produce *natural* steroids in natural proportions. In a 5-year study of patients on ACTH therapy, no case of adrenal *or pituitary* depression or atrophy has been observed.

Because Cortrophin-Zinc is virtually painless on injection and its prolonged action obviates frequent injections, it is now practicable to use Cortrophin-Zinc in most of the indications where formerly reliance has been on corticosteroids. This freedom from apprehension of deleterious depressive effects permits clinical use of valuable hormone therapy on a broader scale than has been possible heretofore.

Clinical Uses and Dosage: The many published reports on the use of Cortrophin-Zinc as well as ACTH, in thousands of patients indicate its value in over 100 disorders. Most responsive have been: allergies and hypersensitivities, rheumatoid arthritis, bronchial asthma, serum sickness and inflammatory skin and eye diseases.

Dosage should be individualized, but generally initial control of symptoms is obtained with a single injection of 40 units of Cortrophin-Zinc daily, until control is evident. Maintenance dosage is generally 20 units (or less) twice a week.



Use of Cortrophin-Zinc with oral steroids is now recommended as a safety measure to supply the important suprarenal stimulation and lessen the hazard of atrophy. Periodic use of Cortrophin-Zinc is advocated with all steroid analogs, such as cortisone, hydrocortisone, prednisone, prednisolone, methylprednisone, and triamcinolone.*

Supply: 5-cc vials containing 40 and 20 U.S.P. units of corticotropin per cc; 1-cc ampuls containing 40 and 20 U.S.P. units of corticotropin, with sterile disposable syringes.

Compazine* Spansule†

capsules are especially useful for prompt and prolonged relief from tension headache.

For the patient whose anxiety and nervousness are manifested as tension headache, one 'Compazine' *Spansule* capsule taken in the morning provides protection *throughout the day.*

Patients on 'Compazine' are, in virtually all cases, free from drowsiness, and often experience an alerting effect. They can carry on normal activity.

And, on the other hand, for the patient who cannot sleep because of anxiety and tension, one 'Compazine' *Spansule* capsule taken before retiring provides relief *throughout the night.*

'Compazine' *Spansule* capsules: 10 mg., 15 mg. and 30 mg.

even for "night eaters"

LEVONOR*

can be given at 8 p.m. or later without keeping the patient awake,[1,3] cuts appetite without rubbing the nerves raw[1-4]

Most obese patients tend to overeat late in the day and at night[5-7]—often referred to as the "night-eating syndrome." Now with LEVONOR you can even control night eating because unlike certain other anorexigenics, the last dose is given in the *evening*, cutting the urge to eat with little or no likelihood of disturbing sleep. The late evening dose does not interfere with sleep in the great majority of patients. The patient gets virtually no psychic stimulation from LEVONOR.[1] Relative freedom from side effects reported as striking.[1-4, 8-10]

NORDMARK

tested clinically in 6,622 overweight patients
effective appetite control . . . analepsis not noted

Investigator	Number of Patients	Average Daily Dose	Average Weekly Weight Loss	Comment
Gadek, et al.[1,10]	80	3-4 tabs.	2 pounds	marked reduction in usual side effects
Feldman[2]	45	3 tabs.	2.38 pounds	no analepsis noted
Gosselin[3]	6,288	3 tabs.	satisfactory	Levonor fills a need
Frohman[4]	49	3-4 tabs.	2.8 pounds	did not increase blood pressure or pulse rate
Pomeranze[8]	125	3-4 tabs.	2 pounds	curbs appetite, real improvement
Berkowitz[9]	35	3-4 tabs.	1.5 pounds	excitation and other side effects not observed

easy dosage schedule: Many physicians prefer their patients to take 1 tablet at 11:00 a.m., 1 tablet at 4:00 p.m. and 1 tablet at 8:00 p.m. Some patients, especially those who have been previously treated with d-amphetamine, may require a temporary initial dosage of 2 tablets 3 times daily. LEVONOR offers the latitude necessary to adjust dosage to the needs of individual patients.

Best results are obtained in conjunction with lowered caloric intake.

supplied: Bottles of 100 tablets. Each tablet contains 5.0 mg. of levo amphetamine alginate (levo 1-phenyl-2-amino-propane alginate, Nordmark) pat. pending.

like the orchid,

L. A. FORMULA

is still unsurpassed

L. A. FORMULA *normalizes* bowel function. It is equally effective in correcting simple constipation and non-specific diarrhea. It is ideal, therefore, in the Irritable Colon cases in which both constipation *and* diarrhea may occur.

L. A. FORMULA is a vegetable concentrate of naturally occurring hemicelluloses. It is derived from blond psyllium seed by our special Ultra-Pulverization Process and simultaneously dispersed in lactose and dextrose. It provides just the moist, smooth, effective bulk so essential to normal peristalsis.

L. A. FORMULA is not to be confused with the ordinary laxatives, neuromuscular stimulants, or mucosal irritants. They *exaggerate* peristaltic activity. L. A. FORMULA *normalizes* it.

L. A. FORMULA, furthermore, is undetectable in fruit juice or milk, pleasant tasting in water, and available in 7 and 14 ounce prescription containers at significantly lower cost-to-patient prices.

ocort®

Triamcinolone LEDERLE

...in Respiratory Allergies: "Good to excellent" results in 29 of 30 patients with chronic intractable bronchial asthma at an average daily dosage of only 7 mg.[6]... Average dosage of 6 mg. daily to control asthma and 2 to 6 mg. to control allergic rhinitis in a group of 42 patients, with an actual reduction of blood pressure in 12 of these.[7]

...in Other Conditions: Two failures, 4 partial remissions and 8 cases with complete disappearance of abnormal chemical findings lead to characterization of ARISTOCORT as possibly the most desirable steroid to date in treatment of the nephrotic syndrome.[8,9]... Prompt decrease in the cyanosis and dyspnea of pulmonary emphysema and fibrosis, with marked improvement in patients refractory to prednisone.[10,11,12]... Favorable response reported for 25 of 28 cases of disseminated lupus erythematosus.[13]

Depending on the acuteness and severity of the disease under therapy, the initial dosage of ARISTOCORT is usually from 8 to 20 mg. daily. When acute manifestations have subsided, maintenance dosage is arrived at gradually, usually by reducing the total daily dosage 2 mg. every 3 days until the smallest dosage has been reached which will suppress symptoms.

Comparative studies of patients changed to ARISTOCORT from prednisone indicate a dosage of ARISTOCORT lower by about ⅓ in rheumatoid arthritis, by ⅓ in allergic rhinitis and bronchial asthma, and by ⅓ to ½ in inflammatory and allergic skin diseases. With ARISTOCORT, no precautions are necessary in regard to dietary restriction of sodium or supplementation with potassium.

ARISTOCORT is available in 2 mg. scored tablets (pink), bottles of 30; and 4 mg. scored tablets (white), bottles of 30 and 100.

Supp-hose†*

FOR LEG FATIGUE AND MILD VARICOSITIES

Recent clinical research demonstrated the excellent value of Supp-hose for leg fatigue, and mild disorders where heavy surgical stockings are not prescribed. The advantage of Supp-hose is that it looks just like any sheer nylon stocking, thus it overcomes one of the main objections of the patient concerned about her appearance.

SO MANY WOMEN COMPLAIN ABOUT LEG FATIGUE!

As you know, expectant mothers, housewives, working women, and women with mild varicosities all complain about discomfort of the extremities. Supp-hose eases this leg fatigue and gives gentle support all day long. Yet Supp-hose contains no rubber! Every stitch is fine nylon with a special twist that provides an elastic quality.

A VERY ECONOMICAL STOCKING!

Patented Supp-hose costs a woman just one-third what she usually pays for heavier surgical stockings. And wear tests indicate Supp-hose should give five times the wear of ordinary nylons. Supp-hose is available in proportioned sizes in beige, natural and white. At drug and department stores.

KAYSER-ROTH HOSIERY COMPANY, Inc., 200 Madison Avenue, N. Y. 16, N. Y. Sold in Canada.

make mine Soyalac

Provides balanced nutritional values

1. Fibre-free **HYPOALLERGENIC** formula.
2. An excellent formula for regular infant feeding.
3. An ideal food for milk allergies, eczema and problem feeding.

SOYALAC helps solve the feeding problem of prematures and infants requiring milk-free diet.

Strikingly similar to mother's milk in composition and ease of assimilation, babies thrive on SOYALAC.

Clinical data furnish evidence of SOYALAC'S value in promoting growth and development.

Protein of high biologic value is obtained from the soybean by an exclusive process.

EDITORIAL

AMA Administration Reorganized

Part of the process of remodeling the AMA had to be complete reoganization of administration at 535 North Dearborn Street. Sweeping changes were made by the AMA Board of Trustees at regular meeting in August. They follow closely the recommendations of the Heller Report. Overhaul of administrative machinery does not affect the basic remodeling of AMA discussed in these columns there months ago[1] but provides much more efficient direction for the many services listed in another editorial in the same issue.[2]

Overloading of the chief executive position was pointed out in the Heller Report. The General Manager, F. J. L. Blasingame, now receives reports from only 6 division heads rather than from 24 individuals formerly reporting from that many departments. The Report, under discussion of staff organization, said:

> As has been noted, the Association increased its activities considerably in the last 15 years. This growth was accompanied by expansion of the staff organization. With its increased size and greater complexity, a close coordination of functions is necessary in order to do an effective job for the profession. ° ° ° Of the more than 650 salaried employees who make up the staff organization, approximately 550 are supervised by the Secretary and General Manager and the rest by the Editor of the *Journal of AMA*.

Some of these employees are assigned to specific councils and committees and work under the immediate direction of the council or committee secretary. Others conduct such activities as public relations, publishing, and business, and are assigned to the departments performing those functions.

Over all, there are a number of basic weaknesses in the organization and composition of the staff which reduce its effectiveness and add to the problems of administration. The following are specific areas in which improvements can be made.

The Secretary and General Manager has too many persons reporting to him. ° ° ° It is axiomatic that no administrator should have more people responsible to him than he can effectively supervise, and to whom he can devote sufficient time to provide guidance in matters of policy and administration. A number of the departments whose staff executives are now responsible to the General Manager are not of sufficient importance or size to warrant his direct supervision. Among these are the Machine Records Division, Membership Department, Bureau of Medical Economic Research, and Council on Mental Health.

In addition to having too many people reporting to him, the General Manager has many other demands on his time. Many outside organizations call on him to make speeches and attend meetings. In addition, he is an ex officio member of all councils and standing committees of the Association. All together, these are important but they take so much time that it is impossible for him properly to plan, coordinate, and administer the activities of the Association.

Other department heads also have too many persons responsible to them. ° ° ° For example, the Director of Public Relations has nine persons responsible directly to him. There are a number of related functions in this department which could be combined. This would reduce the number of persons reporting to the

1. Editorial: Remodeling the AMA, Northwest Med. 57:715-716, (June) 1958.
2. Editorial: Components, Northwest Med. 57:717, (June) 1958.

Director and free him from time-consuming detail, thus permitting him to devote more attention to policy and administrative matters. Similar steps could be taken in other departments . . .

In accordance with these suggestions, The Board of Trustees has created six new divisions and named the head of each. Business will be directed by Mr. Russell H. Clark. Law will continue to be under management of Mr. C. Joseph Stetler. Communications, which includes professional and public relations, will be administered by Mr. Leo Brown. Mr. Aubrey Gates will head the Division of Field Service and Austin Smith will be in charge of the Division of Scientific Publications. This division will be responsible for editorial activities including the editorial departments of *AMA News* and *Today's Health.* Control of advertising and circulation of the two publications will be transferred to the Business Division. Sixth division is that of Council Administration headed by Ernest B. Howard who is also assistant executive vice-president. This division is considered to be a temporary device and may be discontinued or reassigned after further studies on scientific and socio-economic activities of AMA.

Changes were made only to increase the efficiency with which the work load at the Chicago headquarters may be handled. None required revision of constitution or bylaws. •

What Do You Know About Hospitals?

Physicians do not know very much about hospitals if a study reported in *Hospitals*[1] reflects the situation accurately. There is little reason to suspect that it does not. The study was conducted in two hospitals, one a 300 bed hospital in a city of 200,000, the other in a 600 bed hospital in a city of more than a million population. Both were general institutions accepting acute cases.

Questionnaire was composed of 47 questions with multiple choice answers. They were in four groups covering medical staff organization, general administration, personnel administration and financial management. All scores were low, with 90.1 per cent returning less than 60 per cent correct answers. Ignorance of personnel and financial problems of the hospitals was the most striking finding. In these fields the number of correct answers could have been explained by chance alone.

It is interesting to note that physicians in the smaller community were considerably better informed than those practicing in the large city. The report carries no explanation of this difference and does not make any attempt to fix responsibility for meagerness of physicians' knowledge. It does assume, however, that more knowledge of hospital problems might reduce the tensions which sometimes arise between physicians and hospital administrators. Also discussed is the question of how much the physician ought to know about hospital administration. Apparently physicians realize that they should know more since the final question in the survey asked for an opinion on value of more knowledge. More than three-fourths of staff members in the two hospitals indicated that it would be valuable.

Physicians knew very little about admission policy. When asked what types of patients would not knowingly be admitted only 16.9 per cent of staff members in the large hospital and 35.4 per cent in the smaller hospital knew the correct answer. They knew even less about how their patients met hospital bills. On the question of percentage of patients paying all bills out of pocket the answers were 12.5 per cent

1. Gottlieb, S. R., How much do doctors know about hospitals?, Hospitals, 32:33-35, (Aug.) 1958.

correct in the smaller hospital and 24.6 per cent in the larger. Autopsy rate was known by 59 per cent and 21.2 per cent. Even staff appointment responsibility was not well understood. In the smaller hospital 45.1 per cent knew who had the power to appoint and remove staff members but in the larger hospital only 11.9 per cent were informed.

Year of graduation from medical school and number of years of association with the hospital seemed to make no difference in the accuracy of answers but specialization did. General practitioners made the poorest scores. Six specialty groups were about equal in their knowledge of all of the hospital problems. An interesting and probably significant difference showed up when it was discovered that those who used the hospitals most, knew most about them. Highest scores were made by those who made more than 25 hospital calls a month and lowest by those who made 5 or less.

Although the report does not answer the question it raises about desirability of more knowledge on the part of physicians, it would appear that an educational program is very much needed. It is doubtful if hospital administrators have deliberately withheld information from staff members. More studies may be needed to determine whether failure of physicians to know the facts about hospitals stems from administrative neglect to inform, or physician indifference.

It is surprising that the group most vocal about hospital domination of the practice of medicine has the least knowledge of hospital administration. General practitioners should be chagrined to find that members of their group have so neglected to inform themselves on a subject of considerable importance. Since they are not alone, however, in their ignorance of hospital affairs, their chagrin should be shared by all. If physicians individually will not take the trouble to familiarize themselves with hospital operation, the county societies may need to set up intensive educational programs. •

Deficiency In Education

Medical education has been the subject of a great deal of discussion, in recent years, by those within and by those without medical school organizations. It is doubtful, however, if anyone has pointed out more eloquently than the writer of the letter below, one of the significant deficiencies of medical education today. A very important segment of the American public will not get adequate medical care until rural communities are supplied with physicians whose training does not belittle the role of the rural doctor. Rural people can have first class care and do not deserve the fate suggested.

Author of the letter has been in practice in a small Washington community for ten years. He has been engaged in futile search for a younger physician to take over his practice when he leaves for training in a special field.

Northwest Medicine
500 Wall Street
Seattle, Washington

Gentlemen:

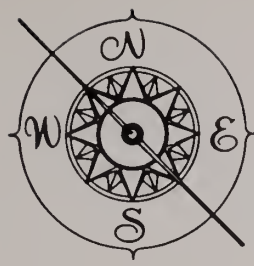
Please discontinue my advertisement in your publication. I received only one reply and this person was interested in a larger community.

The handwriting seems clear; today's young physician wants nothing to do with either solo practice or being in a town without hospital facilities. This is verified by the eight replies received from the AMA ad. A ready made excellent income practice is no inducement.

Prediction: Osteopaths will gradually assume the medical care in these small rural areas.

Very sincerely yours,

Provides therapeutic quantities of all known hematinic factors



Potent 'Trinsicon' offers complete and convenient anemia therapy plus maximum absorption and tolerance. Just two Pulvules 'Trinsicon' daily produce a standard response in the average uncomplicated case of pernicious anemia (and related megaloblastic anemias) and provide at least an average dose of iron for hypochromic anemias, including nutritional deficiency types. The intrinsic factor in the 'Trinsicon' formula enhances (does not inhibit) vitamin B_{12} absorption.

Available in bottles of 60 and 500 at pharmacies everywhere.

*'Trinsicon' (Hematinic Concentrate with Intrinsic Factor, Lilly)

Conservative Treatment of Carcinoma of the Prostate Gland

C. D. Creevy, M.D.
MINNEAPOLIS, MINNESOTA

Current methods of treating prostatic malignancies are based on knowledge of response to hormones. Extensive clinical and experimental studies indicate sensitivity of the prostate to a number of hormones. Estrogens benefit the victim of cancer of the prostate but best results are obtained when administration of estrogen is combined with castration. Other hormones should be tried when relapse occurs.

The prostate is a compound tubular gland derived from five evaginations of the proximal urethra starting in the twelfth embryonic week; development is fairly complete a month later. These evaginations correspond in location to the five lobes of the adult gland, which are regions rather than distinct structures (Fig. 1). The gland remains virtually static until puberty, during which it grows rapidly, then slows down gradually until the age of 30, at which time it measures about 2.5 x 3.5 x 4 cm., and weighs 15 to 20 Gm.

It forms a milky, faintly acid secretion, loaded with doubly refractile lecithin bodies, at the rate of 0.5 to 2 cc. per day, and more during parasympathetic or sexual stimulation (Huggins). The fluid contains electrolytes, fructose, citrates, proteoses, cholesterol, choline, acid phosphatase, and fibrinolysin. This last may apparently cause a serious hemorrhagic diathesis in an occasional patient with disseminated carcinoma. The only known functions of the secretion are to nourish the sperm and to liquefy the ejaculate.

Our knowledge of the sensitivity of the prostate gland to internal secretions probably had its beginnings with John Hunter's description, in the 1870's, of prostatic atrophy following castration. Burrows, and Owen and Cutler noted a transitory enlargement in the newborn, and attributed it to maternal sex hormones. Crowe, Cushing, and Homans observed atrophy of prostate and testes after hypophysectomy. It was later shown that this atrophy could be prevented by administration of anterior pituitary extracts, and that the prostatic but not the testicular changes could be prevented or corrected by androgens.

So much is definite, but much of the rest of our information is confused or speculative, probably because of species differences or of discrepancies in the criteria of various observers.

Read before the 66th Annual Meeting of the Idaho State Medical Association, Sun Valley, Idaho, July 7, 1958.

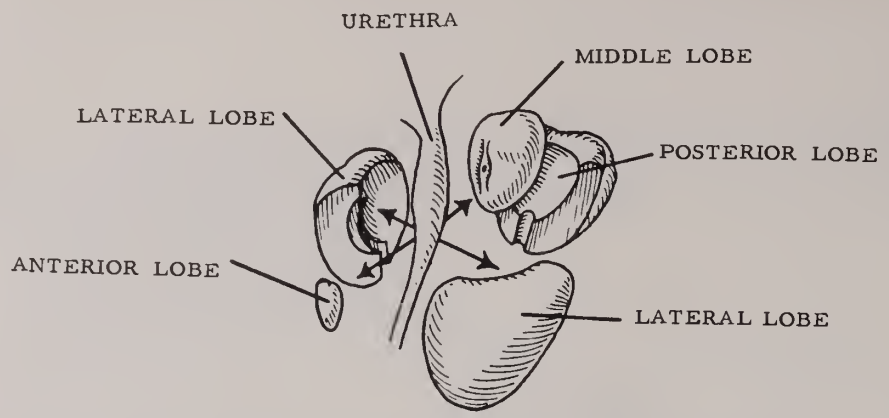

Fig. 1. An exploded view of the prostatic lobes, revealing how they are named according to their relation to the urethra. The normal and the abnormal lobes, while not the same, are named by the same system. (Figure reproduced from V. F. Marshall, Textbook of Urology, 1956, p. 67, by permission of the Hoeber-Harper Co., New York.)

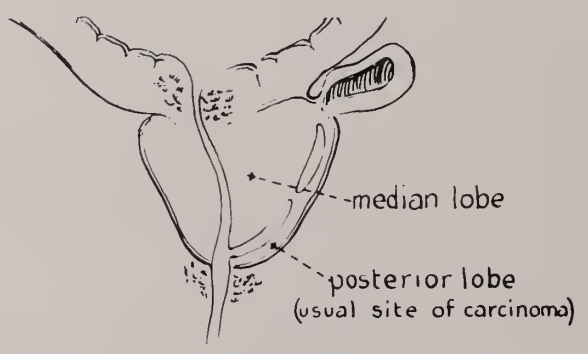
This information may be summarized briefly as follows: prolonged administration of estrogens causes prostatic enlargement in mice (Lacassagne), dogs, and monkeys (Huggins), due mainly to squamous metaplasia. The same agents induce enlargement of prostatic fragments in the anterior chamber of the eye of the castrated rabbit (Krichevsky and Benjamin), but cause shrinkage of the mature rat's prostate (Huggins).

Androgens

Androgens have been alleged to *cause* benign hypertrophy of the prostate in the human (McCullagh), and also to *correct* it (deJongh). They affect prostatic fragments in the anterior chamber of the castrated rabbit's eye just as estrogens do.



Scott has emphasized the paucity of our knowledge of the effects of androgens and estrogens upon the normal adult human prostate.

There is no evidence that adrenal cortical hormones affect the prostate. Richter has shown that the adrenal hyperplasia resulting from castration is accompanied by prostatic atrophy; Sayers suggests that the amount of cortical hormone produced by very hyperplastic adrenals is too small to affect the prostate. Cortisone does not affect the dog's prostatic epithelium (Talalay) nor that of the rat (Scott).

Pituitary and pituitary-like substances cause hypertrophy of the smooth muscle of the monkey's prostate and vesicles (Geschickter, Lewis, and Hartman). This is probably a direct effect, since it occurs in the castrate, and since adrenal cortical hormones do not produce it. Martins and Rocha joined normal with castrated rats in parabiosis, and attributed the ensuing prostatic enlargement in the intact animal to overstimulation by the pituitary of the castrate.

Ferguson reported prostatic hypertrophy in young men dying of teratoma testis with a high titer of gonadotropins, and Powell recorded it clinically after injection of APL for undescended testis. However, Tillisch and Thompson saw spontaneous prostatic hypertrophy in a man in his twenties, so that the significance of the two preceding observations is uncertain.

Nearly all prostatic neoplasms are adenocarcinomas arising in the posterior lobe which lies below and behind the ejaculatory ducts (Fig. 2).

Carcinoma of the Prostate

Fig. 2.

Most grow slowly and metastasize late via lymphatics and blood stream. First metastases pathologically are in the regional nodes; clinically

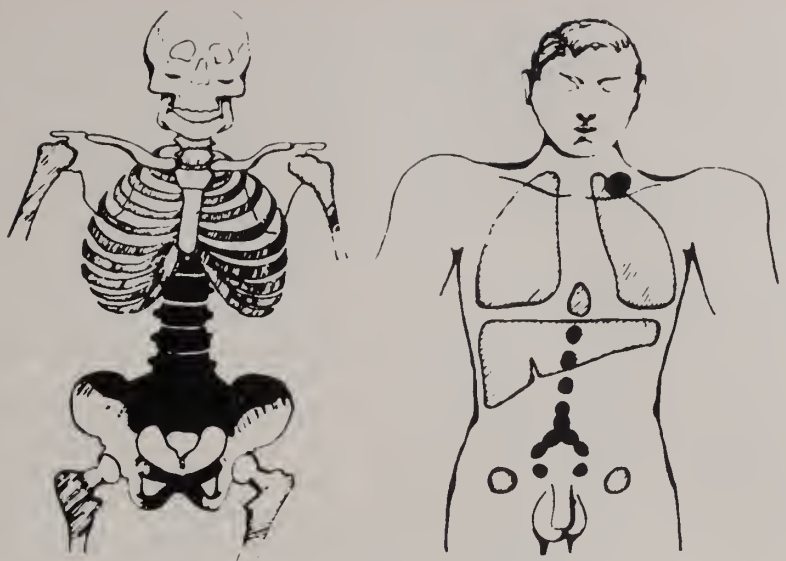


Fig. 3. Sites of metastasis of carcinoma of the prostate.

they appear first in the lumbar spine and pelvis (Fig. 3). Invasion of adjacent structures and metastases both occur late in the course of the disease, but early from the point of view of symptoms of obstruction.

The etiology of prostatic cancer is unknown, although androgens seem implicated. Scott knows of no case following prolonged administration of androgens, but suspects an androgen-estrogen imbalance. Lesser *et al.* studied 100 men past 45 previously treated with androgens, and found no more prostatic disease than in 100 controls.

Carcinoma is found in 15 to 20 per cent of prostatic obstructions, and with steadily increasing frequency as age advances. Hirst and Bergman observed at autopsy that it affected 42 per cent of men from 80 to 84, 71 per cent from 85 to 89, and 80 per cent from 90 to 99. According to Jewett, it causes 15,000 to 20,000 deaths yearly in this country; Hinman surmises that we have three to eight million cases living at one time. The rapid rise in incidence of the last half century appears to represent aging of the population rather than increased individual susceptibility.

Castration

Two facts probably led Huggins to castrate patients with prostatic cancer: the regression of advanced breast cancers after gonadectomy, and the relationship between carcinoma of the prostate and acid phosphatase, an enzyme which hydrolyzes the esters of phosphoric acid. Its function is unknown, and the differences between the acid and alkaline varieties are not clear. In 1935 Kutscher and Wolbergs showed that the adult prostate contained more acid phosphatase than any other tissue. Shortly the Gutmans and Sproul found similar concentrations in prostatic cancer and its metastases. In 1938 the latter observed that while there was but little of the enzyme in the immature gland, it increased with the administration of testosterone. Soon they, Barringer and Woodard, and Huggins discovered elevated acid phosphatase in the serum in some patients with metastasizing carcinoma of the prostate.

Beginning in 1939 Huggins castrated 21 patients with advanced prostatic cancer. There was improvement in 85 per cent (relief of pain, increased appetite and weight, softening and shrinkage of the local lesion and, in some, regression of metastases). The serum acid phosphatase fell toward or to normal during regression. Relapse followed administration of androgen, but this effect could be prevented by the simultaneous administration of estrogen. Very shortly Herbst reported regression from estrogens and Munger from testicular irradiation.

Many have since verified Huggins' original observations, but it was soon found that 20 to 30 per cent of prostatic cancers resisted these measures, while virtually all acquired resistance after periods ranging from one half to ten years.

Huggins and Scott observed that the urinary 17-ketosteroids (mainly androgenic) rose tempo-

rarily after castration, and concluded that relapse resulted from increased production of androgens by adrenals stimulated by the hyperactive castrate pituitary. They therefore subjected four patients to total adrenalectomy in 1945, but were unable to keep them alive long enough to judge the effects upon the disseminated cancers.

Castration Plus Estrogens

In 1950 Nesbit and Baum studied a considerable number of patients treated by androgen control. They found that 31 per cent of those without evident metastases survived castration for 5 years, whereas 29 per cent of a similar group taking estrogens survived for the same period. This figure rose to 44 per cent of those treated by combining the two methods. Survivals fell to 21, 10, and 20 per cent in those with metastases at the beginning of treatment. Corresponding figures in controls treated by other methods were 10 and 6 per cent. The difference in survival between those with and those without metastases doubtless means that the former had more advanced disease when treatment was instituted.

Staubitz *et al.* have confirmed Nesbit's and Baum's conclusion that castration plus estrogen is better than either one alone.

It is evident therefore that Huggins has made an important and gratifying contribution to the comfort and longevity of patients with prostatic carcinoma.

However, the problem of primarily androgen independent cancer and of relapse in initially sensitive ones is unsolved. It is well established that castration and estrogen administration are about equally effective. However, a patient who relapses after initially successful treatment with one method has some chance of remission if the other treatment is then given; relapse after therapy with estrogens may sometimes be corrected by increasing the dose to very high levels.

Huggins revived total adrenalectomy when the advent of cortisone made survival possible, and this was tried in other clinics. However, response was so variable and transitory that few now regard it as a practical treatment for relapsing prostatic cancer. Since adrenalectomy reduces urinary androgens to the vanishing point, it seems that tumors relapse because they escape from the control of hormones, or become androgen independent. The fact that some prostatic cancers have this feature from the beginning has already been mentioned.

While adrenal hyperplasia follows castration, this can apparently be eliminated by estrogens. I have done five total adrenalectomies in castrates who were receiving estrogens; all the adrenals were normal. Moreover, some estrogens, notably Tace, are said not to cause adrenal hyperplasia, yet relapse follows initial success here, too.

Scott has reported six patients hypophysectomized for prostatic carcinoma, five relapsing and one untreated. One was alive nine months unimproved, and one was improving after two months.

Murphy and Schwippert irradiated the pituitary in 30 patients with an average post treatment survival time of 15.6 months as compared to 9.6 months in a larger group treated for relapse by other methods (Nesbit and Baum). Both methods are intended to reduce adrenal activity and probably cannot be expected to affect androgen independent tumors.

Other Hormones

Other hormones have been used both as primary treatment and for relapse. Trunnell has employed progesterone but, while 7 of 10 patients improved somewhat, effects were uncertain and injections were painful.

Testosterone (Brendler *et al.*, and Flocks) may have paradoxic effects in some tumors which have escaped from the control of estrogens, leading to improvement rather than to the aggravation first noted by Huggins. This has been "explained" by reference to changes in the hormonal milieu.

Valk and Owen, Leadbetter, Hayward, and others have sought to produce "medical adrenalectomy" with cortisone, but it remains to be proved conclusively that reported benefits are due to anything but euphoria. More study needs to be done.

Stilbestrol

It seems clear that the best results so far have followed castration plus estrogens. Stilbestrol is the cheapest of these; opinions as to optimum dosages vary, probably because response to a given quantity differs from patient to patient. An average is probably 5 mg. Using the excretion of androgenic 17-ketosteroids as a guide, Birke *et al.* recommended 10 mg. daily for a week or two as a loading dose, and 5 for subsequent maintenance. Experimentation with the individual patient sometimes permits doses as low as 0.5 to 1.0 mg. daily. On the other hand, estrogenic treatment should not be abandoned

because of relapse until large doses (25 to 500 mg. daily—Hudson) have been tried. Selection of the right amount is rendered difficult by what Scott calls differences in the biologic potential of various individual tumors. One patient seen by him survived 25 years after prostatectomy with a histologic diagnosis of cancer, only to return with recurrent obstruction, also due to prostatic neoplasm, having received no hormones in the interim.

Nausea from stilbestrol may be troublesomc. It is uncommon if given in a single dose at bedtime, resultant nausea passing unremarked during sleep. Central origin of the nausea renders enteric coating valueless. Measures to be tried include dramamine, and trial of other estrogens such as alpha estradiol, Estinyl, Tace, or Vallestril.

Kearns has implanted sterile 50 to 100 mg. pellets of alpha estradiol subcutaneously at fairly long intervals in forgetful patients or those intolerant of oral estrogens.

Effects of Estrogenic Therapy

Soreness and enlargement of nipples and breasts are probably indices of estrogenic potency, and claims that a given preparation does not produce them doubtless means only that the recommended dose is weakly estrogenic.

Edema from salt retention may result from estrogenic therapy, particularly when renal or cardiac function is impaired. Low salt and water intake, reduced or intermittent administration, diuretics and, in suitable cases, digitalis should be tried before estrogens are omitted. Edema from lymphatic permeation should not be forgotten.

It has been assumed that estrogens reduce activity of the anterior hypophysis which, in turn, ceases to stimulate testicular activity, thus constituting pharmacologic castration. Other observers feel that there is some direct effect upon the cancer cells. For this reason the soluble diethyl stilbestrol diphosphate has been recommended, with the additional assumption that a high acid phosphatase concentration in the tumor and its metastases will lead to its deposition in them through dephosphorylation, with intensified local effects. Brandes and Bourne have shown that this occurs upon incubation with various tissues from the rat.

Flocks *et al.* have given 250 to 1250 mg. of diethyl stilbestrol diphosphate intravenously each day for 5 to 20 days to 66 patients, and have sometimes repeated the courses monthly. They observed benefits in an appreciable proportion of patients resistant to other estrogens. This agent (Stilphostrol) is currently being tried orally.

The mechanism of any direct effect of estrogens upon prostatic cancer is uncertain. Nicol *et al.* have suggested that they stimulate the reticuloendothelial system to deposit macrophages in the accessory sex organs, and that their conversion to fibrous tissue interferes with growth of the tumor.

If these measures fail or lose their effects, adrenal cortical hormones should be tried. Since prednisone causes less retention of salt than does cortisone, it is probably better. One may start with 50 mg. daily and, if benefits appear, gradually reduce the dose to a maintenance level, which has to be found for each individual.

Older measures must be remembered in relapse. External irradiation (x-ray, cobalt) may relieve the pain of metastases or cause some shrinkage of the primary lesion; the latter may also follow the implantation of radioactive colloidal gold or of radon.

Very occasionally cordotomy may relieve intolerable pain in a refractory patient still in good general condition. Thorazine is occasionally helpful.

Summary and Conclusions

1. The prostate gland is sensitive to a number of hormones.

2. Only estrogens are of demonstrable clinical value in this regard, and then only in 60 to 70 per cent of prostatic cancers.

3. Most carcinomas of the prostate will regress temporarily (6 months to 10 years) after castration, but when relapse occurs, it is difficult to induce another regression.

4. This may sometimes be accomplished by the use of such diverse methods as increased doses of estrogen, the use of testosterone, progesterone, derivatives of cortisone, or by irradiation of the pituitary. The effects of these measures upon primarily or secondarily androgen independent tumors are variable and often transitory; much remains to be learned.•

Procedures for the Control of Hospital Infections

W. R. Giedt, M.D.*
SEATTLE, WASHINGTON

New respect for old rules has been imposed by the staphylococcus. Antibiotics do not merit the faith they have been accorded. The problem is not local but is of increasing importance in all parts of the country. Voluminous literature attests to widespread interest. Most discussions emphasize the necessity of returning to rigid application of long established principles of asepsis.

During the past three or four years many excellent articles have appeared in medical and hospital journals presenting numerous facets of the epidemiology and control of infections occurring in hospitalized patients. The present article is an attempt to present in a brief manner a "distillation" of the findings and recommendations contained in the voluminous recent literature to serve as a guide that may be used in hospitals interested in preventing or controlling such infections. The published sources of information will be found in the bibliography appended.

Epidemiology

Before considering control methods, it will be helpful to review some of the epidemiologic factors involved in the development of the situation we are faced with today. It is safe to say that there have been cross infections in hospitals ever since they have operated as such. Before the time of Lister, surgery without subsequent suppuration was a rarity and the death rate was extremely high. As hospital care improved and Lister's principles of antiseptic surgery were adopted, and later, as these were further refined on the basis of the then young science of bacteriology to become what we now call "aseptic technique," the mortality due to surgical operations was reduced considerably.

Yet, between 1900 and 1934, the infection rate for clean wounds in hospitals where such infections were studied, ranged from 5 to 15 per cent. Physicians who were in training or practice during the twenties and early thirties should have no difficulty in remembering the many cases of osteomyelitis, empyema, peritonitis, and septicemia seen during that time.

Then came the sulfonamides, followed by the antibiotics and numerous synthetic germicides, and for a period of about 20 years, only occasionally did hospital infections appear to be a serious problem.

That this situation has changed within recent years is amply attested to by the voluminous literature the problem has produced. Analysis of the present situation indicates that the problem is going to demand serious continuous attention for some time to come.

The current "staphylococcal problem" emerged about the time it was observed that an increasing number of strains of staphylococci were resisting the action of penicillin. There appears to be a significant relationship between these phenomena.

It seems plausible that during the 20 year period in which antibiotics appeared to be so effective, the process of transmission of infection must have been going on continuously, though masked by the ability of the antibiotic to prevent the development of disease. Now that many

*Chief, Division of Epidemiology, Washington State Department of Health.

organisms no longer respond to these therapeutic agents, disease (pyogenic infection) has again become not only more apparent, but a serious threat to our system of hospitalization.

Agents involved in transmission of hospital infections may be listed briefly as the patients, the personnel and the environment. These are the sources as well as the recipients of the infecting organism. The pathways and means of moving organisms from reservoir to susceptible host are numerous and complicated. In any individual instance there is no way of determining in what manner the organism will be spread—by direct contact, through air-borne transmission, or by indirect contact with fomites. The control of transmission of these infections must be found in the exercise of control over the numerous avenues between patient, personnel and environment.

It has been repeatedly demonstrated that patients with draining pyogenic lesions serve as foci for the dissemination of infection. Organisms from skin or wound infections somehow spread to other exposed areas of skin. Not only does the bed linen become contaminated, but also the hands of the patient, which in turn contaminate many other articles in the room, including the patient's blankets and bedding. Eventually the nasal passages usually become contaminated also. Movement of the patient in bed, or talking, sneezing or coughing of the patient who is a nasal carrier puts organisms into the air. Many of these settle to the floor to be raised and re-distributed by movement of persons and air currents in the room, some of them finally lodging on objects or sites to expose another person. Some patients excrete large numbers of staphylococci in the stool and subsequently contaminate toilet seats, bathroom fixtures, and their own hands.

Wysham *et al.* demonstrated how nursery infants whose skin was colonized by staphylococci served as a reservoir of infection which found its way to non-colonized infants in the same nursery; further, they showed that infants carrying the specific organism in their oropharangeal mucosa were capable of transmitting the infection to the mother's breast while nursing.

All strains of coagulase positive *Staphylococcus aureus* are not equally pathogenic. While 50 per cent or more of the personnel of a hospital may be nasal carriers of staphylococci, only a relatively small proportion of these (4 to 10 per cent) as a rule carry the more virulent strains. All carriers of virulent strains are not continuous active spreaders of the infection. For reasons not well understood, certain nasal carriers are more active and effective disseminators than others. Unfortunately there is no practical method to pre-determine the identification of the person who will become such a hazardous disseminator. Persons with pustular lesions (either patients or personnel) appear to be more dangerous sources of infection than most nasal carriers, providing the nasal carrier does not have an active respiratory tract illness, such as a cold or hay-fever.

The accompanying diagram illustrates some, but by no means all, of these reservoirs and pathways of transmission. It should be pointed out that studies of many outbreaks have shown clearly that the mechanism operative in one outbreak may not be operative in another. All of these transmission possibilities are potentially hazardous and therefore all need to be guarded against.

Evaluation of the Problem in a Particular Hospital

It is necessary to obtain reliable information in order to assess the extent of hospital infections. Impressions are inadequate and frequently erroneous. Since all the services of the hospital will be involved in the effort to obtain the information needed, it is practically necessary to carry out the work under the auspices and with the support of a hospital infection committee (by whatever name it may be called).

Laboratory Service

Considerable laboratory service will be needed to carry out any study of the infections; therefore the committee will need to determine whether the bacteriologic service available is competent to properly identify the organisms isolated. Additional training or other assistance may be needed and can be obtained through the state department of health, or other laboratories.

Minimal bacteriologic service would include (a) isolation of colonies on blood agar plates or differential media such as Chapman-Stone medium, mannitol salt agar or tellurite glycine agar, (b) testing of pigmented colonies for coagulase activity, and (c) antibiotic sensitivity testing.

For more definitive epidemiologic studies, the additional procedure of bacteriophage typing has proved to be very useful. However, it is recommended that this procedure be employed only when an organized epidemiologic investigation is being carried out. Arrangements for bacterio-

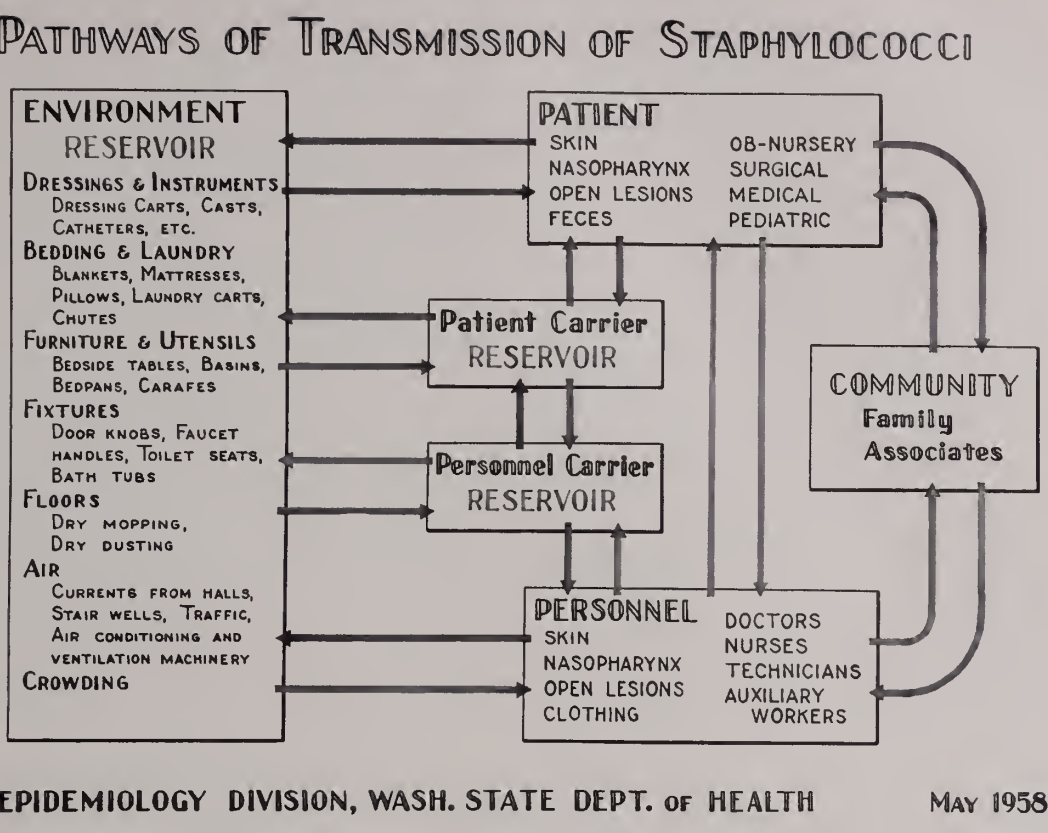

Diagram showing some of the reservoirs and pathways of transmission of staphylococci.

phage typing service may be made through the state department of health laboratory.

Locating and Reporting Infections

An effective procedure for locating infections among patients and personnel must be developed.

All infected lesions must be cultured routinely and a system for reporting of infected lesions must be developed. To accomplish this it is necessary to assign responsibility to a specific person to routinely check laboratory reports and coordinate them with reports of infection recorded on the patient's chart or made to the nursing office.

It must be kept in mind that staphylococcal infections frequently do not become manifest until after the patient has been discharged from the hospital. This is particularly true of newborn infants and parturient mothers. Therefore, in attempting to assess the problem of infection in a hospital, it is important to obtain information about patients after discharge. This has been done quite successfully by phone or questionnaire surveys. Physicians can help by reporting such infections developing at home. Frequently such infections extend to other members of the family.

Obtaining reports of surgical infections will present some difficulty. There will be differences of opinion as to what constitutes an infection. Checking patients' records against actual ward or floor surveys in a number of hospitals has established the fact that many wound infections considered to be minor are not recorded, and frequently such infections are not cultured.

The question of significance of minor infections is raised. If the results of culture show that the infection is due to a coagulase positive S. *aureus,* resistant to most antibiotics, the infection must be considered potentially hazardous. It may have caused only a minor infection in one patient, but it cannot be assumed that, when transferred to another patient, it will not cause a serious infection. This emphasizes the importance of culturing *all* pyogenic infections, no matter in what class of patient (medical, surgical, obstetric) they occur.

In one hospital the task of locating infections is assigned to a particular nurse (who is in charge of special dressing equipment). Each day this nurse asks each charge nurse whether

she has any patients with infections. Since the charge nurse has to order dressing supplies, she is quite aware of which patients have infections. By combining the information about infections obtained from the laboratory, the nursing office and other personnel designated to search for infections, it is possible to find most of the infected patients and personnel.

Considerable time is required to determine the actual incidence of infections among patients and personnel; so while this information is being collected the committee may direct its attention to other areas of hospital practice which need study. There should be a thorough review of practices in actual operation (not merely as recorded in a procedure book) in regard to: (a) *aseptic technique* as carried on in the medical, surgical, obstetric and pediatric services, which should include all nursing and isolation procedures used in the care of infected patients.* It should also include a thorough review of procedures such as handwashing, use of skin disinfectants, masks, dressing cart technique, and operating room procedures. (b) *Housekeeping methods,* including procedures and schedules for mopping and care of floors, dusting, handling of linen and bedding, and laundry service. (c) *Environmental factors,* such as ventilation (particularly in the surgical, obstetric and nursery units), traffic patterns potentially related to transmission of infection, and routine procedures for control-checking of supplies and equipment (particularly such as is distributed from central service and used in all parts of the hospitals).

Control Methods

While patients, personnel and hospital environment are inextricably interrelated in the epidemiology and control of infections developing in hospitalized patients, to present an orderly approach to control methods it is necessary to deal with each of these three categories individually and separately as much as possible. I shall begin with the patient.

The Patient

To the extent possible, patients should be screened upon admission to insure that the presence of infected lesions is noted promptly and the patient cared for in a manner which will not put other non-infected patients in jeopardy.

Patients with draining lesions should be cared for under isolation precautions, and if possible, infected patients should be segregated in such a way as to limit intermingling of infected and non-infected cases in the same part of the hospital. Grouping or centralizing of patients with infections for care on a particular service has additional advantages in that the personnel working regularly in this part of the service will be more accustomed to carrying out the precautions necessary, facilities for isolation care can be made more convenient for use, and supervision of aseptic technique may be made more effective, not only for those assigned to duty in this area, but also for those who must have contact with these patients only occasionally.

Bringing a patient to surgery who already has infected lesions is another avenue through which operating rooms become contaminated. For these reasons, elective surgery should be postponed until even minor infections are cleared up. When surgical or obstetrical procedures cannot be postponed, an operating or delivery room used for "dirty" cases should be employed, following which the room should be scrupulously cleaned and disinfected before re-use.

Patients should not be covered with the blankets from the bed in their room when brought to surgery or delivery room. Only autoclaved or specially sanitized blankets should be used for this purpose.

Patients should not be kept in hospitals any longer than necessary; the shorter the stay the less is the risk of exposure. Shorter stays should also contribute to the prevention of over-crowding.

*Standard references are available which adequately describe isolation technique. The following are particularly recommended: Section 11 of the Supplement to Hospital Standards, Rules and Regulations of the Washington State Board of Health and the hooklet "Guide for the Prevention and Control of Infections in Hospitals" prepared by the New York State Department of Health and the American Public Health Association and puhlished by Health Education Service, P. O. Box 7283, Albany 1, New York.

In the newborn nursery, the practice of admitting new babies to the same unit in which there are infants 3 or more days old should be discontinued, since this procedure contributes to maintaining infection in the nursery. Ideally, nursery units should be quite small and there should be a number of them so that infants born on the same day need not become exposed to other infants who have been in the nursery long enough to have become infected. Certainly, newborn infants should not be admitted to nurseries in which infection is known to be present. The rooming-in procedure has proved very efficacious in terminating or greatly reducing the incidence of nursery infections at least temporarily.

Since it has been shown that infected nursing infants frequently transmit infection to the mother's breast, in nurseries where infection is known to be present it is advisable to place the infants on formula feeding exclusively.

Daily application of germicidal lotions of the hexachlorophene type has been reported to contribute to the control of infection in nurseries, but procedures such as this and the prophylactic administration of antibiotics to infants must be considered temporary measures which do not solve the infection-transmission problems. Too often pyogenic lesions develop after such treatments have been discontinued and the infant is at home.

Personnel and the Carrier Problem

In hospitals having an excessive number of staphylococcal infections, monthly (or more often) nose culture surveys should be made of all personnel working in surgery, obstetrics, nursery and any other area of the hospital involved. If coagulase positive staphylococci are recovered, cultures should be repeated to determine whether infection is permanent or transient. Preferably, known carriers of coagulase positive, antibiotic resistant staphylococci should not be allowed to work in the hospital; however, if it is not feasible to manage without their assistance, they should be impressed with the potential hazard of transmitting their infection and urged to be especially careful in their technique. Such carriers should wear masks and should not work in the areas listed above.

The carrier problem is difficult to manage. Certainly the person with active lesions (furuncles, paronychia, pustular dermatitis) should not be allowed to work in surgery, obstetrics, the nursery, central service, and food service. Known nasal carriers certainly should not be allowed to work while ill with a respiratory disease or hayfever. Such carriers should be placed under the surveillance and care of a hospital staff physician.

Street clothing should not be worn by personnel, including physicians when in contact with patients, and hospital clothing is not to be worn on the street. This is particularly applicable to nurses who wear their uniforms to and from the hospital. Nurses' nylon uniforms should be laundered by a method that will insure sanitization. If laundered at home, this may be accomplished by a final rinse in a suitable sanitizing solution.

In the interest of limiting opportunities for carrying infection from one service to another, a serious attempt should be made to avoid having one person work in more than one service.

Personnel should be given in-service training on the prevention and control of hospital infections. Whenever possible, this should be given during the course of daily work routines. The training should emphasize that personnel are exposed to many sources of infection; that clothing and hands are readily contaminated by contact with skin lesions, dressings, bed clothing, fecal matter, and equipment; that improper mopping, dusting or handling of blankets and bed linen are important means of disseminating the disease producing organisms. Personnel should be impressed with the necessity to protect themselves by wearing masks and cover garments when indicated and by frequent handwashing. The hospital administration must insure that nursing procedures are carried out as carefully during the night shift as during the day time. To encourage and facilitate frequent handwashing, an adequate number of conveniently located handwashing facilities must be provided.

Hospital workers should be encouraged to report their personal illnesses, particularly infections, to their supervisors, and supervisors should be observant in noting and reporting infections. Provision of compensatory sick leave for employees is of great assistance to both hospital and employee.

Medical, Surgical and Nursing Procedures

A. Handwashing and the Use of Antiseptic Rinse

According to studies made by Price, vigorous scrubbing with brush, soap and warm water reduces the basic bacterial flora of the skin at a

constant rate. Irrespective of the initial size of the flora, the number of bacteria is reduced by only approximately one half with each six minutes of scrubbing. He states that "if hands are in frequent contact with contaminated objects, a dangerously large proportion of the resident bacteria (in the skin) may be pathogens, and that in such a case it is almost impossible to disinfect the hands by scrubbing." After testing a variety of germicidal rinses to follow the scrubbing, he finally found that a preparation made up from the following formula was powerfully germicidal, each minute spent in it (at 25 C.) being equivalent to more than 11 minutes of scrubbing and it does not injure the skin:

Ethyl alcohol (95 per cent)	675 ml.
Pure n-propyl alcohol	250 ml.
Distilled water	250 ml.
All measurements made at 78 F. (25 C.)	

According to Price, organisms remaining on surgeons' hands, even after such assiduous treatment, often include pathogens, and these bacteria multiply rapidly beneath the rubber gloves.

The following procedure is recommended in preparation of hands for surgery:

1. Scrub vigorously for 7 to 10 minutes with soap and sterile brush. Either a G-11 type bar or liquid soap may be used.
2. Dry arms and hands with sterile towel (carrying water into next step reduces its germicidal effect).
3. Rinse arms and hands for 2 minutes by the clock in the alcohol mixture described above. This mixture must be prepared accurately and should be fresh. The rinsing should be accomplished by rubbing the skin with sterile gauze, saturated with the solution.

This treatment should reduce the bacterial flora from 50 per cent of the original contamination as result of scrubbing, to less than 2 per cent.

A five minute scrub period between operations, followed by the alcohol mixture rinse appears to be adequate if nothing has been touched following removal of the gloves used in the previous operation.

The addition of compounds, such as hexachlorophene, to soaps appears to reduce the bacterial flora on hands, particularly if used repeatedly and frequently to insure the presence of a residue of the compound remainng on the skin. It should be emphasized that many so-called germicidal compounds may be only bacteriostatic in the concentration used or the length of time they are allowed to act. Persons providing general care to patients with drainng infected wounds certainly must scrub their hands thoroughly after the service has been rendered, and follow this by a rinse with the alcohol mixture described above. If the service to the patient involves contact with dressings or purulent discharge, gloves should be worn.

B. Use of Masks

While the use of a mask does not completely protect either the wearer or the patient, if properly constructed, worn properly and changed frequently, masks can effectively reduce the number of bacteria inhaled or disseminated. Masks must be sufficiently thick to provide an effective filter. They must cover the nose as well as the mouth. After a few minutes of use, they are highly contaminated and must be handled as such—if the mask portion is touched, the hands must be thoroughly scrubbed and disinfected. Preferably, masks should not be worn longer than 30 minutes without changing.

To the extent that it is practical, it is recommended that masks be worn by nurses and physicians while giving direct care to patients with draining infected lesions. In an attempt to limit the introduction of infection into the newborn nursery, it is recommended that masks be worn routinely. However, it is conceded that if masks are not worn properly, changed frequently, and treated as highly contaminated articles, the value of the mask may be outweighed by the potential hazard of contamination of the hands and air through the medium of the mask.

C. Dressing Cart Technique

Ideally, completely individual dressing trays are preferable to a dressing cart which must be used by a number of different persons. Unless scrupulous attention is paid to technique, contamination of commonly used dressing forceps, bandage shears and dressing containers is easily possible. A well trained nurse should be placed in charge of the dressing cart, and she should serve as a reminding guardian of proper technique. Dressings of infected wounds should be handled only by forceps or gloved hands. Soiled dressings, instruments and gloves must be handled with utmost caution to prevent further contamination.

D. Operating Room Precautions

It must be emphasized that under the best of conditions all surgical wounds are contaminated. The problem is to keep such contamination at the lowest level possible to give the tissues the best chance to prevent the development of infection.

Many factors must be controlled to keep the number of bacteria in the operating theatre to a minimum. Mention will be made of the more important ones, as follows:

1. *Ventilation.* Filtered air from the outside should be brought in at a positive pressure so that the flow of the air currents will not be from the corridors into the operating room. Air filters must be washed regularly with a germicide.

2. *Care of floors.* The janitor must be provided with freshly laundered mop heads every day to scrub the floors with a suitable germicide disinfectant. C. W. Walter describes an effective method for sanitizing the floors of operating rooms as follows:

> **At the end of the day, about 10 liters of a detergent-germicide mixture are made up and 1 liter is spilled on the center of the floor. The area is scrubbed thoroughly with a clean mop to completely dissolve any blood or pus. The remaining 9 liters are spilled on the floor and spread with the mop to the periphery of the room, so that the entire floor is covered with a uniform layer of detergent-germicide. Then, begining at the door, the puddle is taken up with a wet pick-up vacuum cleaner. If this procedure is followed for 9 or 10 days, the bacterial count will drop from about 500 per square centimeter to 0 to 1. This is the goal of daily sanitization of the floor.**

During an operation, if blood, pus or dirty sponges drop to the floor, the area should be disinfected immediately with a suitable germicide. Walter suggests the application of Purex to such areas.

3. *Control of traffic.* Studies have shown that movement through a room sets up invisible clouds of dust particles containing bacteria. Also, studies of traffic in and out of operating rooms during operations show that this activity is amazingly high and actually not warranted. During observations made during a 90 minute operation in one study, the doors to the amphitheater were opened and closed no less than 112 times!

According to Lepper, the most important time during which traffic in the surgery should be kept to a minimum is during the first half hour and during last stages when the surgical wound is being closed and the drapes are being removed. Good advance planning and forethought may result in less necessity for making extra trips in or out of the surgical theatre.

Visitors to surgery present a problem, frequently compounded by the tendency to an increase in conversation. Visitors should be allowed in the surgical theatre only if they remove their street clothing and don a clean scrub suit, clean shoes and wear a surgical gown, cap and mask. Studies by Walter show that a gown over street clothing is not sufficiently effective to prevent introduction of an excessive number of bacteria shed from street clothing.

4. *Bringing the patient to surgery.* From the point of view of introduction of infection it is highly undesirable to bring the patient into the operating theatre on his bed brought from the floor. When brought by stretcher cart, the patient's bed blankets should not be used or brought into the surgery. The patient should be covered by freshly laundered sheets and freshly sanitized blankets.

If possible it is preferable to transfer the patient to the surgical table in an anesthesia room. If the patient must be transferred in the surgery, this should be done gently and with the least amount of movement possible, since the movement of linen, blankets and persons creates a considerable air-borne suspension of dust and organisms at a very inopportune time.

5. *Preoperative preparation of skin.* The following technique was described by Philip B. Price and is recommended for use:

a. Before coming to the operating room the patient should receive a bath, with particular attention paid to washing the site of operation with soap and water to remove dirt, fats and transient bacteria.

b. Immediately before operation the site of incision should be washed with gauze dipped in the ethyl alcohol-propyl alcohol mixture described previously, or 70 per cent ethyl alcohol (by weight). This should be allowed to dry slowly to allow sufficient time for it to act.

c. Next apply a solution of 2 per cent iodine in 70 per cent (by weight) ethyl alcohol. The iodine should be allowed to dry slowly and then the dried coat should be

washed off with gauze dipped in alcohol, rubbing the site of incision firmly for 2 or 3 minutes. An alternative to the iodine solution is Scott's alcohol-acetone 2 per cent solution of Mercurochrome, preceded and followed by the alcohol wash.

6. *Cutting casts.* Much care should be taken in cutting dry casts, particularly old casts over infected wounds. The cutting operation raises a fine dust and if the cast is covering an infected wound with old pus-soaked dressings, many of the particles of dust will carry contaminating organisms. For this reason cast cutting should not be done in proximity to surgical theatres. It should be done in a well ventilated room, closed off from the corridor.

E. Use of Antibiotics

All too frequently, infections are encountered which are caused by organisms resistant to all of the antibiotics in common use in a given hospital. This is the natural outcome of the selective annihilation of organisms susceptible to these antibiotics, leaving the resistant strains free to flourish. We have been witnessing a race between the predominance of resistant strains and the discovery and manufacture of newer antibiotics to which these strains are susceptible. The end of this race is not yet in sight.

It has been observed that if a particular antibiotic to which currently prevalent strains of staphylococci are resistant is withheld from use in a hospital, after a period of some months the predominant strains change to again become susceptible to the antibiotic. This finding has suggested the desirability of keeping at least one antibiotic (other than penicillin) from general use, reserving it for serious infections by organisms resistant to all the other antibiotics in common use in the particular hospital. For the same general reasons, the use of routine prophylactic antibiotic treatment before and after clean surgery has been considered to be an undesirable practice.

The Environment

The foregoing sections devoted to the patient, personnel and medical-surgical procedures can be hardly considered apart from the environment. However it remains necessary to devote specific attention to a number of procedures not discussed above, which are important factors in the transmission of infection.

A. Disinfection and Sterilization Procedures

Great faith and reliance is placed upon the efficacy of sterilization procedures, much of which is justified. However, if described procedures are not executed carefully and checked routinely such confidence may not be warranted.

There are several good reference texts available to use as guides and sources of instruction. For hospitals in the state of Washington, the section on Sanitization, Disinfection and Sterilization in the Supplement to Hospital Standards, Rules and Regulations of the State Board of Health is recommended, as it presents in a concise manner the basic principles involved in effecting sterilization, disinfection or sanitization by all of the commonly used methods.

This subject is too extensive for review in this paper, but it is of particular importance to discuss briefly some aspects of the use of chemical sanitizers or germicides.

It is necessary to have a good technical knowledge of the characteristics of chemical agents to be used as sanitizers or germicides to appreciate their limitations. An agent suitable for one use may be entirely unsatisfactory for a different use.

Before release to the market, tests of germicides are carried on in laboratories under strictly controlled conditions. The manufacturer's claims are based on the results of these tests, but the conditions of the tests are not the same as those to which the agent is frequently applied in routine hospital practice. Because those who apply the agent in hospitals frequently are not sufficiently well acquainted with the limitations of the product, an agent may be used under conditions which neutralize its effectiveness.

For instance, in using quaternary ammonium compounds (such as Zephiran) it must be kept in mind that soaps and organic material (such as pus or serum) markedly reduce its effectiveness. Surfaces washed with soap must be very carefully rinsed to be soap-free before application of the agent. Because of this, it is preferable not to use such an agent following washing with soap. The alcoholic tincture of Zephiran is claimed to be able to overcome the neutralizing effect of the soap.

I have witnessed the use of unstable compounds, such as the halogens, under conditions in which it was quite obvious that there would be little reason to hope for effective action. The name, color or odor of germicidal agents seems to produce a profound psychologic effect upon

people to the extent that reason is abandoned and the agents are given mystic powers not actually available. It is important to remember that all of these agents need *time* to act, and that their action may be inhibited by an unsuitable *p*H or the presence of excess organic material.

B. Care of Floors

Floors are probably the largest reservoir of contaminating organisms. Much of the particulate matter from bedding, dressings, and nasopharyngeal secretions that reaches the air finally accumulates on the floor, to be raised and recirculated when drafts set up by movement, or from other sources including dry sweeping, stir up the dust. It is necessary to sanitize floors frequently, and to substitute either damp mopping or vacuum cleaning (with a wet bag) for dry sweeping. The recommended use of vacuum cleaners is questioned by some investigators. There is no doubt that there is some escape of dust from bags as well as from the filter type. Moistening of the bag and use of fine filters changed frequently may decrease this escape.

Dirty mops used day after day without adequate cleaning are a real means of spreading organisms. The usually dark janitor's closet with filthy mops, pails and brooms must be replaced and brought under better supervision. Again, reference to the Supplement to Hospital Standards, Rules and Regulations of the Washington State Board of Health is recommended. Section 6, devoted to Maintenance and Housekeeping, provides an excellent guide for the procedures necessary.

C. Laundry Service

Our studies of contamination of blankets led us inevitably to the laundry and we were amazed at some of the conditions encountered in some hospitals, while others were operating under almost ideal conditions.

The hazardous areas in laundry practice include, first, the sorting room. As Walter has put it, the dirty laundry pile in the sorting room is the compost heap of the hospital—the pile is always there—the bottom is never reached, and the warmth and moisture present provide excellent conditions for the multiplication of bacteria. The sorting room should be separated from the rest of the laundry with exhaust ventilation to the outside. There should be a definite barrier between the sorting room and the area in which the extractors are located to prevent the recontamination of laundry that has already been washed.

The problem of sanitizing blankets to make them safe for use can be solved by adding a synthetic phenolic germicidal compound to the wash water. The action of this compound is not neutralized by soap. Others have recommended a final rinse in a quaternary ammonium compound.

Finally, attention must be given to the collection of dirty laundry and the distribution of clean linen and blankets. Dragging damp hampers of clothing across the floors must not be allowed, nor should clean laundry be delivered to floors in dirty hampers which have been used to collect laundry. Again we may refer to the excellent section on laundry practice included in the Supplement referred to previously.

The practice of distributing cover blankets indiscriminately at night and collecting them for storage during the day must be changed. Each blanket should be used only for one patient and laundered when the patient is discharged. This will automatically alter the custom of laundering blankets routinely only once every 6 or 12 months or until a blanket becomes grossly contaminated.

D. Sanitization of Mattresses and Pillows

Colbeck of Vancouver, B.C., and others have shown how mattresses and pillows may become an excellent reservoir of bacteria if not properly sanitized and protected. Autoclaving of mattresses is not generally feasible and mattresses do not stand up very long under this type of treatment. Practical solution of the problem appears to be the use of impermeable (or only slightly permeable) covers on mattresses and pillows after they have been sanitized. Pillows may be processed in laundries and mattresses wet-sponged and sprayed with a germicide.

E. Care of Utensils and Bedside Equipment

A patient who is a carrier of staphylococci or who has an active purulent infection is capable of contaminating practically all objects handled, such as bed pans, toilet seats, bed tables, bedside lockers and other fixtures and furniture. This is why it is necessary to sanitize all furniture and fixtures daily with a suitable agent. Also this is the reason individual bedside utensils should be provided for each patient and sterilized or sanitized between use for different patients.

The time it takes a patient with infected lesions to contaminate his environment is very short. This is particularly true of ambulatory patients who contaminate door knobs, toilet seats, faucet handles, and bedside equipment within a matter of a few hours. Bathtubs must be thoroughly sanitized each time used.

Conclusion

The emergence of antibiotic resistant strains of staphylococci has led to a serious problem in regard to hospital-acquired infections. A review of the epidemiology of these infections indicates the existence of numerous potential reservoirs and avenues of transmission.

An approach to preventive and control measures through a hospital infection committee is presented. The program suggested includes: (a) an effective system for detecting and reporting infections, (b) methods of managing infected patients and personnel, (c) measures to improve aseptic technique and related nursing procedures, (d) precautions to observe in improved housekeeping and (e) safeguards in environmental control. The success of such a program demands a high degree of cooperation and acceptance of personal responsibility. •

Consultants Propose $1 Billion A Year for Medical Research

The nation should treble its expenditures for medical research and double its output of physicians in the next 12 years, in the opinion of an advisory committee that has just made its report to Secretary Folsom. Chairman of the group was Stanhope Bayne-Jones, former Yale medical dean and former head of the joint administrative board of New York Hospital-Cornell Medical Center. Other members were medical educators and research directors in private industry.

The report proposes that the U.S. supply about half the research funds, or half a billion dollars by 1970, with the rest coming from industry and private philanthropy. U.S. now pays about 56 per cent of medical research costs. Between 14 and 20 new medical schools should be built, partly to supply needed researchers, and some of them should be started immediately. The consultants believe dangers of federal control of research can be avoided through vigilant and sustained application of safeguards.

Control of Infections in General Hospitals

Report from a 500 Bed Private Hospital

James W. Wiley, M.D.
and
Donald T. Smith, M.D.
Portland, Oregon

The problem of antibiotic resistant staphylococci can be met in an open staff, general hospital but requires cooperation of all concerned. Willingness of the staff to admit existence of a problem seems to be prerequisite to a sound control program.

In early 1956, it became apparent that our hospital community was developing predominant strains of antibiotic resistant bacteria. In this it conformed to the situation noted elsewhere throughout the antibiotic-using world. This report presents the experience of one 500 bed privately operated general hospital in meeting this problem.

General Considerations

There are several pertinent differences between such a hospital and the larger teaching institutions from which most reports have arisen concerning the control and interpretation of infection rates. In a smaller private hospital there are the favorable factors of a somewhat shorter individual hospital stay and, in general, there are fewer house staff and medical student observers and other personnel in the operating rooms and wards. On the other hand, control and evaluation of infection rates in private hospitals is somewhat more difficult because of the following factors:

1. There are usually less available laboratory facilities and personnel for intensive bacteriologic investigations.

2. The volume of clinical material scarcely supports detailed statistical analysis and deductions regarding infection rates. This is particularly true in short-term studies.

3. The number of infected cases (only 4 to 8 at any given time) makes operation of a general isolation department inefficient.

4. There is less centralized authoratative control over details of aseptic management.

5. The large number of attending physicians and surgeons results in some difficulty in communication. At Good Samaritan Hospital in 1957, operations were performed by 129 different surgeons. However, bulk of the surgical patient load, and hence the responsibility, is carried by relatively few staff members. Successful infection control depends upon the suggestions and active cooperation of this group with the nursing department and hospital administration.

It was the surgical committee of the attending staff that first became actively interested in the increasing prevalence of staphylococcus infections. Recently the responsibility has been trans-

Read before 43rd annual meeting of University of Oregon Medical School Alumni Association, Portland, Oregon, April 16-18, 1958.
Dr. Wiley and Dr. Smith are from the Surgical Section, Good Samaritan Hospital, Portland, Oregon.

ferred to the newly reactivated isolation committee which now includes members from the surgical, OB, GYN, medical and pediatric sections.

It has not seemed either realistic or constructive to consider that the present status of staphylococcus infections has been the result of a regression from previous standards in aseptic or antiseptic measures. Generally, aseptic and antiseptic measures have not progressed as have anesthesia, blood matching techniques, and other ancillary factors. Contemporary open surgical procedures on grossly contaminated areas such as the gastrointestinal tract and the tracheobronchial tree, often involving prolonged operating time, have been developed which in large part depend on the use of antibiotic agents for infection control. The emergence of antibiotic resistant organisms has dramatized this deficiency and made obvious the necessity for more energetic and refined contamination control than ever previously required.

The organism principally involved in this problem is *Micrococcus pyogenes, var. aureus.* Occasionally, in our experience, nonpigment-forming strains have caused severe infections. All micrococcus organisms recovered from invasive infections have been hemolytic and coagulase positive. The majority of infections have been superficial and individually do not often constitute a significant problem. Considering the widespread prevalence of this organism, the rate of overt infections is surprisingly low. However, *Mi. pyogenes* has several biologic characteristics which make it extremely difficult to irradicate from the community.

1. It readily forms antibiotic resistant strains.[1]
2. It withstands drying indefinitely.[2]
3. It has very weak antigenic properties.[3]
4. The non-disabling nature of most of these infections makes the control of contamination from infected personnel difficult.

At times it has been heartening to consider the precept well-known among epidemiologists, that complete elimination of a pathogenic organism from a community is not necessary in controlling its epidemic manifestations.[4] Also, a single control measure may alone produce great improvement in an epidemic situation.[5]

We were able to establish through public health service facilities that the majority of infecting strains were due to phage type 81/42B/52. This is essentially the same as type 80/81 designated by the International Typing Reference Center. It is the usual strain associated with hospital infections in Oregon and elsewhere.[1,6] Facilities were not available for investigating the correlation between nasopharyngeal and skin cultures and wound infections. For the same reason we could not compare the phage types of hospital-incurred infections with those present on admission.

An approach to epidemic infection control lies along three main lines—reporting, recording and in taking specific measures for decreasing bacterial contamination.

Reporting

The nursing department, through the floor supervisors, has been made responsible for reporting infections. The nursing personnel are in intimate daily contact with each patient and have become quite alert in detecting possible infections.

Recording

Until the part time service of an instructor-nurse was made available, the difficulties in obtaining accurate, current recording of all pertinent data appeared insurmountable.

With the help of the state health department we developed a form incorporating data applicable to most situations (Fig. 1). The individual entries were numbered for later correlation if indicated. A principle function of the responsible nurse is to have this form completed as soon as possible on the same day the infection is reported. When she contacts the physician in charge, the questions often serve to remind him to expedite the necessary measures.

At the end of each month she transcribes the data to a ledger type form and adds a current bar to the graphic correlates (Figs. 2, 3 and 4). We have averaged less than one case daily to be recorded. For this purpose and for supervising isolation and general hygienic measures throughout the hospital, about two hours daily have been adequate.

Figure 2 gives us a monthly reference of the total number of infected cases requiring isolation to the total number of hospital admissions. From 4 to 8 patients are in isolation at any one time under the conditions indicated.

Figure 3 compares the number of wound in-

fections with total major operations. We realize that some infections may become apparent after the patient is discharged. However, this is probably a fairly constant factor from month to month. Minor operations cannot be considered, as the hospital stay in such cases is usually too brief for development of infections.

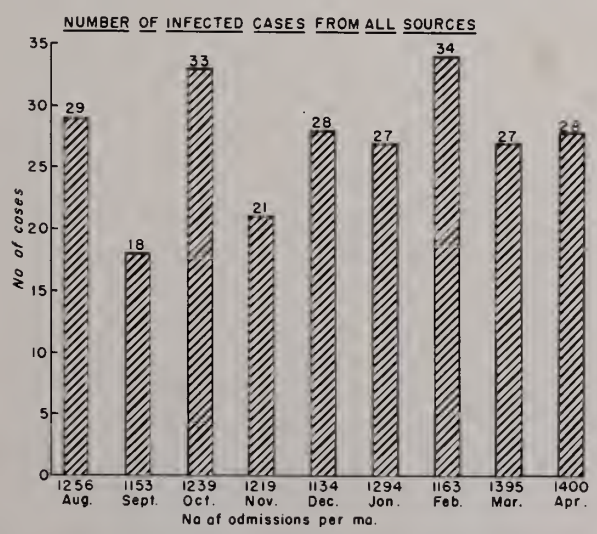

Fig. 2.

In figure 4, as a matter of interest, the number of wound infections is divided by the number of major operations each month. In a hospital of this size it is notable than an increase of several wound infections in a month may increase the rate by several times.

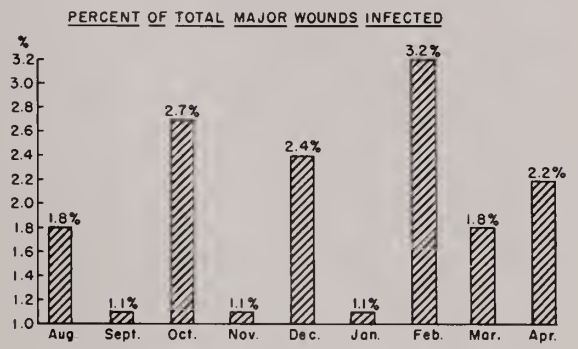

Fig. 3.

Until recorded information is current and complete, statistical and graphic studies are not significant. For instance, it was not until recently that culture and sensitivity tests on suppurating lesions have been approximately complete, even though this service can be obtained without cost

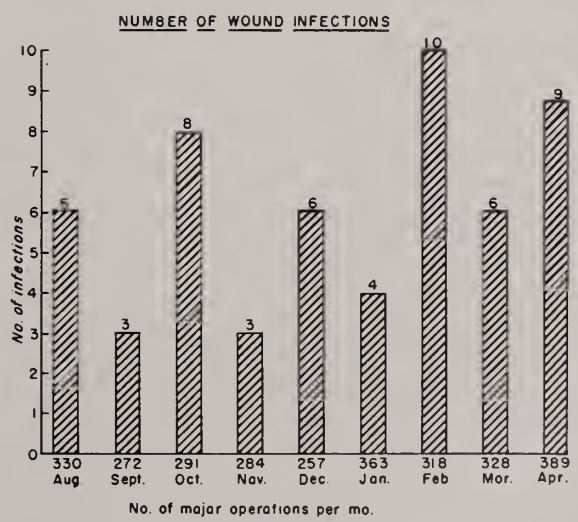

Fig. 4.

to the patient. Now culture and antibiotic sensitivity correlations are being kept on graphic records. For the same reason, records previous to and including the first year of our activities in infection control are not worthy of analysis.

Specific Contamination Control Measures

Concurrently with the development of reporting and recording methods, numerous specific measures were instituted to help control cross contamination.[7,8] Among the more important of these are the following:

1. Sterile bedding, including blankets, was made available for each patient admitted. A blanket drier and stretcher was installed in the laundry and an effective halogenated phenol disinfectant and lint-laying rinse was applied to all blankets. Linens were treated with a softening, lint-laying preparation. Laundering details were reviewed and brought into conformity with recommended practices.
2. Nurses, attendants, and other patient contacts known to have staphylococcus infections were relieved from duty until well.
3. Patients with suppurating lesions were isolated in small private rooms on the same floor. In practice there have been occasional cases in which even less effective segragation measures have been necessary for various reasons.
4. Certain procedures on the wards, such as endotracheal suction and tracheostomy management, were improved by more rigid asepsis.
5. Bathtub decontamination was improved and shower baths were recommended in preference to tub baths.[2]
6. Attention was called, by all means possible, to the inherent danger in prophylactic and pretreatment with antibiotics and the practice has been discouraged.

Other improvements have been principally in the control of dust and skin contamination on the wards and in the operating rooms.

1. Dry dusting and sweeping has been discontinued throughout the hospital.
2. Provisions for hand-washing with an antiseptic detergent was made readily available.
3. The same bis-phenol preparation was advised for bathing patients in isolation and those awaiting surgical procedures. This serves to protect both patients and attendants.
4. Although more intrinsically effective antiseptic preparations for skin use may be available,[9] we have continued to encourage the use of 3 per cent hexachlorophene in a neutral detergent base. There appears to be reliable documentation of its effectiveness when used in adequate concentration.[10] The basic principles seem more important than the specific antiseptic employed.[6]

Operating Suite

In the operating rooms there will always be room for improvement. Asepsis here as elsewhere is only relative.

A. Under the category of dust control the following items have been reviewed and improved wherever possible.

1. Masking methods were investigated. Rapid loss of effectiveness due to drying of droplets was noted. Masks are now changed by all individuals between operations and changing during long operating procedures is advised. Unnecessary conversation in operating rooms is discouraged.[11]
2. Ventilation in surgical rooms was checked and it was found that filtered outside air entered from above, causing air current towards the door.[12]
3. Powdering of hands over a basin of water near the door was instituted and gloving in this area is now routine practice.
4. Use of cloth boot covers or special grounded surgery shoes has become standard practice.
5. Wet antiseptic mopping of surgery floors with clean mops is employed. The more elaborate methods for maintaining floor sterility have not been used except after grossly infected cases.
6. Unnecessary circulation of personnel in and out of operating rooms is discouraged.
7. No street clothing is allowed in corridors of the operating floor.

B. Skin preparation for surgery.

1. Hand scrubbing by those involved in operating procedures is either with 3 per cent hexachlorophene in a detergent base or with soap followed by alcohol rinse. Scrubbing less than 10 minutes is considered inadequate. Cultures of dispensing containers have yielded no bacterial growth.

As it has been shown that over 30 per cent of surgeons' gloves can be expected to become perforated while in use, the importance of optimum preparation is obvious.

2. The patient's skin preparation is in two phases.

a. The preoperative preparation, including shaving of the appropriate areas, has been more satisfactory since both the training of the personnel involved and the inspection of their work has been made the direct responsibility of the surgical supervisor. A 10 minute hexachlorophene detergent scrub of the operative area is part of this procedure. Several days previous preparation is advised whenever possible.

b. Operative skin preparation is by a 10 minute scrub with 3 per cent hexachlorophene on moist sponges, followed by aqueous Zephiran solution. An alternate method using soap, ether, alcohol, and tincture of Zephiran is also used. Any other preparation must be requested and supervised by the operating surgeon.

C. Control of incidental sources of wound contamination, as in open bowel surgery or bacterial peritonitis, must depend upon the individual surgeon's judgment. Pretreatment with broad spectrum antibiotics may result in overgrowth of a resistant organism and this danger has been emphasized.

D. Factors influencing wound and patient resistance to infection are also best controlled by the individual physician. The use of isotonic saline to moisten all sponges has probably been of some help in maintaining wound resistance to contamination. Irrigation of wounds with isotonic saline at body temperature is advised whenever practicable.

Conclusions

1. The incidence of staphylococcus infections in hospital communities can be controlled by more intensive application of standard concepts in aseptic and antiseptic methods.

2. It cannot be reduced by more extensive use of antibiotics.

3. Active cooperation of the attending staff, the nursing department, and the hospital administration is vital to the success of an infection control program in a private general hospital.

4. A well-trained nurse assigned to the responsibility of maintaining current reporting, recording, and control measures has been the key to our understanding and control of local infection problems. •

Addendum

Records obtained since the above manuscript was presented are almost identical to those reported here.

The Cancer Problem in the State of Washington

PAUL E. STEINER, M.D.
CHICAGO, ILLINOIS

Washington statistics, taken from Vital Statistics of the United States, differ from the national only in frequency of prostatic cancer. On the basis of organ classification, the pattern of cancer occurrence seems related to the volume of cells at risk.

This is an attempt to characterize the cancer problem in the state of Washington by its size, types and peculiarities; to explore what inferences may be drawn on etiology from the data; and to suggest studies for the future. This undertaking is based on mortality statistics published by the federal government.[1] These, in turn, were compiled from what the doctors of this state wrote on death certificates. The data have the same accuracy as those certificates.

Because the data are based on cancer deaths and many patients with cancer are cured each year, this analysis may be said to deal only with the size of the unsolved cancer problem in the state of Washington and not with the total problem. To the extent that the doctors in this State cure cancers, the problem is already solved. Because cancer is not a reportable disease, the total size of the problem is unknown. However, it may be calculated quite closely by adding to the fatal cases of each site the number cured, based on estimations of the state-wide, general cure rate for each type of tumor.

The figures for 1955 were used in this analysis because they were the latest available and because it is desirable to make certain five-year comparisons. The analysis includes the malignant neoplasms and the leukemias. Whenever the term *cancer* is used it is a synonym for these two categories of disease. The data apply only to residents of the state of Washington regardless of whether they died within or outside of the State.

It is emphasized that the data in a statistical analysis such as this may shed light on two problems—namely, on cancer control and on etiology of the tumors. The figures show the size of the problem and the present position of each tumor. From these figures the requirements in lay and professional education and in facilities for detection, diagnosis, and treatment can be estimated. If, for example, some type of tumor requires special diagnostic and therapeutic facilities, the size of that need can be calculated from the annual number of cases.

Size of the Problem

In 1955 the record shows 3,959 deaths attributed to malignant neoplasms and leukemia in the state of Washington (table 1). Since 24,517

Table 1. Cancer deaths in relation to deaths from all causes, by sex. State of Washington, 1955.

	Males		Females		Both Sexes	
	Number	%	Number	%	Number	%
Deaths from all causes	14,812	60	9,705	40	24,517	100
Deaths from cancer	2,169	55	1,790	45	3,959	100
Percentage deaths from cancer		15		18		16
U.S.A. total deaths	872,638	57	656,079	43	1,528,717	

(From Vital Statistics of the United States, Vol. 2, 1955.)

Presented at School of Medicine, University of Washington, May 3, 1958.

deaths were reported from all causes, cancer accounted for 16 per cent of the total, or about one in six.

Cancer was responsible for 15 per cent of all deaths in males and for 18 per cent in women. However, the actual numbers were larger in the males—2,169 versus 1,790. The great excess of deaths from all causes in males over females in Washington (table 1) can, no doubt, be accounted for by persons familiar with the local situation. A disproportionate immigration of unmarried men suggests itself as a probable partial explanation. In Washington, 60 per cent of all deaths occurred in males compared with a national figure of 57 per cent.

If an average of about 20 per cent of the cancers of all types and stages in the State are cured, then the annual total of cases is about 5,000. The number living in the State at any one time (i.e., prevalence) would be larger than that figure, however, because average survival from onset is more than one year.

Nature of the Problem by Site

The anatomic distribution of the 3,959 fatal tumors by primary sites is given in table 2. Here

Table 2. Deaths in the state of Washington from malignant neoplasms by site, rank, number, and percentage (1955).

Rank	Site	Deaths	%
1	Large intestine (colon plus rectum)	558	14.1
2	Lung, Trachea, Bronchi (primary plus some unspecified)	425	10.7
3	Stomach	399	10.1
4	Breast	371	9.4
5	Prostate	291	7.4
6	Pancreas	221	5.6
7	Uterus (body plus cervix)	213	5.4
8	Leukemia and aleukemia	172	4.3
9	Malignant lymphoma (lymphosa, Hodgkin's, etc.)	155	3.9
10	Ovary, Fallopian tube, broad ligament	131	3.3
11	Bladder	119	3.0
12	Biliary passages and liver (primary)	95	2.4
13	Brain and nervous system	77	1.9
14	Kidney	73	1.8
15	Esophagus	65	1.6
16	Oral cavity (omitting pharynx)	45	1.1
17	Skin	44	1.1
18	Larynx	28	0.7
19	Thyroid	25	0.6
20	Bone	24	0.6
	Totals, 20 sites	3,531	89.0
	Totals all sites	3,959	100.0

(From Vital Statistics of the United States, Vol. 2, 1955.)

are found the 20 commonest tumors arranged in the order of their frequency, with the number of each and their percentage of the total. It is seen that 89 per cent of all cancer deaths were accounted for by 20 types. The figure is actually larger than that because the remaining 11 per cent included many cases in the same 20 sites but not specifically so designated on the death certificates. The dozens of other sites collectively account for less than 10 per cent of all cancers. These 20 tumors, therefore, comprise most of the cancer problem. Unless improvement can be made in this group, the situation will not be greatly bettered. These 20 tumors will form the basis for further analysis of the problem.

Several general comments should be made about the members of table 2. Data on these 20 tumors are not of equal reliability. The figures on the external and easily accessible growths are probably the most reliable. Among the internal tumors, the second ranking item (lung, trachea and bronchi, 425 cases) contains some tumors in which the death certificate did not specify whether they are primary or metastatic (231 such cases). This figure for lung cancer may, therefore, be unjustifiably swollen by inclusion of secondary growths. On the other hand, the twelfth category—biliary passages and liver—is an unnatural melange of at least three anatomically and possibly etiologically distinctive tumors—namely, those of the gallbladder, of the common, cystic, and hepatic ducts, and of the liver. A large number of cases (51 tumors) were recorded as being in the liver (code 156A) but were not qualified as primary or secondary. These were eliminated from table 2 on the basis that most of them were probably metastatic tumors.

Cure rates are unequal in these 20 tumors, and this fact influences their number and position in table 2. The cures range from a high percentage of all skin cancers, through moderate percentages for breast and uterus, and low precentages for stomach and esophagus, to zero for the leukemias. The advent of a new palliative therapy which lengthens average survival results in a temporary depression of the position of that tumor in such a table, but the tumor eventually comes back to its former position after a lag period equal to the average length of palliation afforded.

It is noteworthy that more than half of all reported fatal cancers (2,044 cases) occurred in five anatomic sites. These were the large intestine, stomach, lung, breast, and prostate. Thus, in differential diagnosis these sites and tumors merit a high index of suspicion. Some of the cancers in these sites are curable today and, perhaps, by concentrating on them in education, diagnosis and therapy much good could be accomplished.

Problem of the Control of Cancer

Before leaving table 2, it can be scanned as a measure of the size and nature of the cancer problem with respect to control and to research in Washington. If a great reduction in cancer mortality is to be made, it must be done among these 20 tumors.

Inasmuch as intensive educational efforts have been made in recent years, beginning about 1948, especially with respect to mammary and uterine cancer, one can begin to measure the efficacy of that program. By the use of periodic breast self-examination and of vaginal smears to detect the early stages of these two important tumors, it was hoped that sizable reductions could be made in mortality. In table 3, cancer

Table 3. Comparisons of cancer deaths in the state of Washington in 1955 and 1950.

Rank in 1955	Site	Deaths in 1955	Deaths in 1950	% change
1	Large intestine	558	528	+ 5.7
2	Lung, Trachea, Bronchi	425	252	+ 68.6
3	Stomach	399	394	+ 1.3
4	Breast	371	265	+ 40.0
5	Prostate	291	221	+ 31.7
6	Pancreas	221	161	+ 37.3
7	Uterus	213	217	− 1.8
8	Leukemia and aleukemia	172	152	+ 13.1
9	Malignant lymphoma	155	150	+ 3.3
10	Ovary, Fallopian tube, broad ligament	131	107	+ 22.4
11	Bladder	119	99	+ 20.2
12	Biliary passages and liver	95	77	+ 23.4
13	Brain and nervous system	77	71	+ 8.4
14	Kidney	73	59	+ 23.7
15	Esophagus	65	52	+ 25.0
16	Oral cavity	45	47	− 4.3
17	Skin	44	33	+ 33.3
18	Larynx	28	27	+ 3.7
19	Thyroid	25	16	+ 56.2
20	Bone	24	35	− 31.4
	Totals 20 sites	3,531	2,963	+ 19.2
	Totals all sites	3,959	3,282	+ 20.6

(From Vital Statistics of the United States, Vol. 2, 1955 and Vol. 3, 1950.)

mortality is compared in 1950[2] and 1955. It is evident that, as far as this period of time is concerned, those hopes were not realized.

It is seen that total cancer mortality in Washington increased about 20 per cent in those five years. This is approximately proportional to the increase in the population and in the number of older people in the State. The rise, therefore, does not represent an increase in risk to the disease on the part of individual persons.

It is obvious that any improvements in therapy did not match the increase. Inasmuch as the over-all increase was 20 per cent, this figure should logically apply to each type of cancer. In table 3 it is seen that it does not. Thus, in six tumors the increase was 30 per cent or more. This is 10 per cent or more above the general average. The six cancers were those of the lung, breast, prostate, pancreas, skin, and thyroid. How much, if any, of this increase is explained by improvements in the diagnosis and reporting of these six varieties of cancer and how much represents a true increase, could only be answered by the physicians in Washington. Note that the greatest rise occurred in lung cancer (68.6 per cent). In this tumor the increase is now generally accepted as real.

In contrast, eight tumors failed by 10 per cent or more to increase proportionately to cancer as a whole. These sites were the large intestine, stomach, uterus, malignant lymphomas, nervous system, mouth, larynx and skeleton. In three of these—namely, uterus, oral cavity, and bone—there was an actual reduction in deaths during the five-year period; this was greatest in the bone tumors. It is possible that this decrease is accounted for by a change in the classification of the myelomas.

The disappointing and disturbing fact that emerges from this table is the failure of breast and uterine carcinoma mortality to show substantial improvements. Breast cancer actually showed a considerable rise. The slight reduction in uterine cancer mortality was surpassed by two tumors (mouth, bone) and nearly equalled by four others (stomach, malignant lymphomas, brain, larynx) of types in which no special intensive educational drive had been made, and in which cures are few. One can question, therefore, until additional evidence is at hand, whether the reduction in the mortality of uterine cancer was the result of the special educational efforts, or whether it represents a trend from other and obscure causes, as in the case of the other members of this group. The current five-year period should provide evidence on this point.

Etiologic Implications

Regional Peculiarities:

Is there anything peculiar in the anatomic site distribution of cancer in the state of Washington which would point to special etiologic factors? Is any variety unusually frequent or infrequent? In table 4 the cancergram of Washington is compared with the national figures.

It is seen that the percentage distribution of the 20 commonest cancers in Washington parallels quite closely the national figures, with exception of the prostate in which there seems to

Table 4. Comparison of percentage distribution of cancer by site in the state of Washington and the United States, 1955.

Rank in U.S.A.	Site	% of all Cancer In U.S.	% of all Cancer In Wash.	Rank in Wash.
1	Large intestine	15.0	14.1	1
2	Lung, Trachea, Bronchi	11.1	10.7	2
3	Stomach	9.2	10.1	3
4	Breast	9.1	9.4	4

be an excess. The relative ranks of some tumors in Washington differ from the larger national series, but such deviations are probably not significant because they are based on relatively small numbers, again with the exception of prostatic carcinoma. Significance of the higher relative frequency of cancer of the prostate gland is not apparent, but the matter appears worthy of special study.

Race:

Racial comparisons of cancer are currently of interest.[3] From the data available in the mortality tables as now constituted, such studies were not possible in Washington. They could, however, be made by special tabulations, and they might be quite profitable. The vital statistics show sizable numbers of deaths each year in Negroes, Indians, Japanese, Chinese, and others. (See table 5.) By adding the cases for 5 or 10-

Table 5. Racial distribution of deaths from all causes in the state of Washington, 1955.

year periods, enough would be present in each group to reveal differences in cancer distribution if such existed.

Sex:

The peculiarities in sex distribution of cancer, apart from those that are sex-limited, sometimes suggest etiologic factors. When the mortality data for the state of Washington are separated by sex, as in table 6, some interesting facts are

Table 6. Distribution of cancer deaths by sex in the state of Washington, 1955, numbers and rank.

Totals, 20 sites		1,929		1,602
Totals, all sites		2,169		1,790

disclosed. The results can also be compared with the national figures. Lung cancer is seen to be the commonest fatal cancer in men, and it was commoner, on the order of six-fold, in men than in women. The ratio of breast cancer in females and males was about 100:1, which is approximately equivalent to the relative numbers of epithelial cells available for carcinogenesis in the two sexes. Cancer was also commoner in the female biliary system (where gallbladder diseases in general are more frequent), the thyroid, and the large intestine.

Rural versus Urban:

This geographic comparison, currently of great interest in respiratory tract and other cancers, also was not made because the necessary data were not readily available. It should be pointed out, however, that the state of Washington offers interesting possibilities for such studies. In the vital statistics, deaths from all causes are almost equally divided between residents of metropolitan and non-metropolitan counties. (See table 7.) The numbers in each category are large

Table 7. Comparison of deaths from all causes in rural and urban areas state of Washington, 1955.

	Deaths
In Metropolitan counties	14,158
In non-Metropolitan counties	10,359

enough to warrant comparative analysis of the tumors following special tabulations. This tech-

nique should disclose special carcinogenic occupational hazards that might exist if they were great.

Cancer Epidemiology by Organs:

It has been pointed out elsewhere[4] that the occurrence of cancer can be epidemiologically studied by using the cell populations of organs as the units at risk instead of persons as in conventional epidemiology. Cancers occur corresponding to every type of cell in the body, and thus every cell can be regarded as being at risk to neoplastic conversion. Regarded as communities of cells, how much difference is there between organs in the amount of cancer?

Using the state of Washington data on cancers in the digestive organs, table 8 has been prepared. The approximate weight of the epithelial cells in each site is used as a rough measure of the relative numbers of cells at risk to give rise to cancer. The actual number of cancers in 1955 is given in an adjacent column. Finally, the number of cancers is calculated per unit measure of cell population, the gram. The range of variation in cancers per unit is quite small—slightly more than a factor of two. Considered in this way the big difference in the total numbers of the cancers in these five locations is seen to be explainable on the basis of unequal numbers of cells at risk. Actually, a cell in one site has about as much chance of giving origin to a cancer as in others. The cells in two parts of the digestive system fall far out of line, contributing far fewer tumors than they should if they were equally susceptible and equally exposed. These exceptional organs are the small intestine and the liver.

Table 8. Relation of the numbers of cancers to cell populations in the digestive system.

Site	Weight of Epithelium in Grams (Approx.)	Cancers	Cancers Per Gram
Mouth	8	45	5.6
Esophagus	10	65	6.5
Stomach	120	399	3.3
Pancreas	90	221	2.5
Large intestine	200	558	2.8

Summary

An attempt has been made to characterize the cancer mortality problem in the state of Washington by amount and anatomic type, and to draw etiologic inferences from the data.

The 3,959 reported cancer deaths comprised 16 per cent of deaths from all causes. In males 15 per cent and in females 18 per cent of all deaths were attributed to the neoplastic diseases. Total number of cases per year is estimated to be about 5,000.

The tumors in 20 anatomic sites accounted for over 90 per cent of all fatal cancers. Thus the main problem is rather simply delineated. The needs in facilities and personnel for adequately detecting and treating the cancers of types that require unusual and special measures can be calculated.

In the five-year period, 1950-1955, a 20 per cent rise in cancer mortality was probably accounted for by an increase in the older population in the State. Increases of 30 per cent or more occurred in six major tumor sites, of which lung cancer showed the greatest rise (68.6 per cent). Increases of only 10 per cent or less took place in eight major tumors, with actual reductions in three (uterus, mouth, bone). It is noteworthy, in view of the special educational efforts that have been made, that mammary cancer showed a sizable increase and uterine cancer a slight decrease but equalled by that of others.

No peculiarities were seen in the cancergram of Washington compared with that of the nation except for a higher relative frequency of prostatic cancer.

Many of the big differences in the amount of cancer in the organs of the digestive system could be accounted for on the simple basis of relative size of the populations of cells at risk to carcinogenesis. •

Pharmacologic Treatment of Depression

FREDERICK LEMERE, M.D.
SEATTLE, WASHINGTON

Depression is one of the commonest and most painful of all the emotional illnesses encountered in general practice. The ever present possibility of self destruction in depressed people makes the recognition and treatment of this condition especially important as no doctor wishes to lose a patient by suicide.

Diagnosis

The recognition of depression is often difficult as it may masquerade behind symptoms characteristic of almost any organic disease. The diagnosis depends on the elicitation of the following symptoms, not all of which need be present:

A. MENTAL
1. *Depressed spirits.* Crying spells. Hopelessness, suicidal ideas.
2. *Guilt feelings.* Self blame. Feelings of inadequacy, unworthiness and inferiority.
3. *Difficulty in concentrating.* Inability to make decisions.
4. *Loss of interest.* No drive or spontaneity.
5. *Apprehension.* Fears of impending catastrophe, insanity, or death.

B. PHYSICAL
1. *Loss of appetite and weight.* Indigestion. Constipation.
2. *Insomnia.*
3. *Fatigue.* Often more severe than with organic disease.
4. *Nervous tension.* Multiple psychosomatic complaints.

If the patient usually feels worse in the morning and better in the afternoon and evening, this fact is diagnostic.

Until very recently the treatment for depression has consisted chiefly of psychotherapy, with electroshock for the more severe cases. Fortunately, most attacks are self limited and the patient recovers within six months to a year regardless of the therapy administered. For the most part, the treatment of depression with drugs has been disappointing, although some symptomatic relief has been obtained in milder cases.

Amphetamines

The amphetamines (Dexedrine, Desoxyn, Methedrine) have been in use for many years and are still the most consistently effective antidepressants available for immediate help in mild cases. The side effects of increased tension (somewhat reduced by the addition of a sedative, as in Dexamyl), insomnia, loss of appetite and, occasionally, habituation, limit their usefulness in office practice. Although somewhat less effective, pipradrol (Meratran) may be a useful substitute for the amphetamines in that it produces less side effects and is not habit forming. In my experience, methylphenidate (Ritalin) has not been met with much patient acceptance.

Tranquilizers

Of the newer drugs, the tranquilizers have been rather disappointing. They often aggravate or even produce depressions. They may be of some help, however, in those cases where anxiety, tension, and agitation are predominant. Special antidepressant properties for certain tranquilizers, such as are claimed for mepazine (Pacatal) and meprobamate plus benactyzine (Deprol), have not, in my opinion, been proven.

Psychic Energizers

As might be expected, the most promising leads for an effective antidepressant are coming

Presented at the Sixth Annual Scientific Assembly of the Washington Academy of General Practice, May 30, 1958, Yakima, Washington.

from the newer psychic energizers. Of these, iproniazid (Marsilid), a monoamine oxidase inhibitor, is the most interesting. In spite of the fact that it fails to help many cases and is quite toxic, it does produce dramatic relief in many severely depressed patients. Beneficial effects may appear within a few days or only after several months of medication. I routinely use iproniazid in moderate to severe depressions and resort to electroshock only when iproniazid fails or there is imminent risk of suicide. Iproniazid should not be given in doses larger than 50 mg. a day and in some patients this has to be cut to 10 mg. every two or three days in order to avoid dangerous side effects.

Commonest side effect is postural hypotension with syncope and injury from falling. This may be combated by reduction of dosage and administration of cortisone or dextro-amphetamine. I often give dextro-amphetamine along with the iproniazid as the two seem to complement each other. Iproniazid may produce paresthesias which are usually relieved by the supplemental administration of 25 mg. daily of vitamin B_6 (pyridoxine). Other side effects may be hyperhidrosis, constipation, difficulty in micturition, sexual impotency, dermatitis, and dependent edema. The greatest danger has been toxic hepatitis. Several deaths attributed to this complication have been reported. Improved compounds with increased effectiveness and less toxicity are being developed and will undoubtedly replace iproniazid as soon as they have had adequate clinical trial.

Another new drug called deanol (Deaner) acts as a psychic energizer by promoting the formation of acetylcholine in the brain and thereby facilitating neuron activity and the transmission of impulses. I have used it for over a year now, and about one half of my mildly depressed patients have preferred it to the amphetamines. It is without side effects except for a feeling of overstimulation on high dosage. It has been of no value in the treatment of severe depressions.

Conclusions

The amphetamines and a new psychic energizer, deanol, are the safest and most consistently helpful drugs for the treatment of mild depressions. The most beneficial drug for moderate to severe depressions is iproniazid. It is quite toxic, however, and not always efficacious.

There is a great need for more adequate antidepressive pharmacologic agents with less side effects. Current research in this field is showing much promise for the development of more satisfactory drugs for the treatment of this distressing illness. •

Your Rights Insured

As a rule, the things you do to enforce your rights, say in a contract, come under adjective or procedural law. The rights themselves are a part of "substantive" law.

You need both procedural and substantive law. For what good would your rights be if you had no way to enforce them? All you need to turn a free country into a tyranny is to take away the means to protect your rights. The rights alone are helpless.

But since everybody knows that your rights can be protected, if need be in court, most people rarely need to go to court. For each contract or lease, say, that lands in court you could count millions at work in peace to the gain of both parties.

A large part of our law sets out your procedural rights. It sets up rules of evidence, so that you can have a fair trial. It also gives you the right to a jury trial, to subpoena unwilling witnesses to testify on your behalf, to have a lawyer represent you and to have the court's judgment carried out, if need be, by the Sheriff or even the armed forces. Procedural law sets out the steps you may take to appeal your case to a higher court.

Much of the most dramatic parts of law—the kinds that make the big headlines—are procedural. The many writs of a court—such as writs of habeas corpus, of mandamas or attachment—are the orders of a court to enforce your rights. They are parts of the procedural or adjective law.

Count these stories—stories of injunctions, of consent decrees, or contempt citations—and you think that the law deals chiefly with conflict. But the unbannered story of the law lies not in conflict, but in peace. Most men, knowing that a way exists to enforce their rights, manage their affairs smoothly and efficiently.

(This column is written to inform, not advise, facts may change the application of the law.)

Washington State Bar Association

Disseminated Coccidioidomycosis

Case Reports

Ralph B. Reaume, M.D. and William Cohen, M.D.
PORTLAND, OREGON

In 1892 Wernicke,[1] and later Posadas,[2] in 1900, described a condition now known as disseminated coccidioidomycosis or, in South America, Posadas-Wernicke disease. In 1937 Dickson[3] described the acute benign form of the disease, previously known as valley fever, desert fever and San Joaquin Valley disease. He demonstrated the relationship between the acute and the disseminated form showing that they were both variations of the same disease caused by the fungus *Coccidioides immitis.*

On the North American continent there is an endemic area of coccidioidomycosis which parallels the border between the United States and Mexico from Texas to California. In addition there are endemic areas in the San Joaquin Valley of California, southwestern Utah and southeastern Nevada.[4] In these areas it is not uncommon for a large percentage of the population to have acquired the primary disease and to have recovered without event. However, in a certain percentage of those with the primary disease the disseminated form occurs.

In the Northwest, individuals who have had the primary disease frequently are discovered by routine skin testing and an occasional individual with the active primary form is seen. This latter occurrence is due to the rapidity of travel between the endemic areas, which are used as fall and winter resorts, and the Northwest. However, the disseminated form of the disease is rarely seen in the Northwest.

The disseminated disease may take two forms; namely, a chronic slowly progressive form and an acute disseminated miliary form. The former is seen occasionally in residents of the Northwest while the latter is rarely, if ever, seen. We do not know of any case of acute disseminated coccidioidomycosis reported from the Northwest. It is for this reason, and also to arouse more interest in a condition which will be seen more frequently because of increased travel, that we present the following two cases, one with chronic disseminated coccidioidomycosis and the other with acute disseminated coccidioidomycosis. No attempt will be made to review the literature, several excellent articles of this type having been published in recent years.[5-7]

CASE REPORTS

Case 1. A 29 year old Caucasian male, was admitted to the Veterans Administration Hospital, Portland, Oregon, for the first time July 9, 1956, with chief complaint of joint swelling and weakness. The present illness began shortly after the patient was discharged from a private hospital in Portland where he had undergone spinal fusion operation in November of 1955. The operation was performed, according to the patient, for ruptured intervertebral disc following back injury. About December 12, 1955, the patient developed chills, fever, drenching sweats, chest pain and cough. The symptoms continued and he was readmitted to the private hospital for approximately three weeks. About December 28, 1955, a nodular lesion appeared on his eyelid. In the next two weeks the fever disappeared but skin lesions appeared over most of the body. Many of these subsequently became purulent and drained. On February 17, 1956, he was admitted to the Multnomah County Hospital with tentative diagnosis of blastomycosis. At that time there was generalized lymphadenopathy and scattered skin lesions over all the body areas, especially on

Fig. 1. Case 1. First month of illness. Multiple nodular densities disseminated throughout both lung fields.

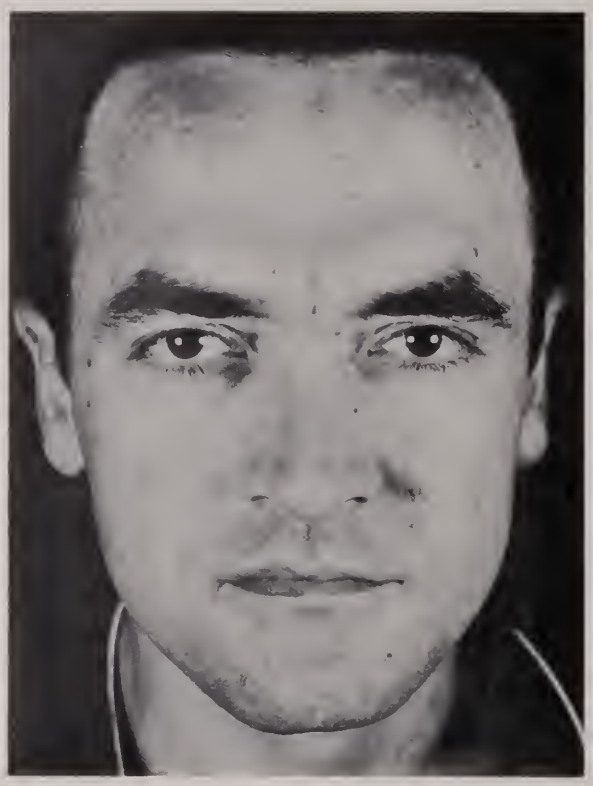

Fig. 2. Case 1. Multiple facial lesions in all stages of development and healing.

the face. Cultures of drainage from the skin lesions revealed *C. immitis.* Biopsy of a skin lesion also was interpreted as showing coccidioidomycosis. Chest x-ray (figure 1) revealed multiple nodulation throughout both lung fields. The patient was discharged, then subsequently readmitted to Multnomah County Hospital three more times for evaluation and therapy. He was treated with potassium iodide and ethyl vanillate during that time. In March 1956 swelling of the left knee, right ankle and both elbows occurred. Weakness became progressively worse in the two months prior to his admission to the Veterans Administration Hospital.

Past history revealed that the patient had been in California in 1944, 1946 and 1949. However, to his knowledge he had never been in the San Joaquin Valley nor had he ever been in southeastern California, Arizona, New Mexico or Texas. From 1949 until the present illness he had lived in Portland, leaving only for a trip to Michigan in 1954. Prior to the present illness the patient had been employed as a mechanic, working on the under-carriage of trucks which had traveled through the San Joaquin valley on their route to Portland.

Fig. 3. Case 1. Typical chronic lesions of elbow and third finger areas.

Examination on admission to this hospital revealed a chronically ill Caucasian male with a temperature of 99.4 F. Moderate swelling and marked tenderness of the right ankle, left knee and both elbows were present. There was no erythema or increased temperature noted over the joints. Scattered over the body were 18-20 elevated crusting lesions with central depressions and surrounding erythema (figures 2-3). They varied in size from 0.5 cm. to 2.0 cm. in diameter. They were neither indurated nor tender. The rest of the examination was negative.

The WBC was 7,850 with a differential of 66 segmented neutrophiles, 5 band neutrophiles, 22 lymphocytes, 3 monocytes and 4 eosinophiles. Sedimentation rate was 46 mm. in one hour (Wintrobe). Hemoglobin was 13.5 Gm. and the hematocrit was 42. A coccidioidin skin test was negative in 1:1000 dilution. Complement fixation tests for blastomycosis and histoplasmosis were negative while the test for coccidioidomycosis was positive in 1:256 dilution. X-ray of the chest now revealed very slight nodulation throughout both lung fields (figure 4). Bone survey was normal.

Fig. 4. Case 1. Chest x-ray taken during the eighth month of illness. Almost complete resolution of the process shown in figure 1.

During the third hospital week the upper portion of the spinal fusion incision became swollen. Aspiration of this area revealed purulent material in which *C. immitis* was found. This area subsequently drained a large amount of purulent material spontaneously. The left knee and right ankle became more swollen during the third hospital month and anemia and fever were noted. A course of amino-stilbamidine was given in August of 1956 but was without apparent benefit. The patient was discharged on November 13, 1956, and subsequently readmitted three more times during late 1956 and early 1957. During that period of time Avosulfon therapy was instituted. The skin lesions regressed in January and February of 1957. However, the joints remained swollen and the left knee required needle drainage. Concomitantly casts were made for the right ankle and the left knee areas. The patient

Fig. 5. Case 1. Left elbow showing fluctuant swelling. Scars from healed coccidioidal lesions in surrounding areas.

remained slightly anemic. He was readmitted on April 29, 1957. Most of the skin lesions had now healed. The right ankle had decreased in size and was less painful. The left knee and both elbows were swollen with the left elbow area being fluctuant (figure 5). The right jaw area was also swollen. The 1:100 coccidioidin skin test was still negative. The blood count was unchanged. Serum albumin was 3.6, the globulin 4.2. X-ray of the right ankle revealed only demineralization. The left knee showed destruction of cartilage and the coronoid process of the left ulna showed slight decrease in density. Following discharge in November 1957, the patient has remained at home in a semi-ambulant status. The joints are only minimally swollen and only two skin lesions remain. He has continued on Avosulfon therapy.

Comment

This case represents one of chronic progressive disseminated coccidioidomycosis which presented primarily as an acute miliary dissemination to the lungs. This latter process cleared only to be followed by chronically progressive lesions in the soft tissues, skin and joints. The acutely disseminated process in the lungs may have been helped by ethyl vanillate and saturated solution of potassium iodide though this is difficult to verify. The chronic progressive disseminated lesions, however, do not appear to have been helped by any form of therapy up to this time.

Case 2. A 59 year old negro male was admitted to the Veterans Administration Hospital, Portland, July 2, 1956, with complaints of chills, fever, cough and chest pain of approximately two weeks duration. Early in the course of the illness he had been treated with penicillin by a physician, but without apparent benefit. Prior to admission a generalized skin eruption appeared.

Social history revealed that the patient was an itinerant fruit picker whose permanent residence had been in Bakersfield, California, for the previous ten years. He arrived in the Portland area approximately three weeks prior to admission to this hospital.

Examination on admission revealed an acutely and seriously ill negro male with blood pressure of 110/80, pulse 96 and temperature of 103 F. There was impaired resonance over both lower lung fields with decreased breath sounds over the right lower chest. There was an erythema multiforme type eruption over the lower abdomen, lower back and gluteal areas. Also several fine nodular skin lesions were present over the forehead.

Laboratory data revealed WBC of 39,000 with 69 segmented neutrophiles, 5 band neutrophiles, 2 metamyelocytes, 18 eosinophiles, 3 lymphocytes and 3 monocytes. Hemoglobin was 13.8 Gm. and the hematocrit 48. Urinalysis, serologic test for syphilis, urea nitrogen, blood glucose, serum proteins, BSP test and cerebral spinal fluid were all normal. Sputum cultures and smears were negative for fungi and tubercle bacilli. Chest x-ray showed miliary type lesions disseminated throughout both lung fields (figure 6).

Fig. 6. Case 2. Miliary dissemination of lesions throughout both lung fields.

Following admission the patient continued to run fever of about 103° daily. The eruption noted on admission became nodular and subsequently pustular with lesions being noted over the face, forehead, neck, abdomen, upper extremities, back and gluteal areas (figure 7). Pus from these lesions showed many spherules typical of *C. immitis*. Complement fixation test for coccidioidal infection was negative while the precipitin test was four plus in 1:10 dilution. Chest roentgenograms revealed increasing confluence of the miliary lesions and concomitantly the patient began to note dyspnea at rest. Potassium iodide and ethyl vanillate therapy were instituted but on the 26th hospital day the patient expired.

Post mortem examination revealed normal peritoneal and pleural surfaces. The lungs were heavier than normal and showed many miliary nodules through all areas of the parenchyma. There was no evidence of a larger primary lesion. The bronchial nodes were slightly enlarged. The spleen was slightly enlarged and had numerous yellowish-white irregular nodules beneath the capsule in the parenchyma. Microscopic studies revealed miliary necrotizing nodules throughout all sections of the lung, these containing many spherules of *C. immitis* (figure 8). The spleen contained several of these granulomata (figure 9) and the heart and adrenal glands also showed at least one lesion. Several

Fig. 7. Case 2. Multiple nodular and pustular lesions of face and forehead.

areas of inflammation were noted in the kidney (figure 10) and organisms were noted in casts in the renal tubules. Bone marrow and lymph nodes sections showed abscesses containing *C. immitis.*

Comment

In contradistinction to case 1 this represents one of disseminated coccidioidomycosis with such a rapidly fatal course that the lesions characteristic of the chronic phase did not have time to present themselves. Diagnosis was established premortem by aspiration and examination of the pus from a skin lesion. This patient was originally admitted to the tuberculosis service because the x-ray appearance of the lungs suggested miliary tuberculosis. It is interesting that the patient did not contract the disease until after ten years residence in the endemic area. The rapidly fatal course is much more common in the dark skinned races in which the rate of miliary dissemination is much greater than in the white race.

Discussion

Individuals in the Pacific Northwest frequently travel to and through the endemic areas of coccidioidomycosis remaining there long enough to acquire the disease in incubational form. They later develop clinical symptoms which are ascribed to acute upper respiratory infection. When pulmonary symptoms predominate it is usually termed atypical pneumonitis. Later in life a pulmonary nodule may be found on routine roentgenogram and the coccidioidin skin test is then found to be positive, thus establishing the diagnosis in retrospect. This situation is not unusual and leads to no difficulties.

In .05 to .2 per cent of all cases of primary coccidioidomycosis, and in up to 1 per cent of cases in which patients are symptomatic or have pulmonary infiltrations, dissemination occurs. In the past, it is conceivable that in non-endemic areas, such as the Pacific Northwest, the diagnosis of disseminated coccidioidomycosis may have been overlooked completely. During the primary phase of the disease the diagnosis may

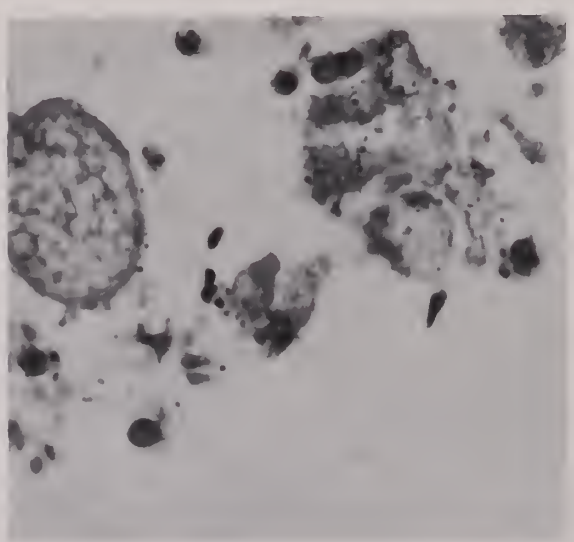

Fig. 8. Case 2. Spherule with endosphores in lung parenchyma, x-300.

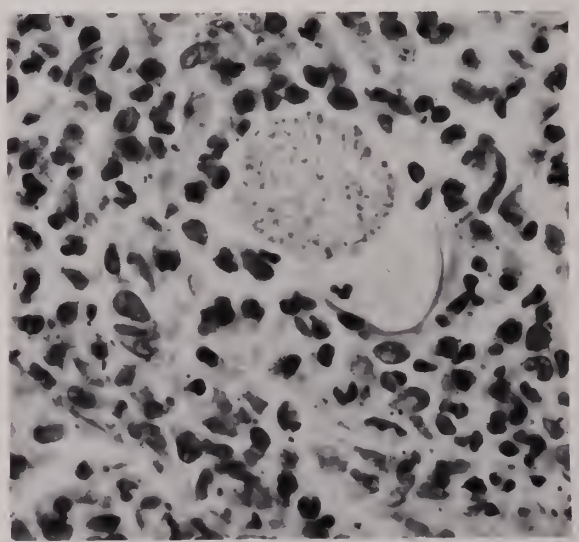

Fig. 9. Case 2. Spleen, x-300. Endosphores of *C. immitis* have ruptured and lie free.

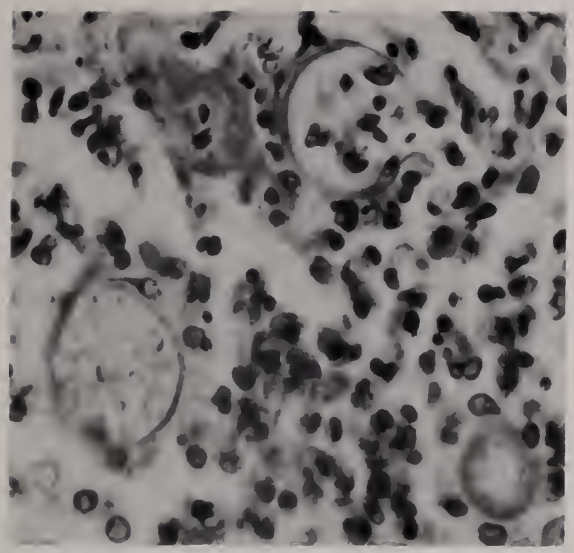

Fig. 10. Case 2. Kidney, x-300. Several spherules are seen, one with endosphores.

be difficult, especially in those individuals who have left the endemic area and in whom the history of a primary infection may be difficult to elicit or in whom there is failure to correlate the previous residence with the present condition. One should not be misguided by a negative skin test in cases of dissemination because in these individuals the skin test is usually negative while the complement fixation is usually positive. In fact, in those primary cases in which a positive skin test becomes negative and the complement fixation test becomes positive or increases in titer, dissemination is probably occurring. Where the dissemination is extremely acute, as in case 2, the usual diagnosis considered is miliary tuberculosis until development of extrapulmonary foci from which material can be secured for smear and culture. In the chronic disseminated form, such as case 1, where soft tissues and joints are involved, the diagnoses commonly considered are tuberculosis, blastomycosis and pyogenic abscess.

The mortality in all disseminated cases, acute and chronic, is approximately 50 per cent. Up to the present time no really satisfactory therapy for coccidioidomycosis has become available. Many preparations have been used in treatment, such as: stilbamidine and its derivatives, amphoterin-B, ethyl vanillate, saturated solution of potassium iodide, actidione, candicidin and the various antibiotics; however, none of these has had a consistently beneficial effect. As a consquence, therefore, only supportive care can be offered the patient.

Summary

Two cases of disseminated coccidioidomycosis occurring in Oregon are presented: one of chronic nature involving the skin, joints and subcutaneous tissues and the other of an acute fulminating nature. Occurrence of the disease in this geographical area is considered unusual enough to warrant its reporting.•

Primary Carcinoma of the Third Portion of the Duodenum

Report of a Case

Arnold J. Herrmann, M.D.
Tacoma, Washington

The case to be reported here represents the only experience with primary carcinoma of the duodenum, in the past fifteen years, in a general hospital of 225 beds with 9,000 plus yearly admissions. It is also the only personal experience with this type of tumor in our office with two surgeons having a combined surgical experience of 38 years. This serves to emphasize the fact that duodenal cancer is a rare lesion.

Incidence of primary carcinoma of the duodenum is established at 0.035 per cent in autopsy studies, with 18 per cent of these being in the infrapapillary portion, 60 per cent in the peripapillary and 22 per cent in the suprapapillary areas. Because of the rarity of this lesion, carcinoma of the duodenum is usually not considered in differential diagnosis in a patient with abdominal complaints. McLean writes that it is surprising how often these patients have a long history of digestive complaints and that their history suggests the type of person who is relegated to the "chronics" by being put on a shelf with vari-colored pills.[1]

This case is being reported because: 1. it will add another case of a rare tumor to the literature, 2. it was possible to resect the lesion and perform an end to end anastomosis, and, 3. it points out the occasional fallacy in accepting obvious disease as the explanation of abdominal complaints.

CASE REPORT

A 68 year old housewife had been bothered with what she called gall bladder trouble for a period of 10 years. Her difficulty began insidiously with vague complaints of indigestion and was climaxed by an acute attack of gall bladder colic ten years ago. At that time her physician had an oral cholecystogram made and she was advised to have a cholecystectomy because her x-rays showed "a bad gall bladder." The patient refused surgery and was placed on a fat poor diet with which she got along fairly well until six months prior to being seen in our office. During the summer she had frequent attacks of bloating with vomiting and belching. This was associated with a burning discomfort just to the right of the mid-epigastric region. These attacks were initiated chiefly by meat or fish and most particularly by halibut. There was no subscapular pain and no colic. During an attack of pain and vomiting she consulted another physician who repeated the cholecystogram and told the patient again that she had a "very bad gall bladder" which should have been removed ten years ago and certainly should be removed now. She again refused surgical intervention and asked for a diet. She was given a gall bladder diet but discovered that even foods on her diet caused distress and did not reduce the number or severity of the attacks described above.

Four months after her last cholecystogram she had lost twenty pounds and she felt too weak to venture outside the house by herself.

There were no past illnesses other than an attack of rheumatism 30 years previously and an appendectomy done at age 25.

Physical examination showed a pale 68 year old female who appeared to be comfortable. Her weight was 153 compared to a normal weight of 175. The blood pressure was 160/80 with a pulse of 90. General examination showed nothing unusual; she was edentulous and there was a scar in the right lower quadrant of the abdomen from her appendectomy. Other findings of significance were limited to the abdomen where tenderness was noted over the gall bladder area at which point a firm mass was felt. It moved with inspiration.

Blood count showed 3,360,000 red cells with 9.15 Gm. of hemoglobin. White blood cells numbered 6,350 with 46 segmented neutrophiles, 2 eosinophiles and 52 lymphocytes. Routine urinalysis was normal.

The unexplained anemia and her symptom complex impelled us to have an upper gastro-intestinal radiologic study made. The radiologist reported that the duodenum beyond the bulb was dilated and the area just proximal to the junction of the duodenum and jejunem showed definite and marked narrowing. The small bowel beyond that area showed no definite abnormality. He reported 50 per cent gastric retention at the end of four hours. The lesion was confirmed by both screen and radiographic findings (figure 1.). It was the opinion of the radiologist that in the differential diagnosis one would consider regional duodenitis, intrinsic neoplasm and small bowel invasion from an extrinsic neoplasm which would most likely be pancreatic. He suggested that the overhanging edges might be regarded as evidence against an inflammatory process and that he had seen carcinoma of the duodenal bulb but had never seen carcinoma at

the location under question. He diagnosed an unquestioned lesion of the distal duodenum and stated that if one saw an annular lesion in the colon such as was demonstrated here that there would be no question of interpreting it as representing a carcinoma.

Surgical exploration was advised and after preoperative blood transfusion the exploration was carried out under pentothal induction and cyclopropane anaesthesia.

A long transverse incision was made above the umbilicus extending over into the left side dividing the recti. The gall bladder was thick walled, distended with white bile with a large stone wedged in the pelvis of the gall bladder. The common duct showed compensatory enlargement but no stones could be felt in it. The liver was grossly normal. In the duodenum, just proximal to the duodeno-jejunal angle, there was a firm hard tumor surrounded by hard metastatic nodes. There were palpable aortic nodes above the region of the duodenum but these were not explored. The stomach and remainder of the gastrointestinal tract were not unusual. The pelvic organs felt normal. After exploration, the transverse colon was lifted up and the duodeno-jejunal angle freed. The mass of tumor tissue was gradually dissected free from retroperitoneal tissues. Several fair sized tributaries of the superior mesenteric vein were ligated close to this large vein. The superior mesenteric vessels were retracted to the right and the duodenum then completely mobilized to a point proximal to the tumor. The bowel was divided and the specimen removed. An end to end anastomosis was then made between the divided jejunum and the proximal end of the duodenum using an outer row of mattress silk sutures and an inner row of chromic gut using the Connell type of stitch. A plain Penrose drain was placed under the duodenal curve and brought out at the right end of the incision. The gall bladder was then removed after separately clamping, cutting and ligating the cystic artery and cystic duct. One piece of gelfoam was placed in the gall bladder fossa to control oozing. A plain Penrose drain was brought out at the right end of the incision from the foramen of Winslow. The incision was then closed with chromic catgut in the peritoneum, interrupted cotton in the fascia and dermal suture in the skin. The immediate postoperative condition was good despite a substantial amount of bleeding during the operation which required the use of three units of blood during the procedure. Total operating time was four hours.

The pathologist reported "a specimen (Fig. 2) consisting of small bowel measuring 15 cm. in length. About 1 cm. from one end of the severed segment of bowel is an ulcerated constricting lesion which has involved the bowel for a length of 3.5 cm. along its lumen. Cut surface shows grey, yellowish stippled tumor tissue which has invaded through the wall of the bowel and into the adjacent tissues. In the adjacent tissues it is found in the form of several nodules measuring up to 2.5 by 1 cm. Also received on this case is the gall bladder which is 7 cm. in length and 4 cm. in diameter. There are tags of adhesions over the surface and the wall is quite fibrous and thickened. The lumen contains some white cloudy bile and a solitary gall stone impacted in the cystic duct end of the organ. Microscopically the tumor in the duodenum is made up of rather markedly anaplastic epithelial cells showing very little tendency to gland formation and in some areas there appears to be squamous metaplasia. The tumor is seen developing from the mucosa of the duodenum and appears to grow straight down through the muscle bundles of the wall and spread out in the lymphatics of the subserosa and mesenteric tissues. The individual tumor cells are large and have relatively large pleomorphic and irregularly staining nuclei along with atypical mitotic figures. The tumor appears to be only moderately vascular on the side towards the lumen. However, there evidently was some bleeding into the lumen in a minor degree. The tumor in the lymph nodes appears a little more differentiated than that of the primary lesion and histologically is not unlike that of a metastasis from a carcinoma primary elsewhere in the bowel. The gall bladder wall is almost completely obliterated and replaced by scar tissue which contains a moderate round cell exudate. A small piece of liver tissue included in the section shows chronic

Fig. 1. Upper gastrointestinal radiologic study showed dilated duodenum and 50 per cent retention after four hours. Lesion was just proximal to junction of the duodenum and jejunum.

focal hepatitis. The pathologic diagnosis is adenocarcinoma, primary in the duodenum, grade II plus malignancy, with extension to regional lymph nodes. Chronic exudative and productive cholecystitis with cholelithiasis."

The postoperative course was marked by low grade fever and several bouts of nausea with vomiting which necessitated use of the Levine tube with continuous gastric suction. Drainage from the wound persisted for 15 days postoperatively. At the date of discharge, 23 days postoperatively, the patient was feeling well and was tolerating and enjoying a soft diet. She was seen two months after her resection at which time she had no complaints and was gaining weight. Two months later, however, she was hospitalized for a few days because of nausea and vomiting. An upper gastrointestinal examination showed duodenal narrowing. The patient tolerated liquids fairly well and some thought was given to performing a gastroenterostomy. However, she rapidly became worse and expired 6 months and two weeks after her operation. There was a prolonged terminal course of complete starvation with gradual emaciation. The duration of this terminal event made us wonder if starvation had not actually inhibited the cancer.

Autopsy revealed retroperitoneal duodenal obstruction by a large mass of tumor which extended along the para-aortic lymph nodes. There was tumor in nodules throughout the mesentery and on the parietal peritoneum. The liver had numerous foci of metastases including one large necrotic area 10 cm. in diameter. There was terminal hypostatic bronchopneumonia and a poor nutritional status as evidenced by emaciation and fatty metamorphosis of the liver.

There is considerable discussion in the literature with reference to the type of operation that

Fig. 2. Pathologic specimen of small bowel measuring 15 cm. in length shows ulcerated constricting lesion about 1 cm. from end of severed segment of bowel. The lesion involves the bowel for a length of 3.5 cm. along its lumen.

should be employed for malignant lesions of the duodenum.[2] In the first and second portions, resection, if done, must include removal of the head of the pancreas. Perhaps these lesions are best by-passed by palliative gastrojejunostomy. Brunschwig and Tiholiz suggest that "as in any surgical attack upon a neoplasm, each patient presents individual problems which must be evaluated to get the best operation."[3] Dixon *et al.* point out that extension into local nodes occurs early and that there is a long latent period before the lesion extends into distant sites such as the liver and lungs.[4] They also indicate that the prognosis for lesions in the duodenum is better than for lesions of the jejunem or ileum. The experience in this case did not bear this out and in retrospect perhaps a palliative gastroenterostomy would have been as valuable as the extensive resection. Gastroenterostomy might have well been done in addition to the resection to avoid the prolonged course of starvation.

Summary

A case of primary carcinoma of the third portion of the duodenum with coincidental gall bladder disease is reported. The surgical procedure performed in this case was resection with primary end to end anastomosis. Immediate surgical recovery was satisfactory but residual, recurring cancer caused death in six months. •

The Practicing Physician, The Patient and Cardiac Surgery

J. C. Michel, M.D.
SEATTLE, WASHINGTON

The careful physician can make accurate diagnosis of heart lesions using office procedures alone. His further responsibility to the patient includes explanation of the role of others and results to be expected, phrased to preserve the patient's emotional balance.

What should patients be told when facing possible cardiac surgery? The following is an attempt to help the practicing physician answer this question. The patient's education in this field via friends, lay articles, and television is incomplete and often erroneous. The family physician may turn to his journals replete with technical details concerning each operation and the statistical evaluation of its success but, to date, little has been said as to how the problem should be presented. Saying too little and letting biased lay opinion prevail is as harmful as saying too much which may have to be retracted later.

The following is not the scientific analysis of a number of cases, but rather the result of experiences accumulated by an internist standing midway between the referring physician and the cardiac surgeon. Of 256 patients seen for an opinion concerning possible surgery, 124 had rheumatic heart disease, 74 had congenital heart disease, 25 had other cardiovascular anomalies, and 33 had no evidence of organic disorders but purely functional disease. Of this total group, 85 have been operated upon and followed from one to seven years after surgery.

Accuracy of Diagnosis

One of the patient's first concerns is with accuracy of diagnosis. In these days of live surgery of the heart, colored illustrations, and the aura surrounding any academic title, clinic, center or foundation, a natural reaction may well be that this is a complicated problem fit only for the specialist. Nothing could be less accurate in cases referred by other physicians for an opinion concerning the indications for surgery. However, in contrast, a small number of patients presented themselves independently, and sometimes against the advice of their family physicians, often misdiagnosed or maladvised.

The referring physician, be he general practitioner, surgeon, internist, orthopedist, or otolaryngologist, was correct in nine cases out of ten. This is a gratifying number when one considers that such referring diagnoses as Eisenmenger's complex, tetralogy of Fallot, patent auricular or patent ventricular septa had all been entertained following the use of history, physical examination, fluoroscopy or x-ray—office procedures which are available to all. No consistent reason for the errors in the other 10 per cent could be found.

Today's referring physician is well trained as to the differential diagnosis between functional and organic murmur. However, murmur hypnosis is still prevalent and failure to pay attention to the heart sounds is frequent. For instance, a loud second pulmonic sound following a systolic murmur in the same region may be compatible with patent auricular septum, whereas a diminished or absent sound in the same location with an identical murmur may lead one to suspect pulmonic stenosis.

Such a differential diagnosis was academic a few years ago, but today the latter condition is of importance as it is readily curable. Furthermore, a universally acceptable procedure for septal closure will soon be adopted. Errors among physicians who failed to recommend consultations were of diagnostic omission—such as failure to seek the cause of cerebrovascular accident in young adults, hence missing mitral stenosis, or calling its symptoms "chronic asthma," or labeling the ominous syncope associated with aortic stenosis as "a fainting spell." In all such

cases, physical signs, such as sounds, murmurs, and thrills, were present for those physicians who wished to avail themselves thereof. The instances above are fortunately rare and far between.

In spite of the probability of making an accurate diagnosis by office procedures, it may be well for the family physician not to commit himself unequivocally as to the precise lesion and need for surgery until appropriate special tests have been completed. When a family with their ailing first born have been led to believe by their family physician that a cure is in sight, the consultant has a difficult time explaining that no help is available because of the presence of an, as yet, unoperable lesion. On the other hand, it is unwise to refer the patient without even mentioning the word surgery. Unless such an idea is gradually broached, it is often so new, so startling, and so shattering, that patient and family alike recoil, wasting precious time for reconsideration.

Need for Complicated Studies

Catheterization of the right half of the heart is of use in congenital heart disease, where a credible impression may be reached before catheterization, but clearly demonstrable diagnostic proof is needed before the patient is submitted to the risks, pain, and expenses of major cardiac surgery. In acquired heart lesions, physical signs, supported by electrocardiogram and x-ray findings, of pure mitral or aortic stenosis should be sufficient to establish the diagnosis. They are so reliable that, for example, careful attention to history and physical signs will enable one to estimate correctly the size of a mitral stenotic valve to the nearest 0.5 cm. sq. In impure lesions, right or left heart catheterization may be necessary. However, the data obtained in this fashion are not the *sine qua non*, but must be integrated with other findings. It is a fallacy to tell a patient "we will do a cardiac catheterization to see if you need surgery." Such a statement is an avowal of insecurity in the art of history taking and physical diagnosis.

The practicing physician who has never seen a cardiac catheterization or an angiocardiography, finds it difficult to describe. It is neither as simple as "they slip a little thing into your arm vein," nor is it as damning as "they stick a tube into your heart." Three things need be said: pain is far less than that inflicted by the dentist—it is even less than that of a simple vena puncture; mask and gown will be worn by the physician to prevent an infection, not "because it is an operation"; and oxygen will be administered, not because of extreme illness, but for diagnostic reasons only. These words will immeasurably help those who try to obtain data not falsified by tachycardia, hyperventilation, and undue anxiety.

Expected Results

Results to be expected from surgery of the heart can only be based on what has been called evaluation of the effects of certain operations. However, this discipline is fraught with pitfalls. A high proportion of normal appendices soon bring disrepute to the operator; so should a high proportion of patients who fail to improve after cardiac surgery. Alas, functional capacity is not a tissue sent to the pathologist, and the results of surgery are frequently laid at the practicing physician's doorstep. As he usually has few cases of such nature, a false impression may be left either of great success or of dismal failure. Indeed, the cardiac surgeon will perform his brilliant foray into the patient's cardiovascular system, but only briefly, and the family physician who has ministered to the patient before the operation will still have the bulk of his care when the latter is returned from the specialist.

To date, the results of cardiac surgery from larger centers have been obtained by interpreting the patient's subjective postoperative symptoms or performing the difficult task of comparative cardiac catheterization before and after surgery. In others, mere questionnaires or check lists have been mailed and their results tabulated. The surgeon frequently, and the practicing physician occasionally, fail to appreciate the psychic benefits of "an operation on the heart" and of "the big scar where I had 18 stitches taken to close me up." Furthermore, the patient who has purchased an expensive and glamorous service is not going to look for flaws. How many sports car enthusiasts would criticize their latest two or three thousand dollar purchase?

Subjective improvement is not always equal to the mass appeal and glamour of surgery of the heart. Betterment hinges on the aims of repair. The cure achieved by ligation of a patent ductus, or the resection of a coarctation, usually gives the patient no subjective changes. In other types of surgery, we do not hope to correct a defect completely, but merely to help, as in mitral,

aortic, or pulmonic valvular procedures. These latter operations do not cure heart disease but only alleviate the altered hemodynamics.

It should be explained to the patient that in these cases we hope to improve their function so that they can do more with fewer symptoms and resume a more nearly normal life. Our goals are to enable them to earn happily a useful living, or to perform housework contentedly and comfortably. Furthermore, subjective improvements following commissurotomies may take some 3 to 18 months to become manifest. Such surgery is not akin to tonsillectomies where the offending organ is removed and the patient discharged and forgotten a few weeks after the operation. In spite of successful repair, digitalis and a low salt diet may still be needed thereafter.

Finally, lay publications have not impressed patients with the fact that heart surgery is only specific for a few purposes; many must be turned away since no suitable method has been discovered to cure their ills. However, they should not be discouraged and given bleak prognoses. It can always be stated that though nothing specific can be done today, the near future holds great promises. The revolutionary changes in the rapidly moving fields of cardiac surgery are akin to the period of some 30 years ago when the outlook for diabetics was changed overnight with the discovery of insulin.

Risks

It is taken for granted that there are risks attendant to surgery of the heart. The greatest gains are usually achieved in patients who are the sickest, but the danger is also the highest in this type. However, if the operation can be performed before total disability and bedfastness ensue, mortality statistics are greatly improved. It has been found advisable to reassure and yet be frank; the physician may say, for instance, "there are risks to everything, even crossing the street, but if my house were burning on the other side of the street, I would run through heavy traffic, in spite of heavy risks, to help put out the fire."

Some patients may be advised to have surgery performed, or at least important preliminary studies, and refuse to do so. Why do they? The majority have been in and out of congestive failure for a long time and, disappointed by the lack of improvement, have peregrinated from physician to physician where they have been given a variety of conflicting opinions. Many recall the recent past when it was stated of rheumatic valvular disease and congestive failure that "nothing more can be done about it." The suggestion that something further might be done is indeed interesting, but merely another item to be added to their long catalogue of opinions. Others wish to have the guarantee of a cure and finally, a few may have been terrified by the inadvertent opinion of friends, the lay press, and, in some cases, even by doctors, as to the pain and danger of a preliminary work-up.

Costs

Patients come to a physician's office with three questions on their minds: 1. What have I got? 2. Can it be fixed? 3. How much will it cost? The total hospital expenses in uncomplicated cases with which I am familiar are usually in the range of $750. This figure includes the cost of a private room, oxygen, and a special nurse; her presence is invaluable in encouraging the simple acts of turning and coughing for the first 48 to 72 hours. In addition, x-rays, electrocardiograms, and occasionally electrolyte profiles may be necessary. Considerable variation is found in the surgeon's fee. The total cost is indeed large, but life is certainly worth the price of a good second car. It can also be stated that without the investment of good health, a wage-earning patient could not be earning his living, a fabulous return on the original investment.

Summary

The practicing physician who feels he might have a candidate for cardiac surgery should inform the patient of these facts before referring the patient:

1. "You have a heart condition which perhaps might be helped by surgery."
2. "You may need further diagnostic tests; they are not at all painful and not highly dangerous."
3. "Surgery will not be recommended unless we have a reasonable hope of improvement, at least enough to allow you to earn a living and lead a contented life."
4. "There are risks to surgery, but based on the outcome of unoperable cases similar to yours, we are certain that you will not improve, but rather get worse."
5. "The total cost of surgery of the heart is not prohibitive, and usually equal to surgery for lung cancer." •

A New Oral Antipruritic

Paul L. Williams, M.D.
SEATTLE, WASHINGTON

Continuous investigations during the past three or four years have revealed the outstanding clinical utility of phenothiazine derivatives. For example, chlorpromazine and prochlorperazine, both of which have potent central activity, have been widely used in the treatment of mental and emotional disorders; promethazine and similar phenothiazines with peripheral activity have been used successfully in the treatment of various allergic conditions.

Trimeprazine (Temaril*), a new phenothiazine, possesses demonstrable central and peripheral activity. Reports of preliminary clinical investigations indicate that trimeprazine, when taken orally, exerts a potent and seemingly specific antipruritic effect in such unrelated conditions as biliary cirrhosis, poison ivy, and neurodermatitis.[1,2] These reports also indicate that trimeprazine can be administered in small daily doses, and that, except for occasional mild drowsiness, the compound does not produce serious side effects. One group of investigators found that trimeprazine, when used in treating pruritis associated with various dermatologic conditions, often permitted the reduction of concomitant therapy, especially steroid therapy.[1]

For clinical use, trimeprazine is prepared as the tartrate salt, the structural formula of which is shown in figure 1. It is a white crystalline

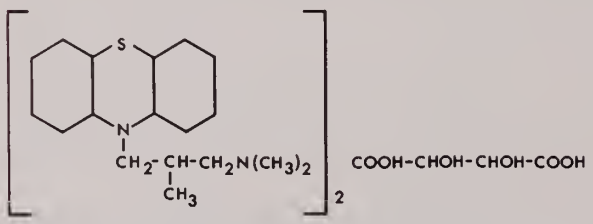

Fig. 1. Structure of the tartrate salt of dl-10-(3-dimethylamino-2-methylpropyl)-phenothiazine.

powder soluble in water, menthanol, and chloroform. It is practically insoluble in ether and benzene.

Because of previous reports, and because of lack of an orally effective agent specific for pruritus, it seemed worthwhile to undertake an evaluation of trimeprazine in a private dermatologic practice to elucidate further, if possible, its antipruritic effect.

*(dl-10-(3-dimethylamino-2-methylpropyl)-phenothiazine. Supplied for investigational use by Smith Kline and French Laboratories.

Material and Method

Ninety patients, in whom severe pruritus was a distressing and complicating factor in acute and chronic dermatoses and systemic diseases, were treated with trimeprazine. A list of the dermatoses and systemic diseases can be found in table 1. The patients selected for the evaluation were chiefly those in whom pruritus had been completely or partially refractory to other forms of therapy, such as topical or systemic applications of steroids, antihistamines, sedatives, and tranquilizers. They ranged in age from 1 year to 75 years; 68 were female, and 22 were male. All were ambulatory but two, who required hospitalization.

Diagnostic procedures were completed on all patients being seen the first time. If familial and personal histories and physical examinations had not been completed recently for patients who were currently under care, these diagnostic procedures were rechecked. All medication was stopped for at least one week, and in some cases longer, prior to placing the patients on trimeprazine. Concomitant therapy was limited as much as possible so that effect of the drug could be determined. In 27 patients with severe dermatoses, however, concomitant therapy was considered desirable, and consisted of topically or systemically administered medication. Patients were seen in the office once a week. The evaluation lasted one year.

Coated tablets containing 2.5 mg. and 5.0 mg. of trimeprazine, and a syrup containing 2.5 mg. of the drug per 5 cc. (one teaspoonful) were used exclusively throughout the evaluation. Initial daily doses of the drug depended on the severity and chronicity of itching, and varied from 2.5 mg. in acute conditions to 25.0 mg. in the two patients who required hospitalization. The usual starting dose was 2.5 mg. taken three or four times a day, usually before meals and before retiring. Once the severe phase of itching was controlled, the total daily maintenance dose, if needed, was reduced to 5.0 mg. Children under 12 years of age were usually started and maintained on a total daily dose of 5.0 mg. When

nighttime itching was severe and interrupted the patient's sleep, a dose larger than the usual daytime dose was taken before retiring. The duration of therapy varied greatly. In acute cases, therapy lasted anywhere from several days to several weeks. In the more severe chronic cases, patients received the drug daily for several months. Two patients have received 5.0 mg. of trimeprazine daily for over nine months with no ill effects whatsoever.

Repeated physical examinations were made on all patients, and complete blood counts and urinalyses were conducted routinely on 33 patients to determine the effect of trimeprazine on blood forming mechanisms and hepatic function. Repeated laboratory tests were conducted on the hospitalized patients. Since all the results of the laboratory tests were negative, irrespective of the duration of therapy, these tests were discontinued. Physical examination of all patients for signs and symptoms of untoward reactions was continued throughout the evaluation.

Results

Because of the subjective nature of itching, and the variability between antipruritic responses, the results reported by the patients were screened by the investigator and, together with his observations, were grouped into two categories, "satisfactory" and "unsatisfactory." It was felt that such a procedure would reduce the variability between results, thereby giving them greater reliability. Satisfactory results included only those results that indicated a complete and lasting relief of pruritis. Results considered unsatisfactory were those indicating that the relief of pruritus was either complete, but intermittent, or consistently incomplete; patients experiencing side effects, regardless of their severity or duration, were also included in this group.

Results of therapy are shown in table 1. Based on the above criteria, 68 (75.5 per cent) of the patients experienced satisfactory (complete relief of pruritus) results, and 22 (24.5 per cent) obtained unsatisfactory results. The latter group included 14 patients who had obtained complete relief of itching, but who had also experienced side effects; 7 patients who obtained incomplete relief of pruritus; and 1 patient who experienced a recurrence of pruritus due to exacerbation of atopic dermatitis.

The onset of trimeprazine's antipruritic effect was reported to occur, generally, within one to three hours after the first dose of the drug had been taken. Naturally, there was some variation between patients depending on age and weight.

Table 1. Results of Trimeprazine therapy.

Diagnosis	Patients	Relief of Itching: Satisfactory	Relief of Itching: Unsatisfactory
Neurodermatitis	35	23	12
Atopic dermatitis	19	17	2
Contact dermatitis	6	5	1
Psoriasis	4	2	2
Pruritus ani/vulvae	4	3	1
Herpes zoster	3	3	0
Varicella	2	1	1
Urticaria (chronic)	2	1	1
Infectious eczematoid dermatitis	1	1	0
Prupruic eruptions	2	1	1
Idiopathic pruritus	2	2	0
Polycthemia rubra vera	1	1	0
Dermatitis hypostatica	2	2	0
Dermatitis medicamentosa	1	0	1
Pruritic seborrheic dermititis	1	1	0
Measles	1	1	0
Intertrigo	1	1	0
Acute pompholyx	2	2	0
Totals	90	68 (75.5%)	22 (24.5%)

Observations regarding the effect of trimeprazine on nighttime itching were also made, since it was a problem for 81 of the patients. Sixty-seven (83 per cent) of the patients obtained complete relief of nighttime itching and were able to sleep without interruption, often for the first time in months. The remaining 14 (17 per cent) patients obtained significant though not complete relief of nighttime itching while they were receiving trimeprazine.

As might be expected, the direct effect—reduced scratching or rubbing of affected areas—resulted in improvement of skin lesions. Since the patients were seen at frequent intervals, it was possible to determine the result of reduced irritation on the skin lesions of those (75) who possessed them when therapy was initiated. In 44 (59 per cent) patients complete healing of the lesions had taken place by the time they had discontinued the drug; in 20 (27 per cent) patients almost complete healing had taken place; in 4 (5 per cent) patients some evidence of healing was apparent, and in 7 (9 per cent) patients no effect on skin lesions could be detected even though these patients were no longer troubled by itching.

The medication was continued at a lower maintenance dose as a prophylactic measure after the particular condition being treated had cleared. In this regard, trimeprazine was found most valuable in preventing the usually anticipated pattern of recurrences in chronic, recrudescent diseases. By thus controlling pruritus, the aggravating itch-scratch cycle could be obviated in many instances.

The antipruritic response to trimeprazine ex-

perienced by 83 patients was compared to that obtained while the patients were receiving previous medication or therapy. Results of this comparison are shown in table 2. In all but 5

Table 2. Antipruritic response of potients to trimeprazine ond to previous theropy.

Previous Medication	Potients	Response to Trimeprozine Superior	Some	Worse
Antihistamines	36	35	1	0
Sedatives	16	16	0	0
Tranquilizers	16	14	2	0
Allergic desensitization	3	3	0	0
Steroids	8	6	2	0
Other	4	4	0	0
Totals	83	78	5	0

patients, the response derived from the administration of trimeprazine was superior to that obtained with previous medication.

Side effects were reported by 14 patients. Lethargy, nightmares, or a non-specific skin eruption was reported by one patient each. The latter effect was transient and was not related to the photo-sensitivity type reaction sometimes seen with the administration of other phenothiazines. Drowsiness, the most frequent side effect noted, was reported by 11 patients. In 6 patients drowsiness was mild and transient; in 3 it was moderate and transient, and in 2 it was severe. The medication was discontinued in both of the latter patients. Usually, drowsiness was reported during the first few days of therapy but by the time the patients had taken the drug for a week this side effect had usually disappeared. The patient who reported nightmares experienced this effect only once, and it was questionable whether it was related to the administration of the drug. No serious side effects were reported.

Comment

Because of the variability of pruritus associated with specific dermatologic conditions, and the extreme variability from patient to patient, it was difficult, at the outset, to standardize the daily dose of trimeprazine. As experience with the drug accumulated, however, average daily doses could be ascertained with little difficulty. Generally, the initial dose consisted of one 2.5 mg. tablet taken two or three times a day. As the study progressed, it was evident that drowsiness, which was only a mild side effect, could be largely eliminated for most patients by having them take their dose of trimeprazine just prior to meals. The dose taken before retiring was usually twice the daytime dose because of increased nighttime itching. Even though nighttime doses were sometimes as high as 20 mg., lethargic effects the following morning were reported by only one patient. It has been my experience that starting with the lower dose has distinct advantages since patients are more cooperative if the dose has to be increased rather than decreased. Then too, experience has shown that patients who tolerate the lower dose usually have no difficulty in tolerating higher doses.

Moderate hypotensive reactions were observed occasionally in patients who were receiving large daily doses (20 mg. or more) of trimeprazine and antihypertensive drugs. Although it is rare that doses of this magnitude are required, it should be pointed out that, in patients receiving antihypertensive drugs, particularly sympatholytic drugs, the initial dose of trimeprazine should be low and should be increased slowly.

One of the most gratifying results to be uncovered in this evaluation was the lack of tolerance to the therapeutic effect that may develop when a drug is used for prolonged periods of time. Several patients who received trimeprazine for nine months or more continued to experience the same antipruritic effect as they did when they were first given the preparation. This effect is, of course, in direct contradistinction to effects produced by drugs such as phenobarbital and antihistamines. One other effect that was not observed during this evaluation was the so-called "therapeutic paradox"—i.e., increased itching or aggravation of symptoms as a result of therapy.

Summary

Trimeprazine, a new oral antipruritic, was evaluated during the past year in a series of 90 patients who experienced pruritis as a complicating factor in acute and chronic dermatologic and systemic disorders. Results of the evaluation indicate that trimeprazine is an effective oral antipruritic; that it can be administered in small daily doses; that it produces no serious untoward effects, even upon prolonged administration; and that it permits a reduction in concomitant therapy. Results also indicate that side effects are minimal and that they are generally present as mild drowsiness. Therapeutic relief could often be enhanced by adjusting the initial doses upward as required to manage adequately the nature and severity of the problem at hand. •

Chlorothiazide (Diuril) Treatment of Edema

Chauncey G. Paxson, M.D.
John H. Morledge, M.D.
and
Robert A. Bruce, M.D.
Seattle, Washington

Edema is one of the most common manifestations of heart disease, cirrhosis, or nephrosis, and satisfactory management of edema in the ambulatory patient is often difficult to achieve. Heretofore, successful therapy has required rigid restriction of sodium intake to the point of enforcing unpalatable diets, and frequent use of diuretics to promote renal excretion of sodium. Effective diuresis has usually required frequent parenteral injections of mercurials which have not been entirely free from discomfort, inconvenience, and untoward reactions for these patients. Thus, the recent announcement of an effective oral diuretic, chlorothiazide,[1] with potent saluretic effects, has been received with more than usual interest.

Chlorothiazide (Diuril) is a non-mercurial compound, related to the sulfonamides, possessing a carbonic-anhydrase inhibitory effect greater than that of sulfadiazine, but less than that of acetazolamide (Diamox). Previous studies have shown that it exerts its major diuretic effect, however, by other mechanisms which are as yet unidentified.[2] In doses of 2.0 Gm. per day it has been shown to effect a prompt diuresis of water, sodium, chloride, and potassium, with reduction of edema, and clinical improvement in congestive heart failure and other edema states.[3] Dosages as low as 0.5 Gm. per day have been effective, and there has been no additional benefit, in general, from dosages of more than 2.0 Gm. per day. Reduction of blood pressure has been noted in some hypertensive subjects who were given chlorothiazide.[4,5] Mechanism of this effect is not clear, but may be related to reduction in body sodium and decrease in circulating blood volume.

It is our purpose in this report to summarize the clinical experience derived from use of this new diuretic in 57 patients at King County Hospital who presented many of the common problems in edema management. None were rigidly controlled with respect to sodium intake, although most had been enjoined to follow the regimen of a salt-free diet. These clinical trials were designed to determine, a) effects of sustained therapy in varying dosages and, b) comparative effectiveness of 2.0 Gm. doses of chlorothiazide, and 2.0 ml. injections of a mercurial on a twice a week schedule. Observations with respect to both control of edema and incidence of untoward effects were carried out.

Effects of Sustained Chlorothiazide Therapy

Initial studies with chlorothiazide alone were carried out on 33 patients in the outpatient clinics and the inpatient wards of King County Hospital. Of these, 2 were cirrhotics with ascites, 2 had edema in association with the nephrotic syndrome, and 29 had congestive heart failure. Cardiac diagnoses were as follows: arteriosclerotic heart disease 11 cases; hypertensive cardiovascular disease 3; cor pulmonale 1; rheumatic heart disease 11; syphilitic heart disease 1; undiagnosed heart disease 2. Of the entire group of 33 patients, severity of edema varied from no grossly visible edema in 10 to minimal edema in 7, moderate edema in 8 and massive edema in 8.

Our most frequently used dosage in this group was 2.0 Gm. of chlorothiazide daily, given in

Supported in part by grant from Merck Sharpe and Dohme Research Laboratories.

four divided doses of 0.5 Gm. each. Five cases were excluded from the total of 33 because of lack of patient cooperation with the study; thus inadequate control of therapy, missed weighing, or doubt as to reliability of these five patients in taking the drug, left 28 cases in which satisfactory observations were recorded. The pertinent results were as follows:

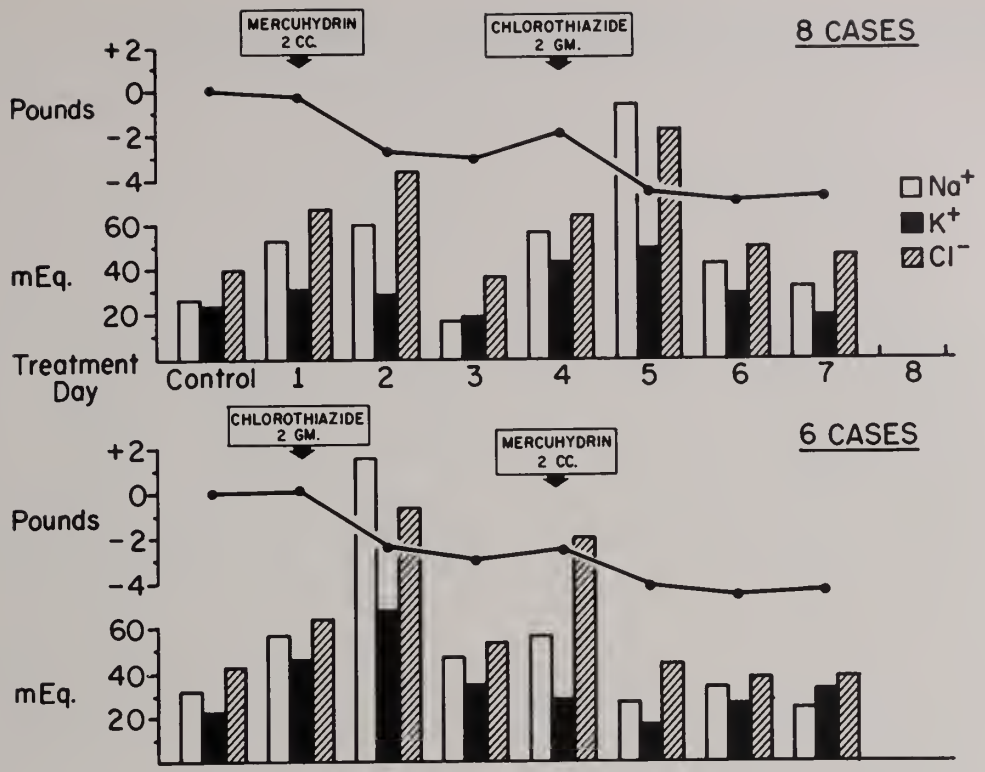
1. Inpatients had an average weight loss of 0.5 pound during the 24-hour control period prior to specific therapy. Diuresis of edema and loss of body weight bore a roughly linear relationship to drug dosage. Thus, during the first 24 hours of therapy, average weight loss was 2.0 pounds on 2.0 Gm. of chlorothiazide daily, while weight loss on the second day of sustained therapy increased by another 2.7 pounds, to an average total of 4.7 pounds. When dosage was decreased to 0.75 Gm. daily, weight loss fell by an average of 1.3 pounds during the first 24 hours of therapy.

2. Observations on sodium excretion were made in 12 of these 28 cases during treatment with chlorothiazide. Average sodium excretion was 100 mEq. in 24 hours with dosage of 0.75 Gm. per day for 2 to 3-day periods, while sodium excretion averaged 189 mEq. per day when dosage was increased to 2.0 Gm. per day.

3. Three of 28 patients (11 per cent) developed nausea or visual disturbances. Since these disappeared when the drug was discontinued and reappeared when therapy was resumed, they were attributed to treatment with chlorothiazide. Another patient developed both first degree AV heart block and ventricular bigeminy which were attributed to excessive loss of potassium in a previously digitalized patient. These manifestations disappeared with supplemental oral potassium chloride therapy. Although no other definite instances of potassium depletion were noted in this group, excessive body potassium loss may occur with either large doses of chlorothiazide or with continued long-term therapy.[3] No serious or irreversible hematologic, neurologic, or other effects were observed. Drowsiness, which sometimes occurs with acetazolamide, and leg cramps or weakness, occasionally associated with mercurial diuretics, were not seen with chlorothiazide.

Comparison with a Mercurial Diuretic

A subsequent study was carried out to compare the effects of an oral dose of chlorothiazide, 2.0 Gm. per day, with the diuretic effects of an injectable mercurial diuretic. A group of 14 patients, of whom 12 were cardiac and 2 were cirrhotics with ascites, was studied in this regard. The patients were not given any specific diuretic therapy for a 48-hour period, during which time daily body weight, urine volume and total urinary sodium, potassium and chloride excretions were determined. These observations served as base line controls prior to the administration of the diuretics under study.



Patients were then given a 2.0 ml. intramuscular injection of meralluride (Mercuhydrin) and observed for 72 hours with the above measurements recorded. They then received 0.5 Gm. chlorothiazide four times a day for 24 hours, with similar weight and urinary studies for the subsequent 72 hours. Eight of the 14 were treated in this sequence; the remaining 6 were treated in the reverse order—i.e., chlorothiazide was followed by meralluride. Comparative data are shown in the figure. Pre-treatment electrolyte excretions in the entire group averaged 28 mEq. of sodium, 23 mEq. of potassium, and 41 mEq. of chloride per 24 hours. Meralluride elicited an average total weight loss of 2.5 pounds during the 48 hours subsequent to injection, with average daily electrolyte excretion of 102 mEq. of sodium, 52 mEq. of potassium, and 149 mEq. of chloride. Chlorothiazide produced an average 48-hour weight loss totalling 2.9 pounds when given in 2.0 Gm. dosage for a single day, and electrolyte excretion for the day following chlorothiazide averaged 187 mEq. of sodium, 55 mEq. of potassium, and 169 mEq. of chloride.

A parallel study was conducted with 9 outpatients who had cardiac edema; they were given meralluride or chlorothiazide twice weekly, and were followed for changes in body weight. Reductions in body weight in this group averaged 1.8 pounds per week when chlorothiazide, 2.0 Gm., was given twice weekly, whereas meralluride given twice weekly in a 2.0 cc. dose resulted in a net gain of 0.4 pound at the end of the week treatment. The meager responses seen in this small series of outpatients were probably due to lack of rigidly controlled sodium intake during the period of these observations.

Conclusions

The following conclusions seem warranted from these studies:

1. Chlorothiazide is a safe, effective oral

Comparison of average effects of chlorothiazide and meralluride on daily body weight and daily urinary electrolyte excretion in 14 inpatients. Note the similarities in weight loss with either diuretic; chlorothiazide elicits diuresis primarily of sodium, exceeding excretion of either potassium or chloride.

diuretic which has a low incidence of undesirable side effects that terminate when the drug is discontinued, or when supplemental potassium is administered.

2. In oral doses of 2.0 Gm. per day, chlorothiazide is as effective as 2.0 ml. of injected meralluride, and could be substituted for injected mercurial diuretics in the practical management of edema states.

3. Striking diuresis of sodium is effected by chlorothiazide, with less prominent but nonetheless significant diuresis of chloride and potassium. Meralluride elicits a diuresis primarily of chloride rather than the cations sodium and potassium.

4. Long-term therapy with chlorothiazide probably should be accompanied by potassium-rich foods or potassium therapy.

5. Our studies did not reveal any significant alteration in blood pressure with one-day chlorothiazide therapy, and no change in blood pressure was seen on sustained chlorothiazide therapy in previously normotensive patients. Too few hypertensive patients were studied to permit conclusions to be drawn on blood pressure response in this study.

6. Despite the ease of administration and relative freedom from side effects of chlorothiazide, it is a potent compound capable of eliciting profound electrolyte depletion. Its administration should be accompanied by a cautious awareness on the part of the physician of potential hazards from sodium, potassium or chloride depletion. •

Training of Rehabilitation Personnel

Developments in the Pacific Northwest

Justus F. Lehmann, M.D.*
SEATTLE, WASHINGTON

In this paper an effort will be made to assess present and future need for training of rehabilitation personnel. Programs and facilities to fulfill the need for training of specialists in the field of rehabilitation will be discussed. Since the limited scope of this paper does not permit a review of all educational programs of specialties participating in rehabilitation, discussion will emphasize the training of medical and closely allied rehabilitation personnel.

Present Need for Trained Rehabilitation Personnel

Expansion of rehabilitation services and facilities is, to a large extent, jeopardized by the lack of a sufficient number of trained personnel. For example, there is a great shortage of physicians who are trained in rehabilitation procedures. Only 322 physicians have been certified by the Board of Physical Medicine and Rehabilitation. We need between two and three thousand specialists in physical medicine and rehabilitation in order to provide adequate services.

The Sub-committee on Paramedical Personnel in Rehabilitation and Care of the Chronically Ill of the Office of Defense Mobilization reported that a similar shortage of physical therapists and occupational therapists exists. This shortage seems to be ever-increasing (tables 1 and 2).[1]

Table 1. Supply and need for physical therapists.

Year	Active Supply	Need for Hospitals	Total Need
1951	5,300	7,200	7,800
1952	5,800	8,020	8,960
1953	6,300	8,840	10,120
1954	6,800	9,660	11,280
1955	7,300	10,480	12,440
1956	7,800	11,300	13,600

This table is reproduced with permission from Mobilization and Health Manpower, II, A Report of the Subcommittee on Paramedical Personnel in Rehabilitation and Care of the Chronically Ill, Office of Defense Mobilization, Washington, D. C., January, 1956.

Future Need for Rehabilitation Personnel

Present lack of trained personnel appears even more serious when we consider the probable expansion of rehabilitation services. One of the reasons why more extensive rehabilitation services are needed every year is the continually increasing number of geriatric cases. It is estimated that by 1980 the number of people in America over 65 years of age will be approximately 22 million.[2] Relative increase in number of older people in our population is demonstrated by figures 1 and 2.[3] Distribution of the age groups in the population in 1900 is compared with that in 1950.

Table 2. Supply and need for acupational therapists.

Year	Active Supply	Need for Hospitals	Total Need
1951	2,600	4,900	5,600
1952	2,900	5,600	6,580
1953	3,200	6,300	7,560
1954	3,500	7,000	8,540
1955	3,700	7,700	9,520
1956	3,900	8,400	10,500

This table is reproduced with permission from Mobilization and Health Manpower, II, A Report of the Subcommittee on Paramedical Personnel in Rehabilitation and Care of the Chronicaly Ill, Office of Defense Mobilization, Washington, D. C., January, 1956.

In addition, technical advancements and increased industrialization have resulted in an ever-increasing number of disabling accidents. In a recent statistical survey, Bakst has estimated that the number of people suffering from long-term disabilities in the United States in 1957 was approximately 5,300,000.[4] Eighty-eight per cent of these disabilities were due to accidents; 2.2 million persons would have been in the labor force had they not been disabled. The number of rehabilitation services will have to be expanded to meet the need created by the general increase of the population in the United States. Figure 3 shows this projected increase up to 1975.[3] At this time our population will exceed 200 million.

Development of Facilities and Services

Since the physician who is charged with primary responsibility for patient care should provide for an adequate treatment program to minimize effects of disease and accident, it seems important that all physicians become acquainted with the scope and the possibilities of compre-

Read before the Pacific Regional Conference of the National Rehabilitation Association, Seattle, Wash., May 21-23, 1958.
*Professor and Executive Officer, Department of Physical Medicine and Rehabilitation, University of Washington School of Medicine, Seattle, Washington.

hensive medical care—that is, rehabilitation procedures. Then they will be able to refer to the corresponding service facilities those patients in whom they recognize the need for comprehensive care.

One step in this direction has been the introduction into medical schools of adequate training programs in physical medicine and rehabilitation. Postgraduate courses acquaint physicians already in medical practice with new procedures and methods.

The physician must also be aware of the other specialties which contribute to the over-all program of the patient and which are also necessary to help the patient to make the best possible psychologic, social and vocational adjustment. In turn, all other professional persons who have contact with the disabled or chronically ill should be aware of the help available and should refer their clients correspondingly.

Hospital administrators should be aware of the need for such facilities. Additional comprehensive rehabilitation centers must be established, and general hospitals should have adequate physical therapy and occupational therapy services. Krusen[2] concurs with the observation of the President's Commission[5] that 20 per cent of bed capacity of general hospitals should be allocated for convalescense and rehabilitation. The Hospital Council of Greater New York estimated that 25 per cent of bed capacity should be allocated for these purposes.[6]

Limited treatment facilities for outpatients can be established by joint effort of the local physicians and the community with the help of agencies concerned with rehabilitation. For the older age group the situation could be much improved by providing optimal care in the hospital. Also, physical therapy and occupational therapy facilities should be available in some of the nursing homes for those patients who need prolonged care.

In order to enlist community support the general public should have knowledge of the potentials of comprehensive medical care. Much has been accomplished in these respects, but much remains to be done in the future.

Results of a pilot program in New York for rehabilitation of disabled welfare recipients have recently demonstrated that adequate comprehensive rehabilitation care would increase the self-sufficiency of patients (table 3); reduce the number of people who have to be discharged to a nursing home (table 4); decrease appreciably

the number of bed-fast patients or patients confined to a wheel chair (table 5); and finally, return an appreciable number of patients to full-time, independent employment (table 6).

The question has been raised as to how in practice can an adequate coverage of rehabilitation facilities and services be provided. We do not have one clear-cut answer to that question, but some pilot programs throughout the nation

According to this definition, a comprehensive rehabilitation center is a multiple disability facility which makes available physical and medical evaluation and services including medical supervision; physical therapy; occupational therapy; psychologic evaluation; social evaluation, including social case work; and vocational evaluation, including vocational counseling and prevocational experience. Other services, if provided on an integrated basis, can be secured by contract from readily available resources outside the center. It is estimated that one such center will be required for each 300,000 population. For the state of Minnesota, with a population of 3.3 million, five centers are either presently in operation or are planned for the immediate future. These centers are working in close cooperation with 77 so-called satellite or community rehabilitation facilities.

These facilities, which are mostly limited to physical therapy and occupational therapy, are supervised and utilized by physicians in the community. They have been established by community effort, and work in close cooperation with the comprehensive rehabilitation centers. This cooperation is maintained by regular visits of consultants from the comprehensive centers to the rehabilitation facilities. Some of the problems which arise are handled by discussion with the community center staff; if the problem cannot be solved in this way, the patient is referred to the comprehensive center by his family physician. In turn, the comprehensive rehabilitation center refers the patient back to his community rehabilitation facility once the major problems have been overcome. The community rehabilitation facilities, as well as the comprehensive rehabilitation centers, work in close cooperation with local and state agencies, especially with the Division of Vocational Rehabilitation.

Some of the comprehensive centers have their own sheltered workshops; others use sheltered workshops sponsored by other agencies concerned with rehabilitation. The accomplishments of this pilot program have been very gratifying so far, and encourage a well-planned coverage of a region with rehabilitation services and facilities in such fashion that community agencies and physicians work not only closely together with the local rehabilitation facilities, but also with the comprehensive rehabilitation centers and with state-wide agencies.

It becomes apparent that more facilities, and therefore more personnel, will be necessary to accomplish the goal of such adequate, comprehensive care for all patients who need it. One of the most formidable obstacles on the road to such achievement is the lack of trained personnel.

Educational Programs and Training Facilities

Teaching programs and training facilities should be an integral part of the planning for ideal rehabilitation services. Only a few noncomprehensive programs are located in the Pacific Northwest (Fig. 4).[1] Even fewer comprehensive rehabilitation facilities which could be used for training are found in this area (Fig. 5).[9] This demonstrates the great need for an expanded educational program in the Pacific Northwest. There is no approved school of physical therapy and only one approved school of occupational therapy. A comprehensive teaching program for medical students and residents is also needed. Therefore, the University of Washington decided to expand the teaching programs by establishing a comprehensive rehabilitation center within the University Hospital and a new Department of Physical Medicine and Rehabilitation within the School of Medicine.

Within this department, Divisions of Physical Therapy and Occupational Therapy have been organized. In addition, the following units are

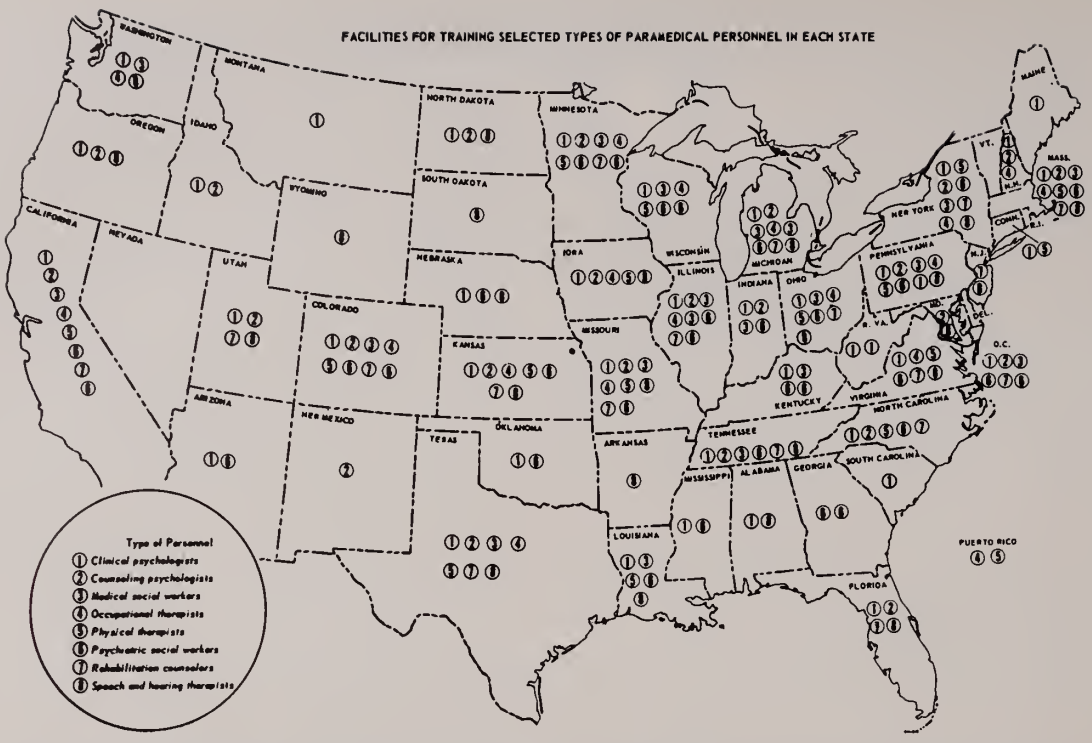

Fig. 4. This figure is reproduced with permission from Mobilization and Health Manpower, II, A Report of the Subcommittee on Paramedical Personnel in Rehabilitation and Care of the Chronically Ill, Office of Defense Mobilization, Washington, D. C., January, 1956.

included: 1) vocational counseling, 2) psychologic testing, 3) speech and hearing, 4) social service, 5) an adaptive equipment shop, and 6) rehabilitation ward. Figure 6 diagrams the organization of the units within the Rehabilitation Center. This comprehensive center will be used primarily for teaching medical students, interns, medical residents, future physiatrists and graduate students in other medical specialties interested in rehabilitation, as well as students in physical and occupational therapy. The department will also offer a joint teaching program and work experience in rehabilitation for students in some of the paramedical specialties, such as social service, speech and hearing therapy, vocational counseling, psychology and nursing. Thus, the department will directly assist the community, the state, the Pacific Northwest and Alaska by training personnel, medical and non-medical, to staff rehabilitation centers and other facilities in the area. Since the demand for rehabilitation services is great, this is a long-term program and its full effect will not be felt for several years. In areas, such as physical therapy and occupational therapy, this effect will be noticeable earlier.

Research as a teaching device will be done in the laboratories. Clinical research will be conducted on the ward and in the outpatient department. This research will not only round out the teaching program but also will help to improve rehabilitation procedures and to adapt these to the specific needs in the area to be served.

At the same time, in order to provide the variety of handicaps and diseases suitable for an adequate student experience, service will be given to patients of the community and the region. This service will be given to both inpatients and outpatients in order to provide for adequate teaching.

The team approach to rehabilitation, accompanied by panel discussions of patients' problems, will be stressed as one of the major techniques in comprehensive care (table 7). The team approach is, in my opinion, of the utmost importance to a training facility. Students of the

Table 7. The rehabilitation team.

Members of the team will be the following:

A. Physicians of all medical specialties as consultants
B. Physical Therapist
C. Occupational Therapist
D. Speech and Hearing Therapist
E. Social Service Worker
F. Vocational Counselor
G. Psychologist
H. Nurse
I. Dietician
J. Office of Vocational Rehabilitation Representative
K. Coordinator of the Team will be the Director of the Rehabilitation Center

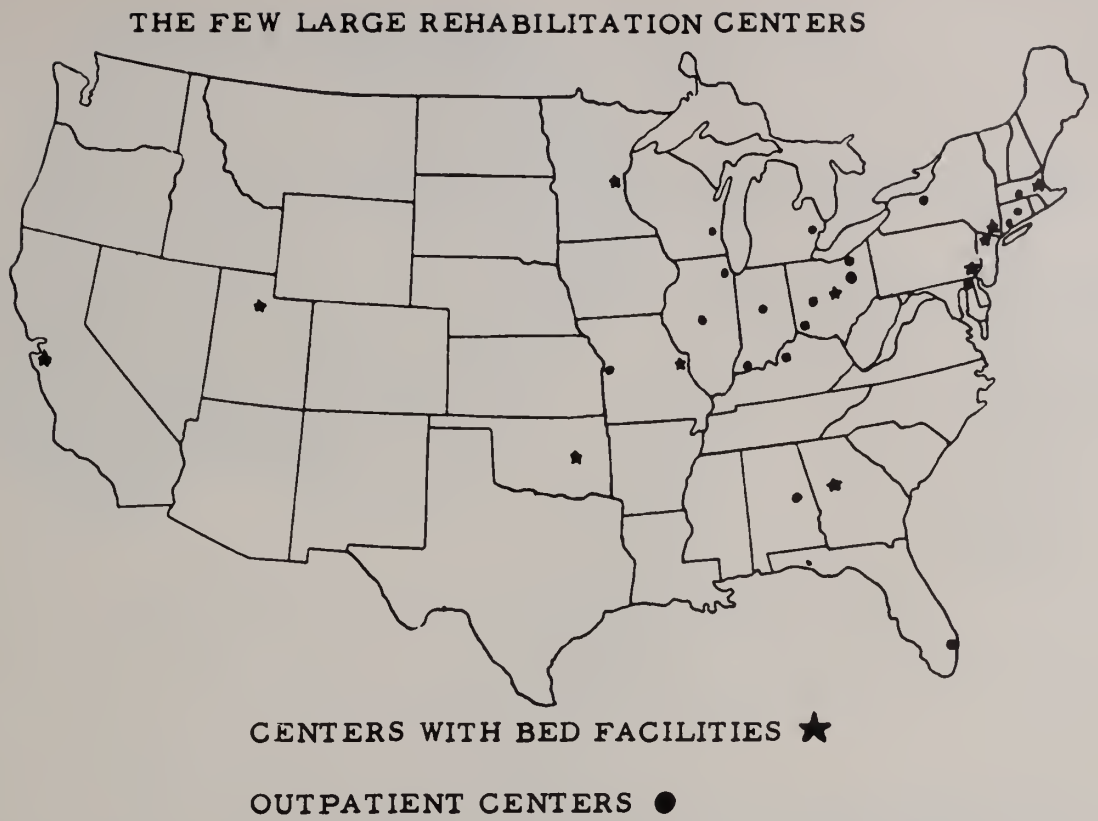

Fig. 5. This figure is reproduced with permission from What Are the Facts About Disabled People? What Can be Done for Them Through Rehabilitation?, National Health Education Committee, Inc., New York, 1957.

various specialties interested in rehabilitation will learn how to cooperate with other specialties to the benefit of the patient. The resident in physical medicine and rehabilitation will learn how to plan an adequate treatment program to minimize the effects of disease or accident. He will learn how to interpret to the other team members the physical limitations of the patient. He will also get acquainted with treatment procedures applicable to the primary injury or disease and their secondary complications or sequels. The medical student who does not plan to become a physiatrist will learn how to determine when his future patients will need comprehensive medical care, more than can be provided by one specialty alone. Both resident and student will learn how they can cooperate with the non-medical specialties to the benefit of the patient. They will learn to recognize and appreciate the contribution of these specialties to the over-all care of the patient. It will be emphasized that proper medical care alone is not sufficient to enable the patient to make the maximum psychologic, social and vocational adjustment to his disability. Physical therapy and occupational therapy students, in turn, will learn how to work together efficiently with the medical profession and the non-medical specialists.

These examples demonstrate how the student's experience will be enriched by the comprehensive training facility. He will benefit not only from the teaching provided for his own specialty, but also, to a large extent, by the teaching provided for other specialties. Thus, for example, the student in social service and vocational counseling will obtain a more extensive understanding of the medical problems, as well as the help that can be provided by physical therapy and by proper prevocational evaluation in occupational therapy. The student in psychology will learn how to guide the team by diagnostic evaluation of the psychologic difficulties of the patient and by evaluating his mental abilities. The resident in psychiatry will not only use the conventional methods of treatment, but will also learn how to help the patient resolve his difficulties by indirect treatment given by other team members.

Summary

In summary, it seems to be advantageous to

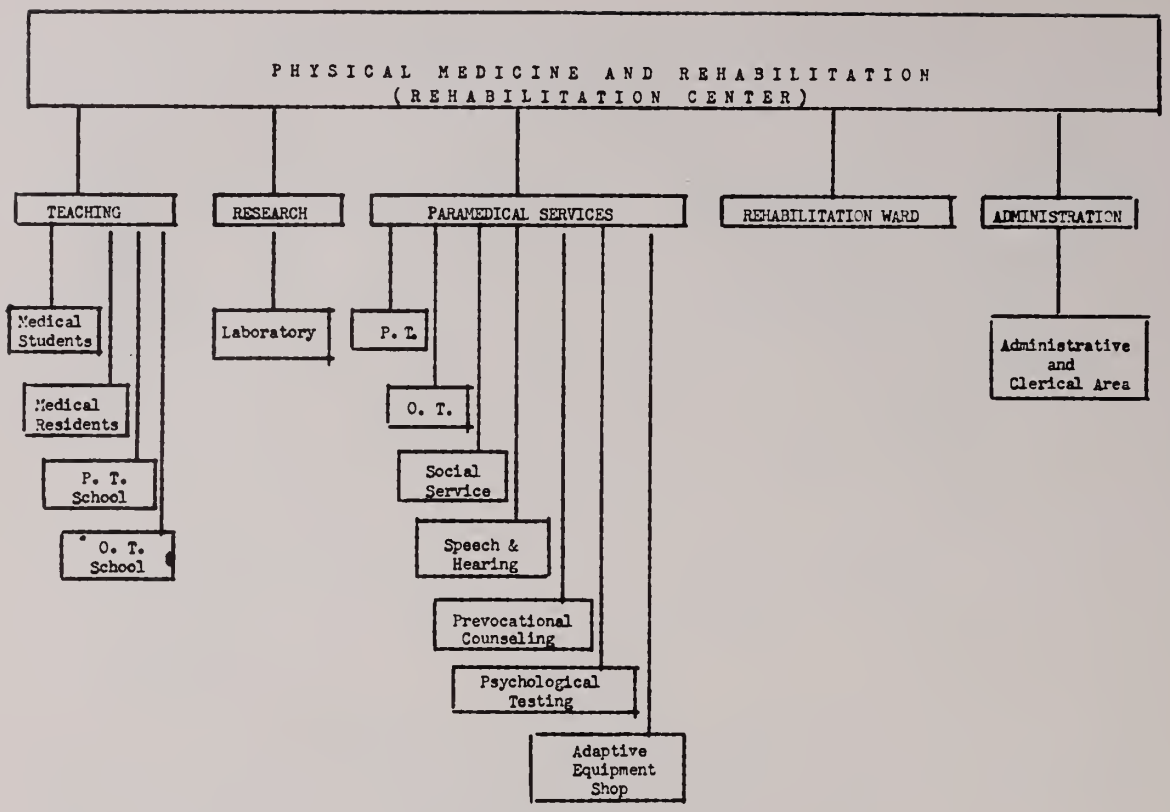

Fig. 6. Organization of the units within the Rehabilitation Center.

utilize one comprehensive training facility for all educational programs in the field of rehabilitation. It is evident that one training program will stimulate the others. Also, it is more economical to use jointly the many available facilities and courses. The location of such a training facility within a university medical school makes available for these programs a wide variety of teachers and consultants. It provides a broad research program as a basis for more profound understanding of textbook knowledge, as well as of techniques and procedures used in practice. Such a comprehensive teaching facility can provide a richer experience and a greater variety of patients to be rehabilitated than can any individual and separate program.

The training program at the University of Washington will be an integral part of the rehabilitation service in the area of the Pacific Northwest. The Center will serve as a model, and it is hoped that the experience gained will benefit other rehabilitation services yet to be established in the future.

The establishment of this program has become possible only by the generous help that the University has received from many sources. Hill-Burton funds have been made available for construction of the Rehabilitation Center. The departments of health of Oregon and Alaska made possible the transfer of funds from their states to Washington for this construction. Equipment has been provided through a grant from the Elizabeth Kenny Foundation. The Office of Vocational Rehabilitation has substantially assisted the School of Medicine in establishing the training program. Thus, this program has already become a joint effort of various individuals and agencies. •

"Unsaturated Fats and Serum Cholesterol"

...a review of the latest Concepts and Results of Current Research

Now ready for distribution to physicians as a special service by Corn Products Refining Company, this book supplements and supersedes the 1957 monograph "Vegetable Oils in Nutrition" and provides a broader coverage of this important subject.

This new book is the most up-to-date annotated bibliography on current research pertaining to:

1. The origin and behavior of cholesterol in the human body;
2. The effect of different dietary fats on serum cholesterol levels;
3. The nature of the active components in vegetable oils;
4. Suggestions for practical diets.

As a regular part of daily meals Mazola® Corn Oil can be used for control of serum cholesterol levels

MAZOLA CORN OIL, a natural food and a superior salad and cooking oil, used as part of the daily diet, can be helpful in the control of serum cholesterol levels.

Extensive clinical findings now show that serum cholesterol levels tend to be lower when an adequate amount of MAZOLA CORN OIL is part of the daily meals... high levels are lowered, normal levels remain normal.

MAZOLA...the only readily available vegetable oil made from golden corn oil... is rich in the important unsaturated fatty acids. 85% of all the fatty acids in MAZOLA are unsaturated and 56% of the fatty acid content is linoleic.

As a result, MAZOLA CORN OIL is unusually well suited for helping achieve dietary adjustments commonly recommended by authorities on nutrition—that from one-third to one-half of the total fat in-take should be of the unsaturated type when serum cholesterol control is a problem.

Being a natural food, MAZOLA CORN OIL can be included as part of the every day meals—simply and without disturbing the patient's usual eating habits.

Each Tablespoonful of Mazola* Corn Oil Provides Approximately 126 Calories—and:

Linoleic Acid	7.4 Gm.
Sitosterols	130 mg.
Natural Tocopherols	15 mg.

Typical Amounts Per Diet

For a 3600 calorie diet	3 tablespoonsful
For a 3000 calorie diet	2.5 tablespoonsful
For a 2000 calorie diet	1.5 tablespoonsful

*Reg. U. S. Pat. Off.

CORN PRODUCTS REFINING COMPANY

pneumonitis

adenitis

OREGON STATE MEDICAL SOCIETY
1115 S. W. Taylor Street
Portland 5, Oregon

ANNUAL MEETING
September 3-5, 1958
Portland

President, Vern W. Miller, M.D., Salem
Secretary-Treasurer, Max H. Parrott, M.D., Portland
Executive Secretary, Mr. Roscoe Miller, Portland

W. C. Foster, President of State Board of Medical Examiners, Dies July 4

Wilmot Coyne Foster, President of the State Board of Medical Examiners, passed away July 4. Dr. Foster, who was recently appointed to a third five-year term by Gov. Robert D. Holmes, had been a member of the State Board of Medical Examiners since 1944 and previously had served as president and secretary-treasurer. In 1957 he was elected to the Executive Committee of the Federation of State Medical Boards.

WILMOT C. FOSTER, M.D.

Dr. Foster was graduated from the University of Oregon Medical School in 1920 and received his postgraduate training from the University of Minnesota and the University of Chicago with a Master of Science Degree from the University of Oregon Medical School in 1923. He served four years as fellow in surgery at the Mayo Clinic, Rochester, Minnesota, where he was made first assistant of the Department of Surgical Anatomy.

He was formerly associate instructor of surgery and anatomy at the University of Oregon Medical School, chief surgeon for the Portland Gas and Coke Company, surgical consultant for the American Can Company, and chairman of the Selective Service Department during World War II.

Dr. Foster was a member of the medical staffs of St. Vincent, Providence, Physicians and Surgeons and Emanuel Hospitals. He served as Chief of Staff in 1952 and Chief of Surgery from 1954-1955 at St. Vincent Hospital, Portland.

Robert S. Dow of Portland Co-Authors Volume

Robert S. Dow of Portland has collaborated with Giuseppe Moruzzi of Pisa, Italy, in the publication of a 675-page volume entitled The Physiology and Pathology of the Cerebellum.

The collaboration between Dr. Dow and Dr. Moruzzi was made possible by the Fulbright research scholarship awarded Dr. Dow during the 1953-1954 academic year.

Dr. Dow is an associate clinical professor of medicine (neurology) at the University of Oregon Medical School. Dr. Moruzzi is a professor of physiology and head of the Institute of Physiology, University of Pisa.

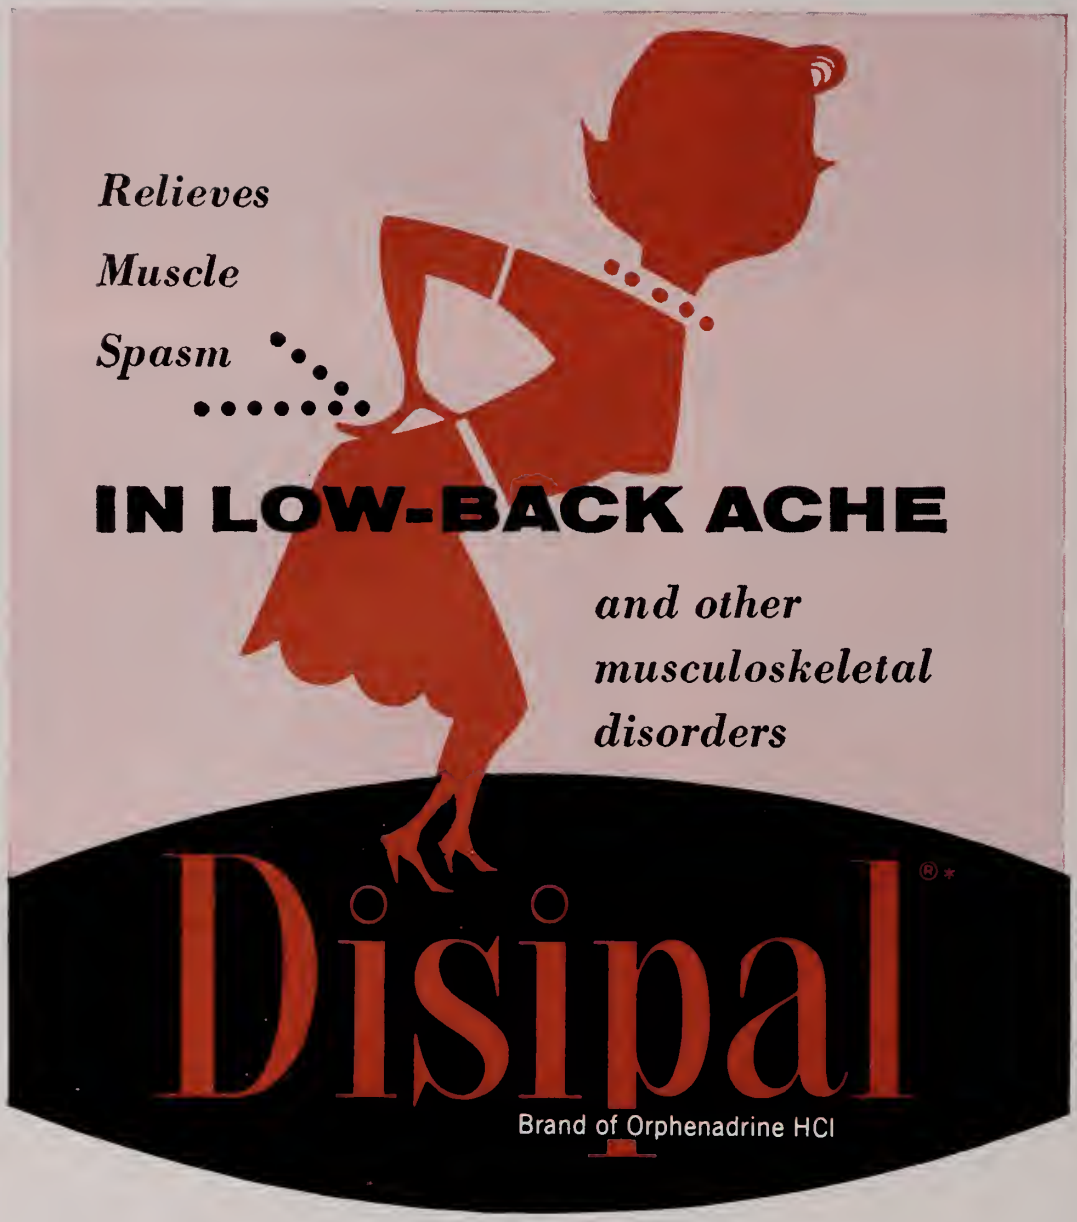
State Society Slates Investigation of Quackery Charges in Oregon

Recent national reports that quackery is on the upswing has prompted Oregon State Medical Society to initiate a state-wide investigation of instances where phony medical devices and treatment are being used to bilk the public.

At the same time the Society offered to cooperate with the State Board of Medical Examiners in stamping out the illegal practice of medicine.

Arch W. Diack, Chairman of the Society's Committee on Public Policy, reported that the Food and Drug Administration has called for more aggressive action against quackery to protect unfortunate persons who spend millions of dollars a year on fake cancer cures alone. He explained that as a voluntary organization, the Medical Society does not have the legal authority to prosecute the quack.

The Society plans to launch a public education campaign and at the same time gather information from the 25 component medical societies throughout the state regarding local incidents of possible quackery. Any information that is obtained from the communities will be turned over to the appropriate authorities.



In a recent address, Albert H. Holland, Jr., medical director for the FDA, stated that medical quackery is one of the nation's big public health problems. Dr. Holland reported the National Better Business Bureau is receiving ten times as many quackery complaints as came in two years ago.

Gordon Steinfeld Named Chairman of New Committee on Aging

Gordon D. Steinfeld of Salem has been named the first chairman of Oregon State Medical Society's new Committee on Aging and will represent the Society at the AMA Planning Conference on Medical Society Action in the Field of Aging to be held in Chicago, September 13-14.

At its July meeting the Council authorized Vern W. Miller, president, to appoint a committee to gather pertinent local information on health needs of the aged. Approval of the new committee followed a report from the Committee on Public Policy which recommended that the broad scope of the problem requires the full attention of a special committee.

In addition to surveying the needs in Oregon, the Committee on Aging will cooperate with other individuals or groups interested in providing means for senior citizens to meet their health needs.

In Parkinsonism

Highly selective action...energizing against weakness, fatigue, adynamia and akinesia...potent against sialorrhea, diaphoresis, oculogyria and blepharospasm... lessens rigidity and tremor... alleviates depression...safe... even in glaucoma.

*Trademark of Brocades-Stheeman & Pharmacia. U.S. Patent No. 2,567,351. Other patents pending.

Relieves Spasm, Pain, and Depression too

In muscle spasm due to sprains, strains, herniated intervertebral disc, fibrositis, noninflammatory arthritic states and many other musculoskeletal disorders, the first demand is for relief. Disipal fills this need. It is quickly effective in skeletal muscle spasm almost regardless of origin. Its mood-alleviating effect braces the patient against the depression so often accompanying severe pain of any type.

Dosage: 1 tablet (50 mg.) t.i.d.

Riker LOS ANGELES

Oregon Academy of General Practice Announces Program for Annual Session, Oct. 16-17

Oregon Academy of General Practice will hold its Annual Scientific Session October 16 and 17, 1958, at the Multnomah Hotel in Portland.

The scientific program features 14 outstanding speakers, with topics chosen especially for the general practitioner. The schedule includes talks by E. Gray Dimond, Professor of Medicine at University of Kansas; Abou D. Pollack, Assistant Professor of Pathology at John Hopkins University and Pathologist for Baltimore City Hospital; and John Armes Gius, Professor of Surgery at University of Iowa.

Fred Mac D. Richardson, Coordinator of Professional Affairs for Pennsylvania Hospital, will speak at the Annual Banquet October 16, on The Future of General Practice. Luncheon speaker that day will be John G. Walsh of Sacramento, California, Chairman of the AAGP Board of Directors. Dr. Walsh's topic is Proper Relationship Between Medical Profession and the Third Party.

Social events planned for the meeting include, in addition to the Annual Banquet, a luncheon and fashion show for the ladies on Friday, and a golf tournament on Saturday morning, October 18.

There is a non-member registration fee of $5.00, except for students, interns and residents. Ten hours of AAGP Category I credit will be granted for attendance.

PROGRAM

Oregon Academy of General Practice
1958 Scientific Session

October 16 and 17
Multnomah Hotel, Portland

THURSDAY, OCT. 16:

7:30- 9:30	Congress of Delegates
8:00-10:00	Opening of Registration and Exhibits
10:00-10:30	Pediatric Allergies G. J. Schunk, M.D., *Salem* *Clinical Instructor Pediatrics, UOMS*
10:30-11:00	Treatment of Plantar Warts and Keratosis Bertram L. Trelstad, M.D., *Salem* *President, OAGP*
11:00-12:00	Treatment of Breast Diseases: Some Controversial Issues John Armes, M.D. *Prof. of Surgery, U. of Iowa*
12:00- 1:30	Luncheon: Proper Relationship Between Medical Profession and the Third Party John G. Walsh, M.D., *Sacramento, Cal.* *Chairman, AAGP Board of Directors*
1:30- 2:00	Peripheral Vascular Disease Toshio Inahara, M.D. *Clinical Instructor Surgery, UOMS*
2:00- 2:30	Recognition of Gross Surgical Pathology Joseph E. Nohlgren, M.D. *Clinical Instructor Pathology, UOMS*
2:30- 3:00	Treatment of Hand Injuries Laurence R. Langston, M.D. *Clinical Instructor Orthopedics, UOMS*
3:00- 4:00	Recess to Visit Technical Exhibits
4:00- 5:00	Lupus Erythematosis Abou D. Pollack, M.D. *Asst. Prof. Pathology, Johns Hopkins U.*
6:00- 7:30	Social Hour and Annual Banquet— The Future of General Practice Fred Mac D. Richardson, M.D., *Philadelphia* *Coordinator of Prof. Affairs, Penn. Hosp.*

FRIDAY, OCT. 17:

7:30- 9:30	Congress of Delegates
8:00-10:00	Opening of Registration and Exhibits
10:00-10:30	Hernia Repair Millard S. Rosenblatt, M.D. *Assoc. Clinical Prof. Surgery, UOMS*
10:30-11:00	Hazards of Tonsillectomy Richard J. O'Shea, M.D., *Oswego, OAGP*
11:00-12:00	How To Be Sick Successfully Thomas Holmes, M.D. *Prof. Psychiatry U. of Wash. School of Medicine*
12:00- 1:30	Luncheon: Panel Discussion Robert L. Mighell, M.D., *Moderator* A. D. Pollack, M.D. E. G. Dimond, M.D. J. A. Gius, M.D. Thomas Holmes, M.D.
1:30- 2:00	Practical Consideration of Anemia Bernard Pirofsky, M.D. *Instructor Medicine, UOMS*
2:00- 2:30	How To Treat Carcinoma of the Cervix Ivan I. Langley, M.D., *Portland*
2:30- 3:00	Fracture Session Howard L. Cherry, M.D. *Clinical Instructor Orthopedics, UOMS*
3:00- 4:00	Recess To Visit Technical Exhibits
4:00- 5:00	Exercise Electrocardiogram As an Ofifce Procedure E. Gray Dimond, M.D. *Prof. Med., U. of Kansas*

SATURDAY, OCT. 18:

7:30 A.M.	Golf Tournament—Columbia Edgewater Golf Club

J. V. Straumfjord Named by Governor To State Board of Medical Examiners

Jon V. Straumfjord of Astoria has been appointed by Governor Holmes of Oregon to the State Board of Medical Examiners to fill the vacancy created by the death of Wilmot C. Foster.

Dr. Straumfjord, recommended to the governor by Oregon State Medical Society, was graduated from the University of Oregon Medical School in 1929 and later served his internship at Multnomah County Hospital. From 1929 to 1934 he was on the staff of the University of Oregon Medical School and from 1930 to 1934 was a staff member of the Dr. Robert C. Coffey Clinic and Hospital. He has engaged in private practice in Astoria since 1934.

JON V. STRAUMFJORD, M.D.

His professional affiliations include membership and past-presidency of the North Pacific Society of Internal Medicine and membership in the American College of Physicians. Dr. Straumfjord is a member of the board of trustees of NORTHWEST MEDICINE.

Dr. Straumfjord's two older sons, Jon V. and A. Allen, are both physicians, the first being at present resident in clinical pathology at Providence Hospital, Portland, and A. Allen being flight surgeon in the U.S. Navy. His youngest son, Robert W., is a senior medical student at the University of Oregon Medical School.

Postgraduate Meeting To Coincide with Oregon-Oklahoma Football Game

Oregon physicians planning to attend the Oregon-Oklahoma football game Oct. 4, 1958, will have an opportunity the same weekend to take advantage of a postgraduate meeting at the University of Oklahoma Medical Center. Postgraduate sessions are scheduled for October 3 and 4.

Program of the two-day meeting is as follows: Friday, October 3—9:00 A.M. to 5:00 P.M., A combined scientific session; 7:30 P.M., Dinner at the Faculty Club for registrants and their ladies. Saturday, October 4—8.30 A.M. to 10:30 A.M., Choice of five pre-game breakfast round table conferences: Surgery, medicine, pediatrics, obstetrics, gynecology.

Those wishing additional information and final program are asked to write the Office of Postgraduate Education, University of Oklahoma Medical Center, 801 N.E. Thirteenth Street, Oklahoma City 4, Oklahoma. Tickets to the football game may be obtained by writing to University of Oklahoma Athletic Ticket Office, Norman, Oklahoma.

Committee of Multnomah Medical Society Reports Misdirections of Public Health Office

Committee on Medical Economics of the Multnomah County Medical Society reported to the Society on August 5 that misdirection had been taken by the Multnomah County health officer in the fields of immunization and patient-care in general services to the community. This report was accepted by the Council of the County Society.

Conclusion of this special report read as follows: "Your committee recommends that the matters covered by this report be transmitted to the Director of the Oregon State Board of Health and that the Council (of the Multnomah County Medical Society) provide for a similar investigation to be conducted not later than a year hence to ascertain what changes in the policies of the Division (Multnomah County Division of Public Health) have been effected."

As directed in the report, the County Society has sent a letter to Harold M. Erickson, State Health Officer, suggesting a meeting between Dr. Erickson, the Multnomah County and Portland Health Officers, the Executive Committee of the County Society and the Committee on Medical Economics to further consider this matter.

KIDS LOVE IT!

ANELIX

ANALGESIC and ANTIPYRETIC

in TASTY liquid form

safer ... more effective than aspirin*

Use: to reduce pain, relieve itching, and lower temperature. Excellent adjunct to antibiotic and sulfanomide therapy.

Each teasp. of Anelix contains 120 mgm. of N-acetyl-p-aminophenol (Kirkman) in a raspberry flavored vehicle.

*R. C. Batterman & A. J. Grossman: Analgesic effectiveness and safety of N-acetyl-p-aminophenol, Federation Proc. 14; 316-317, March 1955.

KIRKMAN PHARMACAL CO. Seattle 99, Washington

This article was prepared by the authors to acquaint the physicians of Oregon and the Northwest with the purpose and nature of the Medford Boys' Growth Study. The increasing stress on physical fitness and participation in competitive athletics should make this study of special interest to physicians and other groups concerned with the health and growth of our youth. JOHN F. ABLE, M.D.,* *Portland*

Medford Boys' Growth Study

H. HARRISON CLARK, Ed.D.,
RESEARCH PROFESSOR AND PRINCIPAL INVESTIGATOR
UNIVERSITY OF OREGON, EUGENE

ARTHUR A. ESSLINGER, PH.D., DEAN
SCHOOL OF HEALTH AND PHYSICAL EDUCATION
UNIVERSITY OF OREGON, EUGENE

Because of the troublesome problems arising from inter-school competitive athletics for boys among Oregon elementary schools, the Oregon Association of District Superintendents in January 1955 requested the Joint Staff Committee** to study whether or not current practices were harmful to the physical and emotional welfare of the participants. The Joint Staff Committee requested the School of Health and Physical Education, University of Oregon, to consider the matter and in so doing to consult with the University of Oregon Medical School on a research plan designed to obtain answers to these problems. The authors and representatives from the Medical School prepared an elaborate ten-year research plan involving approximately $500,000. The cost of this study was considered so prohibitive that it could not be undertaken. Instead, the Joint Staff Committee proposed that smaller phases of the problem be attempted if financial support could be found. This project was also discussed in the Advisory Council on Health, Education and Fitness of the Joint Staff Committee. This council includes representatives from various educational organizations along with representatives from the Oregon State Medical and Dental Societies.

Background of Study

Subsequently, the School of Health and Physical Education was able to raise a small budget to initiate a study involving certain of the non-medical and non-physiologic aspects of the much more extensive plan proposed jointly with the Medical School. During the first year, the study was sponsored by the University of Oregon, Southern Oregon College, Athletic Institute (Chicago, Illinois), and the Medford, Oregon, public schools. Inasmuch as this budget was sufficient only to permit the administration of the necessary tests, the Oregon State Department of Education provided an additional grant during the second year of the study to aid in the statistical treatment of the test data; the overall amount of funds for this year is approximately $6,000.

The subjects included in this study are public school boys in Medford, Oregon. Medford was chosen for three reasons as follows: (1) Organized inter-school athletic competition has been conducted in the late elementary grades for many years, which thus permits a study of the athletic problem at this early level. (2) The Medford School System had an outstanding health examination program. (3) The Superintendent of Schools, Leonard B. Mayfield, and the Director of Physical Education, Lee V. Ragsdale, indicated strong enthusiasm and pledged financial support for the project. The selection of Medford proved advantageous in another respect. Through the interest and efforts of Mr. Theodore Schopf, Athletic Director, the nearby state institution, Southern Oregon College, volunteered testing and financial help.

Purposes of Study

The overall and long-range purposes of the Medford Boys' Growth Study are as follows:

1. To construct physical and motor growth curves for such factors as the following: maturity indices, body structure measures, coordinated muscular strength elements and batteries, strength of individual muscle groups, agility and speed, explosive muscular power, and reaction time.

2. To contrast all traits in the study for boys at different levels of athletic ability, with special emphasis upon those who make and who do not make athletic teams competing in inter-school competition.

3. To relate the various physical and motor growth factors to: skeletal age, adolescent development, somatotype, growth level, nutritional status, socio-personal adjustment, and scholastic aptitude and achievement.

4. As concomitant studies: to revise and construct

(Continued on page 1188)

*Chairman, Committee on School Health and Representative to the Advisory Council to the Joint Staff Committee of the State Department of Education, the State Board of Health and the State System of Higher Education—Oregon State Medical Society. Member, Joint Committee on Health Problems in Education of the American Medical Association and the National Education Association.

**The Joint Staff Committee consists of representatives from the State Department of Public Health, the State Education Department, and the State System of Higher Education.

(Continued from page 1187)

strength tests for upper elementary, junior high, and senior high school boys; and to determine the interrelationships of the various factors included in the study at various age levels.

Analysis Permitted by Study

The study is planned to permit the following series of analyses:

1. Cross-sectional analysis for upper elementary and junior high school boys, or, more specifically, boys 9 to 15 years of age inclusive. For this analysis, 40 boys were tested at each of the seven ages; thus, the total sample consisted of 280 boys.

2. A semi-longitudinal, or convergent, analysis, based on four-year sequences with each fourth year overlapping. The overlapping ages will be 9, 12, and 15 years. For this analysis, a total of approximately 100 boys were initially tested at these ages and at 7 years of age.

3. A longitudinal study, especially from 7 to 18 years, if time and continued financing permit. In this situation, the boys tested during 1956-57 at the ages of 7, 9, 12, and 15 years would be tested annually until they graduated from high school. The growth changes for each of these boys would then be analyzed.

All subjects had received the usual health examination required by the school system and were approved by examining physicians for full participation in the school physical education program. Tests are administered within two months (before or after) of each boy's birthday to insure adequate homogeneity as related to chronologic age.

Conclusion

This research project should make a significant contribution to our knowledge of the physical and motor performances of boys at different ages and the relationship of these factors to psychologic and social development and to scholastic aptitude and achievement. Additional understanding of these physical and motor factors that are the most significant growth indicators, particularly during adolescence, should also be possible. Furthermore, the study should provide essential information contrasting the basic traits of boys who make and who do not make inter-scholastic athletic teams, as a phase of solving that perplexing problem of whether young boys should participate in this form of competition. •

HYLAND'S PINK ASPIRIN FOR CHILDREN

Gives 27-56% higher blood levels of salicylate

THE ONLY ASPIRIN FORMULATED ESPECIALLY FOR INFANTS

In a recent test of three "infants' & children's" aspirin tablets*...results conclusively showed that Hyland's Pink Aspirin for Children produced blood levels of salicylate 27-56% higher than the other brands. • Here's why: Hyland's Pink Aspirin for Children is the only Triturate. Triturates, often used for injection, are absorbed more quickly...safely. Hyland's contains no starch or binder ...ingredients used in compressed tablets which retard assimilation. Controlled dosage for any age—no inaccurate breaking of adult-type tablets. • No "emotional trauma" for your infant patients...specify Hyland's Pink Aspirin for Children (they love the raspberry flavor)...the Triturate tablet that's specially formulated for them! *detailed report sent on request

ANNUAL MEETING
Spokane
September 14-17, 1958

President, Milo T. Harris, M.D., Spokane Secretary, F. A. Tucker, M.D., Seattle Executive Secretary, Mr. R. W. Neill, Seattle

Twelve Scientific Films Scheduled at State Medical Convention

Twelve scientific films of current medical interest will be shown on Monday, September 15, during the 1958 convention of the Washington State Medical Association in Spokane, according to an announcement by President Milo T. Harris.

The films will be shown in the Isabella Room of the Davenport Hotel, where the convention will be held September 14-17. The movie program was arranged particularly for physicians not participating in the convention sports activities which will be held that day.

A. H. Robnett of Spokane, chairman of the scientific film program, announces the following schedule:

SCIENTIFIC MOVIES
Monday, September 15
Isabella Room

MORNING PROGRAM

9:00 a.m.—Hypnotism

Paul Starr, Los Angeles

The full range of thyroid hypofunction, from frank myxedema to mild or subclinical hypothyroidism (metabolic insufficiency) is covered in this film. Physiology, diagnosis, and therapy are each discussed and illustrated by actual cases. Particular reference is made to diagnostic problems and newest concepts in diagnostic methods. Color, sound, 30 minutes.

9:30 a.m.—Technique of Proctoscopy

Raymond J. Jackman and Edward R. Morgan, Rochester, Minnesota

This motion picture demonstrates on a sagittal section of the pelvis, as well as endoscopic photographs on a live model, the technique of passing the protoscope. Color, sound, 16 minutes.

9:56 a.m.—Hemorrhoids or Piles and the Early Detection of Rectal Cancer

A. Lawrence Abel and H. Gordon Ungley, London

This film presents a modern approach to differential diagnosis and treatment of internal and external hemorrhoids with particular reference to the identification of associated pathological conditions of anus and rectum. Color, sound, 24 minutes.

10:25 a.m.—Treatment of Edema in Congestive Heart Failure

A review of the normal and abnormal fluid and electrolyte content and balance of the body as they relate to congestive heart failure is presented. The backward and forward failure theories are explained and the various means for controlling edema of this type are discussed. Color, sound, 20 minutes.

10:50 a.m.—Fractures About the Knee

William Larmon, Chicago

This film explores the anatomy of the joint and its surrounding structures as they affect and are affected by fractures in the area. Management of three fractures are then detailed: fractures of the patella, intercondylar fractures of the femur, and fractures of the tibial plateau. Color, sound, 24 min.

11:19 a.m.—Bilateral Upper Extremity Amputation

Francis M. Brink and David E. Sullivan, Spokane

What a person can do in spite of a serious handicap is illustrated in this film. It shows a woman, about 40, with bilateral upper extremity amputations a very short distance below the elbow joints. She is not wearing prostheses. She is doing housework, changing a baby, and even doing fancy needlework. This woman is married, reared four children, and made their clothes. Color, sound, 9 min.

11:33 a.m.—Breech Delivery

Bruce Mayes, University of Sydney, Australia

This film demonstrates the types of breech presentation, their relation to pelvic types, diagnosis by palpation and x-ray, x-ray pelvimetry, and external version. Breech extraction is then demonstrated using the Lovsett technique to deliver the arms. Color, sound, 18 minutes.

AFTERNOON PROGRAM

2:00 p.m.—Human Gastric Function

Stewart Wolf, Oklahoma City, Oklahoma

A unique patient widely known in medical circles had an accident in early child-

(Continued on page 1192)

(Continued from page 1191)

hood which resulted in an extensive gastric fistula. The fistula permitted examination of the mucosa, secretory action and gastric motility under varying conditions. These studies gave the investigators new insight into the stomach's complex responses to different psychological states and stresses. Color, sound, 18 minutes.

2:23 p.m.—Aneurysms of the Abdominal Aorta; Surgical Considerations Based Upon Analysis of 500 Cases

Michael E. De Bakey, Denton A. Cooley and E. Stanley Crawford, Houston, Texas

This film is concerned with surgical considerations of aneurysms of the abdominal aorta treated by resection and replacement by aortic homografts and various plastic substitutes. Certain characteristic clinical, pathologic and diagnostic features of these aneurysms are illustrated. Emphasis is placed upon surgical management. Color, sound, 27 minutes.

2:55 p.m.—Congenital Atresia of the Esophagus

Willis J. Potts, William L. Riker and Arthur DeBoer, Chicago

The management of the newborn infant with congenital atresia of the esophagus and tracheoesophageal fistula represents an interesting, almost classic example of medical and surgical achievement. This film depicts the signs and symptoms of the condition, the diagnostic procedures, the operation itself and the postoperative care. Color, sound, 23 minutes.

3:23 p.m.—Disorders of the Heart Beat

American Heart Association, New York

This film presents material on atrial and ventricular premature beats, on atrial and ventricular paroxysmal tachycardia, on atrial flutter and fibrillation, ventricular fibrillation and on certain conduction defects. Color, sound, 17 minutes.

3:45 p.m.—Auto Crash

John More, Ithaca, New York

This film shows the results of automobile crash injury research at Cornell University, and how this information was used in developing safety features in automobiles. Black and white, sound, 15 minutes.

(The following films, which are described above, will be shown a second time during the afternoon.)

4:05 p.m.—Hemorrhoids or Piles and the Early Detection of Rectal Cancer

4:34 p.m.—Breech Delivery

Washington State Obstetritians To Meet in Spokane October 11

Washington State Obstetrical Association fall meeting is slated for Saturday, October 11, at the Davenport Hotel, Spokane. Guest speakers will be: Duncan E. Reid, Boston, professor of obstetrics, Harvard Medical School, and Keith P. Russell, Los Angeles, University of California School of Medicine.

The program is as follows:

9:00 Registration
9:30 *Management of Labor and Delivery*
Duncan E. Reid, M.D.
10:30 *Forensic Obstetrics*
Keith P. Russell, M.D.
12:00 Luncheon and Round Table
Richard D. Reekie, M.D., Moderator
2:30 *Repetitive Abortion and Premature Labor*
Duncan E. Reid, M.D.
3:30 *Pregnancy and the Thyroid Gland*
Keith P. Russell, M.D.
4:30 Business Meeting
6:00 Social Hour
7:00 Banquet
The Doctor's Wife Tells the Truth
Mrs. Mary Bard Jensen

Advance registration is necessary. Fee is $11 for members and $15 for non-members, which includes luncheon, social hour and banquet. Wives are invited to the social hour and banquet and the charge is $5. Those planning to attend the fall session are asked to make their checks payable to Washington State Obstetrical Association and mail to 1420 Seneca St., Seattle 1.

Hypertension and Congestive Heart Disease Is Theme of Annual Symposium

Four outstanding authorities in the field of heart disease will speak at the Washington State Heart Association's Annual Symposium Friday and Saturday, October 17 and 18, at the University of Washington. The sessions are co-sponsored by the State Health Department.

Guest speakers are: Sir George White Pickering, Regius Professor of Medicine, University of Oxford, England; Carleton Chapman, Professor of Medicine, University of Texas, Dallas, Texas; Lewis Dexter, Professor of Medicine, Harvard University, Boston, Massachusetts; and James V. Warren, Professor of Medicine, Duke University, Durham, North Carolina.

Robert Bruce of Seattle, Chairman of the Symposium Planning Committee, has announced that "Hypertension and Congestive Heart Disease" is the theme for the tenth annual scientific sessions.

Highlights of the program include: Starling's Concepts of Heart Failure in Man and Concept of Essential Hypertension, Sir Pickering; Hemodynamic Effects of Exercise and Response of Hypertensive Patients to Physical Exercise, Dr. Chapman; Clinical-Physiologic Correlations of Congestive Heart Failure and Cardiac Output and Congestive Heart Failure, Dr. Dexter; Treatment of Congestive Failure and The Natural History of Hypertensive Disease in Man and Hypertension in the Giraffe, Dr. Warren.

Guest speakers at the Annual Symposium Banquet Friday evening at the Washington Athletic Club will be both Dr. and Mrs. Warren. Gloria Warren is the author, with Evelyn Stead, of one of the most widely-known volumes on low-fat cooking.

As in previous years, abstracts of papers to be presented will be available at the Symposium. There is no registration fee. The Symposium is approved for credit in Category I, American Academy of General Practice.

HE NEEDN'T BE HIGH-STRUNG

WEIGHT REDUCTION: Obese patients may resist dieting because they fear losing the emotional security often involved in overeating. **AMBAR** helps them hold the diet line by giving them a more alert, brighter outlook. **WITHOUT JITTERS:** Methamphetamine, a potent CNS augmenter, produces less cardiovascular effect than amphetamine. In **AMBAR** it is combined with just enough phenobarbital to prevent overstimulation. **AMBAR EXTENTABS** provide 10-12 hours of appetite suppression in one controlled-release, extended-action tablet: methamphetamine hydrochloride, 10.0 mg.; phenobarbital (1 gr.) 64.8 mg. **AMBAR TABLETS** for conventional dosage or intermittent therapy contain methamphetamine hydrochloride, 3.33 mg.; phenobarbital (⅓ gr.) 21.6 mg. Senator Jackson Proposes More Social Security

U. S. Sen. Henry M. Jackson (D., Wash.) has announced that 194,334 Washington State residents were receiving monthly benefits totalling $11,007,000, an average of slightly less than $57 per month, as of the end of last year.

The figures for 1957, just released by the Department of Health, Education and Welfare, cover benefits paid for retired workers, wives or husbands, children, widows or widowers, mothers, parents and disabled workers.

Jackson believes the low average shows need for further increase in Social Security disbursement citing cost-of-living increase every month for almost two years. He said he would support in the Senate "at least" 7 per cent increase in benefits voted by the House, together with certain other refinements of the law.

The pending changes would grant flat 7 per cent increases, or a minimum increase of $3 to each insured worker, would raise the individual ceiling from $108.50 to $118 per month, and the family limit from $200 to $254 per month These changes apply to those now on the roles. Insured workers coming on roles in the future would be eligible for up to $127 per month.

Of the Washington State recipients, Jackson said 2,537 were disabled workers between the ages of 50 and 64 who benefitted for the first time by 1956 changes he co-sponsored in the Social Security Act making disabled workers over 50 eligible for benefits.

Jackson said another 1956 amendment he co-sponsored, lowering the women's retirement age to 62, meant that throughout the nation some 300,000 women, 63-64, started receiving benefits for the first time; no state breakdowns of this figure were available.

The Secretary of Health, Education and Welfare, reported that more than 11 million persons were sharing in the Social Security program at the end of 1957. This total represented an increase of approximately two million beneficiaries as a result of 1956 amendments to the law.

Spending Growth to Perplex Legislature

Washington State, according to the Research Council estimates, will end the current biennium next June 30 with a deficit of about $100 million in the General Fund. To avoid running the red ink into larger figures during the following two years, the Legislature (assuming normal growth of present revenues) will have to find an additional $173 million.

Subcommittees of the Governor's Tax Advisory Council have made some major recommendations for taxation changes, but the Tax Council itself has not yet acted upon them. The Research Council estimates that these recommendations would yield at least $25.8 million more to the State (and probably an indefinite additional amount).

Future state spending, however, is due to go up sharply because of increases in the number of persons receiving services from programs now in effect. Without any change in the levels of service, we estimate that upwards of an additional $133 million may be required in 1959-61 principally in welfare, public schools, higher education and institutions.

The estimate of a net $25.8 million total increase in revenue from recommendations by Tax Advisory Council subcommittees includes the following additional taxes:

1) A business and occupation tax on farming (exempting part-time agricultural pursuit) at the rate of 0.4 per cent; 2) a B & O tax on income from property rental at the rate of 0.4 per cent; 3) a sales tax on personal services at the present rate; 4) an insurance premiums tax on medical service bureaus and health care agencies at the present rate.

In addition to the above changes, there were two major recommendations (tax on financial institutions and intangibles) for which no revenue estimate was possible because of a lack of experience in determining the extent of the base.

All of these proposals together would not even come close to producing the estimated $173 million additional needed income. That point re-emphasizes the Research Council's position that it never has been more imperative to re-examine the State's services in relation to the public's willingness and ability to pay for them.

To put the question another way: If our income, based on present taxes, will be about $670 million for the next fiscal period, should we continue spending at the rate of $843 million and levy taxes to make up the difference?

Taken from report of the Washington State Research Council, July 24, 1948.

GET YOUR BABIES OFF TO A STRONG START WITH

Happy Jeanette, aglow with health, is a Baker's Blue Ribbon Baby.

Baker's

MODIFIED MILK

A complete formula in liquid and powder form prepared exclusively from Grade A Milk

Doctor, your dietary decision can build *Blue Ribbon* babies. The baby who wins the blue ribbon is the one whose doctor—no one else—selects its formula.

BAKER'S MODIFIED MILK BUILDS BLUE RIBBON BABIES

- A complete, balanced uniform formula.
- Convenient and easy to prepare—simply add water.
- Made from milk of outstanding purity.
- Provides adequate amounts of all known essential vitamins plus much-needed iron.
- Butterfat replaced by easily digested vegetable oils.
- Twice homogenized for better digestion and absorption.
- Helps doctor control infant's formula longer. Advertised to the medical profession only.
- Economical to use—eliminates need for additional vitamins and iron.

Available in drug stores

WSMA Executive Committee Urges Poliomyelitis Immunization of Preschoolers

The attack of paralytic poliomyelitis in the preschool child is three to four times that of the older child. This fact has recently been emphasized by the American Academy of Pediatrics in a drive they are sponsoring to get the preschool child immunized against poliomyelitis. In the State of Washington we hope every physician will bear these facts in mind and that he will check on each preschool child who comes to his notice, either to initiate poliomyelitis immunization, or complete those already started.

Locations

Frank F. Allen has joined the surgical staff of the Wenatchee Valley Clinic. He will head the department of urology. Dr. Allen received his medical degree from Tufts College Medical School in 1948. He served an internship and residency at the U. S. Naval Hospital, Chelsea, Mass., and on completion served as medical officer aboard the USS Oriskany, 6th Fleet Hospital Ship. Following his specialty training in urology at the US Naval Hospital, San Diego, Calif., Dr. Allen was Chief, Urology Department Naval Hospital, Guam, Mariana Islands.

Waverly Ellsworth, heart surgeon and former clinical instructor in surgery at the University of Michigan Medical School, has opened offices in Spokane. Dr. Ellsworth was graduated from the University of Buffalo School of Medicine in 1949 and interned at Mary Hitchcock Memorial Hospital, Hanover, N.H. He completed two years of anesthesia and general surgical training at Hitchcock, in Boston and at the Veterans Hospital in White River Junction, Vt.

Richard T. Andersen has joined the staff of the Snoqualmie Valley Clinic in Snoqualmie as a general practitioner. Dr. Andersen is a graduate of St. Louis University of Medicine and took his internship at Providence Hospital, Seattle.

Thomas W. Skalley has become associated with the Everett Clinic in Everett. Dr. Skalley received his medical training at the University of Washington School of Medicine from which he was graduated in 1954. He served his internship at Charity Hospital, New Orleans, and then remained at that same hospital until 1958 as resident physician in obstetrics and gynecology.

John Lorang has entered into association with Galen A. Rogers in Clarkston. Dr. Lorang received his medical degree from the Stritch School of Medicine of Loyola University, Chicago. For the last two years he has been at Sacred Heart Hospital, Spokane, where he first served his internship and then served as senior resident surgeon.

Ralph Eddings has joined the staff of the Snoqualmie Valley Clinic in Snoqualmie where he will engage in general practice. Dr. Eddings completed his medical studies at the University of Washington School of Medicine. Following his internship at King County Hospital, he served a one-year residency in surgery at the Veterans Hospital in Seattle.

Theodore J. Fuller has joined the department of internal medicine at the Wenatchee Valley Clinic. Dr. Fuller received his medical degree from Washington University School of Medicine, St. Louis, Mo., in 1953. He served his internship and residency at Barnes Hospital, St. Louis. In 1956 he was associated with the University of Washington School of Medicine where he was awarded a fellowship by the National Heart Institute to conduct special research in diseases of the heart and lungs. Prior to coming to Wenatchee he was in the private practice of internal medicine, specializing in diseases of the chest, with offices in Seattle.

Roderick S. Coler has opened offices in Kennewick for the practice of internal medicine and diagnosis. Dr. Coler was graduated from New York Medical College, Flower and Fifth Avenue Hospitals, in 1954. He interned at Good Samaritan Hospital in Portland and then took his specialty residency training at the Veterans Administration Hospital, Portland.

John M. Bell has joined Malcolm Heath for the practice of medicine in the San Juan Islands. Dr. Bell was graduated from Standford University School of Medicine in 1945 and had been associated with the Palo Alto Clinic in California since 1947.

Joseph W. Brasch has entered into association with John J. Black of Spokane for the practice of obstetrics and gynecology. Dr. Brasch received his medical degree in 1954 from the Stritch School of Medicine of Loyola University, Chicago, and served his internship at Sacred Heart Hospital, Spokane. He took his residency training at Evanston, Ill.

Ralph A. Foster has resumed his practice in Yakima following four years of postgraduate study of surgery at Seattle. Dr. Foster took his surgical training at the Virginia Mason Hospital. After completing his training at the Hospital, he accepted a one-year fellowship in surgery at the Mason Clinic where he was associated with Joel Baker. Dr. Foster is a 1938 graduate of the University of Oregon Medical School.

R. Hugh Minor has opened offices in Kennewick for the practice of ophthalmology. Dr. Minor is a 1954 graduate of the University of Washington School of Medicine. He served a one-year internship at Philadelphia General Hospital and recently completed three years service as a fellow in ophthalmology.

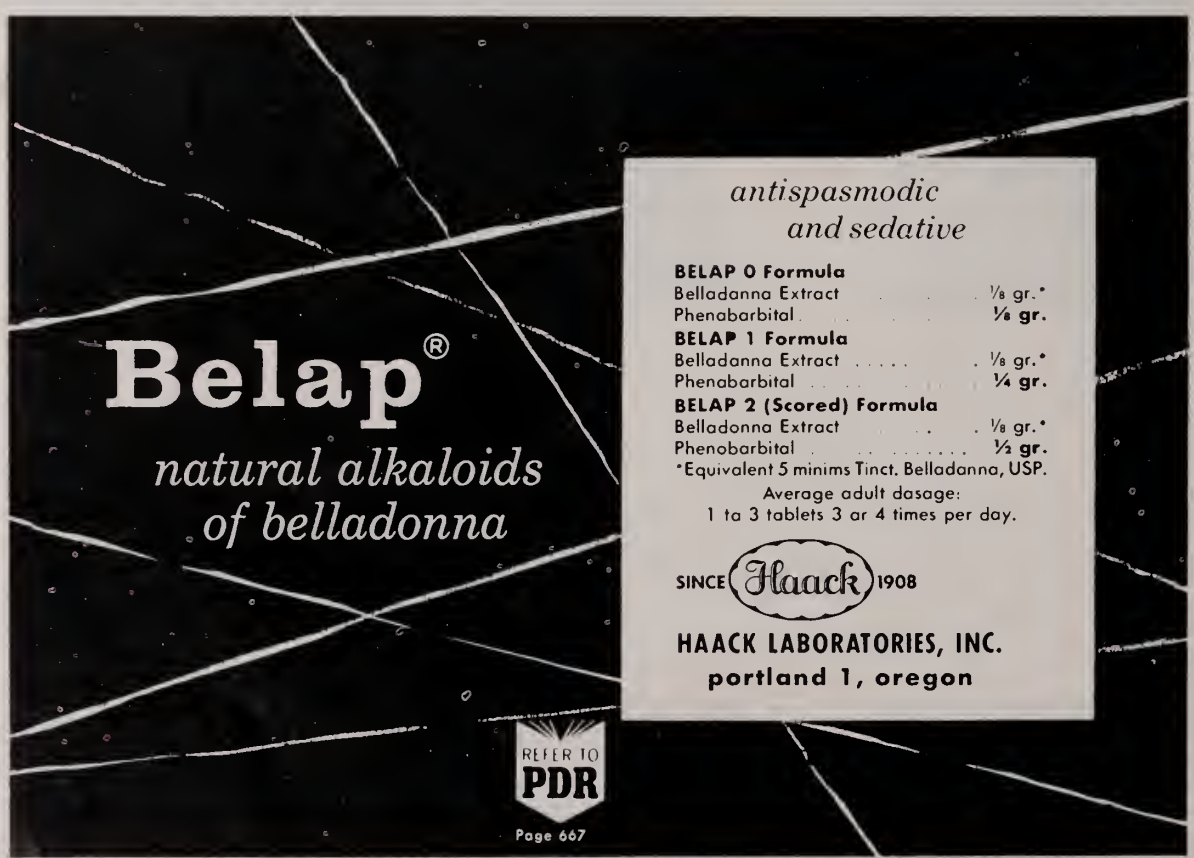
Charles Illingworth of Glasgow To Give Strauss Lecture at U.W.

On Friday, November 7, Professor Charles F. W. Illingworth will give the Ninth Annual Alfred A. Strauss Lecture sponsored by the Department of Surgery of the University of Washington School of Medicine. Professor Illingworth. Regius Professor of Surgery at the University of Glasgow, Scotland, will speak on Endocrine Aspects of Breast Cancer. The lecture will be held in the Auditorium of the Health Sciences Building, University of Washington, at 8:15 p.m. Previous Strauss Lecturers have been Alfred A. Strauss, Dallas Phemister, Warren Cole, Owen Wagensteen, Lester Dragstedt, Edward Churchill, and Alfred Blalock.

Prof. Charles F. W. Illingworth

Professor Illingworth is president of the British Society of Gastroenterology, and past president of the Association of Surgeons of Great Britain and Ireland, and the Surgical Research Society.



Professor Illingworth is the author of numerous articles and surgical textbooks which include: A Textbook of Surgical Pathology, A Short Textbook of Surgery, A Textbook of Surgical Treatment, Including Operative Surgery, and a monograph, Peptic Ulcer. Professor Illingworth is world-famous for his contributions to the surgical knowledge of digestive disorders.

In recent years Professor Illingworth has extended his interests and research to the hormonal aspects of cancer. Under his guidance the first ablation of the pituitary gland with radioactive materials was performed in Great Britain. Approximately 100 patients with advanced carcinoma of the breast have been treated with this technique, and dramatic palliation has resulted in a significant number. Extensive biochemic determinations have been performed in all of these patients in an attempt to acquire basic knowledge concerning this dread disease and the mechanisms which may or may not control its growth. Professor Illingworth will review the current concepts of therapy for breast carcinoma in light of these many studies.

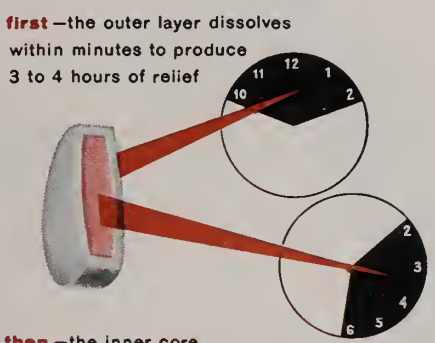
Professor Illingworth will spend the entire week of November 2 in the Department of Surgery, participating in ward rounds, operating room demonstrations and seminars at King County Hospital, Seattle. All physicians are welcome to attend these functions also.

Seattle Physicians Urged To Return UGN Pledges Promptly

Letters have been mailed to all Seattle physicians asking for donations to this fall's United Good Neighbor Campaign. A. L. Banks, chairman of the Physician's Section, UGN, reports that $51,773 is the quota aimed for and urges that Full Share pledges be returned as promptly as possible. Last year, physicians gave $50,629.44, or 95.7 per cent of their quota of $52,888.

running noses and open stuffed noses orally

Relief in minutes....lasts for hours



In the common cold, nasal allergies, sinusitis, and postnasal drip, one timed-release Triaminic tablet brings welcome relief of symptoms *in minutes*. Running noses stop, clogged noses open—and *stay* open for 6 to 8 hours. The patient can breathe again.

With *topical* decongestants, "unfortunately, the period of decongestion is often followed by a phase of secondary reaction during which the congestion may be equal to, if not greater than, the original condition. . . ."* The patient then must reapply the medication and the vicious cycle is repeated, resulting in local overtreatment, pathological changes in nasal mucosa, and frequently "nose drop addiction."

Triaminic does not cause secondary congestion, eliminates local overtreatment and consequent nasal pathology.

*Morrison, L. F.: Arch. Otolaryng. 59:48-53 (Jan.) 1954.

Each timed-release tablet keeps the nasal passages clear for 6 to 8 hours— provides "around-the-clock" freedom from congestion on just three tablets a day

Each timed-release TRIAMINIC *Tablet contains:*

Phenylpropanolamine hydrochloride	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

Dosage: 1 tablet in the morning, mid-afternoon, and in the evening, if needed. To be swallowed whole to preserve the timed-release feature.

Also available: Triaminic Juvelets, timed-release, half-dosage tablets; Triaminic Syrup, for children and those adults who prefer a liquid medication.

State Board of Medicine

The regular meeting of the State Board of Medicine was held in Boise, July 14, 15, 16, 1958. Members of the Board attending the session included S. M. Poindexter, Boise, Chairman; W. B. Ross, Nampa, Vice-Chairman; Leland K. Krantz, Idaho Falls; Fred T. Kolouch, Twin Falls, and two new members, C. Gedney Barclay, Coeur d'Alene, and Joseph E. Baldeck, Lewiston.

* * *

Three physicians wrote the examination and received their licenses to practice medicine and surgery in the state:

Eugene Floyd Landers, Nampa (State School). Graduate University of Colorado School of Medicine, Denver, M.D. Degree June 1957. Internship Presbyterian Hospital, Denver, 1957-58. General.

Colin Vance Taylor, Boise. Graduate University of Oregon Medical School, Portland, M.D. Degree June 1957. Internship Good Samaritan Hospital, Portland, 1957-58. General.

Charles Rex Borup, Boise. Graduate University of Utah College of Medicine, Salt Lake City, M.D. Degree June 1957. Internship Thomas Dee Memorial Hospital, Ogden, 1957-58. General.

* * *

Permanent licenses were granted to the following who had received Temporary Licenses since the January, 1958 meeting of the board:

John William Armstrong, Lewiston; *Richard N. Smith,* Twin Falls; *Dale D. J. Chodos,* Idaho Falls; *David Clarence Valder,* Moscow; *Gordon Wesley Johnson,* Caldwell; *Bert R. Erickson,* Caldwell; *John R. Nielsen,* Caldwell, and *Lewis C. Duncan,* Spokane, Washington.

* * *

Licenses were granted to the following candidates on the basis of written examination in a state maintaining standards comparable to Idaho, or through certification of the National Board of Medical Examiners:

Marvin Earl Blough, Nampa. Graduate University of Kansas School of Medicine, Kansas City. M.D. Degree June 1953. Internship Wesley Hospital, Wichita, 1953-54. General.

William Alfred Birt, Milton, West Virginia. Graduate Temple University Medical School, Philadelphia, Pennsylvania. M.D. Degree March 1956. Internship George Geisinger Memorial, Danville, Pennsylvania, 1946-47. General Surgery.

John Benson Clauser, Military Service. Graduate Indiana University School of Medicine. Bloomington and Indianapolis, Indiana. M.D. Degree June 1956. Internship Indianapolis General Hospital, Indianapolis, Indiana, 1956-57. Anesthesia.

Augustus Masashi Tanaka, Ontario, Oregon. Graduate Long Island College of Medicine, (now the State University of New York Downstate Medical Center, College Of Medicine) Brooklyn. M.D. Degree June 1951. Internship Kings County Hospital, Brooklyn, 1951-52. Surgery.

Karl Edwin Blake, Pittsburgh, Pennsylvania. Graduate School of Medicine, University of Pittsburgh, Pittsburgh, Pennsylvania. M.D. Degree April 1948. Internship St. Joseph's Hospital, Pittsburgh, 1948-49. General Surgery.

Willie Oscar Autery, Jr., Gooding (Idaho State Tuberculosis Hospital). Graduate Baylor University College of Medicine, Houston, Texas. M.D. Degree May 1957. Internship General Rose Memorial Hospital, Denver, Colorado, 1957-58. General.

Richard G. Gardner, Boise, Graduate University of Oregon Medical School, Portland, Oregon. M.D. Degree June 1953. Internship University of Oregon Medical School Hospitals and Clinics, Portland, Oregon, 1953-54. Orthopedics.

John J. Lorang, Clarkston, Washington. Graduate Stritch School of Medicine of Loyola University, Chicago, Illinois. M.D. Degree June 1956. Internship Sacred Heart Hospital, Spokane, Washington, 1956-57. General.

Charles Walker Schabacker, Twin Falls. Graduate University of Minnesota Medical School, Minneapolis, Minnesota. M.D. Degree June 1954. Internship Fitzsimons Army Hospital, Denver, Colorado, 1954-55. Pediatrics.

Charles Richard Nixon, Blackfoot. Graduate The George Washington University School of Medicine, Washington, D. C. M.D. Degree June 1957. Internship Latter Day Saints Hospital, Salt Lake City, Utah, 1957-58. General.

* * *

A Temporary License was issued on July 22 to *Elmer McLeod Wright,* Twin Falls. Graduate of Western Reserve University Medical School, Cleveland. Internship, University Hospitals. Residency in pediatrics, University Hospitals and City Hospital, Cleveland. Granted TL-208. Pediatrics.

[illegible] (as novobiocin calcium) . 62.5 mg.
[illegible] monophosphate ..... 100 mg.

[illegible]:

[illegible] Capsules
[illegible] adult dosage is 2 capsules q.i.d.

[illegible] KM Granules
[illegible] treatment of moderately acute infections in infants and children, the recommended dosage is 1 teaspoonful per 15 to [illegible] of body weight per day, administered in 3 or 4 equal doses. Severe or prolonged infections require higher doses. Dosage for adults is 2 to 4 teaspoonfuls 3 or 4 times daily, depending on the type and severity of the infection.

American College of Surgeons Slates Sectional Meeting at Vancouver, B.C.

One of the five sectional meetings of 1959 scheduled by the American College of Surgeons will be held at Vancouver, B.C., February 26, 27 and 28. Thomas R. Sarjeant, chairman of the local committee, reports that his committee has outlined a meeting which includes extensive symposiums on trauma, cancer and infections. In addition, numerous papers and panel discussions on arterial occlusive disease and disease of the pancreas will be presented.

The Fellowship Luncheon, with its panel on College activities will be held Friday, February 27. Sessions on February 26 and 27 will take place at the Hotel Vancouver. The third day's meetings will move to Vancouver General Hospital.

Halcyon Hospital, Inc.

9239 - First N. E.

American Association of Medical Assistants To Hold Second Annual Meeting in Chicago

Physicians are asked to bring to the attention of their assistants the Second Annual Meeting of the American Association of Medical Assistants. The group meets October 31, November 1 and 2, 1958, at the Palmer House, Chicago.

Friday, October 31, will be devoted to a house of delegates meeting, general business session, advisors' symposium, tour of the AMA Building and a program of speakers, films and exhibits furnished by AMA and presented in the AMA auditorium. F. J. L. Blasingame, general manager of AMA, will give the welcome and Morris B. Fishbein will be the dinner speaker.

Program for Saturday has been divided into three special sections listed as: business, technical and medical. These sections will run concurrently. Business session will include talks and demonstrations on insurance, office machines, credit, record forms, telephone techniques and banking. Subjects to be discussed during the medical session are: emergencies, medicolegal problems, case histories, good housekeeping and personal grooming, civil defense and public relations. Technical presentations scheduled are as follows: new laboratory procedures; new developments in x-ray; inner office professional ethics; ECG ultrasonic and diathermy; aseptic techniques. In addition, a talk on What Is Good Practice for the Physician and Medical Assistant will be given by Raleigh Oldfield, president, Illinois Medical Society.

The meeting will close at Sunday noon following a morning brunch.

Registration fee of $18 should be made payable to the American Association of Medical Assistants and mailed to: Mrs. Mary S. Aird, 1749 West 97th St., Chicago 43, Illinois. Hotel reservations should be made directly with the Palmer House.

Life Insurance Medical Research Fund Awards Grants for Heart Research

The Life Insurance Medical Research Fund has given 81 awards totalling $1,098,680 in support of heart research during the coming year. Fifty-seven of the awards are in the form of grants to research institutions for specified projects in basic heart research and four of these grants, for a total of $70,620, have been awarded to the two medical schools in the Northwest.

The University of Oregon Medical School has received $17,600 for research by William D. Blake on neurohumoral control of kidney function. Grants given to the University of Washington School of Medicine are: $21,120 for research by H. Stanley Bennett on the fine structure of blood and lymphatic vessels, $17,600 to support research by Frank M. Huennekens on one-carbon metabolism, and $14,300 for research by Robert E. Priest on the action of hormones on blood vessel walls, and the prevention of atherosclerosis.

Organized in 1946 by a group of life insurance companies, the Life Insurance Medical Research Fund has devoted its entire resources to study of heart disease. Each year the fund allocates more than one million dollars for heart research. The fund receives its support from about 150 life insurance companies in the United States and Canada.

Report from the Washington Office of AMA

WASHINGTON, D.C. — The civilian Medicare program is struggling through an uncomfortable period of readjustment while attempting to cut its costs by about 30 per cent.

Had the program continued the way it was operating last year, the cost this year would be an estimated $100 million. Instead, the Defense Department, on the urging of Congress, is attempting to keep the costs within the appropriated $70.2 million.

No one can estimate as yet actually what is being saved. Some services that previously were authorized in civilian hospitals and from civilian doctors have been eliminated, thus shifting these costs from the government to the service families. At the same time many dependents who had been cared for outside the military now are required to go to the service hospitals.

If they do not like what is happening, there is not much the Medicare administrators, the doctors and the hospitals can do about it, at least not until the new Congress meets next January. Then, if situation is out of hand and there is widespread discontent among the service families, the problem could be returned to the lap of Congress.

Awkward as are the restrictions in some areas, the situation could have been much worse. The House originally proposed only $60 million for the civilian program, and ordered the Defense Department not to exceed that figure. In the Senate, Senator Knowland (R., Calif.) sponsored an amendment increasing the total to $70.2 million, and lifting the ceiling on spending. The Knowland proposal was approved.

The conference committee accepted the Senate changes, but in its report on the bill instructed the department to stay within he $70.2 million. This the department is attempting to do, but if the figure has to be exceeded for good reasons, the department would have to shift funds or ask for a supplemental appropriation and explain the need.

If the ceiling had been kept in the bill itself, the department could not have spent a penny more than the $60 million.

Here are the major restrictions, as outlined by the department to a meeting of Medicare contractor representatives:

- Dependents living with their sponsors to use military facilities, unless the military authorities certify that civilian care is necessary because service facilities are not available. Dependents not living with sponsors to have freedom of choice of military or civilian medicine, as now.
- In maternity cases, if the patients are living apart from sponsors, they will continue to have freedom of choice. If living with sponsors, new patients or those in the first trimester must use service facilities if available. Those in the second and third trimester, if under civilian care October 1, may continue, but if for any reason they change doctors, military facilities must be used if available.
- The new regulations also discontinue all services "not clearly specified in the law" for all dependents. The eliminated services include medical care ordinarily rendered on an outpatient basis, acute emotional disorders, and elective surgery. Emergency care may be obtained from civilian sources without prior authorization.
- Where more than one service facility is located in the area, a military clearing house will screen dependents and hospitals to insure that all service hospitals are used "to the optimum."

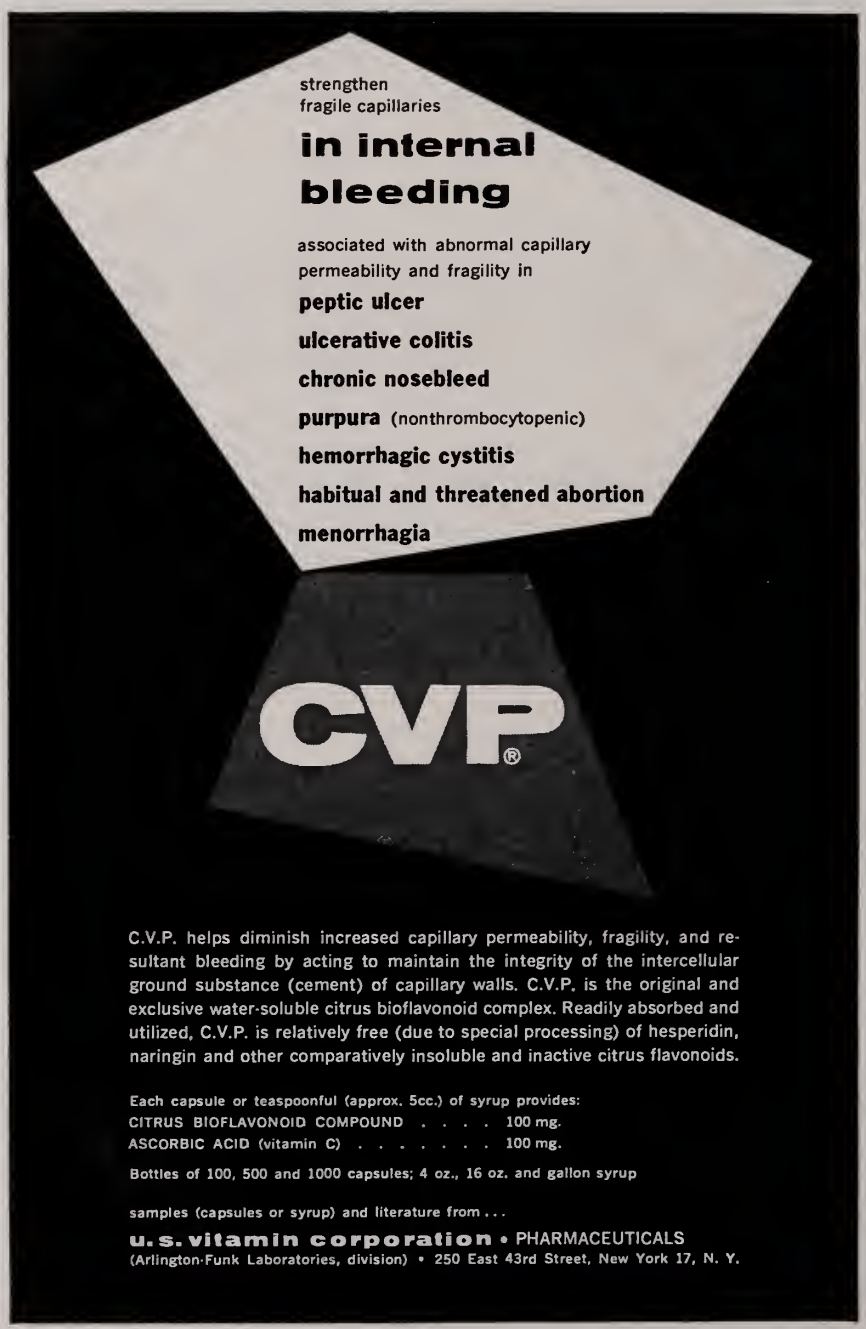
* * *

Congress has received a variety of advise on what to do about the hospitalization of veterans now and in the years ahead. Everybody seems to agree that 20 to 30 years from now will see a sharp increase in the number of non-service-connected disabilities among the veteran population. The question then is how many of these cases should be taken care of by the federal government.

During hearings by the House Veterans Affairs Committee, Russell B. Roth, chairman of the American Medical Association Committee on Federal Medical Services, reiterated the AMA stand that service-connected cases should receive best care possible in VA facilities and that non-service-connected illness should be the responsibility of state and local governments, if the veteran is unable to pay for his care.

(Continued on page 1208)

(Continued from page 1207)



Before adjourning, the House Committee introduced a bill that did little to clear up the issue of non-service-connected care. It was aimed rather at the Budget Bureau in an effort to assure that some 5,000 beds now closed because of "administrative decisions" would be placed in use—presumably for non-service-connected cases.

° ° °

Note:

A group of physicians, research executives and a former director of the Budget Bureau has concluded that the nation should treble its expenditures for medical research and double its annual output of physicians, all in the next 12 years. The consultants' group to the Secretary of Health, Education, and Welfare proposes that the federal government supply about half a billion dollars by 1970, with an equal amount to come from industry and philanthropy. Head of the study group was Stanhope Bayne-Jones, former dean of the Yale medical school.

William J. Kennard, M.D.

COSA-TETRACYN*

glucosamine potentiated tetracycline

IN RESEARCH

1. HIGHEST TETRACYCLINE SERUM LEVELS[1, 2]
2. MOST CONSISTENTLY ELEVATED SERUM LEVELS[1]
3. SAFE PHYSIOLOGIC POTENTIATION WITH A NATURAL HUMAN METABOLITE[3]

Anti Depressant Deaner®

p-acetamidobenzoic acid salt of 2-dimethylaminoethanol

Extensive clinical trials in over 2,000 patients prove 'Deaner' to be of value in the alleviation of a wide variety of emotional disturbances. Patients who lack in energy, are mildly depressed, and find it difficult to concentrate are greatly benefited by 'Deaner'.

REPORTS FROM INVESTIGATORS

In medical student volunteers, 'Deaner' produced increased daytime energy and attentiveness at lectures, sounder sleep (with a reduction in the hours of sleep needed), better ability to concentrate on both studying and writing, decreased apprehensiveness prior to and during examinations, a more affable mood and outspoken personality.

1. Murphree, H. B., Jr.; Jenney, E. H., and Pfeiffer, C. C.: 2-Dimethylaminoethanol as a Central Nervous System Stimulant, Presented before Assoc. for Research in Nervous and Mental Disease, New York, Dec. 12-14, 1957. To be published.

In Exhaustion and Depression—In a study of over 100 patients suffering from various psychiatric disorders, especially exhaustion and mild depression, the clinical effect of 'Deaner' was to increase energy and to relieve depression in over 70%.

2. Lemere, F., and Lasater, J. H.: Am. J. Psychiat. *114*:655 (Jan.) 1958.

In Learning Problems—Some of the children with reading problems and other learning defects have improved markedly during their treatment with 'Deaner'.

3. Oettinger, L., Jr.: Presented before the American Encephalographic Society Meeting, Atlantic City, June 14, 1958. To be published.

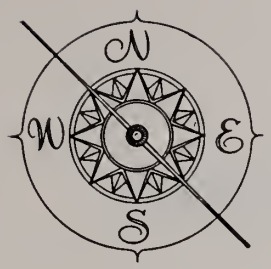
ADVANTAGES OF DEANER

Effects come on gradually and are prolonged...

Without causing hyperirritability, jitteriness or emotional tension...

Without causing excess motor activity...

Without causing loss of appetite...



Without elevating blood pressure or heart rate...

Without sudden letdown on discontinuance of therapy.

DOSAGE: Initially, 1 tablet (25 mg.) daily in the morning. Maintenance dose, 1 to 3 tablets; for children, ½ to 3 tablets. Full benefits may require two weeks or more of therapy. 'Deaner' is supplied in scored tablets containing 25 mg. of 2-dimethylaminoethanol.

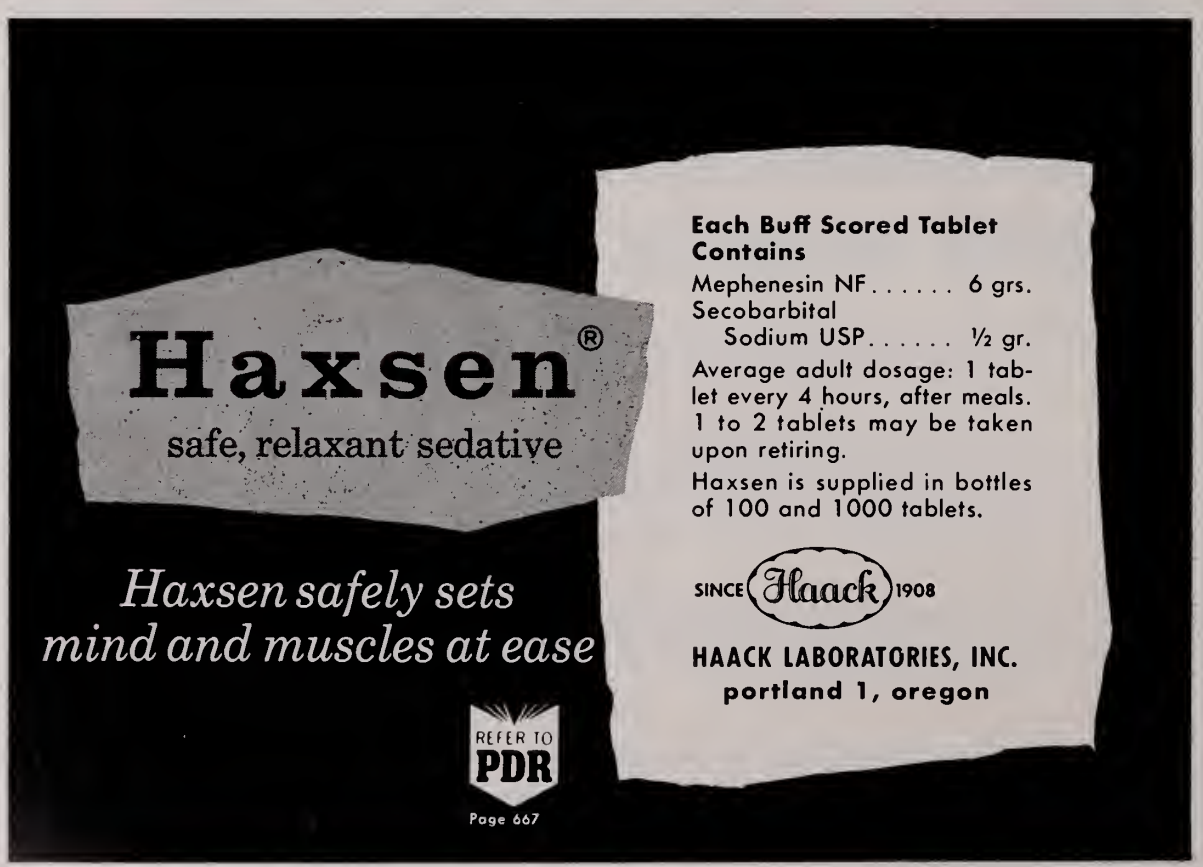
YOUR SPEECH REVEALS YOUR PERSONALITY. By Dominick A. Barbara, M.D. Foreword by Nolan D. C. Lewis. 174 pp. Price $5.50. Charles C Thomas, Springfield, Ill. 1958.



This short volume with an adulatory preface by Nolan D. C. Lewis is "intended to provide psychiatrists, speech teachers, psychologists, social workers and those interested in language and communication studies . . . a keener understanding of communicative behavior as it appears in everyday and clinical situations." The author, who has written an earlier monograph on stuttering, is attempting to broaden his horizon by correlating his knowledge of language structure and semantics with his clinical and theoretic orientation as a disciple of the Adlerian-Horney culturalistic branch of psychoanalytic thought.

The first section of the book, dealing with language structure and symbols, concerns a subject foreign to most clinicians in the psychiatric field. The author is to be commended for providing a brief introduction to a difficult and often "dry" subject in an informal and interesting way. In the longer second section, entitled Speech and Personality, there is an attempt to separate types of speech disturbance with neurotic personality types (The Voice of the Timid, The Master's Voice, The Expansive Speaker and The Resigned Speaker). He ends up concentrating on the need in our culture for a simplified language and drives home his thesis that as neurosis is relieved through psychotherapy and the individual comes to really know himself, his inner comfort and increased reality awareness are reflected in more direct, simple and accurate speech.

Perhaps in part because of the confines of the author's basically Adlerian orientation, he ends up with an over-expansive, over-simplified view that limits the clinical usefulness of the book.

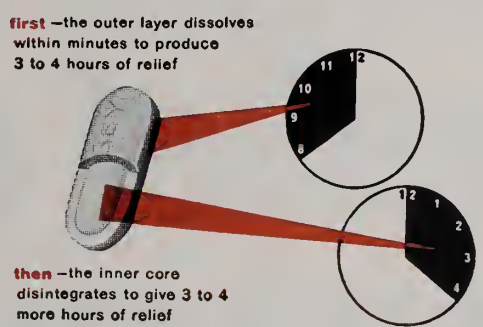
George H. Allison, M.D.

(Continued on page 1233)

coughing for 6 to 8 hours

with one "timed-release" tablet

Tussaminic is non-narcotic—the patient simply swallows one timed-release "double-dose" tablet before breakfast to work cough-free all day. Another tablet before dinner lets him relax cough-free all evening. A final tablet at bedtime lets him sleep cough-free all night. Thus, cough relief is measured in hours, not minutes.



Tussaminic is not only valuable for the patient with a coughing cold, but also for the habitual morning hacker. And due to its Triaminic component, associated bronchial and nasal congestion frequently clears.

Each tablet contains:

TRIAMINIC® .....100 mg.
(Phenylpropanolamine hydrochloride 50 mg., Pheniramine maleate 25 mg., Pyrilamine maleate 25 mg.)
Dormethan* ..... 30 mg.
Terpin hydrate.....300 mg.
*brand of dextromethorphan hydrobromide

Dosage: 1 Tussaminic tablet before breakfast, dinner and at bedtime.

Tussaminic "timed-release" tablets provide prolonged cough relief. Each tablet contains two full doses of long-lasting antitussive, expectorant, anti-allergic and decongestant components.

NEW Tussaminic "timed-release" tablets

Non-narcotic antitussive decongestant

HOW YOU CAN REACH

TOMORROW

YESTERDAY, progress was an automobile, a wireless radio, an x-ray machine; today it's a TV antenna, an automatic washer and a polio vaccine. And tomorrow—tomorrow progress might be a trip to the moon, a gasoline pill or a fabric that never wears out. For as Victor Hugo said, "*Would you realize what progress is, call it Tomorrow.*" To make progress a reality, to reach "tomorrow", takes preparation today. That is why such an important part of the Shadel program is devoted to research. Only such preparation will produce the ultimate answer to the problem of alcoholism.

premenstrual

'DIURIL'

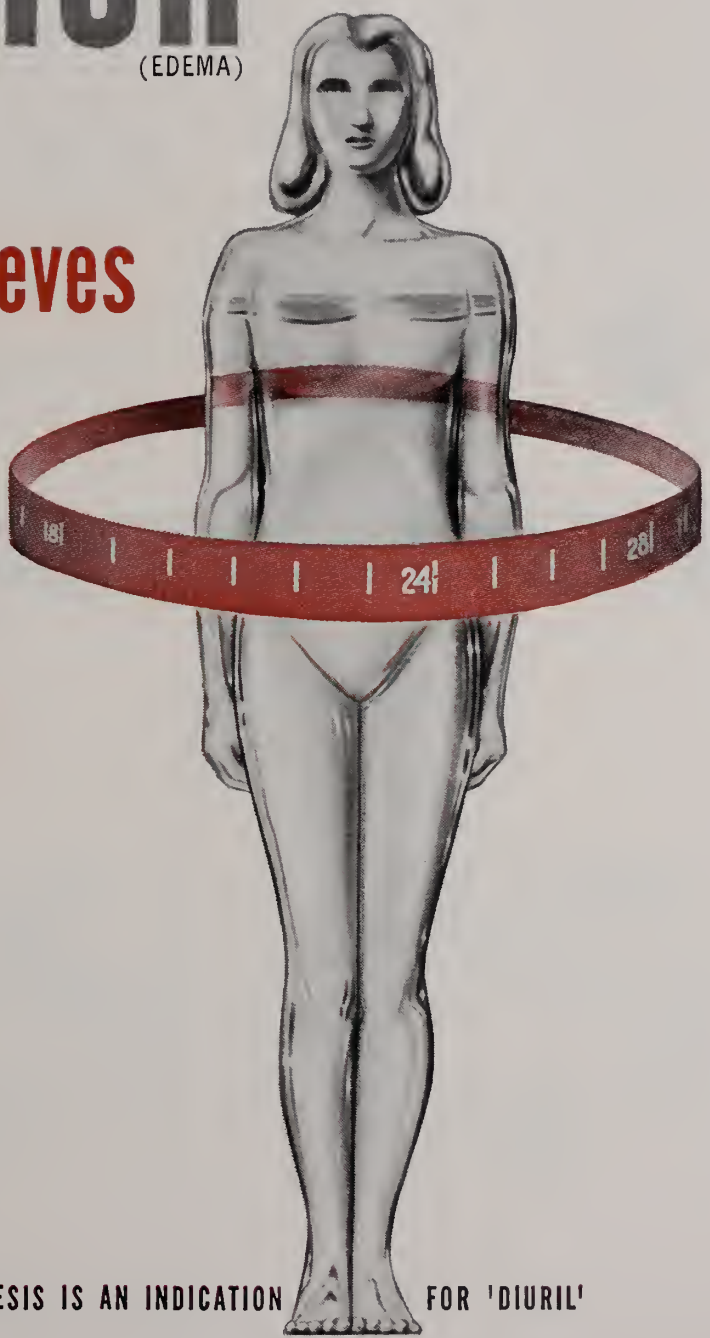
(CHLOROTHIAZIDE)

FORD, R. V., Rochelle, J.B.III, Handley, C. A., Moyer, J. H. and Spurr, C. L.: J.A.M.A. **166**:129, Jan. 11, 1958.

". . . in premenstrual edema, convenience of therapy points to the selection of chlorothiazide, since it is both potent and free from adverse electrolyte actions." In the vast majority of patients, 'DIURIL' relieves or prevents the fluid "build-up" of the premenstrual syndrome. The onset of relief often occurs within two hours following convenient, oral, once-a-day dosage. 'DIURIL' is well tolerated, does not interfere with hormonal balance and is continuously effective—even on continued daily administration.

DOSAGE: one 500 mg. tablet 'DIURIL' daily—beginning the first morning of symptoms and continuing until after onset of menses. For optimal therapy, dosage schedule should be adjusted to meet the needs of the individual patient.

SUPPLIED: 250 mg. and 500 mg. scored tablets 'DIURIL' (chlorothiazide); bottles of 100 and 1,000.



DIURIL is a trade-mark of Merck & Co., Inc.

Doctors, too,  *like "Premarin"*

The reasons are fairly simple. Doctors like "Premarin," in the first place, because it really relieves the symptoms of the menopause. It doesn't just mask them – it replaces what the patient lacks – natural estrogen.

Furthermore, if the patient is suffering from headache, insomnia, and arthritic-like symptoms before the menopause and even after, "Premarin" takes care of that, too.

Women, of course, like "Premarin," too, because it quickly relieves their symptoms and gives them a "sense of well-being."

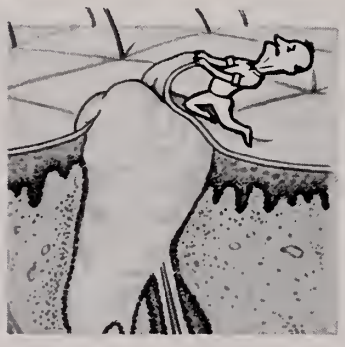
IN ACNE

Fostex® degreases the skin and helps remove blackheads



Fostex contains a combination of surface active agents (Sebulytic*) which:

◂ Completely emulsify excess oil so that it is quickly washed off the skin.

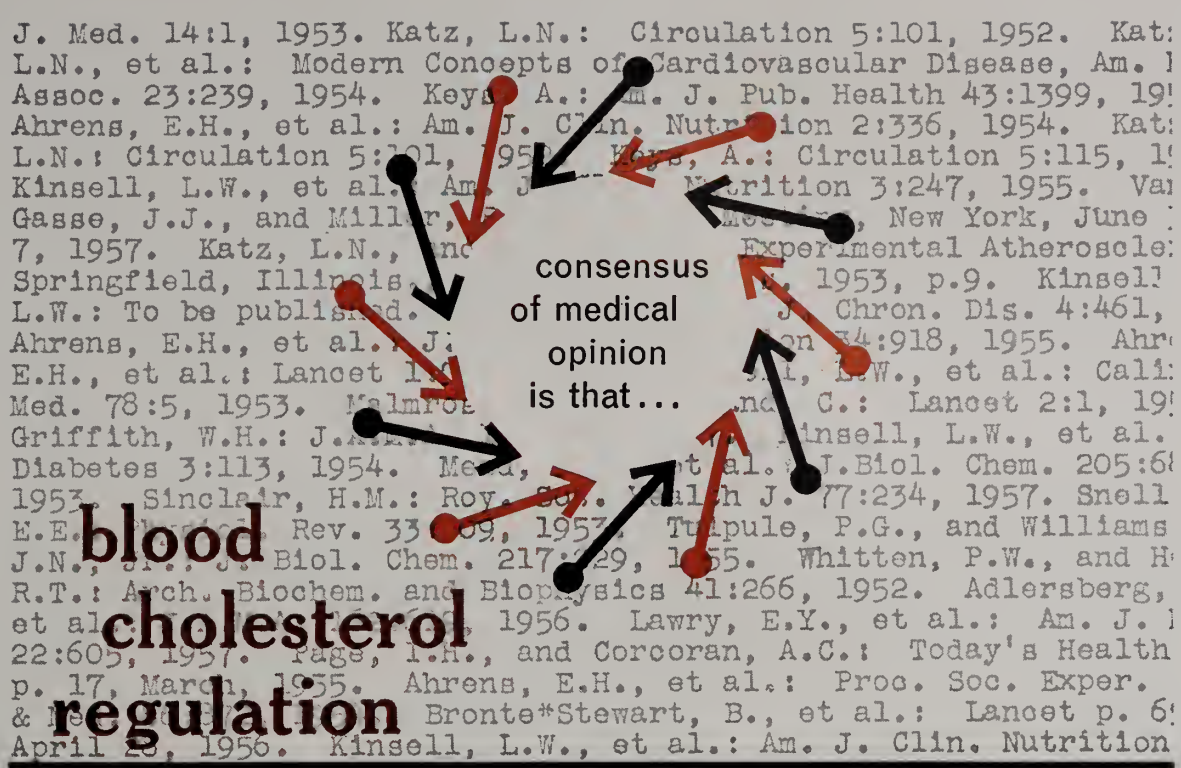
◂ Penetrate and soften comedones, unblocking the pores and facilitating removal of sebum plugs.

Fostex dries and peels the skin

◂ The Sebulytic base of Fostex dries and promotes peeling of the skin . . . actions enhanced by the keratolytic effects of micropulverized sulfur and salicylic acid.

*(Sodium lauryl sulfoacetate, sodium alkyl aryl polyether sulfonate, sodium dioctyl sulfosuccinate.)

FOSTEX CREAM
for therapeutic washing of skin in the initial phase of acne treatment, when maximum degreasing and peeling are desired.



FOSTEX CAKE
for maintenance therapy to keep skin dry and substantially free of comedones.

Fostex is easy for your patients to use

◂ Patients stop using soap on affected skin areas. Instead they use Fostex for therapeutic washing of the skin. The Fostex lather is massaged into the skin for 5 minutes—then rinse and dry.

is desirable

That elevated blood cholesterol levels can be readily reduced or prevented by the addition to the diet of various vegetable fats containing linoleic acid has been observed by numerous investigators. It also appears that diets rich in essential fatty acids are much more effective in lowering plasma-lipid levels than are the low-fat (high-carbohydrate) diets.

Arcofac, a nutritional supplement, contains linoleic acid, an essential polyunsaturated fatty acid in high concentration. In addition, it also provides vitamin B_6, deemed necessary for conversion of linoleic acid into the primary essential fatty acid, arachidonic acid. The body apparently is dependent upon an adequate intake of both linoleic acid and vitamin B_6 for normal cholesterol levels. The presence of vitamin E, a powerful antioxidant, helps maintain the fatty acids in an unsaturated state.

The Arcofac regimen is safe . . . effective . . . well tolerated . . . and imposes no radical changes in diet. Virtually all foods (including animal fats) may be eaten, if a proper balance is maintained between saturated and unsaturated fatty acids. Prophylactic dosage is 1–2 tablespoonfuls daily; therapeutic—2–8 tablespoonfuls daily.

Each tablespoonful (15 ml.) of Arcofac emulsion contains:

Essential fatty acids†.....6.8 Gm.
(measured as linoleic) with 2.5 I.U. of Vitamin E*

Pyridoxine hydrochloride
(Vitamin B_6).....1.0 mg.

†Supplied by safflower oil which contains the highest concentration of polyunsaturated fatty acids of any commercially available vegetable oil.

*Added as Mixed Tocopherols Concentrate, N.F.

OTH BASIC DIURETIC REGIMENS

MOX*

ACETAZOLAMIDE LEDERLE

1

Advantages of DIAMOX in single-drug diuresis

DIAMOX—operating through the well-understood mechanism of *bicarbonate* transport regulation—provides ample, prolonged diuresis in the great majority of patients.

DIAMOX is virtually non toxic . . . has not caused renal or gastric irritation . . . has no pronounced effect on blood pressure. It is rapidly excreted, does not accumulate in the body, permits convenient dosage adjustment, allows unbroken sleep. Small, tasteless, easy-to-take tablets . . . usual dosage, only one a day.

CARDIAC EDEMA

PREMENSTRUAL TENSION

EDEMA OF PREGNANCY

OBESITY

2

Advantages of DIAMOX in intensive, two-drug diuresis

When intensive diuresis must be maintained, DIAMOX, alternated with an agent for regulation of *chloride* transport, has proved a regimen of choice. Through dual *bicarbonate-chloride* regulation, it produces maximal sodium-water excretion with minimal distortion of serum electrolyte patterns, greater patient comfort, lessened risk of induced drug resistance.

ADVANCED CONGESTIVE HEART FAILURE

REFRACTORY TOXEMIA OF PREGNANCY

This is Metabol'aid—designed primarily for regular daily use by your patients in their homes.

metabol'aid . . .

for prescribed effortless circulatory augmentation

A NEW MODALITY FOR INDUCING CONTROLLED RHYTHMIC MOTION TO EXPEDITE EXCHANGES OF BLOOD AND LYMPH

Failure to exercise properly is recognized as the basic cause of a wide variety of medical complaints. To meet this problem, the gentle oscillatory motion of Metabol'aid encourages free exchange of vital body fluids in a way which can be easily measured and controlled.

For patients who will not exercise, the effortless daily use of Metabol'aid's rhythmic motion encourages precise adherence to instruction. For patients unable to exercise, Metabol'aid's *induced* motion offers ideally ancillary action to incapacitated musculature without elevation in heart rate or blood pressure.

Metabol'aid is available *only on the prescription* and under the supervision of the physician. For further details, jot "Metabol'aid" on your Rx blank and mail to

Wound Healing with Cod Liver Oil Ointment

MARIUS G. GRAYZEL, M.D.
SAUL SCHAPIRO, M.D.
BROOKLYN, NEW YORK

The primary aim or the treatment of wounds is to restore structure and function to a damaged tissue or organ in the shortest possible time. To accomplish this, suitable local as well as general medical and surgical measures must be employed. At the present time there are many local methods for the treatment of wounds, especially infected ones. The attitude appears to be that no single method offers any particular advantage over the other forms of treatment. We feel that the local treatment of certain types of wounds with a bland, nourishing, protective cod liver oil ointment offers certain advantages over other accepted local applications. There are many reports of the successful treatment of wounds with cod liver oil ointment [illegible]. Most of these publications appeared prior to the era of antibiotic therapy. To determine the value of cod liver oil ointments under present-day conditions, 706 cases were studied and compared with the experiences of others using different measures.

METHODS AND RESULTS

The patients were unselected. To obtain as large and as varied a series as possible, there were taken all cases not treated by others according to their preferred methods of surgical management. The only exceptions were the exclusion of large, open suppurative and necrotic wounds, or multiple complicated compound fracture or extensive third-degree burns. The patients were treated in five different institutions. Except for the agreement to use a specified cod liver oil treatment as the sole local application, the entire management was in the hands of 16 cooperating physicians. Usually one or two surgeons handled a particular case. In a few instances it was possible to treat one involved area with cod liver oil ointment and other somewhat similarly involved areas with other sterile treatment. The cod liver oil ointment used in the local treatment of all wounds was Desitin Ointment, supplied generously by Desitin Chemical Company, Providence, Rhode Island.

liver oil ointment and other somewhat similarly involved areas with other sterile treatment. The cod liver oil ointment used in the local treatment of all wounds was Desitin Ointment, supplied generously by Desitin Chemical Company, Providence, Rhode Island. Vaseline-impregnated gauze or dry sterile gauze. The wounds included or the study were of seven types (Table 1).

All wounds, whether of traumatic, thermal, chemical or infectious origin, are essentially similar. They are practically always infected in varying degree. Some traumatic wounds may present a contusion in that, if the wounds are considered sufficiently clean and sterile, they may be closed immediately by suture and kept in that state by local dressings.

The objectives of treatment in all the cases were to sustain the patient, correct shock, supply fluids, electrolytes and blood if indicated, improve the nutritional state, and to protect the tissue and prevent infection. If warranted, the wound was closed by primary or secondary intention or otherwise allowed to heal well and rapidly, so that either skin grafting or closure of the wound could be performed as soon as possible, preferably within one to three weeks.

To prevent infection in contaminated wounds, mineral debridement and cleansing were instituted. If cellulitis or pockets of pus were encountered a combination of mechanical debridement and wet dressings was used. Cod liver oil ointment was then applied liberally and evenly either directly to the wound and its margins or by means of a sterile gauze pad containing a heavy application of the ointment. Over this, cellulose-cotton gauze pads or gauze dressings and cotton bandages were applied. This dressing was retained for four to seven days depending upon the nature of the wound. At the end of this period, the dressing was removed and the wound was inspected. If it were thought necessary, similar dressings were reapplied after debridement and cleansing of the wound with the sterile normal saline, and kept in place another four to seven days. In a few instances a third dressing was necessary. If at any time suturing of the wound or skin grafting were indicated, these procedures were employed. In addition, appropriate antibiotics and, when indicated, parenteral antitoxin and tetanus antitoxin or toxoid were given. As early as possible, to aid wound healing and to supply optimal nutritional needs, the patient was given a high caloric diet containing adequate protein and a high carbohydrate level as well as large doses of vitamins. In this report we shall concern ourselves

DESITIN® ointment

promotes "early, clean and healthy healing"

in

- **traumatic and infectious wounds**
- **burns (first, second, third degree)**
- **abdominal fistulae and wounds**
- **pressure sores and ulcers**
- **pilonidal cysts and sinuses**
- **ano-rectal wounds • chest wounds**

This confirms previous findings regarding the efficacy of soothing, protective, non-irritant Desitin Ointment—rich in cod liver oil—to accelerate healing in many other skin conditions . . . diaper rash, ulcers (decubitus, varicose, diabetic), etc.

PRACTICE OPPORTUNITIES

OPPORTUNITY FOR GENERAL PRACTICE

Well established general practice available in Longview, Wash. Leaving to specialize January 1959. Write Box 61-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

EENT PRACTICE FOR SALE

Well established EENT practice available in Eastern Washington. Take over 6 yr. lease and modern equipped offices. Be able to refract and do minor ENT office work. Reliable guild optician in area to help in dispensing. Liberal terms. Write Box 60-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

WASHINGTON INSTITUTION OPPORTUNITIES

PHYSICIAN II — $11,916-14,220, PHYSICIAN I — $10,908-13,020. The expanded treatment program in Washington State Institutions continues to create new staff, specialty, and administrative positions in nearly all areas of the state. Specialty and administrative (Physician II) are required to have four years experience in the practice of medicine or two years of supervisory medical experience, or two years of approved residency training, or four years in the practice of a specialty. Staff physicians (Physicians I) need only to have their license to practice in the State of Washington. For further information regarding these positions, contact: State Personnel Board, 212 General Administration Building, Olympia, Wash.

ANESTHETIST NEEDED

The Washington State Department of Institutions Northern State Hospital at Sedro Woolley has a full time vacancy for an Anesthetist (Physician II—salary range—$11,916-14,220). For full information on this Merit System position, contact: Washington State Personnel Board, 212 General Administration Building, Olympia, Wash.

PHYSICIAN NEEDED FOR KETTLE FALLS, WASH.

Town's only physician recently went into government service. Population 900, drawing area 3,500. Spacious office available, also equipment if desired. Good payroll town—lumber, railroad and farming. New modern hospital 8 miles. Write Chamber of Commerce, Mr. Kay Carrick, Pres., Kettle Falls, Wash.

MEDICAL EQUIPMENT AND PRACTICE FOR SALE

Completely furnished office and equipment available in downtown professional bldg., suitable for OB-Gyn or general practice. Phone Seattle MAin 4-4440 or write Box 63-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

GENERAL PRACTICE OPPORTUNITY

General practice available in Central Oregon. Good income, pleasant community, hunting and fishing, excellent schools. No initial investment. Write P. O. Box 5006, Eugene, Oregon.

PLACEMENT BUREAUS

PHYSICIANS AND SURGEONS REGISTRY

PRE-MICRONIZATION assures particle size for maximum effectiveness

Medihaler-EPI®

For quick relief of bronchospasm of any origin. More rapid than injected epinephrine in acute allergic attacks.

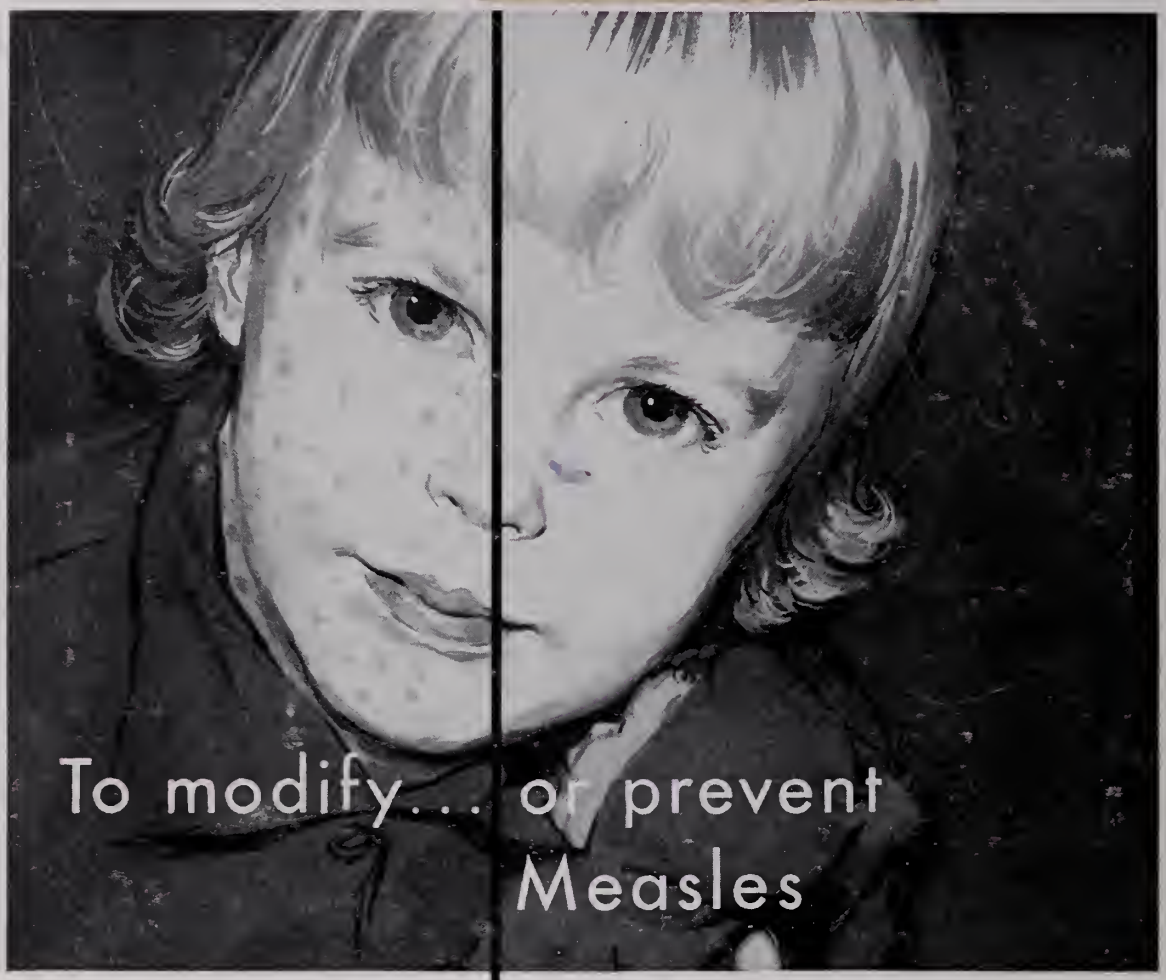
Epinephrine bitartrate, 7.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.15 mg. free epinephrine.

Medihaler-ISO®

Unsurpassed for rapid relief of symptoms of asthma and emphysema.

Isoproterenol sulfate, 2.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.06 mg. free isoproterenol.

MEDIHALER® *For Ample Air Right Now!*



Millions of asthmatic attacks have been aborted faster, more effectively, more economically with Medihaler-Epi and Medihaler-Iso. Automatically measured dosage and true nebulization...nothing to pour or measure...One inhalation usually gives prompt relief.

Prescribe Medihaler medication with Oral Adapter as first prescription. Refills available without Oral Adapter.

The Medihaler Principle of automatically measured-dose aerosol medications in spillproof, leakproof, shatterproof, vest-pocket size dispensers also available in Medihaler-Phen® (phenylephrine, hydrocortisone, phenylpropanolamine, neomycin) for prompt, **lasting** relief of nasal congestion.

Derived from human venous blood

Maximum response to recommended dosages is assured because each production lot—made from venous blood drawn from 3500 male and female donors—has a consistently high level of immune body content.

20 to 1 concentration

Polio Immune Globulin/Cutter is so concentrated that 2.0 cc. contains the antibody equivalent of more than 40 cc. of normal immune serum.

Also recommended for:

• passive immunization against paralytic poliomyelitis • prevention of infectious hepatitis • treatment of agammaglobulinemia and hypogammaglobulinemia • maternal rubella • and as combination therapy with antibiotics in certain other infectious diseases.

Available in 2 cc. and 10 cc. vials.

For modification schedule and color enlargement of chart of typical measles course *ask your Cutter man* or write to Dept. 27-J

Polio IMMUNE GLOBULIN

CUTTER Gamma Globulin

Protect against the always present danger of serious complications in unmodified measles.

Used as a measles modifier, Polio Immune Globulin/Cutter allows full active immunity, yet reduces the severity of the attack.

When measles prevention is indicated, Polio Immune Globulin/Cutter confers an effective passive immunity for about 3 to 4 weeks.

in amenorrhea . . .

HIGHLY EFFECTIVE CYCLIC THERAP(

NORLUTIN®

(norethindrone, Parke-Dav

In gynecological disorders amenable to progestational therapy, clinic effects of injected progesterone can now be produced by small oral dos of NORLUTIN. In amenorrhea, for example, 10-20 mg. daily for 5 days after estrogen priming—will induce "...a prompt temperature rise ar withdrawal bleeding 24-72 hours after medication is stopped."[1]

CASE SUMMARY[2] Amenorrhea of four years' duration in a 24-year-old marri woman. A course of 10 mg. NORLUTIN, twice daily for five days, was follow after three days by menses. When no spontaneous menstruation occurred duri the following 35 days, this treatment was repeated and again induced mens Using ethisterone, similar results were unobtainable in this patient.

INDICATIONS FOR NORLUTIN: conditions involving deficiency of progesterone such primary and secondary amenorrhea, menstrual irregularity, functional uterine bleedin endocrine infertility, habitual abortion, threatened abortion, premenstrual tension, ar dysmenorrhea.

PACKAGING: 5-mg. scored tablets, bottles of 30.

CLASSIFIED ADVERTISING

All classified advertisements are set in the style of this journal with a single bold face headline. Each line, including the headline and partial lines, is charged at $1.00. Copy must be received by the advertising manager at the editorial office no later than 10th of month preceding date of issue. Proof is not shown. Copy of ad as it appeared in the journal accompanies billing.

SUBSCRIPTIONS

Distribution restricted to members of the medical profession and those in closely allied fields. Subscriptions received through medical associations will begin month membership becomes effective. $5.50 per year (honorary association members, residents, interns and medical students, $3.00 per year); single copies, 50c.

Change of Address

Notice of change of address must be given at least six weeks prior to date change will become effective. Notice should be directed to circulation manager at the editorial office. Old and new address should be included as well as a statement whether or not change is permanent. Duplicate copies cannot be sent to replace those undelivered through failure to notify of change of address.

the clinical results are **positive** when

NILEVAR® restores positive nitrogen balance

The anabolic effects of Nilevar are quickly manifest both to the patient and to the attending physician.

When loss of nitrogen delays postsurgical recovery or stalls convalescence after acute illness and in severe burns and trauma, Nilevar has been found to effect these responses:

- **Appetite improves**
- **Weight increases**
- **The patient feels better**
- **The patient recovers faster**

Similarly Nilevar helps correct the "protein catabolic state" associated with prolonged bed rest in carcinomatosis, tuberculosis, anorexia nervosa and other chronic wasting diseases.

Nilevar is unique among anabolic steroids in that androgenic side action is minimal or absent in appropriate dosage.

Nilevar (brand of norethandrolone) is supplied as tablets of 10 mg. and ampuls (1 cc.) of 25 mg. The dosage for adults is 20 to 30 mg. daily in single courses no longer than three months. For children the daily dosage is 0.5 mg. per kilogram of body weight, in single courses no longer than three months.

SEARLE Research in the Service of Medicine.
G. D. SEARLE & CO., CHICAGO 80, ILLINOIS

for depression

▲Deprol▲†

Clinically confirmed in over 1,200 documented case histories[1,2]

CONFIRMED EFFICACY

Deprol ► acts promptly to control depression *without* stimulation

► restores natural sleep

► reduces depressive rumination and crying

DOCUMENTED SAFETY

Deprol is unlike amine-oxidase inhibitors

► does not adversely affect blood pressure or sexual function

► causes no excessive elation

► produces no liver toxicity

► does not interfere with other drug therapies

Deprol is unlike central nervous stimulants

► does not cause insomnia

► produces no amphetamine-like jitteriness

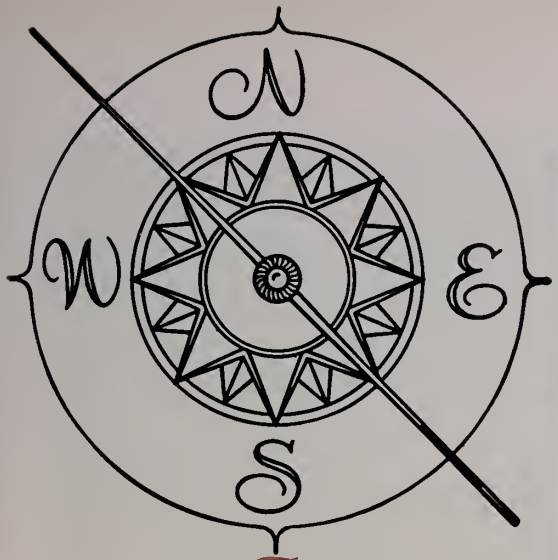
► does not depress appetite

► has no depression-producing aftereffects

► can be used freely in hypertension and in unstable personalities

Dosage: Usual starting dose is 1 tablet q.i.d. When necessary, this dose may be gradually increased up to 3 tablets q.i.d.

Composition: Each tablet contains 400 mg. meprobamate and 1 mg. 2-diethylaminoethyl benzilate hydrochloride (benactyzine HCl).



Supplied: Bottles of 50 scored tablets.

1. Alexander, L.: Chemotherapy of depression—Use of meprobamate combined with benactyzine (2-diethylaminoethyl benzilate) hydrochloride. J.A.M.A. 166:1019, March 1, 1958. 2. Current personal communications; in the files of Wallace Laboratories.

bicarbonate-regulating diuretic

Acetazolamide Lederle

HOW DIURETICS ACT

Primarily by regulation of bicarbonate transport	DIAMOX acetazolamide
Primarily by regulation of chloride transport	mercurials chlorothiazide

1

Advantages of DIAMOX in single-drug diuresis

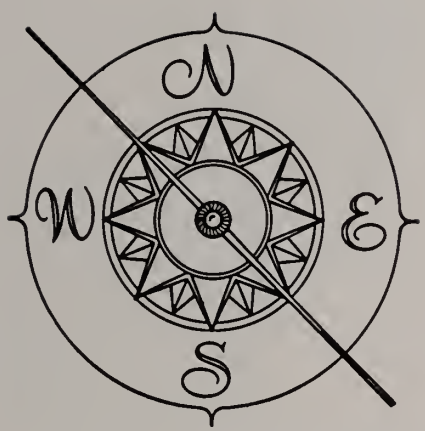
DIAMOX — operating through the well-understood mechanism of *bicarbonate* transport regulation—provides ample, prolonged diuresis in the great majority of patients.

DIAMOX is virtually nontoxic . . . has not caused renal or gastric irritation . . . has no pronounced effect on blood pressure. It is rapidly excreted, does not accumulate in the body, permits convenient dosage adjustment, allows unbroken sleep. Small, tasteless, easy-to-take tablets . . . usual dosage, only one a day.

- CARDIAC EDEMA
- PREMENSTRUAL TENSION
- EDEMA OF PREGNANCY
- OBESITY

2

Advantages of DIAMOX in intensive, two-drug diuresis



When intensive diuresis must be maintained, DIAMOX, alternated with an agent for regulation of *chloride* transport, has proved a regimen of choice. Through dual *bicarbonate-chloride* regulation, it produces maximal sodium-water excretion with minimal distortion of serum electrolyte patterns, greater patient comfort, lessened risk of induced drug resistance.

- ADVANCED CONGESTIVE HEART FAILURE
- REFRACTORY TOXEMIA OF PREGNANCY

STEROSAN®
Hydrocortisone

Cream and Ointment (chlorquinaldol GEIGY with hydrocortisone)

The case illustrated below typifies the superior response produced by STEROSAN-Hydrocortisone. Combining potent antibacterial-antifungal action with a reliable anti-inflammatory and antipruritic effect, STEROSAN-Hydrocortisone is valuable in a wider range of infective or allergic dermatoses.

A severe infectious eczematoid dermatitis on foot of 15-year-old boy. Patient used STEROSAN-Hydrocortisone preparation 3 times a day for 23 days with a dramatic improvement as shown.*

Happy Jeanette, aglow with health, is a Baker's Blue Ribbon Baby.

GET YOUR BABIES OFF TO A STRONG START WITH

Baker's

MODIFIED MILK

A complete formula in liquid and powder form prepared exclusively from Grade A Milk

Doctor, your dietary decision can build *Blue Ribbon* babies. The baby who wins the blue ribbon is the one whose doctor—no one else—selects its formula.

BAKER'S MODIFIED MILK BUILDS BLUE RIBBON BABIES

- A complete, balanced uniform formula.
- Convenient and easy to prepare—simply add water.
- Made from milk of outstanding purity.
- Provides adequate amounts of all known essential vitamins plus much-needed iron.
- Butterfat replaced by easily digested vegetable oils.
- Twice homogenized for better digestion and absorption.
- Helps doctor control infant's formula longer. Advertised to the medical profession only.
- Economical to use—eliminates need for additional vitamins and iron.

Available in drug stores

OTHER PRODUCTS—VARAMEL—a scientifically formulated evaporated milk product prepared exclusively from Grade A Milk

Milk Products Exclusively for the Medical Profession

BONADOXIN®
STOPS MORNING SICKNESS, BUT...

Highest percentage of relief: In *Drugs of Choice*[1], clinical data on several therapies for nausea and vomiting of pregnancy is summarized. BONADOXIN afforded the highest percentage of relief in the "excellent" (79%) and "good" (16%) combined categories. The majority of cases were completely controlled in the first week of treatment, almost all on one tablet nightly.

Safe, too:
BONADOXIN doesn't "stop" the patient. It is free of side effects commonly associated with overpotent antinauseants. Goldsmith, reporting on 620 controlled cases, states that "toxicity and intolerance [are] zero."[2]

BONADOXIN

DOESN'T STOP THE PATIENT!

Now available in tablet or drop form.

Dosage: usually one tablet or one tsp. (5 cc.) at bedtime. Severe cases may require another dose on arising.

Supplied: tiny pink-and-blue tablets, bottles of 25 and 100. Bonadoxin Drops in 30 cc. dropper bottles.

Each tiny pink-and-blue Bonadoxin tablet contains:
Meclizine HCl (25 mg.)
...for symptomatic relief
Pyridoxine HCl (50 mg.)
...for metabolic action and prompt antinauseant effect.

Infant colic?
Non-narcotic Bonadoxin Drops stop colic in about 85% of cases.
Each cc. contains:
Meclizine Dihydrochloride...8.33 mg.
Pyridoxine Hydrochloride...16.67 mg.

Dosage:

under 6 months	0.5 cc.	2 or 3 times daily, on the tongue, in fruit juice or water
6 months to 2 years	1.5 to 2 cc.	
2 to 6 years	3 cc.	
adults and children over 6 years	1 teaspoon (5 cc.)	

Supplied:
fruit-flavored, clear green syrup in 30 cc. dropper bottles.

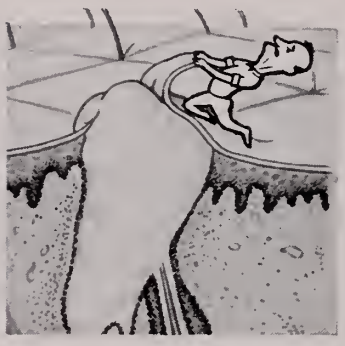
IN ACNE

Fostex® degreases the skin and helps remove blackheads



Fostex contains a combination of surface active agents (Sebulytic*) which:

◂ Completely emulsify excess oil so that it is quickly washed off the skin.

◂ Penetrate and soften comedones, unblocking the pores and facilitating removal of sebum plugs.

Fostex dries and peels the skin

◂ The Sebulytic base of Fostex dries and promotes peeling of the skin . . . actions enhanced by the keratolytic effects of micropulverized sulfur and salicylic acid.

*(Sodium lauryl sulfoacetate, sodium alkyl aryl polyether sulfonate, sodium dioctyl sulfosuccinate.)

FOSTEX CREAM
for therapeutic washing of skin in the initial phase of acne treatment, when maximum degreasing and peeling are desired.

FOSTEX CAKE
for maintenance therapy to keep skin dry and substantially free of comedones.

Fostex is easy for your patients to use

◂ Patients stop using soap on affected skin areas. Instead they use Fostex for therapeutic washing of the skin. The Fostex lather is massaged into the skin for 5 minutes—then rinse and dry.

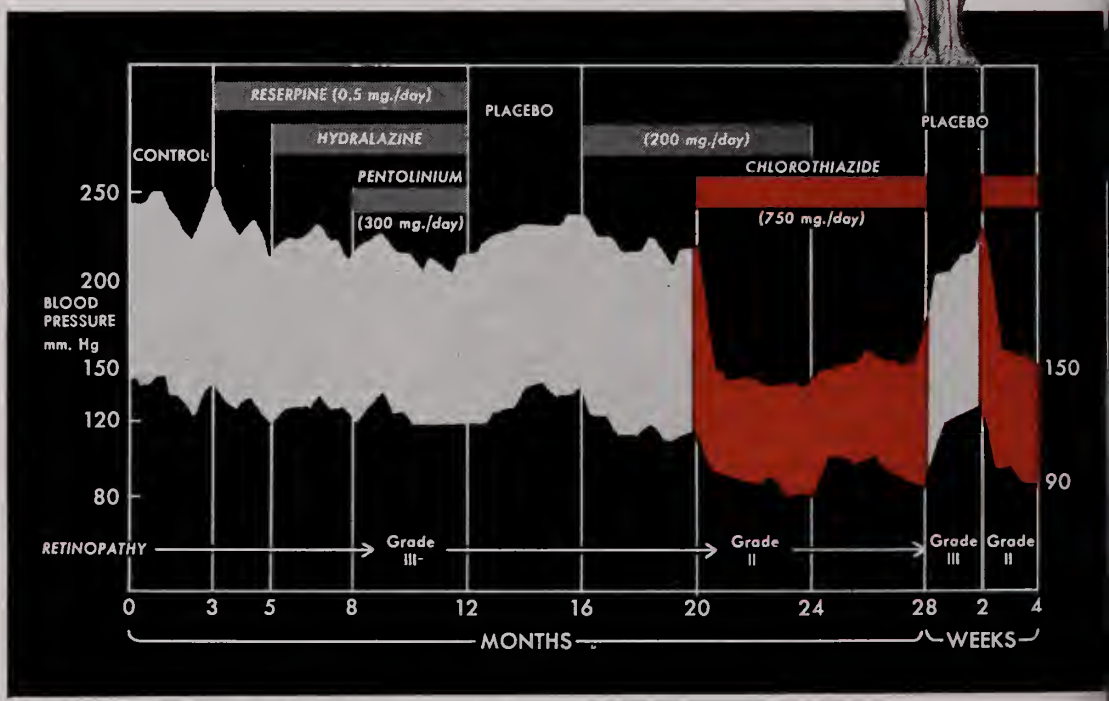
Investigator

after investigator reports



Wilkins, R. W.: New England J. Med. **257**:1026, Nov. 21, 1957.

"Chlorothiazide added to other antihypertensive drugs reduced the blood pressure in 19 of 23 hypertensive patients." "All of 11 hypertension subjects in whom splanchnicectomy had been performed had a striking blood pressure response to oral administration of chlorothiazide." ". . . it is not hypotensive in normotensive patients with congestive heart failure, in whom it is markedly diuretic; it is hypotensive in both compensated and decompensated hypertensive patients (in the former without congestive heart failure, it is not markedly diuretic, whereas in the latter in congestive heart failure, it is markedly diuretic). . . ."

Freis, E. D., Wanko, A., Wilson, I. H. and Parrish, A. E.: J.A.M.A. **166**:137, Jan. 11, 1958.

"Chlorothiazide (maintenance dose, 0.5 Gm. twice daily) added to the regimen of 73 ambulatory hypertensive patients who were receiving other antihypertensive drugs as well caused an additional reduction [16%] of blood pressure." "The advantages of chlorothiazide were (1) significant antihypertensive effect in a high percentage of patients, particularly when combined with other agents, (2) absence of significant side effects or toxicity in the dosages used, (3) absence of tolerance (at least thus far), and (4) effectiveness with simple 'rule of thumb' oral dosage schedules."

In "Chlorothiazide: A New Type of Drug for the Treatment of Arterial Hypertension," Hollander, W. and Wilkins, R. W.: Boston Med. Quart. **8**: 1, September, 1957.

he effectiveness of 'DIURIL' (CHLOROTHIAZIDE) in Hypertension

as simple as 1-2-3

1 **INITIATE THERAPY WITH 'DIURIL'.** 'DIURIL' is given in a dosage range of from 250 mg. twice a day to 500 mg. three times a day.

2 **ADJUST DOSAGE OF OTHER AGENTS.** The dosage of other antihypertensive medication (reserpine, veratrum, hydralazine, etc.) is adjusted as indicated by patient response. If the patient is established on a ganglionic blocking agent (e.g., 'INVERSINE') this should be continued, but the total daily dose should be immediately reduced by as much as 25 to 50 per cent. This will reduce the serious side effects often observed with ganglionic blockade.

3 **ADJUST DOSAGE OF ALL MEDICATION.** The patient must be frequently observed and careful adjustment of all agents should be made to determine optimal maintenance dosage.

SUPPLIED: 250 mg. and 500 mg. scored tablets 'DIURIL' (chlorothiazide); bottles of 100 and 1,000.

'DIURIL' is a trade-mark of Merck & Co., Inc.

Achromycin* V

TETRACYCLINE WITH CITRIC ACID LEDERLE

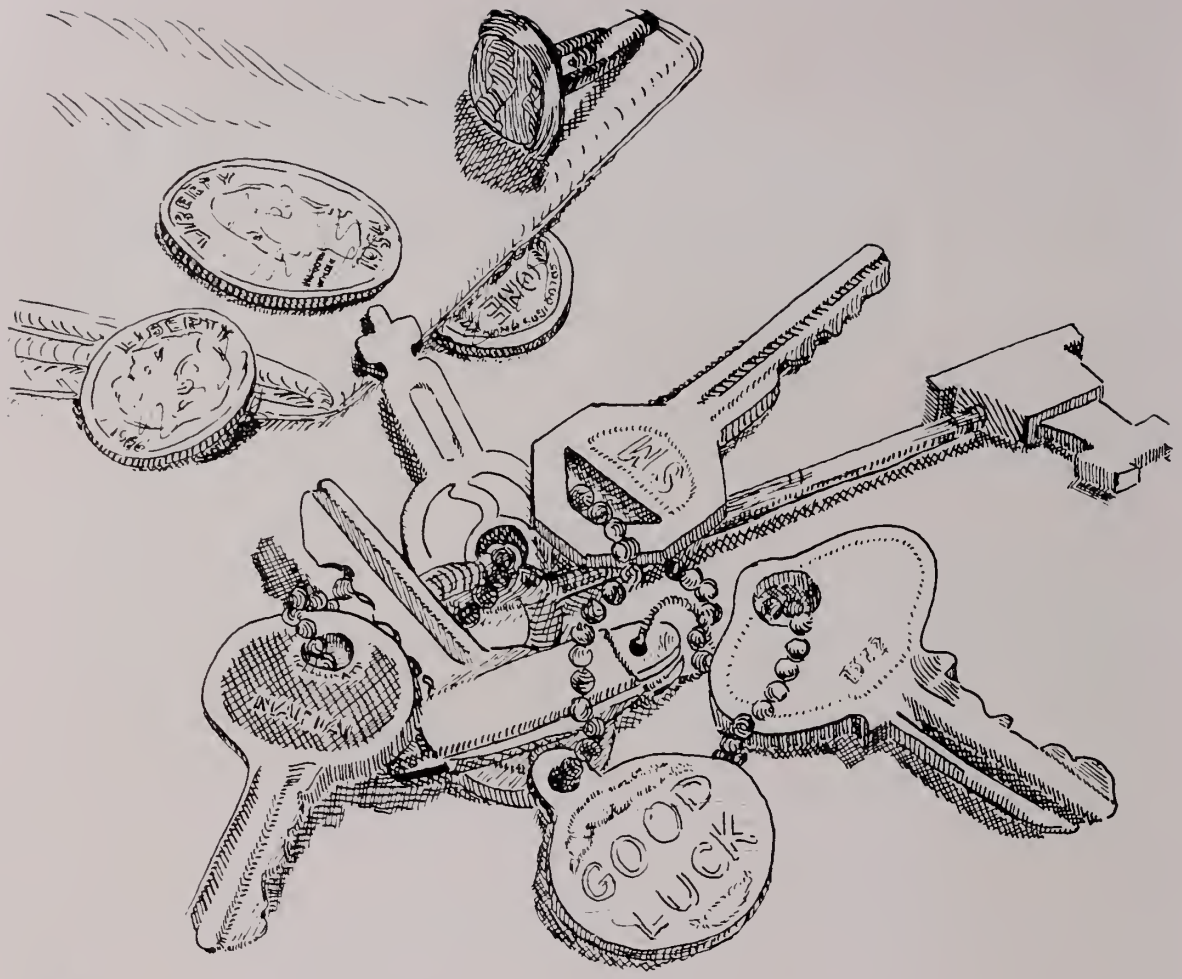
ASSURES EVERY PATIENT PRECISE ANTIBIOTIC ACTION UNDER THE VARIED CONDITIONS OF REALISTIC CLINICAL PRACTICE

produces optimal gastric conditions

Ideally, most antibiotics are given on an empty stomach. Since citric acid helps control unfavorable variances in gastric content,conditions in the stomach are optimal with ACHROMYCIN V tetracycline with citric acid.

prevents interference with absorption

Sequestering of antibiotic molecules by free metallic ions, always present in the intestinal tract, can deprive patients of a full therapeutic dose. The three active carboxyl radicals which protect the action of ACHROMYCIN V trap these free cations and allow uninhibited antibiotic absorption.



provides for peak antibiotic action

At the site of infection where, in essence, all antibiotics are proved, ACHROMYCIN V combats a wide range of pathogens under optimal tissue conditions. Citric acid, a factor of medically established value in the natural acid-base regulating mechanism of the G.I. tract, facilitates a more complete, and rapid antibiotic action.

MORE DOCTORS PRESCRIBE ACHROMYCIN V THAN ANY OTHER BROAD-SPECTRUM ANTIBIOTIC

More Than A Necessity

A KEY CHAIN carries a variety of items needed to perform many varied tasks met with every busy day. Added to the necessity of having each item available is the greater value of holding them together in one convenient cluster. Centralization in a hospital, too, is more than just a necessity. To its users, a hospital gains an added luster of convenience when it brings together all the items necessary to deal with a specific problem. Such a hospital is Shadel. In dealing with one, and only one problem—alcoholism—Shadel provides complete care for the patient during confinement, supervises rehabilitation, and at the same time gives him the benefit of its modern research program. Care, supervision, and research—all necessities in dealing with alcoholism—conveniently provided in one operation, Shadel.

CORRESPONDENCE

A Sure Cure

Seattle, Washington

EDITOR, NORTHWEST MEDICINE:

The following was recently found in a box of old papers belonging to Col. Joseph Cavell Higginbotham, the great grandfather of a distant cousin of mine. It might make an amusing filler for NORTHWEST MEDICINE.

Whitely's Receipt
for the Cure of Dropsy

2 galls. of hard cider
4 lbs. of new nails
1-1/2 pints of high land grapevine ashes
2 handsful of pine tops
2 handsful of Sarsaparilla root
2 handsful of Burdock root
2 handsful of Golden Rod
1 handful of Garlic root
1 handful of Cammamile flowers

Put all together in a pot closely covered. Simmer it down to one gallon; let it settle and then, drean it off in a jug. Take one gill three times a day for seven days, then 1/2 a gill until the disease is removed. Take no other medicine while using this. Diet, Hard Cider and Crackers. No salt nor greece must be used. Keep out of the damp air and take moderate exercise.

Cordially,
William R. Halliday, M.D.

NEW BOOK... just off the press... send now for your FREE copy

"Unsaturated Fats and Serum Cholesterol"

A review of the latest concepts and results of current research

This new book contains the most up-to-date bibliography of current research on: 1. The origin and behavior of cholesterol in the human body; 2. The effect of different dietary fats on serum cholesterol levels; 3. The nature of the active components in vegetable oils; and 4. Suggestions for practical diets.

Now ready for distribution to Physicians by the makers of MAZOLA Corn Oil, this book supplements the 1957 monograph, "Vegetable Oils in Nutrition" and provides a broader coverage of this important subject.

As a regular part of daily meals

MAZOLA® CORN OIL

can be used for control of Serum Cholesterol levels

MAZOLA CORN OIL... the only leading oil made from golden corn, is rich in the important unsaturated fatty acids—When an adequate amount of Mazola is part of the daily meals, elevated serum cholesterol levels tend to be lowered... normal levels tend to stay level...

MAZOLA CORN OIL is a natural food, *and* cholesterol free, can easily be included as part of the every day meals... simply and without seriously disturbing the patient's usual eating habits... in salads, baking and other cooking processes.

EDITORIAL

Return to a Drastic Code

Hammurabi, king and lawgiver to the Babylonians four thousand years ago, wrote into his code some harsh rules about the practice of physicians. Experience and time eliminated them but the courts and a few attorneys seem bent upon re-establishing a code almost as harsh, financially if not physically. The harm caused by some courts is just as devastating. The destructive influence is not confined to verdicts but extends to suits filed but never tried, no matter how baseless they may be. Against much of this there is no protection. The problem is growing.

In discussing the matter at a meeting in Washington, D.C., last March, Mr. C. Joseph Stetler, director of AMA legal department, said, "If the present trend continues and if a physician must become increasingly apprehensive of legal suits, his own defensive instinct will inevitably, in some measure, overcome his humanitarian and professional motivations. Such a doctor will be inclined to give too much time to protecting himself and less to the care of his patient."

Apprehension is not lessened by a decision handed down by the Court of Appeals in the State of New York. In this case there was award not only for physical injury claimed to have been sustained at the hands of a physician, but also for mental anguish over something which *might* have happened. Dissenting justices pointed out the danger of the prevailing decision which awarded the plaintiff $10,000 for a scar and $15,000 for worry about the possibility of contracting cancer. Their opinion was that "legal responsibility for an injury may not include mental suffering in contemplation of injuries which may never develop out of those already suffered, based upon a doctor's statement as to mere possible developments." It was unfortunate that they were outvoted.

Two years ago suit was filed in this area against a surgical partnership practice. It had no merit and was withdrawn after the plaintiff's third attorney finally agreed with those who had preceded him, that it could not be won. In the intervening months, however, health of the partners was all but ruined by sleepless nights, worried days and endless hours with attorneys preparing, at much expense, to defend the unjust suit. Had the suit been prosecuted and won by the plaintiff for the amount named, it would have taken the entire net earnings of the partnership for the entire time the agreement had been in existence, about fifteen years.

The *Journal of the Medical Society of New Jersey* has this to say about the effect of these suits: "Suppose, for example, that you are 99 per cent sure that this is a benign condition. Still, they might sue you, alleging negligence, if you omitted even a single laboratory study or failed to summon a consultant.*** Accordingly

you order more and more laboratory work, summon a whole corps of consultants, keep the patient longer in the hospital. Nobody is going to say *you* were negligent. This over-cautiousness leads to higher bills for the patient, and this in turn causes more complaints about the high cost of medical care.° ° ° The truth is that a rash of malpractice litigation does *not* serve the public interest° ° ° trigger happy plaintiffs are, in the long run, going to lower standards of public health."

When, in any one area, one out of four physicians has been served papers as a defendant in a malpractice action, the situation approaches the harshness of that in the time of Hammurabi. Mr. Stetler reports the above ratio for California. In Babylon the physician could lose both hands at the wrist if he lost his case. Destructive possibilities facing the physician today sometimes seem no less effective in their ultimate result. Even more important, in the long run may be the damage done to the medical care generally available in this country. •

Hospital Delegates Invite Government Control

The American Hospital Association has adopted a resolution inviting government control of an important segment of health care. Delegates, meeting in Chicago last month, not only registered no serious objection to governmental support of hospitalization of the elderly but went so far as to outline the principles under which it should be provided. Perhaps it is significant that the delegates inserted in the resolution a short sentence to the effect that hospitals should be paid in full for such care. Complete text of the resolution will be found in the general news section of this issue.

This proposal is typical of moves by those interested in socialization. It is difficult to oppugn a proposal to be kind to the aged and the socializers know it very well indeed. They are ready with cries of inhumanity, hard-heartedness and greed. Yet those who wish to preserve the system of individual responsibility and private enterprise must align themselves against this and all other such moves. The foundations of economic freedom must crumble eventually if they are eaten away, little by little.

The American Hospital Association has repeatedly shown itself not to be in sympathy with the aims of medicine. It has given support to corporate medical practice which is not particularly surprising. Corporate practice, if legal, would permit the hospital to hire physicians and dispose of their services on a fee basis, the fees going to the hospital. It is quite understandable that many hospital administrators would like to conduct such a business. Invitation to governmental participation, however, is another matter. Support by the hospital group is surprising, even though it is possible to understand the attractiveness to hospital administrators of a scheme which would bring in more patients and more money.

It is surprising in view of the fact that hospital boards of trustees usually include many business men who should understand the importance of a free enterprise system. Unless hoodwinked by the socializers or not aware of what their delegates are doing, they should be the first to oppose socialization of any part of hospital care.

Physicians who count among their friends those business men who sit on hospital boards should point out the dangers to business when the government is handed control of any portion of the system of individual responsibility. •

Changed Attitude Toward Osteopathy

Oregon and Washington have made significant change in attitude toward osteopathy. Oregon State Medical Society, at the meeting in Portland early in September, adopted a resolution directing Oregon delegates to the American Medical Association to "diligently attempt to persuade the AMA to cooperate with the osteopathic schools in every way possible to improve their educational standards and effectiveness." Less than two weeks later at Spokane, Washington State Medical Association utilized a resolution to advise the Washington delegates of its sentiment that AMA should, "take steps to offer help to improve the admission requirements, the standard of teaching, and the scope of the scientific curriculum of the Osteopathic Colleges in order that these Colleges may improve the training and caliber of their graduates."

At the 1955 AMA meeting the House of Delegates received a report from a study committee established in 1952. Colleges of osteopathy at Los Angeles, Des Moines, Chicago, Kansas City and Kirksville cooperated with the study and were visited by members of the committee. Only one, the college at Philadelphia, refused.

Those who had visited the osteopathic schools had been much impressed by the sincerity and idealism of the men conducting the schools. However it was obvious that the osteopathic schools were handicapped by inadequate financing, insufficient clinical material and facilities, lack of trained clinical teachers, too much faculty inbreeding and lack of opportunity for graduates to take postgraduate training. It was found that osteopathic therapy was included but receiving less and less attention in curricula. Emphasis on it was found to be variable and diminishing. Admission requirements as well as courses required seemed to differ little from those of medical schools.

In its report the committee said,

> The American Medical Association must decide whether it will assist in improving the medical care rendered by doctors of osteopathy. The committee believes that the only constructive course which can be followed is to enlarge the medical education opportunities of the students and graduates of schools of osteopathy by elimination of the classification of teaching in colleges of osteopathy as the teaching of 'cultist' healing. The past of osteopathy is unimportant. Its present, and particularly its future, are important to the medical care of the American people.

The commitee recommended removal of the stigma of cultism, encouragement of doctors of medicine to assist in undergraduate and postgraduate teaching of osteopaths in those states in which such conduct would not be contrary to announced policy of the state medical association, determination of local relationships between osteopathy and medicine by state and county medical organizations and continuation of the committee's work.

Reference committee recommended acceptance of the report. This touched off one of the most vigorous and eloquent debates heard in the AMA House in recent years.

Speaker after speaker took the rostrum to praise the study committee for its work and to support the recommendation of the reference committee. There was ringing applause and it appeared to increase in volume as each speaker added his arguments to those previously presented. It was impossible to escape the impression that the delegates were being won over. In voting, however, other forces were at play.

A minority report recommended rejection of the committee report. The minority report prevailed. In the voting, it seemed obvious that the delegates were not expressing their own convictions but were considering the reactions of their constituents. Apparently they did not believe that members at home were ready to accept removal of the stigma.

Actions by Oregon and Washington indicate that most physicians in this area are now ready to extend a helping hand to osteopathy. These moves should not be interpreted as an attempt to bring osteopaths into medical organizations or alter in any way the legal status of osteopaths. Intent in both states is to help improve standards to the end that people in this area will have better care. It should be noted carefully that the AMA study committee made no reference to changes other than removal of the statement that osteopathic training constitutes the teaching of cultist healing. It should also be noted that the position of state and county medical organizations as final arbiters was given full recognition. Directives in such matters must come from the county society to the state association and finally to the AMA which is simply a federation of state organizations. Actions by Oregon and Washington are in keeping with the proper structure of democratic organization. They reflect a change in local viewpoint which ultimately will help change the position of the national organization.•

Surgical Injuries of the Ureters

C. D. Creevy, M.D.
MINNEAPOLIS, MINNESOTA

In the interests of brevity and completeness, this discussion will concern only accidental surgical injuries of the ureters. These occur most frequently during abdominal operations upon the female genitalia or the lower large intestine, usually in the presence of dense adhesions, infiltrating neoplasms, or of brisk bleeding which is hard to control, and occasionally during vaginal procedures. The urologist has occasion deliberately to cut and reimplant them during removal of diverticula and cancers of the bladder, and in the correction of retrocaval ureters and ureteral strictures. He may strip the ureter too extensively during ureterointestinal anastomosis. The gynecologist may do the same during Wertheim hysterectomy. Slow necrosis may result, particularly if irradiation preceded operation.

Types of Injuries and Diagnosis

A variety of injuries may occur. The intact ureter may be tied or pinched off when sharply angulated by adjacent ligatures or sutures; it may be perforated by stick ties, or divided with or without ligature or removal of a segment; a piece may be snipped off laterally; or it may undergo rapid or gradual necrosis following crushing by a clamp or destruction of its extrinsic blood supply from energetic removal of part of its adventitia in an effort to excise all of the adjacent lymphatic tissue during an operation for cancer.

The nature of the resulting symptoms depends upon whether the injury is unilateral or bilateral, whether occlusion is complete or incomplete, and whether the injury results in leakage of urine into or behind the peritoneal cavity, or to the outside.

Complete bilateral occlusion causes anuria, usually without other manifestations until uremia develops. Fever and renal pain may occur if the ureter of an infected kidney is ligated. Unilateral complete obstruction is ordinarily entirely silent except in the presence of an antecedent renal infection, in which case chills, fever, renal pain, and toxemia may develop, but these phenomena are more likely to follow partial obstruction. The volume of the urinary output is not altered by unilateral injuries if the opposite kidney is normal.

If the damaged ureter leaks into the peritoneal cavity, signs of free intraperitoneal fluid and of peritoneal irritation will be added to the symptoms already mentioned. Uremia follows bilateral but not unilateral leakage. Retroperitoneal extravasation may produce signs suggestive of a perirenal or psoas abscess. Escape of

Read before the 66 Annual Meeting of the Idaho State Medical Association, Sun Valley, Idaho, July 9, 1958.

Fig. 1. Ureterovaginal fistula.

urine from the abdominal or vaginal wound means, of course, that there is a fistula. One can differentiate between ureteral and vesical fistulae by distending the bladder with colored fluid (indigo carmine). If the fluid escaping is unstained, it comes from the ureter. If the dye escapes from the fistula, the urine is leaking from the bladder rather than from the ureter. It is true that dye may leak from an ureteral fistula by reflux of urine up the ureter from the bladder, but this is uncommon. Its occurrence may be verified by cystography which will delineate the reflux and extravasation.

Cystoscopy is indicated whenever any of the above symptoms or findings follow operations in the vicinity of the ureters. Excretory urography is likely to be unsatisfactory because of the presence in the bowel of excessive amounts of gas, and because the presence of a fresh wound makes impossible the satisfactory application of the abdominal compression so necessary for a good urogram. After inspection of the bladder to make sure that it is intact, the ureters are catheterized. If catheters pass readily to both renal pelves and recover clear urine, one has, for practical purposes, excluded any ureteral injury except a small perforation. If there is reason to suspect that one is present, it is wiser to leave the catheter in the affected ureter than to try to verify the presence of an ureteral fistula by ureterography, lest it be impossible to reinsert the catheter into the damaged ureter. If the inlying ureteral catheter is well placed with its eye in the renal pelvis, and is carefully secured in position, the fistula will probably heal.

The same thing is true if a catheter can be

Fig. 2. Catheter is outside left ureter.

passed to the renal pelvis from the ureteral orifice despite the presence of an ureterovaginal fistula. If the catheter is left in place, the fistula may heal spontaneously or after light electrocoagulation of its vaginal opening (Fig. 1).

If there is any evidence of leakage of urine into the peritoneum or behind it, free drainage must be supplied. If the catheters pass full length but no urine can be aspirated, one must suspect that the ureters have been divided so that the catheters have passed out of the ureters at the site of injury. This is easily verified or disproved by injecting a little contrast medium into the catheters and exposing a film (Fig. 2). If the injected agent is outside the urinary tract, immediate repair is indicated. It will be discussed later. If normal renal pelves are outlined, ureterograms should be made to exclude the presence of perforation. In their absence, any anuria must be due to dehydration, shock, or intrinsic renal disease.

Most often it will be impossible to pass a catheter beyond the site of injury, a finding which demands immediate operation if the obstruction is bilateral. Unilateral lesions should be operated upon promptly, but are emergencies only if there is evidence of intra- or retroperitoneal leakage, since Hinman has shown that the kidney of the dog may recover, in favorable circumstances, after complete ureteral occlusion lasting as long as three weeks. One should remember, however, that the presence of infection in the blocked kidney demands prompt action if the organ is to be saved without undue risk to the patient, and that waiting too long in the hope that an occluding or kinking ligature

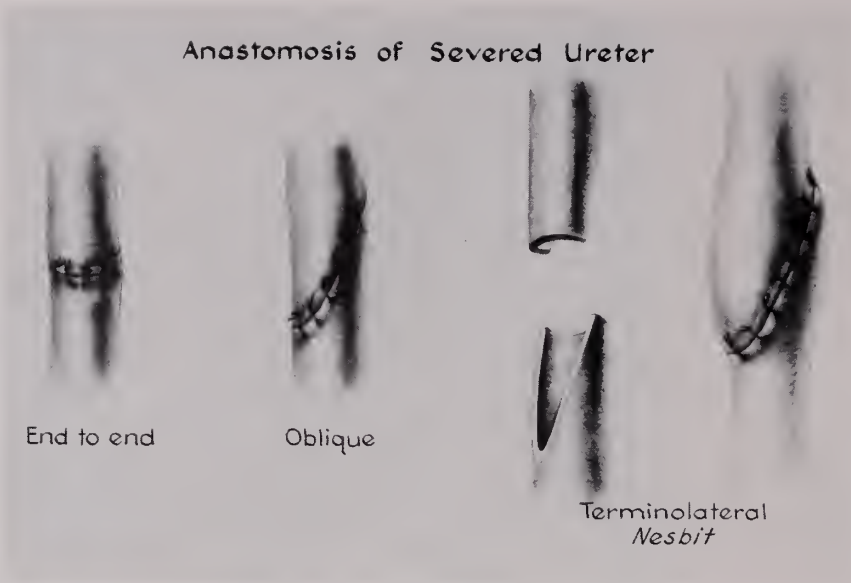

Fig. 3.

will be absorbed may lead to so much fibrosis at the site of injury as to make repair difficult. There is no great hurry when ureterovaginal fistula is the only sign of injury.

Treatment

The best course to follow in the presence of bilateral complete obstruction of the ureters depends upon general condition of the patient. If it is poor, unilateral nephrostomy is safest. As soon as the general state is satisfactory, the abdominal wound should be reopened (or an abdominal incision made if the original operation was a vaginal one). In patients in good condition the abdomen is opened at once. The ureters above the site of obstruction are dilated and can be followed quite readily to the point of injury. Urinary leakage can be seen. Ligatures and sutures from the point of injury downward are removed until any kinks or constrictions disappear. If no urine is seen outside the ureter, one may puncture it above the level of the suspected obstruction with a fine needle and inject a solution of indigo carmine. If none leaks out of the ureter, and if it can then be recovered from a catheter previously placed in the bladder, ureteral continuity has been reestablished and it is safe to close the abdomen with drainage. In the case of bilateral injury of this type, it is desirable to use indigo carmine for the first side and, after it has been recovered from the bladder, to inject phenolsulphonephthalein on the other side. The fluid recovered from the bladder is then made alkaline to decolorize the blue dye and bring out the red of the phenolsulphonephthalein.

A small lateral wound of the ureter without loss of tissue may be sutured with fine (0000) chromic catgut in the adventitia, and the connection with the bladder verified with indigo carmine. If the result is satisfactory, abdominal closure with extraperitoneal drainage may be made. If there is a large laceration or complete division of the ureter, one should pass a small catheter down the distal segment into the bladder to make sure of its patency. It is withdrawn, and a small perforation is then made in the distal segment of the ureter below the injury. The largest Robinson (two-eyed) or polyethyelene catheter that fits snugly into the ureter without distending it is then passed up through the site of injury into the renal pelvis and secured with fine plain catgut to the adventitia of the ureter at the point of entry. The flared end of the catheter is brought out extraperitoneally. If the distal segment cannot be found, one may sometimes locate it readily by inserting an ureteral catheter into it through a cystoscope. If this fails, a tubed flap of bladder may be used to replace the lost segment (see below).

The type of repair of complete division depends upon the condition of the ureter. If it

has been divided cleanly without crushing, and if its lumen is larger than normal, a catheter is threaded up to the renal pelvis as described above, and a simple end-to-end anastomosis is made over the catheter with four or five loosely tied sutures of 0000 or 00000 chromic catgut in the adventitia, any crushed tissue at the severed ends being trimmed off first (Fig. 3).

If the lumen is small, a stricture is likely to follow this type of repair, and an oblique or terminolateral anastomosis is preferred because it increases the circumference of the suture line so that, in the absence of an unusual amount of postoperative scarring, a wide anastomosis will remain after contraction of the scar. The sleeve type of anastomosis found in all the textbooks, in which the upper end of the ureter is invaginated into the lower end, is objectionable because it leaves a ledge within the ureter. This may defeat all attempts to dilate it postoperatively, should this become necessary, and necessitate reoperation.

When a segment of the ureter is missing, both the location and the length of the defect are important. Short defects may be overcome by mobilizing the ureter with some of the surrounding tissues above and below, taking care to preserve the extrinsic blood supply, and making one of the anastomoses already described. McArthur bridged a defect too long for a direct union by passing a catheter from the bladder or from a perforation in the distal segment up to the renal pelvis, suturing the soft tissues loosely around the exposed portion of the catheter, and leaving it to Providence to rebuild the missing segment. He made no follow-up studies of the kidney. This asks too much of Mother Nature.

Higgins, Moore, and Smith have succeeded in mobilizing the upper segment of the damaged ureter, drawing it beneath the posterior parietal peritoneum, and anastomosing its end to the side of the intact opposite ureter. This is justifiable only if the opposite kidney is inadequate, because otherwise one endangers the sound kidney for the benefit of the injured one if anything goes wrong; a stricture at the anastomosis cannot be dilated. The operation is a surgical tour de force.

When the defect is in the pelvic ureter, the upper segment may be mobilized and reimplanted into or anastomosed to the bladder, particularly if the missing segment is short or if the upper segment of the ureter is dilated, and therefore elongated (Figs. 4 and 5). If the injured or missing portion of the ureter is so long that neither reimplantation nor anastomosis is possible without tension, one may fashion a flap from the wall of the bladder, convert it into a tube, and implant the ureter into it or make an anastomosis between them (Fig. 6). If the bladder is normal in size a considerable length of pelvic ureter can be replaced in this manner, but if the bladder is fibrous and contracted, this cannot be done. If the defect is too long for replacement by a tubed flap of bladder, an isolated segment of ileum may be anastomosed to the ureter above the injury and to the bladder below.

These techniques are applicable to all types of surgical injuries of the ureters, including those discovered at time of the original operation, those found within a few days, and those which manifest themselves after an interval, as is often the case with ureterovaginal fistula.

General Principles of Ureteral Repair

Certain general principles are common to all operations for repair of the ureter. Nonabsorbable sutures should never be used in the urinary tract itself, not even in its adventitia, because they will almost inevitably work their way into the lumen of the urinary tract, there to become encrusted with urinary salts. There should be no tension whatever at the site of repair. All sutures should be loosely tied in the adventitia, aiming at approximation without necrosis. Nothing should be wrapped around the anastomosis lest it contract later. The urine should be diverted from the area of any extensive repair of the ureter by means of nephrostomy, pyelostomy, or ureterostomy or conducted past it by means of a catheter. The latter is usually simpler and is preferred because the inlying catheter keeps the repaired ureter straight, and separates granulating surfaces during healing so that they cannot become adherent. An ureteral catheter should not be used for this purpose because it is too easily plugged, with resultant disruption of the anastomosis. Per contra, the catheter should never distend the ureter to the point of blanching; necrosis may result.

One may pass one end of the catheter down into the bladder and the other up to the kidney, fishing the distal end out through the urethra or through a puncture in the anterior wall of the bladder. However, it is better to bring the distal end of the catheter out of a puncture in the wall of the ureter below the injury because

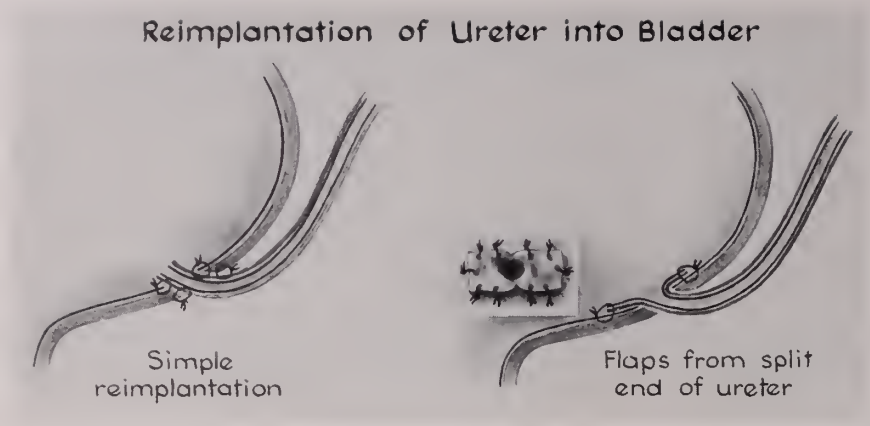

Fig. 4.

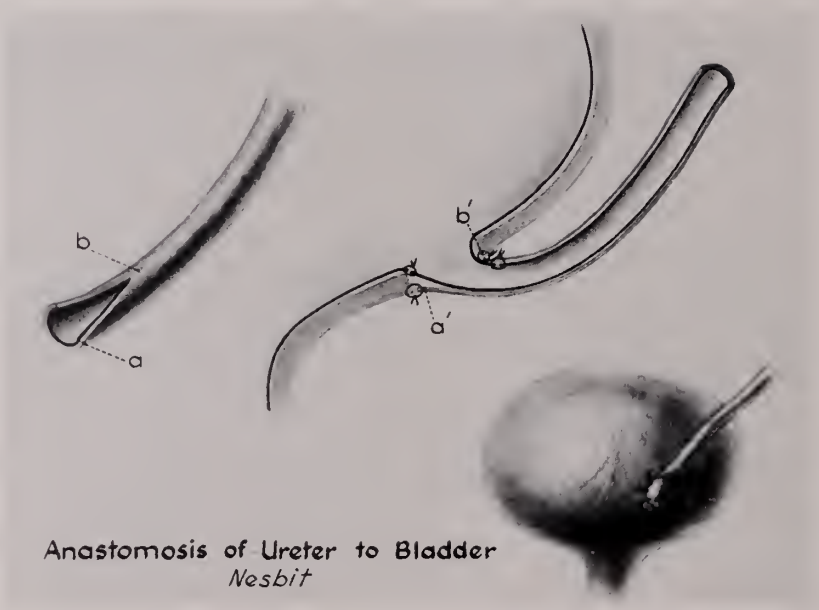

Fig. 5.

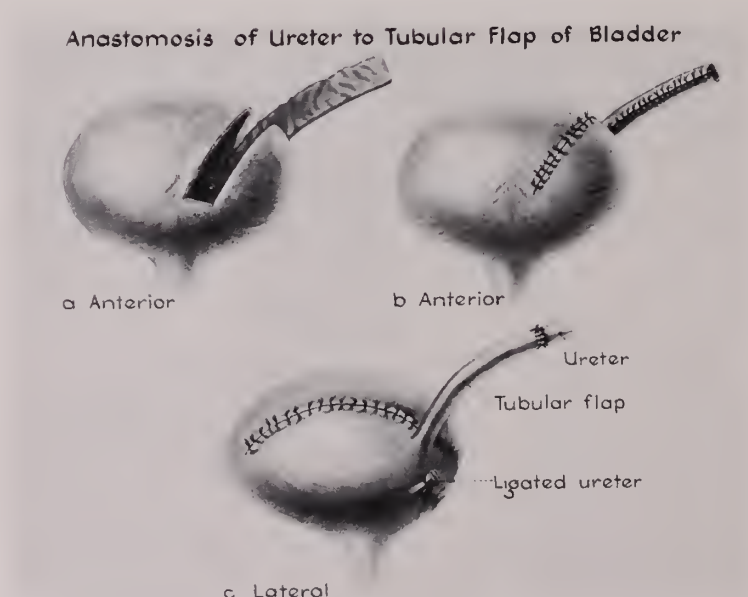

Fig. 6.

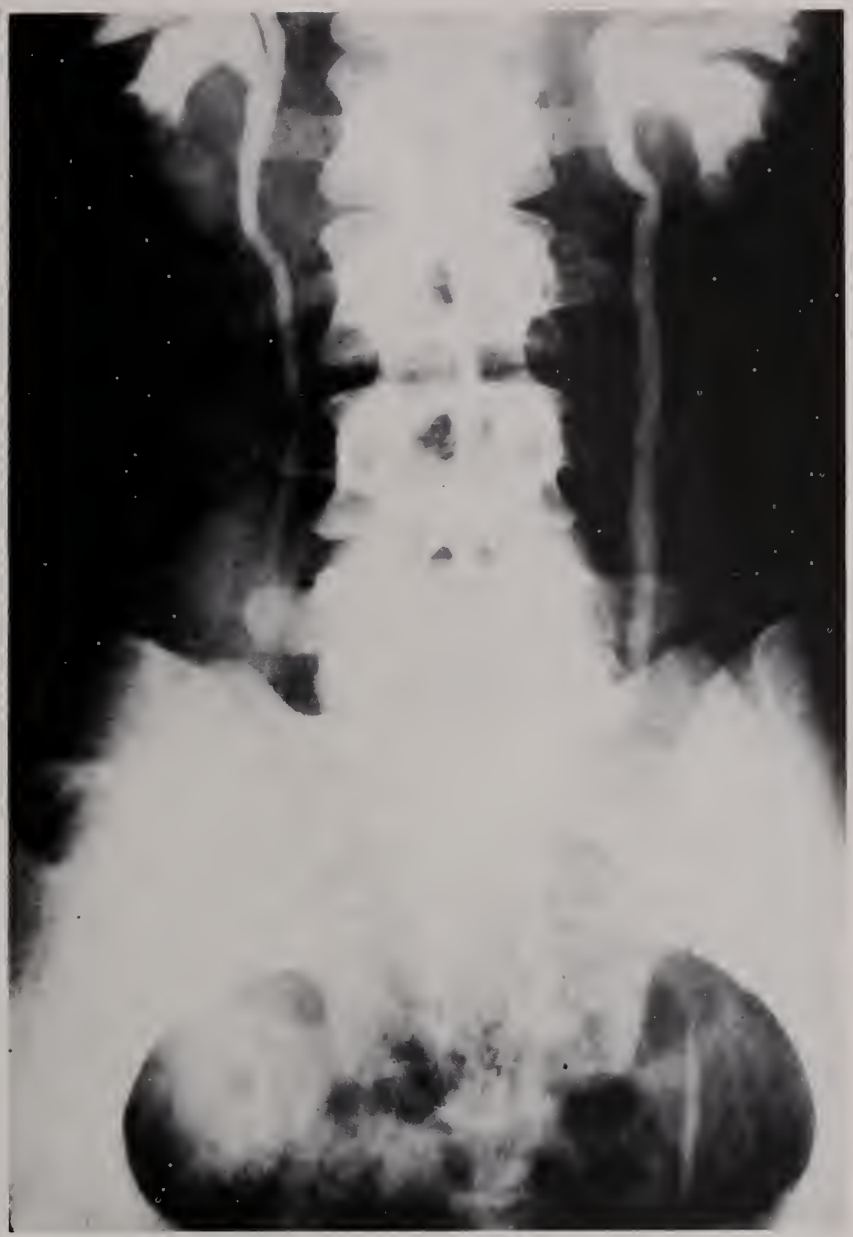

Fig. 7. Eighteen months after oblique end-to-end anastomosis of left ureter.

suturing the catheter at the site of its emergence is effective in keeping it from slipping down before the time for its removal. All such catheters should be left in place for from 10 to 21 days, depending upon smoothness of the convalescence. Drains alongside these catheters may be removed as soon as drainage around them ceases to do more than stain the dressing.

T tubes may be used to pass urine through an anastomosis or repair, but I am always uneasy after using them because the upper arm of the T does not reach the renal pelvis. This increases the possibility that urine may pass around the tube and damage the repair.

It is probably wise to administer an antibiotic or urinary antiseptic while catheters are in place. This will not prevent infection, but will serve to minimize it. One may start with streptomycin and penicillin during the immediate postoperative period while the patient is unable to take oral medication. This may be replaced within a few days with oral sulfadiazine or Gan-

Fig. 9. Four years after bilateral ureteral implantation.

trisin in moderate doses. Tetracycline and Chloromycetin are reserved for short term treatment or for serious infections. One does not wish to immunize organisms against them while there is a foreign body in the ureter.

The fluid intake should be high while a catheter is in place, primarily to reduce danger of plugging. Chief danger of an inlying catheter used for long periods lies in the introduction of urea splitting bacteria into the urinary tract with resultant encrustation of the tubes and the later formation of stones. For this reason it is probably wise to administer an aluminum salt while the catheter is in place, thus keeping much of the dietary phosphorus in the bowel and reducing the excretion in the urine of phosphates, an important constituent of the encrustations. Early and frequent ambulation helps to prevent stasis of the urine in the dependent calices of the kidney, another important factor in the formation of stones.

If both ureters have been completely ob-

structed for some time before repair, one must remember that the ensuing diuresis may result in the loss of a good deal of salt and water from the body, and should adjust their intake accordingly.

Late follow-up after a successful repair of ureteral injury is as important as a successful operation to make certain that neither stricture, secondary infection, nor lithiasis ruins the result. This means that the urine must be sterilized after healing has occurred, and that periodic excretory urograms or retrograde pyelograms should be made until danger of stricture is past —usually a matter of a year or two. If narrowing of the anastomosis or hydronephrosis above it appears, ureteral dilatation is required (Figs. 7, 8, and 9).

Nephrectomy and Ureteral Ligation

You will have noticed that I have not mentioned deliberate ligation of the injured ureter nor nephrectomy as satisfactory methods of treatment. Both are objectionable unless preoperative studies of the patient have shown unmistakably that the opposite kidney is capable of supporting life alone. This implies at least a good excretory urogram capably interpreted. Palpation of the opposite kidney at operation is a very poor guide to its functional capacity, and should be relied upon only in a grave emergency, since badly damaged kidneys may feel quite normal, even to the experienced urologist. In case of doubt it is far more conservative to make a temporary nephrostomy, pyelostomy or even a cutaneous ureterostomy and to swallow one's pride. Ureteral ligation has certain disadvantages of its own: It may lead to a fulminating acute pyelonephritis if the kidney is infected; the ureteral ligature, no matter how care-

Fig. 9. Five years after Boari's operation on the right.

fully placed, may slip or cut through. Therefore, ureteral ligation has no place in the treatment of ureteral injury except in dire emergencies.

Prevention of Ureteral Injury

The prophylaxis of ureteral injury is largely a matter of care in dissection and of the exercise of foresight. One should remember that the ureter may be displaced by neoplasms or inflammation; it may be pulled up with peritoneum. Rough, hasty, slashing dissection should be avoided; one must never grab blindly for a bleeder in a pool of blood in the region of the ureter. If a difficult dissection is anticipated, it is cheap insurance to insert a large catheter into each ureter just before operation, this can be done while the abdomen is open if unexpected difficulties are encountered, even by a relatively inexperienced cystoscopist.

Summary and Conclusions

1. Surgical injuries of the ureters occur most frequently during difficult or bloody pelvic dissections.
2. Their recognition is usually simple.
3. Type of repair depends upon type of injury and condition of patient.●

University of Minnesota Medical School (14).

Report from the Washington Office of AMA

WASHINGTON, D.C. — When the Congress that is elected in November goes to work next January 7 it will have before it a half dozen important health-medical issues that the last Congress took some interest in but did not resolve. They include hospitalization under social security, tax-deferment on annuities, loans and mortgage guarantees for hospitals and nursing homes, aid to medical schools and amendment of Veterans Administration's hospitalization procedures.

The issue of hospitalization under social security—the Forand bill principle—will come into the spotlight shortly after the new session starts. Under instructions from the House Ways and Means Committee, the Department of Health, Education, and Welfare will complete a study on the problems of financing hospital care for the aged before next February 1. Some study of medical costs may also be included.

Decision to move ahead with a study of medical care costs for the aged was reached by the committee at the same time it excluded the Forand idea from the social security bill enacted during the summer. HEW was told to pay particular attention to the possibility of increasing OASI taxes, and with the money purchasing health insurance (nonprofit or commercial) to take effect upon retirement or disability. This would differ from the Forand plan in that health care would be financed through insurance, and not paid for directly by the Federal government.

The Keogh bill to allow doctors and other self-employed to defer income taxes on money put into retirement funds passed the House with very little opposition, but encountered difficulty in the Senate. It was defeated there in the closing days, and under unusual circumstances. Policy committees of both parties decided to oppose the bill as too costly, and the vote came in the course of a complicated legislative maneuver that could not be used as a test of whether individual Senators favored or opposed the bill itself.

Keogh bill sponsors, however, are encouraged that 32 Senators resisted official party instructions and stayed with the pension plan. They are confident that next year under more favorable legislative circumstances the measure will clear the Senate.

An effort was made late in the session to authorize grants to medical schools for building and equipping teaching as well as research facilities. The bill extending the reasearch grants program also would have allowed use of the grants for "multi-purpose" structures (teaching and research) if emphasis were on research. However, for fear this change would hold up the simple extension bill, it was dropped off before the bill reached the House floor. Sponsors of aid to medical education will be back next year and campaign on this issue alone.

Treatment of Ankle Injuries

Don H. O'Donoghue, M.D.
Oklahoma City, Oklahoma

Injuries to the ankle joint constitute one of the most common conditions which the general practitioner will encounter. There is no doubt that many ankle injuries are treated over-casually. Hence, origin of the expression, "Once a sprain, always a sprain." It is my opinion that there has not been sufficient consideration given to the exact pathology present in each individual case. In order to be able to treat intelligently any injury of the ankle joint, a definite diagnosis must be made as to the exact nature of the damage. This predicates a working knowledge of the anatomy of the region involved.

Let us consider the anatomic characteristics of the ankle joint that have a direct bearing on the type of injury that occurs in response to various forces applied (Fig. 1). The ankle joint is functionally a hinge joint with motion only in one plane—namely, flexion and extension. The bony structure is designed to make up a mortice and tenon with considerable inherent stability. The mortice is formed by the lateral malleolus, the under surface of the tibia and the medial malleolus. The tenon is the body of the talus which is shaped to fit snugly into the mortice. It is noted that the lateral malleolus is longer than the medial malleolus. Its distal tip extends to the bottom of the talus at the level

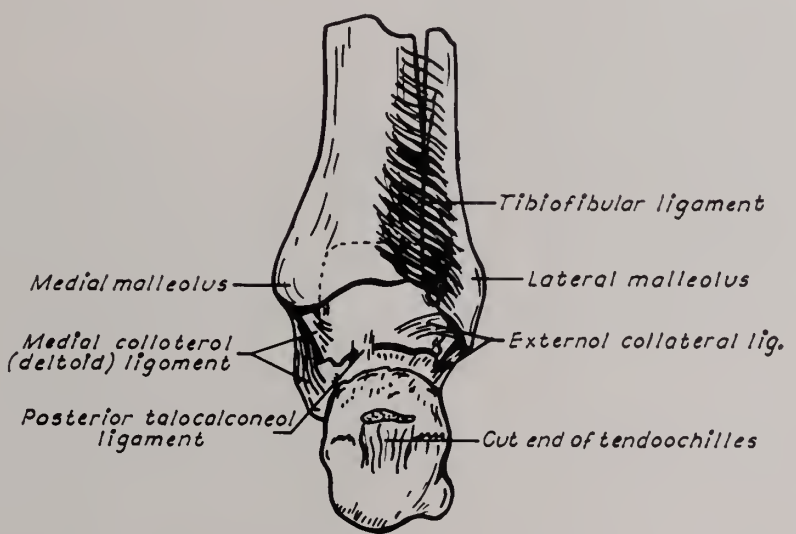

Fig. 1. Posterior view of the right ankle. Note tip of lateral malleolus extends to the bottom of the talus whereas the tip of the medial malleolus extends only one half way down the verticle height of the talus. Note the gradual increase in thickness of the tibiofibular ligament as it approaches the ankle. The medial collateral ligament is extremely heavy as compared to the lateral collateral.

Read before the 66th Annual Meeting of the Idaho State Medical Association, Sun Valley, Idaho, July 8, 1958.

of the talocalcaneal joint. It is roughly rectangular in outline, but actually somewhat narrower at the level of the lower end of the tibia. The medial malleolus on the other hand is short and thick, being roughly pyramidal in shape with its base upward. Its distal tip extends only half way down on the body of the talus. The tibia and fibula are bound together by the anterior and posterior tibiofibular ligaments which are really thickened expansions of the same interosseous membrane which fastens the two bones together throughout their length. Although there is some motion in the articulation between the tibia and fibula at the lower end, there is to all practical purposes complete stability between the two bones. Thus, the ankle joint has stability from two sources: first, the bone formation described above and, second, the extensive investiture of ligaments that surround the joint.

The ligaments become thin in front and behind to permit flexion and extension of the joint, and thicken on the sides to become the tibial and fibular collateral ligaments. The medial collateral, or deltoid, ligament is particularly strong, has a very broad attachment to the internal malleolus and extends downward in many bands to become intimately connected to the ligaments supporting the arch of the foot. In addition to stabilizing the ankle joint on the medial side, it serves to support the arch and hence is a doubly vital structure.

It is possible to dissect the lateral collateral ligament into many separate ligaments but there are three primary fasciculi; one running forward to attach to the talus anteriorly (anterior talofibular), another backward to attach to the posterior portion of the talus (poserior talo-fibular), and one directly downward to attach to the calcaneous (calcaneo-fibular). These ligaments also blend into the lateral ligaments of the foot, extending forward onto the cuboid and to the base of the fifth metatarsal. Together the medial and lateral ligaments, acting in conjunction with the two malleoli, serve to prevent lateral rocking motion at the ankle joint.

The long lateral malleolus, with the medial ligament, prevents excess motion to the outer side. The length of the lateral malleolus firmly holds the body of the talus so that lateral motion in the tarsus is more restricted than is medial. A normal range of flexion-extension is permitted with its axis at the tip of the medial malleolus.

Since the ankle joint is functionally a hinge joint freely permitting only dorsiflexion and plantarflexion, it follows that ligament injuries to the ankle are primarily due to lateral stresses and so readily fall into two categories—namely, inversion injuries and eversion injuries. In an inversion injury, the ankle and foot are forced into inversion, internal rotation and plantar flexion in relation to the leg. Similarly, eversion injuries result from eversion, external rotation and dorsiflexion.

Inversion Injuries

In inversion injuries as the foot rolls inward in relation to the leg, the push will be applied against the medial malleolus and the pull applied to the lateral ligament which is functionally designed to stop this motion. As a result of over inversion, this ligament will tear slightly, partially, or completely depending upon the strength and duration of the force applied. As the inverting force continues and the lateral ligament gives way, the ankle opens up on the lateral side thus forcibly thrusting the talus against the medial malleolus (Fig. 2). This buttress,

Fig. 2. AP x-ray of ankle. *Left*: Standard view. *Right*: Inversion stress x-ray showing the talus rotating over the tip of the medial malleolus and departing from the fibula laterally. This indicates loss of the external collateral ligament.

being short and stubby, may act as a fulcrum with its tip against the middle of the internal surface of the talus so that the talus will rotate over the malleolus rather than break it off. In this case the injury will be confined to the lateral side of the foot and will be primarily a ligament injury. The lateral ligament may tear

at its attachment to the foot or in its substance or at its attachment to the fibula. Indeed, the external malleolus may be fractured at any point up to the level of the inferior articular surface of the tibia.

Inversion injury is the most frequent type of injury occurring at the ankle joint. Eighty-five per cent of all injuries to the ankle consist of inversion injuries and are ligament injuries, so-called sprain or sprain fracture. However, if the abnormal force continues and is very severe, the medial malleolus may actually be pushed off at its attachment to the tibia. The talus may be driven against the posterior or medial portion of the tibia and break off the posterior lip of the inferior articular surface of the tibia. Obviously other injuries may occur, such as fracture of the medial margin of the talus, fracture to the neck of the talus, or damage to the other tarsal bones, but by far the most common injury is to the external collateral ligament.

Eversion Injuries

If an eversion force is applied, the foot is carried outward in relationship to the leg and the talus is forced laterally. Here the anatomic difference between the two malleoli becomes quite significant and indicates the type of injury one should expect from an eversion force. Whereas, on the inner side the medial malleolus is short and the talus may rotate over it, on the outer side the lateral malleolus extending downward throughout the full height of the talus prevents rotation over its tip and a lateral thrust is applied directly against the lateral malleolus. The push is toward the outer side; the pull away from the medial side of the foot.

As the talus is forcibly driven against the lateral malleolus, the malleolus serves to stop this motion before undue stress is applied to the medial ligament. If the force continues and is severe, the lateral malleolus will give way. This injury may be manifested in several different ways. The malleolus may break off at the level of the lower end of the tibia and this may be the extent of the injury. Much more frequently the medial collateral ligament will also give away with tibiofibular separation (Fig. 3). However, the same force may actually drive the fibula away from the tibia, the fibula itself holding and tibiofibular ligament rupturing (Fig. 4).

Fig. 4. *Left*: Rupture of the medial collateral ligament, displacement of the talus laterally, separation of the fibula and tibia by rupture of the tibiofibular ligament. The fibula itself is intact. Note avulsed fragment of bone and ligament caught between medial malleolus and talus. *Right*: After repair of medial ligament and tibiofibular separation.

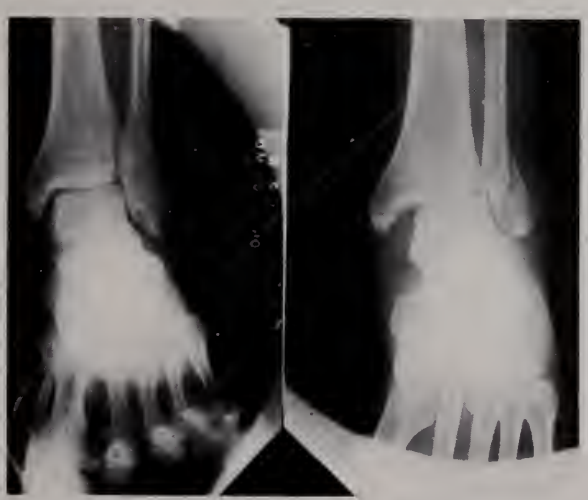

Fig. 3. *Left*: Straight AP x-ray indicating fracture of the fibula. *Right*: Same patient after displacing the talus laterally which shows this is not a simple fracture of the fibula but that the medial collateral ligament is torn.

This permits separation of the ankle mortice. If this separation continues widely enough, the interosseous membrane binding the tibia and fibula together holds at some point and the fibula will break somewhere in the shaft (Fig. 5).

One may state categorically that if there is fracture of the fibula above the level of the ankle joint not caused by a direct blow, the tibiofibular ligament has been ruptured and integrity of the ankle mortice has been lost. When the force has been extensive enough to rupture the

Fig. 5. *Right*: Rupture of the medial ligament, separation of the tibiofibular ligament, lateral displacement of the talus, fracture of the fibula above the level of the joint. This fracture cannot occur without rupture of the medial ligament. *Left*: After repair of the medial ligament and fixation of the tibiofibular joint.

tibiofibular ligament, the talus must indeed have been carried laterally far enough to place overstress on the medial ligament which in turn gives way.

Injuries which may occur on the medial side of the foot are similar to those which occur on the lateral side with inversion injuries. That is, the deltoid ligament may be ruptured at any point in its substance or at either attachment, or the medial malleolus may be pulled away from its attachment to the tibia. Although severe forces may cause other injuries, such as fracture of the margins of the lower articular surfaces of the tibia or fracture of the tarsal bones, by far the more frequent injuries are to the two malleoli and to the corresponding ligaments. Although a great majority of all injuries to the ankle are sprains and consist of inversion injuries, most fractures of the ankle are caused by eversion forces.

It is immediately apparent that it is extremely important in a given case to analyze the forces applied in order to interpret properly the physical and x-ray findings. In many cases what appears to be a simple fracture of the shaft of the fibula will indeed be a complete dislocation of the ankle with rupture of the tibio-fibular and deltoid ligaments. The result obtained in a given case will depend upon how carefully and accurately one has analyzed the exact nature of the damage. For treatment to be at all intelligent, diagnosis must be accurate.

Diagnosis

1. *History.* Since the forces which cause ankle injuries are of such significance in the condition which results, one must determine, if possible, the exact mechanics of the injury. Was the foot inverted or everted? How did the accident oc-

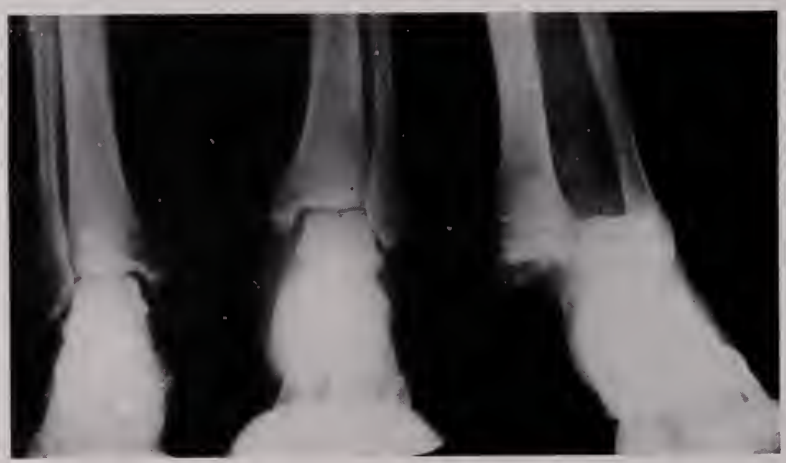

Fig. 6. Severe sprain before and after reduction shows importance of x-ray before reduction. Note reduction is not complete in center view as compared to normal ankle. While very careful interpretation of the middle view would indicate there was some ligament damage as indicated by slight lateral separation of the talus due to impingement of the ligament between the talus and malleolus, the original view on the right gives a dramatic representation of the nature of this injury—namely, ruptured medial collateral, ruptured tibiofibular ligament. One might expect here a fracture of the fibula through its neck superiorly. This did not occur in this case however. Repair of medial ligament and fixation of fibula to tibia by long screw resulted in normal ankle.

Fig. 7. Routine AP and lateral x-ray are apparently negative. Oblique view reveals true condition—namely, fracture of medial malleolus, rupture of tibiofibular ligament. In this instance the clinical examination of the foot did not agree with the x-ray findings so further x-ray study was made.

cur? Was disability immediate? Or, is disability the result of swelling and edema? Was there a primary deformity which was corrected by the patient or a friend or the x-ray technician in making the picture? How long ago did the injury occur? What was the treatment? Has heat been applied, or cold? All these factors give important leads, not only as to the type and location of injury, but as to its severity. They will be invaluable guides to the treatment indicated.

2. *Examination.* Examination of the injured ankle should be preceded by careful examination of the opposite leg in order that a normal may be obtained for comparison. One should then proceed to a meticulous but extremely gentle examination of the involved extremity. If one begins by simple observation, he can obtain the confidence of the apprehensive patient and more detailed information may be obtained. Observation will reveal deformity, the location and amount of swelling, tension in the skin, and the extent of circulatory impairment. Following observation, by careful palpation one can determine the tension and the degree of swelling. There may be obvious bony crepitation on careful palpation through the skin. Then, by gentle manipulation determine the pain-free range of motion and see if there is increased lateral motion. If lateral motion is not permitted, notice whether there is pain on attempting to elicite lateral motion. Any abnormal motion indicates serious ligament or bone injury.

3. *X-ray examination.* X-ray examination ought to be carried out only after careful clinical examination by the surgeon. If posible, he should examine the foot before the x-ray is made. X-ray technicians are trained to position extremeties in certain standard ways and often manipulation of the part to get proper x-ray position will reduce deformities or screen injuries which might otherwise be obvious. The x-ray technician should be instructed to make the original picture without correction of the position of the foot since this may give an invaluable guide as to degree of injury (Fig. 6). Following this original picture, proper positioning can be made to obtain the standard views. At least three views should be made: an AP of the tarsus, an AP of the ankle, and a lateral of the ankle and foot. Oblique views are invaluable and may reveal fractures not seen in conventional views (Fig. 7). If abnormal motion can be elicited, an x-ray made in the abnormal position is of considerable value (Fig. 3). If the x-ray examination does not appear to be consistent with the clinical findings, a careful review of all findings must be made. In other words, if it appears to you that there is a fracture and x-ray does not reveal it, further views may clarify the situation.

Careful attention to all these details of history, physical examination and x-ray visualization will often permit early diagnosis of a serious injury. Definitive treatment may then be carried out promptly rather than after a period of time during which it is determined that the injury

is more serious than it was first considered to be. Although the majority of injuries to the ankle will be sprains without bone involvement, it is extremely embarassing to discover after several weeks that the treatment was woefully inadequate because of more extensive damage than was recognized at the time the treatment was begun.

Treatment

Before treatment can be properly initiated in any individual case, it is important to classify the injury not only as to type and structures damaged but also as to severity. It is axiomatic that the closer an injury approaches the joint the more necessary it is to get completely accurate repositioning of the injured structures. One must not be satisfied with incomplete reduction or partial replacement of fractures or dislocations about the ankle any more than about any other joint. Indeed, it is more important to get accurate repositioning in a weight-bearing joint than in the non-weight bearing joints in the upper extremity.

One hundred per cent reduction must be accomplished by whatever method will insure the best result, not by the method which at the time seems the most convenient. A little extra care at the time of injury will save a great deal of time and trouble at a later date. It is a well recognized fact that surgery will be required in a certain percentage of injuries about the ankle joint. Recognizing this fact, it is extremely important that surgery be considered as a method of treatment per primam. If it is necessary to carry out surgery in order to obtain the best results, it should be done promptly, at time of injury, rather than backed into after nonsurgical treatment has failed.

Since the majority of injuries about the ankle are sprains, I shall first consider the treatment of sprains. Sprains can most readily be classified into three divisions—namely, *mild, moderate* and *severe.* This arbitrary division is largely self-explanatory but is subject to a good deal of variation according to the individual physician. The groups will, of necessity, overlap.

A *mild* sprain is one in which there has been a partial tear of some of the elements of one of the ligaments at the ankle joint without any actual functional weakening of this ligament as a whole. In such a case, one would expect to find minimal symptoms; local tenderness, local swelling and mild disability. Indeed the disability may be so mild that the patient does not even seek advice from a physician.

Examination will reveal no pain on normal motion, no abnormal motion and only a moderate degree of pain on reapplying the stress which caused the original injury. X-ray examination will be negative. This type of case requires no very extensive treatment and is the type which gives dramatic results from the local treatment which was so extremely popular a few years ago. Unfortunately, these local methods have been applied in many cases where they were entirely inadequate.

Local application of ethyl chloride spray tends to break down the cycle of vessel spasm and reduce the local swelling and edema. It can have no effect on strength of the ligament itself nor on its healing. This should be kept in mind since it does tend to relieve the symptoms but does not protect the part. However, in the mild case, local injection of procaine and hyaluronidase will tend to permit rapid absorption of the hematoma and reduce pain. It is valuable in treatment.

In this instance, the ideal treatment would be rest with application of ice followed by heat. However, in a mild sprain this is usually not necessary. It is not justified if it interferes with the patient's occupation. Local injection followed by adequate strapping (Fig. 8) and a well fitted shoe may be all the treatment that is necessary since there is no actual weakness of the ankle joint.

It should be pointed out again, however, that if one is to permit normal activity, one must be extremely sure of the diagnosis. It is unwise in any case to use local treatment which relieves the symptoms and then permit the injured person to participate in active sports immediately. Lapse of several hours may determine a little more accurately the extent of injury.

A *moderate* sprain consists of one in which there has been an actual tear of a portion of the ligament but in which the integrity of the ligament has not been entirely lost. There is some weakness of the ligament but no abnormal motion is permitted. Ordinarily, history is given of sharp inversion of the foot and a fall with immediate severe pain. The patient is not necessarily wholly incapacitated for walking since direct weight bearing does not put strain on the injured ligament.

Symptoms are usually so severe that medical aid is sought. On examination there is found to

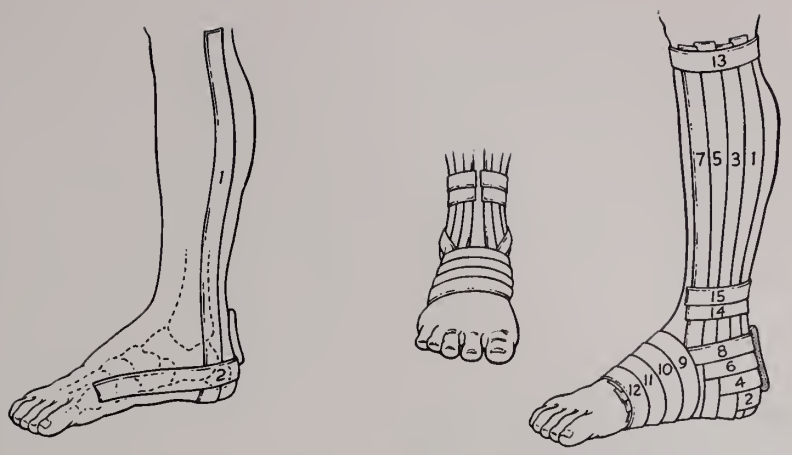

Fig. 8. Ankle strapping, Gibney type. The verticle straps are for lateral ligament support; the horizontal straps are for fixation of the dressing. For remedial strapping, the strips should be as illustrated. For protective strapping, taping should stop at the height of strip 15. Left shows the felt pad which should be placed under the tape to protect the heel cord. This is quite important if the athlete is to run. If the foot is expected to swell, the circular straps around the foot should be cut down the front. The whole foot should be wrapped with gauze bandage or elastic bandage.

be severe pain in the ankle, swelling diffusely through the ankle and foot and tenderness over the lateral side of the foot and ankle, usually sharply increased at the area of the damaged ligament. This may be at the attachment of the ligament to the foot, or at the malleolus, or it may be in the substance of the ligament. The patient may hold the foot in an inverted position but any attempt to invert the foot beyond this point will cause severe pain. Even normal motion may be painful. An attempt to reproduce the forces causing injury will elicit severe pain. However, there will be no abnormal motion since a portion of the ligament is still intact. X-ray is negative except as it may show a sprain-fracture at one or the other attachments of the ligament.

In consideration of treatment it should be borne in mind that whereas in the mild sprain there is no weakness and protection is not vital, in the moderate sprain there is definite weakness of the ligament. The main purpose of treatment is to protect the ankle against further injury until healing occurs, as well as to promote repair of the damage already present. Rather mild injury superimposed over the already weakened ligament may cause complete avulsion.

The ideal treatment would be local injection of the area with hyaluronidase and procaine, followed by compression bandage and ice pack for several hours. Here again, relief of symptoms by local injection should not permit early ambulation or early function of the part since this will have a detrimental effect upon healing. The patient should be put to bed with pressure bandage and ice pack for 8 to 10 hours. At the end of this time, further analysis should be made as to extent of the injury.

Following the period of ice packing, a posterior and a lateral stirrup splint should be applied from below the knee to the toes in order to maintain the part in normal weight bearing position. The patient should then be allowed to get up on crutches but should be advised not to bear weight on the extremity. Several days later, after the swelling subsides, this splint should be replaced by a walking cast which may be worn for ten days to three weeks depending upon extent of the damage.

It may be argued that a cast handicaps the patient needlessly. Usually, it will be found that, in a ligament injury of this degree, the patient will be substantially disabled in any event and he will actually get around more efficiently and with less pain in the walking cast than he will with ordinary wrapping or strapping. Following removal of the cast at the end of 10 to 20 days, it is advisable to apply well

fitted adhesive strapping of the Gibney type (Fig. 8) in order to protect the ligament against further injury. This strapping should be worn until symptoms are minimal, ordinarily at least four weeks from the time of injury. If the original injury is treated adequately in this manner, there is little reason to expect recurrent injuries since the ligament will heal at its normal length and strength.

A *severe* ankle sprain consists of one in which the integrity of the ligament has been lost completely. The ligament is either pulled completely in two or one or the other of its attachments has given way. History will be essentially the same as for moderate sprain but all complaints will be more severe. The patient will frequently volunteer information that the foot had been deformed, had been reduced by manipulation, and that pain was relieved by the reduction.

Examination will reveal more serious and extensive findings than in the other groups. The swelling will be more extreme. The pain will be more severe. Any attempt at motion of the foot will be resisted. The patient is extremely apprehensive. If the foot is examined very early, abnormal motion may be elicited without undue pain. It is justifiable, in certain cases, to inject procaine in the painful area or even to induce light anesthesia in order to determine whether or not there is complete disruption of one of the ligaments of the ankle joint. An x-ray should be made in the abnormal position if possible (Figs. 2 and 3). These cases are relatively infrequent but when they occur the consequences may be extremely disastrous, if the true condition is not recognized and appropriate treatment instituted. Many of the most disabling injuries reveal no demonstrable fracture (Fig. 6), but are caused by dislocation. Ligament injury may be extremely severe.

One of these serious injuries to the ankle is disruption of the medial collateral and tibiofibular ligaments, in which case the x-ray findings may be completely negative. Also the external collateral ligament may be completely torn and a normal x-ray picture seen. From the standpoint of treatment, one must recognize the condition present in order to determine the treatment. Obviously, treatment must be far more comprehensive than that for an ordinary sprain of the ankle. This is the reason that the diagnosis must be made at the earliest possible moment. If surgery is to be utilized for repair of the ligament, it should be done promptly in order to secure the best results. If there is a complete severance of the medial collateral or tibiofibular ligament or both, surgical treatment is certainly the treatment of choice.

If there is complete avulsion of the external ligament, it may well heal in a satisfactory position without surgical intervention since snug support is not as necessary for the lateral ligament as for the medial or tibiofibular. However these are patients in whom recurrent sprains occur due to overlength of the ligament. If it can be determined that there is a complete tear of this ligament, surgical repair will not only speed recovery but will improve the probability of obtaining a 100 per cent functional result.

The single most important consideration is that one must not temporize but must make up his mind whether or not surgery is to be done. The time to carry out surgery is at the earliest time that it can be determined it should be done. While late surgery is not nearly as favorable as is early operation, it should not be omitted simply because the diagnosis has not been made at time of the injury.

If it is concluded that non-surgical treatment is the treatment of choice, then the same treatment is indicated as for a moderate sprain, namely: local injection, compression, ice packs, splinting, walking cast, and adhesive strapping. All of these phases must be somewhat more extensive and protection must be carried out for 8 to 10 weeks since there is marked functional loss in the ligament. If such a long period of immobilization is required, formal rehabilitation becomes necessary. Actually, rehabilitation is required in direct proportion to the length of time it is necessary to immobilize the joint.

Following operative repair, posterior and lateral stirrup splints are utilized for about 10 to 12 days. Then stitches are removed and a walking cast applied which the patient will wear until four weeks postoperative. At this time, strapping and rehabilitation commence. Actually, rehabilitation will be much less important if a walking cast has been used since the muscles in the extremity not immobilized will be in good condition. I do not believe the oft repeated statement that "Ligament injuries are worse than fractures." This aphorism has arisen from the fact that serious ligament injuries have been undertreated and so the consequences have been more severe than from an adquately treated fracture. Careful history of the patient having painful recurrent sprains in

the ankle will probably uncover an initial injury which was inadequately treated.

Fractures About the Ankle

I have noted above that while the most common injury to the ankle is sprain and is an inversion injury, the most common eversion injury to the ankle is actually fracture. The two most important considerations in the treatment of fractures about the ankle are: 1. maintenance of the integrity of the ankle mortice, and 2. complete re-establishment of the weight bearing surfaces of the talus and tibia.

Good function of the ankle will not follow separation between the tibia and fibula with corresponding widening of the ankle mortice. Irregularity of the weight bearing surface is usually quite obvious on x-ray examination. It is extremely important that one analyze the relationship between the tibia and fibula very carefully in order to determine that there is no separation between the two. Actually, the vast majority of fractures around the ankle are so-called malleolar fractures (Fig. 9). If they have been complete, they have been accompanied by some dislocation of the ankle (Fig. 10).

Fig. 9. Bi-malleolar fracture. All ligaments intact. This is the same force which is illustrated in figures 3 and 6. In this particular case the dislocation was probably not complete since the fibular fracture was apparently incomplete. This should be treated by replacement of the medial malleolus and internal fixation, no treatment being necessary on the lateral side of the ankle.

Fig. 10. This is a classical illustration of eversion force. It is the same wide dislocation of the ankle as revealed in figure 6. In this instance the medial malleolus was pulled off, the tibiofibular ligament ruptured, the fibula moved widely lateral, the interosseous membrane at the lower third of the leg held and the fibula ruptured at this level. It could have broken at any level as far up as the neck. It is noted in the repair that the fibular fracture, being unimportant, is ignored. The medial malleolus was fixed with screws and the fibula held to the tibia by a long screw. This was done some 15 years ago. I would presently use longer screws through the malleolus, one or two being used depending upon the size and stability of the fragment. As a rule, all the screws should transfix the opposite cortex.

If there is a fracture of the lateral malleolus, there is frequently avulsion of the medial collateral ligament. If there is a fracture of the medial malleolus by an inversion force, there may be an avulsion of the lateral ligament. If there has been a fracture of the medial malleolus because of an eversion force, either the lateral malleolus must be broken, or the tibio-fibular ligament ruptured. The same force which causes a bi-malleolar fracture may cause fracture of the medial malleolus with ruptured tibiofibular ligament or rupture of the medial ligament and rupture of the tibiofibular ligament with no fracture at all.

Thus, it can be seen that the treatment of ligament injuries and fractures to the ankle are inseparable since if the two basic goals are borne in mind—namely, the integrity of the ankle mortice and the normal weight bearing surface—the treatment indicated will become quite clear. Actually, it is not usual for the weight bearing surfaces to be involved. Ordinarily the lower end of the tibia and the upper end of the talus are not fractured in ankle injuries so that what is actually being discussed is the malleolar fracture. This is caused by the same forces which cause sprains.

In bi-malleolar fractures, it is virtually impossible to obtain and maintain accurate correction of both fractures without internal fixation. In these cases, internal fixation has long been the rule. The excellent results obtained by this method have encouraged me to apply it to injuries apparently less severe. With fracture of the medial malleolus accompanied by a tibiofibular separation, I feel that open reduction should be carried out, with internal malleolus accurately replaced and held by screw or some other method of fixation. At the same time, the tibia and fibula should be held together by a long metal screw. If the injury is a fracture of both malleoli, it is better to use internal fixation on both sides unless the lateral malleolus is quite stable after reduction.

The techniques of these various surgical procedures are readily available elsewhere and need not be described here. Surgery should be carried out only by one well versed in the anatomy. The proper surgical environment is a *sine qua non* to success.

Since in many instances open surgery may be simpler to do and easier to manage postoperatively than manipulative treatment, it follows that adequate preparation is essential before any physician should attempt to manage a serious fracture or dislocation about a joint.

Only by extreme care in examination, conscientious selection of the best method and thorough preparation in technique can one expect to obtain optimum results in treatment of injuries about the ankle. •

REPORT FROM THE WASHINGTON OFFICE OF AMA:

can Medical Association, fell by the wayside in the House during the closing hours of the session, after having cleared the Senate with no trouble whatever. This also will be pushed next year, and may have a better chance of passage because of the growing emphasis on need for solving the problems of the aged.

Far too late for passage, Chairman Olin Teague's House Veterans Affairs Committee reported out a bill that would make a number of changes in VA hospitalization procedures, liberalizing some and tightening up on others. The bill also would require VA to open 5,000 beds over which Mr. Teague and VA Administrator Whittier have been squabbling for months, the latter maintaining that the beds are not needed. That issue still is unresolved, inasmuch as the bill did not pass.

Congress did roll out a sizeable list of medical-health laws. It ordered the calling of a 1961 White House Conference on the Aging, gave Food and Drug Administration authority to enforce its pre-testing standards on foods to which chemicals and other substances have been added, authorization loans as well as grants under the Hill-Burton program, authorized grants for the country's schools of public health and for civil defense purposes, raised military and VA physician's pay, and required labor and management health and welfare plans to make reports and open up their books for inspection by members.

American Medical Association was able to persuade the Department of Defense and the administrator to retain the post of Assistant Secretary (health and medical) in the reorganization, one of the assistant secretary posts would have been eliminated, and the medical assistant was marked for down-grading. However, Secretary McElroy eventually announced that the position would be continued.

Even before Congress adjourned, it was clear that trouble was in sight for Medicare because of inadequate appropriations and instructions from Congress not to exceed the appropriation. To keep within the limitation, if possible, Defense Department was channeling many thousands of service families to military facilities, and at the same time limiting the scope of care permitted in civilian facilities.

William J. Kennard, M.D.

Repair of Tendon Injuries in the Hand

Michael L. Mason, M.D.
CHICAGO, ILLINOIS

The repair of tendon injuries to the hand is not by any means a settled problem. Much of the problem is inherent in the tissue itself, in its manner of healing and in the functional demands put upon it. Other factors in the problem concern the surgical procedures themselves, not so much the gross techniques as the manner in which the surgeon carries it out. There are other facets, too, having to do mainly with associated conditions—for example, combined skin, bone, tendon and nerve defects in the immediate case, and scars and contractures in the secondary case. An adequate discussion of tendon surgery of the hand would expand into a volume.

Tendon Characteristics

Tendon is a highly specialized tissue which subserves the function of transmitting the pull of a muscle to some bone which is thereby moved by it. It is, however, by no means simply an inert rope, but is living tissue which responds to external stimuli and is very sensitive to trauma. It is composed of long fibrils of collagen (Fig. 1), held together rather loosely by an interfibrillar cement substance. Tendon cells themselves are not abundant and are scattered throughout this fibrillar tissue as flattened and elongated structures outside the collagenous components. The fibrils will withstand an enormous amount of pull if this pull is directed parallel to the fibers. If, on the other hand, pull is made transversely to the fibers, they separate and fray out like the bristles of a broom.

Circulation of tendon (Fig. 2) is not generous, but by no means absent, as in cartilage. Vessels enter the tendon from either end and course through it in longitudinal fashion. Vessels also come in from the sides. In the case of one type of tendon, blood vessels come in from all sides; in another type, these entering vessels come in

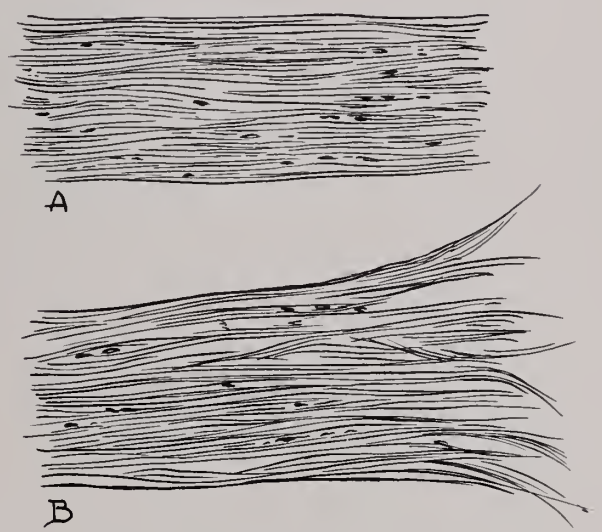

Fig. 1. (A) Tendon is composed of long strands of collagen interspersed with flattened tendon cells and bound together loosely. (B) When the outer peritendineum is torn the tendon frays out in a very discouraging fashion.

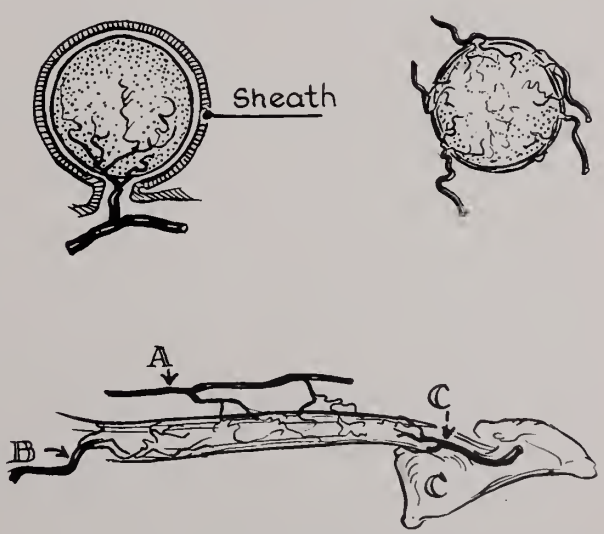

Fig. 2. Circulation in tendon is not generous but comes from three sources: (A) from the surrounding tissues, (B) from the muscle from which it originates, and (C) from vessels about the area of insertion. In case of sheath enclosed tendon, the vessels come in through a mesotenon along one side of the tendon. Tendons not enclosed in sheaths receive vessels on all sides from the surrounding lax tissue known as paratenon.

Sommer Memorial Lecture. Presented at meeting of the Oregon State Medical Society, Portland, Oregon, September 5, 1958.

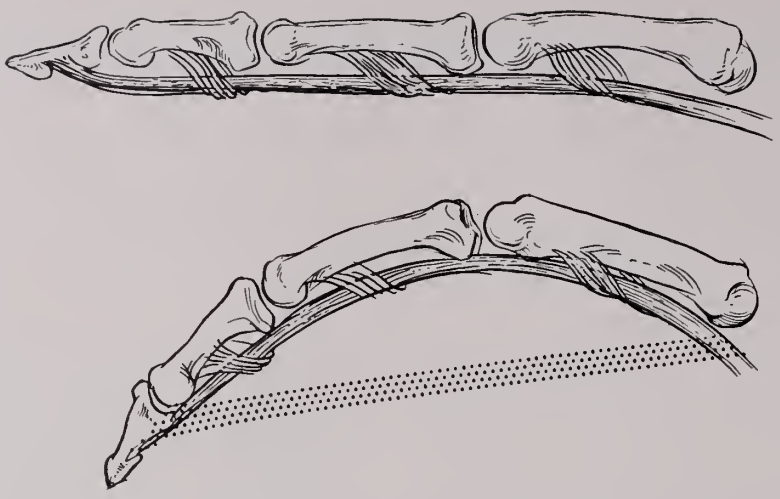

Fig. 3. Tendon which subtends the arc of movement of a joint—e.g., flexor tendons on the digits, flexors and extensors at the wrist—are held against the bone surface by fibrous ligaments. If this did not obtain, the tendon would bow-string forward when the muscle contracts.

along one side only and in very much condensed ligament-like structures known as mesotendons or vincula.

Accessory Tissues

Tendon which runs a straight course lies within lax areolar tissue known as peritenon, and, although this is attached to the tendon surface and carries in numerous vessels, it permits the tendon to move back and forth through its necessary course. In those areas where it is necessary for tendon to pull along a curved line (Fig. 3), the tendon is held against the underlying bone surface in a canal which permits the enclosed tendon to glide through it and not pull itself out of position. These are the sheath-enclosed tendons, and they are found over any area where pull would draw the tendon away. Such areas are found in the wrist, both volar and dorsal, where the transverse carpal ligament on one side and the dorsal carpal ligament and its compartments on the other hold the tendons in their course. The volar surfaces of the digits are also supplied with vaginal ligaments and tendon sheaths. There are no such ligaments on the dorsal surface of the fingers, and here the pull of the extensor tendon does not draw them away from the surface of the bone.

Tendon is living tissue, very sensitive to vascular disturbances. It may survive by imbibition of nutriments from tissue fluids for a short period of time and if the tendon is not too large. Hence, tendon grafts should be small. However, if vascular connections are not soon established with surrounding tissues, the tendon dies. This has considerable significance in tendon repair and tendon grafting. The site of suture of the tendon graft should lie in loose areolar tissue and should not be completely encircled by a rigid osteofibrous canal.

Three Phases of Healing

A study of the manner of healing of tendons is, likewise, helpful to the surgeon in his attempts at tendon repair, either by graft or suture. When two tendon ends are brought together by suture, their union takes place in three phases. There is first an exudative cuff laid down around the site of repair which coagulates and fuses the two opposed ends together. The union due to this fibrinous cuff is very weak and is not sufficient to do more than keep the ends lined up. The sutures themselves hold the tendon ends in apposition for the first 24 hours or so, but after this their holding power drops to almost zero, since the tendon softens and sutures pull out of it with the greatest of ease.

Toward the end of the first week, the fibrinous callus begins to be organized into fibrous tissue, still soft and easily ruptured, but, nevertheless, with gradually increasing holding power. The tendon itself has taken very little part in the healing process up to now, although one can see evidences in the tendon of cellular increase.

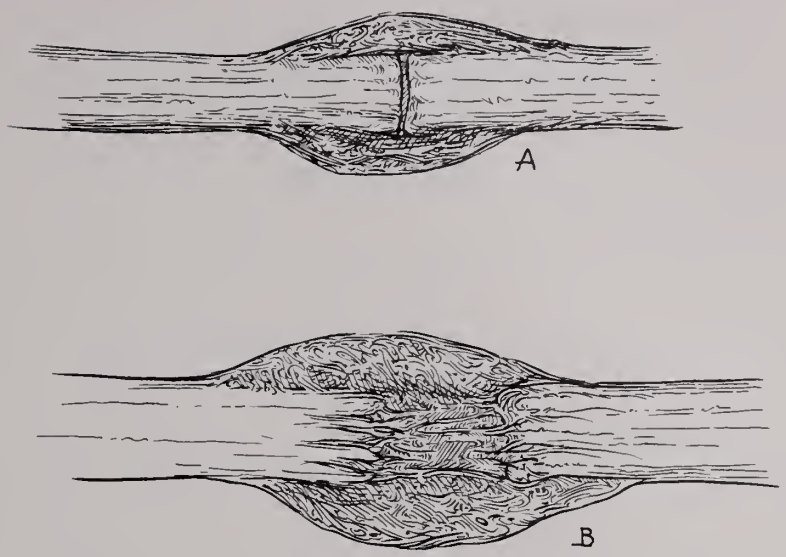

Fig. 4 Tendon heals normally by the production of a callus which comes initially from surrounding tissues and later from tendon itself. This forms a moderate enlargement (A) at the site of union. This callus is quite responsive to trauma and if pull is made upon it too early (B), it responds by becoming thicker and heavier and the enclosed tendon ends tend to pull apart or may even separate.

Toward the end of the second week the tendon component of healing seems to be coming into its own. The gap between the tendon ends is filled with a granulation-like tissue and into this come strands of cells from each tendon end. With the advent of this ingrowth, the union becomes firmer and more solid and its tensile strength increases quite rapidly.

From now on the tissue between the tendon stumps becomes more and more dense; the nuclei tend to line up in long parallel rows, and, by the end of the third week, the union due to external callus plus gap tissue becomes very strong. A fair amount of force is required to rupture it.

After the third week, in a successful repair, the strength of union rapidly increases, and by the end of the fourth or fifth week is strong enough to permit use.

Source of Repair Substance

Elements of the initial union, and the blood supply to the healing tendon come from the tissues immediately around the site of repair. Exudate from this source and the blood vessels penetrating it form a strong cuff which fuses the whole area into a solid, continuous mass. This fusion with surrounding tissue is an essential element of tendon repair. If it does not take place, union fails to occur.

In a successful repair, however, a curious change occurs in the surrounding cuff. Whereas earlier it was solid, continuous tissue, spaces begin to develop in it, and it begins to assume a looser structure. This develops over a period of many months so that in the end the tendon comes to lie in loose areolar tissue, often with spaces resembling a tendon sheath, which permits it to glide.

Effect of Motion

The effect of early motion upon the site of union is very interesting and gives us a clue as to the period of immobilization (Fig. 4). If motion is started very early, the tendon ends pull apart. Later on, the ends may not separate entirely but the callus about them becomes heavier and heavier, and the connections with surrounding tissues more and more extensive. The callus reacts to the strain put upon it and becomes thicker and thicker. While this increase in size of the callus would seem to make the union stronger, measurements of the strength of this union show that the thick callus is scarcely stronger than a smaller callus of a similar age which has not been subjected to strain, while size for size it is weaker. The disadvantage of this thick callus lies in the fact that it comes largely from surrounding tissues and may remain firmly adherent to them. If such a callus

forms within the osteofibrous tunnel on a finger, it firmly fixes the tendon to the walls of the tunnel, and its very bulk would prevent it from passing under the pulleys.

The conclusions reached from a very brief consideration of the process of tendon healing indicate that not only should we take the tendon into consideration, but the surrounding tissues as well. These tissues should be well vascularized, soft and flexible so that the connections between them and the healing tendon will act somewhat like the peritenon of the extensor tendons over the dorsum of the hand. To pursue this point further, in those areas where the suture line would lie within the fibro-osseous tunnels (e.g., carpal tunnel, digital tunnels), one of two procedures should be practiced. Either the tunnel is unroofed so as to permit the soft areolar tissue about it to fall into the area of repair, or some procedure is carried out that permits the line of repair to lie outside the tunnel so that only smooth non-traumatized tendon lies in the tunnel.

As for the tendon itself, its relatively meager vascular supply may be easily compromised and lead to necrosis. It may survive a short period of time by imbibition of fluids from the surrounding tissues. If these tissues are dense fibrous membranes, vascular connections may be quite difficult to develop, and, hence, a thick heavy tendon may be reduced to scar and become completely useless.

The surface of the tendon is covered by a thin sheet of tissue which helps to hold the collagen fibrils together. However, this tissue is easily torn by even very gentle handling and this leads to scar formation. Also, when this tissue is torn, the tendon frays out in a most deplorable fashion so as to make repair a veritable nightmare.

Clues to Immobilization Period

The rate at which tendon heals is the clue as to the period of immobilization. True enough, we are hoping for gliding of the tendon; however, we have seen that too early motion may either cause disruption of the suture line or lead to gross enlargement of the callus. Hence, in order to secure good union, it is necessary to keep the ends of the tendon in apposition for three weeks without permitting any motion at all, and then to permit guarded motion only for a further seven to fourteen days. At the time of release from splinting, the surrounding callus is solid and adherent. This is unfortunate for motion but cannot be avoided since one must first secure union. The appearance of lacunae in this callus takes place gradually over a period of months, and there seems to be no magic means of hastening this process. We do know, however, that it is unsafe to start motion too early or to delay it too long. Also it is very difficult to predict the outcome of tendon repair much under three to four months. Even after this, if moderate motion has developed, we may anticipate improvement over the period of a year.

An unsolved problem is the tension under which tendons should be sutured. When end-to-end suture is carried out in instances where there has been no loss of tendon tissue, obviously the ends are simply sutured to each other. However, the situation is different in older cases in which the retraction of the proximal stump is due not only to muscular action, but there is also an absolute shortening of the tendon-muscle due to fibrosis in the muscle. In these cases also, it may be necessary to sacrifice some tendon length from the proximal stump because of necrosis. Here a defect is produced which must be bridged by a graft. How long should this graft be or what is the tension under which it should be placed?

We can usually assume two things: 1. The muscle itself assumes a sort of neutral position. It is neither completely relaxed nor completely contracted. 2. The range of activity of the muscle, however, is restricted due to contracture, and, hence, with long-standing injuries, we cannot always anticipate securing a full range of motion. We can anticipate that, with exercises and elastic traction splints, the contracted muscle can be stretched out somewhat, but probably never completely.

Over-Correction

If the hand is permitted to fall into the position of rest—i.e., if the hand is supinated on the arm board and the digits permitted to fall naturally into position—they will flex at all joints about 25 to 30 degrees. This flexion, however, becomes increasingly greater from thumb to fifth finger. The finger without a tendon will not flex and will have to be brought into flexion by passive motion. The graft is then placed at that tension which will bring the finger down into slightly more flexion than the neighboring digits. In other words, the deformity is over-corrected. If the surgeon errs, it should be on the side of over-correction rather than under-correction.

How are the tendon ends to be held in apposition? The obvious answer, of course, is by

suture, but the solution is not nearly so obvious. We have seen that sutures will hold for a short period of time only and that they tend to pull out very easily. Increasing size of the sutures does not help, but is actually harmful, since it increases the necrosis and reaction in the stump.

Suture Methods

Various methods have been tried to maintain end-to-end apposition. Various types of sutures have been developed to secure a strong hold on tendon ends. The basis of all of them is to transfer the pull of the suture from one parallel to the collagen fibers to one transverse to the fibers since through-and-through types of sutures simply pull out. Many of the various methods work very well, but all demand practice, gentleness in handling the tendon and fine suture material. Effort is made to avoid placing knots between the tendon ends, and to avoid sutures which constrict or compromise blood supply.

Bunnell developed the pull-out wire. In this technique, the hold in the tendon is placed well above the actual line of apposition so that it lies in normal tendon and not in the zone of healing. Pull on it brings the ends together where they are held by passing the distal ends of the wire through the proximal stump on through the digit to be tied over a button outside. Thus, the pull of the proximal stump does not work on the line of apposition but on the wire only. This technique has the advantage of removing all sutures from the tendon after solid healing has occurred. It must not be assumed, however, that this technique was devised to permit early motion. Bunnell splinted his cases following this type of suture.

Another method, which is never used any longer, was to paralyze the muscle of the sutured tendon with novocaine. So far as I have been able to discover, this method was not very successful.

Splinting

In all methods for maintaining apposition of tendon ends, external splinting is used. Splinting is in the position to relax the line of suture. Thus, if flexor tendons are repaired, the wrist and involved fingers are held flexed with all joints at about 45 degrees. If extensor tendons are repaired, the wrist is extended about 45 degrees while the involved digits are brought out into extension. To be avoided, however, is complete extension to 180 degrees, especially of the metacarpophalangeal joints. A slight amount of flexion is needed here to prevent contracture of the collateral ligaments of these joints and an extension deformity which is most difficult, if not impossible, to correct.

The period during which immobilization is needed is indicated by studies on the tensile strength of healing tendons. For usual repair, three to four weeks of continuous rest are required to insure a union strong enough to allow guarded activity and two to three weeks longer with restriction on use, before full use is permitted.

How Should Results Be Judged?

Some other generalities are worthy of discussion. The question which surgeons are trying to solve concerns criteria for end results; and an attempt is made to grade the hand according to the percentage of motion attained by tendon repair. So many factors come into consideration that it is almost impossible to take them all into account. A perfect result is practically never achieved; there is always some restriction of motion, however slight.

If we take function as the basis for grading tendons, we must take into consideration the use to which the hand is put. A concert pianist or violinist who has lost 15 to 20 degrees flexion of the tip of the left little finger may still be able to play but probably never again in concert class. Obviously, if we were to judge end result on a 15 to 20 per cent loss of use of the left fifth finger, we would not be expressing at all the loss which he or she has sustained. On the other hand, a laborer or a surgeon would suffer no actual functional loss. If a patient has suffered division of all tendons to the hand, which is thus rendered entirely useless, even a modicum of motion in the fingers following surgery is enough to enable him to dress, take care of himself at toilet, eat and do many kinds of work. Yet, if we were to put a percentage value loss on the hand, it would be almost 100 per cent of that which it was previous to surgery. Can we say this operation was a failure because he gained only a few percentage points in function? I have one patient, a carpenter, who suffered a circular saw cut to his left hand dividing nerves and tendons to the thumb, index and middle finger, and amputating the ring finger. He was seen several weeks following injury with the hand still swollen, and useless. After several more weeks of home physical therapy, conscientiously practiced by a patient who desired to get well, the hand became pliable enough to

warrant surgery. Three tendon grafts and six nerve sutures were required to attempt correction of the loss. No brilliant 100 per cent function was restored, nor did we anticipate it. However, he was able to return to his old work. He could pick up nails and hold them with the injured hand, not as well as before but sufficient to return him to work. Final results cannot be stated in percentages.

The foregoing is not presented as an excuse for mediocre end results in tendon surgery. We must always strive to gain perfection. On the other hand, however, we must not refuse surgery to the man with a severe crippling injury, simply because we cannot hope for a brilliant end result, if we can render the hand functional.

Stimulus of Mild Tension

We have stressed the need for immobilization following repair of tendons, but have said nothing about the effect of function on the development of the union. If we examine tendon during the growth of the uniting tissue in the very early stages of growth, the nuclei are abundant and show no evidence of any definite arrangement. Very soon, however, these nuclei begin to line up in long parallel rows in the direction of the line of pull of the tendon. In instances where suture has failed and the growing tissue fails to unite the two ends, the cellular arrangment remains haphazard. It has been postulated that the minute tonic contractions of the muscle act as a stimulating force to the growing tissue which lines itself up along the line of pull of the tendon. Our own experiments, likewise, indicated that this functional stress had considerable influence on the growth of the tendon. When stress was put on the growing callus at an early stage, the callus became more and more exuberant. When absolute rest was assured, it remained smaller and less bulky. After the third week, it seemed to us that use of the tendon led to increased rate in regaining tensile strength. This is an example of Wolf's law—that form follows function.

How to make use of this factor is the difficult problem. Probably simply the normal tonic contractions serve the purpose well at the start. If, however, we could so utilize the motion in a gentle way all along, it might be possible to free the tendon from the surrounding callus more quickly and more surely. It is no problem to secure union of tendons, but it is often a real problem to get them to glide afterwards.

Primary vs Secondary Repair

The repair of the tendons of the hand falls into two categories—that of primary repair and that of secondary repair.

In the case of primary repair, the controversy today centers especially about the indications for it. Should divided tendons always be repaired at the time of initial care of the wound? Many of the indications have to do with the condition and location of the wound, and with the condition of the patient. Others have to do with the ability of the surgeon and facilities available to him.

There are certain general considerations which apply, regardless of location of the wound or tendons involved. A vital consideration is the degree of contamination of the wound and the possibility of infection developing. Contamination of the wound by virulent invasive organisms may occur at the time of infliction when the injury is due to badly contaminated objects, such as human teeth, autopsy knives, broken sputum cups, or toilet plumbing. Such wounds should never be closed, and tendon surgery is out of the question. Ordinarily, however, such serious contamination does not occur initially, but virulent contaminants may gain access to the wound secondarily when first-aid has been poor, or when the wound has been tampered with and fingered without aseptic precautions being taken. In such wounds, primary tendon surgery is seldom, if ever, feasible. If any doubt exists, the wound should simply be closed and tendon repair carried out later.

Time

Time since injury is also an important factor despite the present tendency today to disregard this element under a protective screen of antibiotics. To my mind, the tenets of Friedric still hold, and a wound over eight hours old must be looked upon as infected—not just contaminated. For tendon repair, I feel eight hours is too long an interval except, possibly, for extensor tendons over the dorsum of the hand. Four to six hours post-injury should be the upper limits, and, in case of injuries involving the flexors in the fingers, two hours seems better. How rigid one should be in following these time limits is a matter of personal opinion. There is no doubt but that these limits may be overstepped from time to time, and no evil results follow. However, these are safe time limits and, unless exceptionally favorable conditions exist, they should be observed.

The nature of the injury, itself, is also important. Wounds vary in the amount and extent of tissue damage, and the greater the damage to tissues, the less the indications are for primary tendon repair. Sharp cut injuries from knives and glass and similar sharp objects cause no tissue damage beyond the actual line of tissue division. Many structures may be injured, multiple nerve and tendon injuries may be present, but, unless other considerations contraindicate, repair may be carried out at the primary operation. On the other hand, crushing wounds lead to extensive tissue injury, extending over a widespread area. Damaged tissue may demand very wide excision and even that left behind, while viable, may be capable of healing if no further burden be added to it. The presence of fractures contraindicates primary repair since the healing fracture and healing tendon are certain to become adherent to each other.

Cover

Wounds associated with loss of covering tissue are rarely suitable for primary repair. It is imperative that the site of suture be covered with good skin, and this must often be provided by a skin graft, followed by a flap, following which tendon repair may be carried out. Thus, these patients must often wait several months and undergo two or more operative procedures before repair of the tendons can be undertaken.

The site of the tendon injury has become quite a center of controversy in determining indications for primary repair. This controversy concerns especially the flexor tendons in the digital canals. For defining areas of the hand in relation to indication for primary repair, it has become customary first off to separate the flexors from the extensors. In general, the indications for primary repair of the extensors are somewhat more liberal than for the flexors. But this does not hold 100 per cent by any means. Finally, it is not so much the method of repair as the manner in which it is carried out that counts.

Extensor Tendon Repair

Extensor tendons, if divided over the wrist where they are enclosed in tendon sheaths, tend to retract quite a distance. However, they may be exposed by proper incisions, and, if other indications are satisfactory, primary repair may be undertaken up to six or eight hours post-injury. Over the metacarpus, the extensors retract very little, and primary suture is carried out easily. The same holds for divisions over the metacarpophalangeal joint. Here the joint capsule also is usually divided and must be closed. Injury of the central slip of the extensor aponeurosis over the proximal interphalangeal joint should be repaired primarily, if at all possible, since, if it is allowed to persist for any period of time, the upward retraction of the proximal stump and the volar displacement of the lateral slips lead to a peculiar deformity which may be difficult to correct. Should primary repair be contraindicated, it is important to keep the finger splinted in extension at the proximal interphalangeal joint until repair may be carried out.

Baseball Finger

Division of the extensor tendon over the distal interphalangeal joint is commonly seen as a baseball finger and is most often due to a closed injury whereby the terminal phalanx is acutely and forcefully flexed while the extensor tendon is pulling it strongly into extension. Rupture takes place at or just proximal to insertion where the tendon is extremely thin.

Whether or not this injury should be treated conservatively or by surgery is somewhat a matter of controversy. If the wound is an open one, primary repair should be done if other indications permit. If suture is contraindicated, the finger should be splinted with the distal joint completely extended and the proximal interphalangeal and metacarpophalangeal joints very slightly flexed (10 degrees or so) so as to avoid capsular contractures, which occur if these joints are completely extended.

If the injury is a closed one, the surgeon should always secure an x-ray, since there is often an avulsion of the bone of insertion rather than tendon tear. In that case, splinting only seems indicated.

If there is no bony avulsion, one of two courses may be taken. The area may be exposed through a bayonet incision and the tendon sutured with very fine silk. The wound is closed and the finger splinted out as will be described below.

The surgeon may elect, however, to treat the tendon division by splinting alone, and it should be said that splinting is generally sufficient. The finger should be splinted in such a way as to relax the tendon. To do this, the distal interphalangeal joint should be hyperextended, and the proximal interphalangeal joint extended. In the first week or so following injury, I have

found it helpful to splint the finger and wrist in very slight flexion of the metacarpophalangeal joint and about 45 degrees of extension of the wrist. Following the first week or so, the finger only requires splinting, and at the interphalangeal joints only. Many surgeons feel that the proximal interphalangeal joint should be splinted in flexion, since they maintain that the extensor pull of the lateral slips is relaxed thereby. I am not entirely sure that this is the case.

The finger may be splinted by external splints of various sorts, by plaster, or by internal splinting with a Kirschner wire. Pratt, Bunnell and Howard have treated a goodly series by means of internal wires and report very good results.

The tendon heals spontaneously, but with a soft callus which requires about six weeks to become sufficiently strong to extend the tip without stretching. As a matter of fact, after six weeks of continuous splinting the patient should wear a splint of some sort at night to prevent the more powerful flexors from stretching the callus, and often, regardless of the method of repair, the healed tendon very frequently stretches and perfect extension is seldom seen. Even if neglected, however, it is seldom that some healing does not occur. There may be very moderate droop or quite marked but some active extension is usually present. The tendon will heal, even if lengthened and the callus eventually matures into quite strong tissue.

Spontaneous repair will occur quite frequently in the case of the paratenon-covered tendons over the dorsum, provided proper splinting is carried out. From time to time a patient will present himself 24 hours or more following an injury for which nothing was done initially. Such a wound must not be sutured, nor can tendon repair be carried out. However, it is a comfort to know that spontaneous tendon union can occur even if no suture is possible. This spontaneous repair will not take place in the sheath-enclosed tendons, nor in the flexor tendons anywhere along their course. Therefore there is nothing to be gained by splinting of the flexor tendon injury in flexion when suture has not been possible.

Flexor Tendon Repair

The situation with regards to the flexor tendons is somewhat different from that of the extensors. Injuries of these tendons have been divided into several zones, depending upon varying situations met with in the hand. Zone I covers that portion of the tendon of the flexor profundus from the middle of the middle phalanx to the insertion. Here the profundus is the sole tendon in the sheath, and, if it is divided, it can be advanced slightly and sutured to the distal stump. The fibrous sheath over the site of suture should be excised, taking care to leave a narrow pulley, but this pulley should lie as far proximalward as possible so that it will not interfere with the gliding of the suture line.

Zone II extends from the proximal end of Zone I upwards to the end of the fibrous tendon sheath in the palm. In this zone, there lie the two slips of the sublimis tendon, and, passing between these slips to reach the distal phalanx, is the profundus tendon. In other words, there are three tendons enclosed in a rigid-walled, osteofibrous canal. Conditions here for tendon suture are very unfavorable. The canal has just enough space to permit the enclosed tendons to glide. If any enlargement occurs, such as would take place if suture were carried out, blood supply of the tendons would be compromised and necrosis would probably result. If necrosis did not occur, the callus, receiving as it does its cells and blood supply from surrounding tissues, would be hopelessly fused with the sheath.

Repair in Zone II

Injuries in this zone may divide one or both of the enclosed tendons. If one only is divided, it is almost always the profundus, since here it is the most superficial, at least over most of this area. In this case, it is indicated simply to cleanse and close the wound initially. Repair of this injury will require a tendon graft of very thin tendon passing through the sublimis fork.

Many surgeons advise against any tendon repair and simply fuse the distal joint in slight flexion by an arthrodesis or tenodesis. It is my feeling, however, that a graft is worthwhile. If it is quite thin, it can be led through the sublimis fork easily and a very narrow pulley is left over the middle phalanx. If active motion is secured, the patient has better control of the distal phalanx, even if the motion is limited. If no active motion is secured, the patient has the same result as if an arthrodesis had been carried out.

When both tendons in the canal are divided, which is most usually the case, the surgeon who initially sees the patient has a real problem posed to him. Should he attempt repair, or should he simply close the wound and plan on secondary repair by graft later? To arrive at an

answer, let us leave out of consideration all of those instances in which tendon surgery is definitely out; e.g., wounds more than four to six hours old, those badly contaminated or those associated with fractures or crushing injury, all of which preclude any type of tendon surgery. Should one attempt primary repair, even under the most favorable circumstances? There are many surgeons, and they seem to be in the majority at present, who state categorically that primary suture is absolutely contraindicated, no matter how clean the wound and favorable the circumstances. They point out that tendon suture in this rigid canal will end up by adherence of the tendon to the walls of the tunnel and that secondary repair by graft after that is very difficult. They point to the almost uniformly poor results of this procedure.

It is my opinion, however, that one sees, from time to time, a case in which primary repair is permissible. These are very infrequent and one can say that, as a general rule, unless the best of circumstances obtain, simple closure of the wound is best.

What are the conditions in which primary suture is indicated? First off, the wound should not be over a few hours old, under two at best and not over three at most. It must have been sustained under reasonably clean circumstances; e.g., from knife or glass cut. It must have been covered at once with a sterile, or at least a clean dressing. The dressing should not have been removed elsewhere for inspection or for attempt at repair. The general condition of the patient should, of course, be satisfactory. The equipment and suture material available should be satisfactory, and the surgeon should have a competent assistant. Finally, the surgeon, himself, should be skilled in tendon surgery. This latter is very important, and there should be no hesitancy on the part of a surgeon to forego this repair if he has not had training in it.

Sublimis Removed

If primary suture is undertaken, there are one or two steps in the procedure which can be emphasized. Only the profundus is repaired—the sublimis is removed. There is some controversy as to whether the sublimis should be cut off right at its insertion or whether a short bit of it should be left subtending the joint so as to prevent hyperextension deformity. I do not think it has been shown that this deformity is due to lack of sublimis over the anterior joint capsule. If leaving it in will prevent the deformity, it should be left in since, if hyperextension occurs, it is most difficult to correct.

The reason for frequent failure of suture within the sheath lies in the rigid nature of its walls. The tendon callus, formed as it is from surrounding tissue, is densely adherent to the walls, and hence tends to form insoluble adhesions. Also, as the callus increases in size, it may compress the blood supply of the healing tendon and lead to necrosis. To prevent these two eventualities, it is necessary to excise a window in the fibrous sheath over the site of tendon repair. This window insures that the healing tendon comes in contact with soft areolar fatty tissue over at least three-fourths of its circumference, and that the vascular connections may be lax enough to permit motion.

Palmar Zone

So much for the so-called no-man's land on the volar surface. The division of tendons in the palmar zone is ordinarily amenable to primary repair. It is usually possible to repair both profundus and sublimis tendons and shift the lumbrical muscle between the suture lines. Some surgeons advise suturing the profundus only and removing the sublimis. A successful end-result in either case is satisfactory, but function is somewhat better when both have been repaired.

Division directly in the carpal tunnel is quite rare and usually repair can be so carried out that suture lines of tendons are separated from each other by remnants of synovial sheaths. The tunnel should not be tightly closed, but should be left open, suturing the subcutaneous tissue only.

Injuries at the Wrist

Injuries in the wrist and lower forearm cause most distressing contractures if early correction is not carried out. Hence, every effort should be made to carry out primary surgery in these injuries. There may be as many as 12 tendons and two large nerves divided so that primary repair may, and frequently does, take four or five hours. While it is helpful to repair both sublimis and profundus tendons, no criticism can be made if only the profundus tendons are repaired. The flexor pollicis longus and carpal flexors should, likewise, be sutured, but the palmaris longus need not be sutured.

In those instances in which primary tendon repair cannot be carried out, the wounds are closed and allowed to heal. In the uncomplicated case, when healing has occurred by primary intention, secondary repair may be carried out.

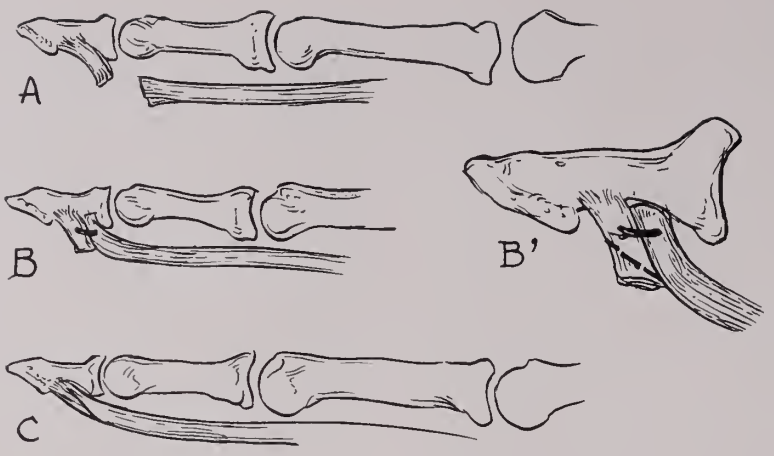

Fig. 5. The tendon graft is attached distally by snubbing it beneath the distal stump of the profundus against the periosteum of the distal phalanx. Care must be taken to go as far distal to the joint as possible and to avoid damage to the joint capsule.

With smooth healing, this can be done in three to five weeks at which time, if there has been no injury to the sheath, the tissues will be smooth and clean.

If there has been a reaction, or if the finger has stiffened and the tissues have become indurated, it will be necessary to spend some time mobilizing joints and taking measures to reduce the edema and stiffness. Not until the maximum improvement has been obtained should tendon repair be undertaken. It may be necessary in some cases to divide joint collateral ligaments to use traction splinting, or to replace scarred skin with a pedicle flap before the tissues will take a graft.

In previous pages we discussed the philosophy of functional restoration of the hand and pointed out that, although we should strive for a perfect result, we should not deny surgery to a patient whose hand is so badly scarred that only a modicum of motion can be obtained. We must, of course, be certain that the maximum mobilization has been secured and the tissues are in the best obtainable condition.

Grafts

Secondary tendon repair, particularly on the volar surface of the fingers, can rarely be accomplished by suture. Ordinarily a tendon graft is required, except occasionally in case of profundus division on the middle phalanx.

Tendon for grafting may be obtained from the palmaris longus, if only one tendon is required, or from the dorsom of the foot, if more are needed. Some surgeons have utilized the plantaris when an especially thin and long graft is required—e.g., grafting through the fork of the sublimis for profundus replacement.

The finger should be opened widely to uncover the whole involved area so as to remove remnants of the flexor tendons and scarred remnants of the tendon sheath. Two narrow pulleys about one-quarter inch wide should be left over the middle and proximal phalanges. The incision we prefer is a mid-lateral one which starts obliquely across the volar surface of the distal phalanx about midway between the distal crease and the tip and passes up the mid-lateral surface of the finger. I like to go volar to the nerve and vessels. In case of the index and little fingers, the incision can be prolonged along the side of the hand, and then transversly across the palm so as to expose the whole tendon. In case of the middle and ring fingers, this prolongation cannot be carried out. Instead the digital portion of the incision stops just distal to the proximal crease and is then carried transversely across the finger. The proximal end of the sheath may then be uncovered through an oblique or transverse incision in the palm.

After the digital canal has been cleared out, the proximal stumps are sought in the palm and are mobilized. It is my practice to divide the sublimis after pulling it as far distally as possible and allowing it to retract. The profundus stump with lumbrical muscle is then freed from adhesions and is exposed fairly well up in the

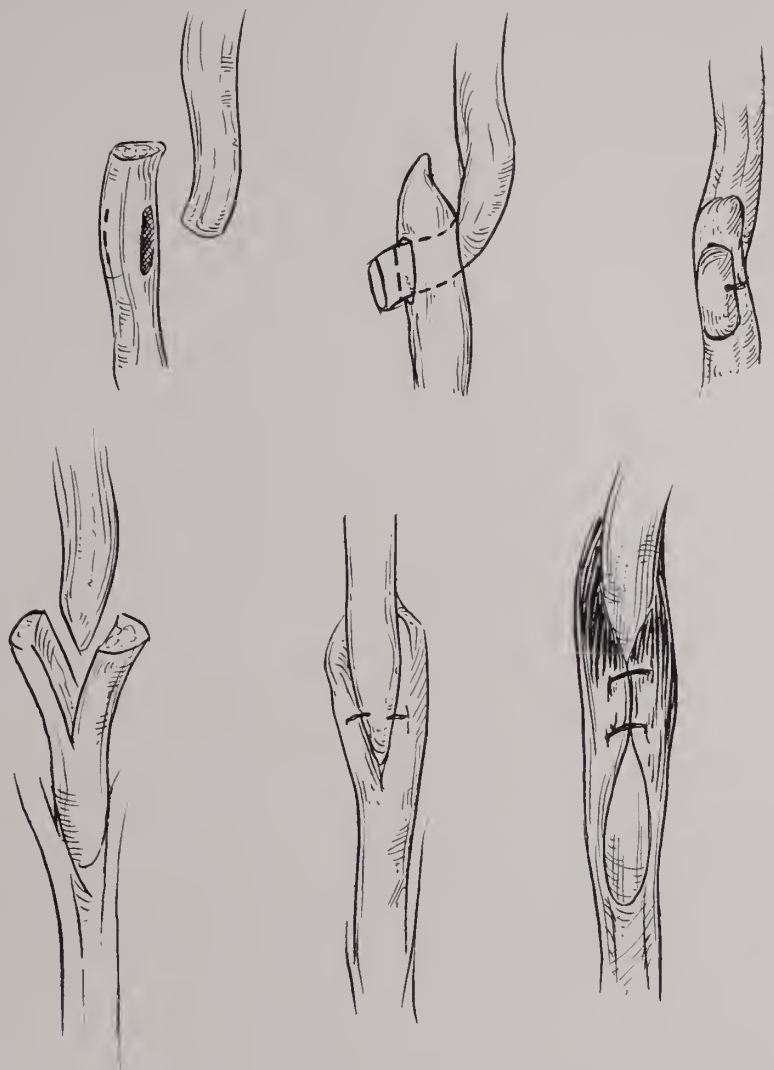

Fig. 6. The tendon graft is inserted in the proximal stump of the profundus at the level of the lumbrical muscle. It may be led through a small buttonhole in the profundus, or inserted into a fish tail division of the tendon. In either case the lumbrical muscle is tacked about the line of suture.

palm so as to permit suture of proximal stump to graft in soft areolar tissue of the palm.

Attachment of the graft distally (Fig. 5) is accomplished by snubbing the graft beneath a short section of the distal stump of the profundus and on top of the bone which has been scarified to insure firm attachment. Care is taken to place this attachment well distal to the joint. The surgeon must avoid injury to the joint capsule; otherwise a flexion deformity will occur from fibrosis. Sutures with fine silk (6-0) are all that are needed, since it has been shown by Hauser that tendon attaches itself quite quickly to raw bone.

If it has not been possible to save a pulley over an area of the finger, a pulley should be fashioned from a segment of tendon. It may be passed clear around the finger or attached on either side.

When this distal attachment and fashioning of pulleys has been accomplished, the finger is closed since it can be more easily sutured in extended than in flexed position, as it must be when the proximal attachment is being made in the palm.

The proximal attachment (Fig. 6) is made under the tension discussed above. It may be accomplished either by passing the graft through

a buttonhole in the proximal profundus stump, or by splitting the stump into two halves and putting the graft between them. An actual end-to-end suture is seldom feasible because of discrepancy between the graft and tendon stump. The callus tends to be somewhat bulbous but, since it lies in loose areolar tissue, it does not interfere with motion.

The matter of after-care need not be gone into in detail here. The periods of immobilization have been indicated above. After removal of the splint, it is my practice to encourage the patient to do his own physical therapy. He is instructed to wash his hands four or five times for four or five minutes in warm, soapy water. He is told this is not a matter of soaking, but of actual active washing of both hands. He is instructed to carry out active use of the fingers and told that just wriggling the fingers in the air is not exercise. He is encouraged to use his hand for purposeful acts.

Final results of these procedures should not be assessed too early. Six months should give some clue as to eventual function.

Summary

I have tried to give, in brief outline, the physiology of tendon repair and to indicate, in a general way, the basic principles of tendon surgery. Details of technique have been described only if they seem to illustrate the general facts of tendon healing. I have tried to stress the need for careful, gentle surgery and the need for rest of the healing tendon since it depends for its blood supply on the ingrowth from tissues around it. Without this ingrowth, tendon repair cannot take place.•

154 E. Erie Street, (11).

The Marriage of the Farmer's Daughter

This is the story of a poor peasant in France [in 1846], and the effect that the tariff had on his attempts to provide an adequate trousseau for his daughter.

This particular peasant had planted a few grape vines of his own. After much sweat and time, he harvested enough grapes to make a cask of wine. "I shall sell this wine," he said to his wife, "and buy enough material to enable you to make a trousseau for our daughter."

Our honest peasant took his cask of wine to the nearest town. There he met an Englishman and a Belgian, and began to bargain with them about exchanging his wine for cloth.

The Belgian said, "Give me your wine, and I will supply you with 15 parcels of the material you want."

Then the Englishman entered the bargaining with this offer: "Since we English can manufacture cloth at less cost than the Belgians, I will give you 20 parcels for your cask of wine."

The peasant was about to sell to the Englishman when a custom house official, who had heard the conversation, spoke to the wine owner: "My friend," he said, "trade with the Belgian if you wish, but I have orders to stop you from trading with the Englishman."

"What!" exclaimed the astounded countryman. "You wish me to be content with 15 parcels of material that come from Brussels when I can get 20 parcels that have come from Manchester?"

"Certainly," answered the customshouse official, "don't you understand that France would suffer if you received 20 parcels instead of 15?"

The peasant answered, "No, I don't understand it at all."

"Well, I'm sorry I can't explain it," replied the customshouse official, "but there is no doubt that it's true. You see, all our government officials and journalists have agreed that the more a nation receives in exchange for its products, the more it is impoverished."

Thus because of the French tariff against low-cost English textiles, the peasant had no alternative but to trade his wine for high-cost Belgian textiles. As a result, his daughter got only three-fourths of her trousseau. And those unsophisticated countrymen are still wondering to this day how it happened that a person is ruined by receiving four yards of cloth instead of three. They still don't understand why a person with nine towels is richer than a person with twelve.

Clinical Significance of Factors Influencing Excretion of Salt and Water

and Preston B. Lowrance, M.D.
Charlottesville, Virginia

Twenty-three years ago (June 28, 1935) I had the pleasure of addressing some of you in Spokane at a meeting of the Pacific Northwest Medical Association on essentially this same subject. At that time we noted together the effects of rest, digitalis, and diuretics on the edema of heart failure. At least veiled reference, I am happy to say, was made to diet with a high potassium sodium ration and the production of a diminished fixed base in the treatment of edema (actually meaning a low sodium diet), but neither in this address nor in the textbooks or current literature of the day was there any direct reference to sodium restriction and its true relation to water balance. Indeed, all patients received a diminished water intake without reference to sodium. I am glad to say that I questioned the validity of restricted water at that time.

Even though the French through chloride studies related edema to salt in 1901, it was not until 1941 that Schroeder clearly stated the importance of salt restriction in the treatment of heart failure. From then on the true relationship of sodium to water has been brought out. Possibly the early confusion by the French concerning chloride was due in large part to difficulties in measurement of sodium, a procedure now quite simple.

Recently remarking to my wife over my own stupidity in 1935 at not seeing the sodium and water relationship more clearly, I was comforted when she quoted the old Chinese proverb, "A journey of a thousand miles begins with a single step." I think you will agree that since the first step by Withering with the discovery of digitalis in 1785 we have come a long way in our journey.

It is the purpose of this lecture to observe some past findings and to state briefly our present state in the control of water balance in heart failure.

As we have progressed to sodium restriction in edema, we also in 1944, finally gave up water restriction at Schemm's timely insistence. Although it is not necessary to force water in heart failure to the extent of Schemm's recommendations, we now know how much to use and when. Occasionally we still restrict water under certain circumstances as noted below.

Present Concept of Congestive Heart Failure

Following the clarification of sodium and water relationship, another series of rapid steps has been taken toward the understanding and, hence, better treatment of heart failure. The situation becomes quite complicated and we now know of a number of factors in heart failure, some of which we can modify. Time permits only a brief outline of these, beautifully summarized recently by Johnson and Conn, and quoted here in part:

> Some of the major systems which appear to operate in the development of congestive heart failure with edema are as follows:
>
> 1. Heart
>
> Decreased effective cardiac output
>
> 2. Vascular system
>
> Increased venous blood volume and pressure
>
> Transudation
>
> Decreased volume pressure or blood

Sommer Memorial Lecture. Presented by the senior author at meeting of the Oregon State Medical Society, Portland, Oregon, September 5, 1958.

flow in all or in a portion of the arterial circulation

Arterial receptor center through which production of ASH (aldosterone-simulating hormone) is reflexly increased via hypothalamic center

3. Adrenal cortex

Increased secretion of aldosterone (independent of pituitary ACTH) in response to ASH

4. Kidney

Decreased renal plasma flow

Early—no detectable decrease of GFR (glomerular filtration rate)

Late—severe decrease of GFR

Increased reabsorptive capacity for sodium before, as well as after, an increase of venous pressure can be demonstrated. Persistence of normal reabsorptive capacity for water. Normal responsiveness to endogenous and exogenous ADH (antidiuretic hormone)

5. Hypothalamic—Posterior Hypophyseal System

Early congestive failure—no abnormality ADH production or degradation

Late—increased ADH release independent of osmoreceptor control.

As Homer Smith points out in a recent review: "It is commonly accepted that water balance is primarily conditioned by the osmotic pressure of body fluids but abundant evidence shows that the antidiuretic system is subject to excitation and inhibition by neural pathways or agents acting independently of osmotic pressure (the only such agent emphasized here is alcohol which affords an illustration of inhibition) and presumably the activity of this system at any moment reflects the algebraic sum of several such excitatory and inhibitory stimuli."

As a working hypothesis he tentatively accepts the location of these "volume or stretch" receptors in the left atrium and intrapericardial pulmonary veins, as described by Henry, Gauer *et al.*, realizing that this does not preclude the later demonstration of volume receptors elsewhere.

My own experience with the antidiuresis of quiet standing has convinced me of the importance of the antidiuretic hormone in primary water retention. I have been able to demonstrate that antidiuresis occurs in hip amputees in the sitting position, thus eliminating pooling of blood in the legs and reducing renal blood flow as the sole mechanism. As a practical feature this reminds us that diuresis is best obtained in the reclining position. I was also able to block the antidiuresis of quiet standing with alcohol, which in turn has a practical application in therapy of primary water retention.

With this complicated addition of volume receptors as well as osmoreceptors to our present understanding of fluid balance, what practical changes in treatment arise? No recent drastic changes have occurred but in little ways coming events cast their shadows before. Let me review briefly my present position in the management of congestive heart failure.

Treatment of Congestive Heart Failure with Edema

Obviously the first move is to favor the restoration of adequate cardiac output by rest and digitalis and, second, to so manipulate the remaining secondary factors as to further aid the return of normal circulatory function.

Our weapons for such a fight are rest, digitalis, sodium restriction, diuretics, chloride and electrolyte replacement when necessary; cardiac surgery in certain patients; alcohol in certain circumstances and, finally, even prednisone rarely as noted below. Some or all of these at any given time may touch on a part or parts of the complicated systems involved in heart failure but restoration of adequate cardiac output is always the ultimate goal.

As already implied, at times we create conditions during the treatment of congestive heart failure which may require additional adjustment. For example, the diuresis following rest and digitalis leads to loss of water and electrolytes in physiologic amounts but no electrolyte complications ordinarily arise from this type of diuresis. On the other hand, diuretics may produce quite definite electrolyte abnormality as may cardiac surgery or prolonged severe heart failure.

Briefly what are some of the effects produced by our main diuretics? A few examples are given:

Mercurial diuretics primarily increase chloride and sodium excretion and the chief action of mercury is said to be diminished tubular reabsorption of the chloride ion. Pitts does not agree and still believes diminished sodium reabsorption results from mercury diuretics. There is some slight increase in potassium loss which may be appreciable with repeated use of this diuretic. Failure of mercury response, or so-called mercury fastness, is often reflected in a low serum chloride although it must be remem-

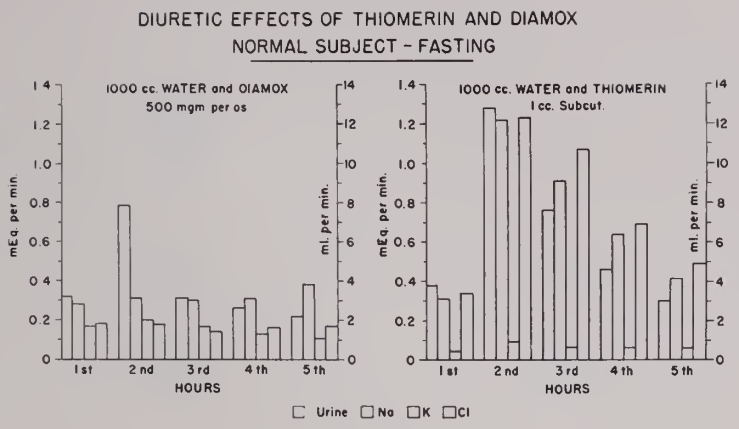

Fig. 1. Differences in electrolyte excretion following administration of two diuretics.

bered that fall in the glomerular filtration rate likewise may present the tubule with less chloride and produce the same effect. Perhaps mercury fastness, so called, is better depicted by a urine chloride of less than 40 mEq./liter than by plasma chloride level, as pointed out by Rubin and Braveman.

Xanthine derivatives as diuretic drugs are numerous and widely used in times past. Aminophylline, as an example, causes an increase in the excretion rate of sodium and chloride without consistent changes in potassium and bicarbonate. The increased glomerular filtration rate following intravenous aminophylline should also be noted as a helpful method of raising chloride load for tubular rejection with concomitant use of mercurial diuretics.

Carbonic anhydrase inhibitors, of which acetazoleamide (Diamox) is a good current example, promote the excretion of sodium and potassium with less chloride excretion effect. Tolerance is developed quickly so that intermittent dosage is desirable. Production of acidosis under close supervision in conjunction with ammonium chloride is mentioned below in the treatment of severe failure with water retention.

Chlorothiazide has appeared recently as an exciting and complicated diuretic of favorable uses with some drawbacks. In vitro it is an inhibitory of carbonic anhydrase, but in man this does not appear to be the mechanism for the production of diuresis which is obscure. Unlike acetazoleamide, tolerance does not occur even with daily administration. It promotes sodium and chloride excretion about equally and has little effect on bicarbonate. It also is said not to greatly increase potassium excretion but this has not been my experience. Time does not permit a discussion of this fascinating effect of chlorothiazide following sympathectomy or of ganglionic blacking drugs on blood pressure. Unfortunately, I have seen several examples of dermatitis following its use, necessitating discontinuance. Aside from these and perhaps other drawbacks it is an excellent oral diuretic, probably the best to date.

Electrolyte Disturbances in Congestive Heart Failure and Treatment of Failure

However, vigorous use of diuretic agents may lead to unbalanced electrolyte losses, posing new problems in replacement. In addition, certain long-standing cases of heart failure may show the dilution syndrome as do some patients following cardiac surgery.

Time does not permit more than a brief outline of some effects of excessive diuretic therapy and possibly dietary restriction. The following states of disturbed electrolyte and water balance may occur:

I. Hyponatremia due to dilution:

a) Acute—resulting from retention of water in greater quantities than sodium under stress or possibly reflex changes or both, as after mitral commissurotomy. This state nearly always corrects itself but alcohol may occasionally hasten the excretion of water over salt.

Total body sodium may be increased in the acute dilutional state in spite of low serum sodium.

b) Chronic dilutional hyponatremia. Patients who have severe, prolonged heart failure may develop hyponatremia with edema though there has been no obvious stress to precipitate this. This indicates a serious disorder. The physiologic mechanisms which allow this to occur are difficult to define, but probably result from a resetting of the osmoreceptors and volume re-

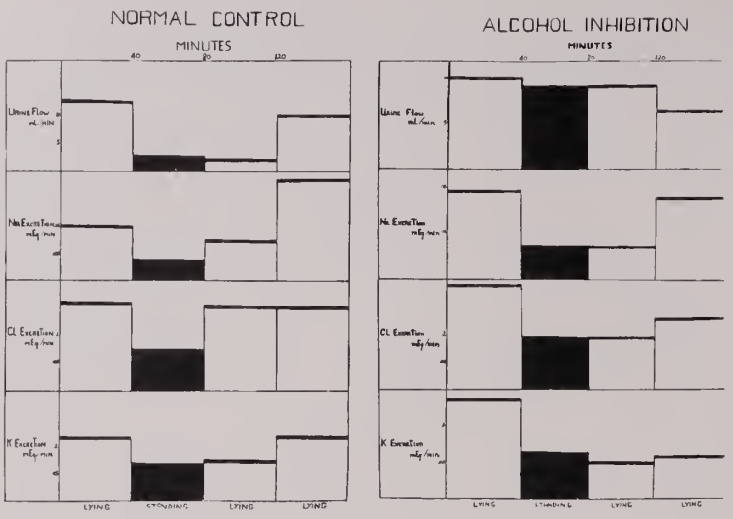

Fig. 2. Illustrates antidiuresis and antisaluresis of quiet standing on the left and alcohol inhibition of the neurohypophysis with no antidiuresis on the right.

ceptors which normally maintain tonicity and volume of the body water compartments. These are set at a lower level so that when the concentration of sodium which reflects tonicity is lowered, ADH is not decreased as it normally is, but continues to exert its effect on the renal tubules and water retention is sustained. In a similar fashion, expansion of the extracellular fluid is not followed by decrease in aldosterone excretion but this hormone is continuously secreted and results in increase of body sodium. There is evidence that aldosterone is secreted in increased quantities in heart failure and even after apparent correction of congestive failure.

There are probably cellular factors also in chronic dilutional hyponatremia of heart failure. These entail:

1. Changes in the cells so that the osmotic activity of cellular solutes is decreased with resulting loss of water from the cells and dilution of the extracellular fluid.
2. Shifts of sodium into the cells and inactivation by combining with proteins.
3. Inability of the cells to maintain a normal sodium-potassium ratio within the cells. This results in increase in intracellular sodium and decrease of intracellular potassium.

Correction of chronic dilutional hyponatremia is difficult at best and sometimes impossible. It is a serious state. Alcohol to promote excretion of water over salt, possibly the use of Mannitol as an osmotic diuretic, the cautious production of acidosis by ammonium chloride and acetazoleamide followed by a mercurial diuretic and water intake restriction, maintainance of potassium balance and very occasionally the use of prednisone for its cellular effect—all are of unpredictable help. Hypertonic salt solution given intravenously in this condition is rarely, if ever, helpful and generally is frowned upon by most good observers.

II. Hyponatremia due to depletion. Though hyponatremia complicating congestive heart failure is usually due to retention of water in greater quantities than sodium, occasionally it results from a loss of sodium in greater quantities than water. This may follow vomiting, diarrhea, loss of sodium through a salt losing kidney, by paracentesis or by the frequent administration of mercurial diuretics. After such losses if water is given without electrolytes, hyponatremia results.

Treatment here is directed toward correction by diet adequate in sodium in the mild cases and hypertonic sodium slowly administered intravenously in the severer situations. Correction of hypokalemia should be accomplished and mercurial diuresis withheld.

Elkington deplores the present confusion in terminology and clearly outlines the chief hyponatremic states ranging from the acute sodium depletion syndrome, through the water intoxication syndrome, the dilution syndrome—a new steady state, to the extreme and often terminal end of the spectrum, the tired cell syndrome in which abnormal metabolic cellular function leads to failure to maintain a low sodium concentration inside the cell and produces a high potassium concentration outside.

Two clinical danger signals are helpful in spotting serious water balance disturbances occurring in the course of congestive heart failure. These are the appearance of azotemia and fail-

ure to respond to mercurial diuretics. Either or both should stimulate detailed investigation.

Serum sodium alone does not always tell the true story. Total circulating sodium (a product of serum sodium concentration and plasma volume) taken together with plasma volume may be a better guide in difficult situations. On the one hand serum sodium can be low with a high plasma volume and high total circulating sodium, as in dilution hyponatremia, however on the other hand the serum sodium again may be low but with a low plasma volume the total circulating sodium is now distinguishing the situation as sodium depletion hyponatremia.

Between these extremes of sodium depletion on the one hand and excess water gain on the other lie lesser disturbances. One or two of these need passing mention.

Hypochloremic alkalosis due to vigorous use of mercurials can be repaired in mild situations with diet, ammonium chloride, and correction of potassium deficit. Hypochloremic alkalosis with its high plasma bicarbonate is occasionally difficult to distinguish from a respiratory acidosis with its high bicarbonate. Even the blood *p*H may fall into so narrow a range as to make the distinction difficult. At times the best choice in such a situation is often a clinical decision (as pointed out by Schwartz and Relman) and the presence of anoxemia and severe pulmonary disease would suggest the possibility of respiratory acidosis.

Summary

In conclusion, we have come a long way in 23 years. Viewing the complicated schema of the pathogenesis of heart failure above, we still turn to the treatment of the heart itself as our first and obligatory consideration. Restoration of adequate cardiac output is the desideratum. Induction of fluid loss effected through the kidney, if not excessive, may favor restoration of normal cellular and extracellular fluid balance and promote cardiac efficiency.

We are learning mechanisms affecting the antidiuretic hormone but we are less well acquainted with aldosterone, its role and possible manipulation.

We dabble with adjustments of electrolyte concentration in body fluids—sometimes wisely with simple chloride and potassium replacement; occasionally unwisely with the use of hypertonic saline.

Although alcohol, osmotic diuretics, and prednisone occasionally help in restoring the patient's ability to get rid of free water, we are a long way from solving the problem of dilutional hyponatremia.

And finally, we at last recognize abnormal fluid balance states of our own making and we are adapting a more realistic attitude to this situation. •

Clinical Pathologic Conference

Tacoma General Hospital, Tacoma, Washington

Prepared Under Direction of Merrill J. Wicks, M.D.

Protocol

Murray Johnson: This 58 year old white man was admitted for removal of a hydrocele which was done with no difficulty. On the first postoperative day he complained of considerable epigastric pain. He had history of gastric ulcer and was given anacids which did not seem to help him. The pain seemed to localize a little more to the upper right quadrant. He became acutely ill and had chills and fever. It was soon obvious that he had a progressively acute abdomen. The surgeon opened him and found an acute gallbladder containing pus. I neglected to say, he developed jaundice during this acute abdominal episode. There was some question at the start as to whether it could have been hepatitis but it was decided that findings indicated obstructive jaundice associated with fever. The condition found was acute fibropurulent cholecystitis.

They took the gallbladder out and removed stones from the common duct. They did have some difficulty because they could not probe through into the duodenum. They put a T tube in and he was sent back to the ward in fairly good condition. This was a long operation, in fact about four hours according to the chart, and you can imagine the difficulties that you would have in a case like this. Postoperatively his temperature and pulse came down and he did pretty well although it was a slow convalescence. He was still jaundiced on the ninth postoperative day. He drained quite well from the T tube and had much drainage from his Penrose drain. He persisted with acholic stools. A cholangiogram was done through the T tube on the 16th postoperative day. The sutures were out, the Penrose drain was out and cholangiogram showed dye entering the duodenum rather promptly. There was a filling defect in the common duct or the hepatic duct which could be due to a stone (Fig. 1).

Fig. 1. Cholangiogram on sixteenth postoperative day showed dye entering the duodenum rather promptly. There was a filling defect in the common duct or the hepatic duct which could be due to a stone.

Roy Patton: The thing that concerned the surgeon was the presence of lucent areas which

were felt might perhaps represent stones in the duct system.

Dr. Johnson: The man was supposed to go home the next day since he was doing well and, as a matter of fact, the attending physician had him discharged on the chart. However, on the day after the cholangiogram the man suddenly went into shock with blood pressure of 75/50. I notice by the notes that he had been up walking around just prior to this.

He was shocky and restless. He did not have any severe pain but, according to the nurses' notes and the doctors' notes, had a tight pain in the lower left chest. I believe he also had some vague substernal discomfort but it was not noted on the chart. This was not a severe pain, however. At this time he developed bilateral friction rubs in the anterior axillary line at the seventh and eighth interspaces, on both sides. He also had crepitant rales in both lungs posteriorly. The diaphragm seemed to move normally with respirations. Heart sounds, however, were inaudible. A specific note was made that dilated neck veins were not present at this time. He had a negative Homan's sign. No other note is made, however, concerning possible thrombophlebitis or thrombosis. There was no leg tenderness or swelling at this time.

From this time on he had progressively downhill course. It was obvious with the rales in the chest after onset of shock that his physicians considered this to be most likely pulmonary embolus. Most of us would agree that this is the likely thing since the signs were localized in the chest. They did their level best to keep his blood pressure up but there was a progressive, downhill course from here on out. The next day he had severe chest pain which was pleuritic in nature. It is noted, by one of the several men who saw him, that the jugular veins were distended and that he was dyspneic. There was no note at any time of cyanosis which ordinarily you would think of in some phase of pulmonary embolism.

The friction rubs remained the same, although there was some little difference noted on the chart by the different men who examined him. They were persistent friction rubs on both right and left with the left being more prominent. It was noted also that the jaundice, which had been clearing, was more severe. Radial pulse was noted to be 100 and regular with a few beats obliterated on inspiration. Incidentally, the nurses noted that even during the convalescent period there was cardiac irregularity at times. Now whether this was true or not we have no way of knowing except that the physicians in examining him did not find anything up to the time of his sudden shock. On the 19th day the pain was in the right lower chest whereas it had been more on the left before. It was noted on several examinations that the abdomen remained soft and that bowel tones were diminished. One thing not noted was that the amount of bile drainage was considerably less and also his urinary output was less during shock. He was treated with heparin and he was digitalized. On the 21st day he was in more critical condition. Thoracentesis was done on the left side which had more dullness and more positive signs than the right. A small amount of fluid was obtained. It was clear and serous. A later report showed that culture was negative. Abdominal paracentesis was done at the same time in the left upper quadrant and it was negative for bile, feces and blood. It can be negative if you happen to get pressure from the viscera against your needle so one tap does not necessarily mean there was nothing in the abdomen. The patient died at 10:10 p.m. on the 21st day. He died suddenly with another attack, going into shock. There are two chest x-rays. One was taken shortly after his original episode (Fig. 2).

Dr. Patton: All the chest films were portable.

Discussion

Dr. Johnson: It is evident that he had some enlargement of his heart. It looks to me as though there is a little fluid at the base. On the next film it is obvious that it it bilateral and it is reported by the radiologist that this possibly would indicate pulmonary edema. Of course in thinking of pulmonary emboli, we all remember the typical wedge shaped shadows. However, that occurs in relatively few cases. Many cases have almost negative x-ray findings after repeated pulmonary emboli, if they are relatively small, so this could certainly be compatible with our original thinking of pulmonary emboli. One other thing as far as medications, he did have antibiotics when he first had his trouble. Chloromycetin was started in the postoperative period. Some Terramycin was given on the 17th day with the onset of his acute chest pain.

Fig. 2. Portable chest x-ray taken soon after the patient's first episode of sudden shock on the seventeenth postoperative day.

There is no evidence of blood loss during any of this and even when he had his acute shock his hemoglobin was up to a good level. He did show a very high total white count, indicating the possibility of pulmonary emboli, myocardial infarction or it could also have indicated some localized peritonitis at the area of operation. Serum transaminase was noted before operation as 79 units. When he had his acute cholecystitis it was 49 and then when he had his severe episode of shock it was 81 units. Of course, serum transaminase is not specific. It is supposed to be elevated in liver, cardiac muscle or somatic muscle damage. It is possible, although the EKG's as reported here are negative on two occasions, that he had emboli coming from the right side of his heart but it is more likely that they would come from the pelvic veins in relation to the original surgery. There is one thing in relation to his last illness that I would like to mention—when he became more jaundiced he had been receiving Levophed. Although there is no evidence here that he had liver damage we have noted liver infarction with the use of Levophed. It is conceivable that he could have had biliary peritonitis and such thing as subphrenic abscess which would give the picture we see here. Ordinarily we would not get the friction rubs and certainly not bilateral friction rubs from subphrenic abscess.

Dr. Patton: First, I would like to ask Dr. Smith, who saw this man several times before he died, if he has anything to add to what Dr. Johnson has said.

Theodore Smith: The friction rubs were very unusual. They were loud enough so you could almost hear them without a stethoscope. They were palpable over a large area of the chest, first on the left and later on the right. They covered all the lower part of the right axillary area. He had Levophed intermittently. He was a very stoic individual and he complained little of pain. Apparently he was ill some days before his contemplated discharge. Large doses of analgesics and some Demorol were given for the chest pain. When I first saw him he had no signs of cardiac failure. He had very marked dilatation of the jugular veins. He had a peculiar pulse which was obliterated by inspiration. Heart tones were barely audible when I first saw him. He had relatively little fever.

Dr. Patton: Yes, I think that it is a point that should be made—that there was no temperature elevation after the gallbladder operation. His white count was high and showed a shift to the left. Does anyone else have questions or comments?

Ralph Huff: What about his respiratory picture? There is no mention as to whether he had respiratory distress.

Dr. Smith: He had very rapid respiration but this was felt to be caused by his severe pain. His color remained good and no cyanosis was noted.

Dr. Huff: What about the sputum? Were there any cultures?

Dr. Smith: Apparently he had no cultures.

Dr. Huff: Had he had an x-ray of the chest before this hospitalization?

Dr. Smith: I do not know of any.

Govnor Teats: Was there any sign here of cor pulmonale in the electrocardiograms?

George M. Whitacre: The first EKG does show tachycardia at the rate of about 115 to 120 and that evidently was before his gallbladder operation. The general contour was relatively normal on the next one which was taken the day he went into shock and again there was some tachycardia at the rate of 100. The T waves are a little bit low all the way across. I would call it abnormal—nonspecific. There are no changes of acute cor pulmonale. Ordinarily with cor pulmonale we have some ST depression in leads 2 and 3 with depression or inversion of T waves over the right precordium. Those changes are not present. There is not too much positional change.

Dr. Patton: Dr. Johnson, what about this man's acute cholecystitis following another surgical procedure?

Dr. Johnson: I think we have to be on the alert for that because it is reported, particularly with upper abdominal procedures, that acute cholecystitis occurs more frequently than it does in people with gallbladder disease. I think anything that upsets the system, such as asymptomatic stone, stone in the common duct or chronic cholecystitis, can result in acute cholecystitis following abdominal surgery.

Dr. Patton: Is this a recognized post-surgical complication?

Dr. Johnson: For spermatocele? It has been recognized that acute cholecysitis can occur following any operation and it may be difficult to recognize. It appears in the same way appendicitis can occur. I do not know of any figures on the incidence.

S. F. Herrmann: Has any thought been given to the possible relationship of the cholangiogram to his subsequent symptoms? He was all right until after the cholangiogram. The next day he went into collapse. It is conceivable that the vena cava might have been thrombosed in the process of performing the cholangiogram.

Dr. Johnson: As I read over the chart it was hard to find any evidence for this. The x-ray shows good drainage of contrast medium into the duodenum.

H. A. Anderson: I have a little trouble because there are no EKG changes indicative of cor pulmonale or pulmonary embolism. The chest x-rays show pulmonary edema and evidence suggestive of left ventricular failure. I would have to make my first impression *myocardial infarction.* I think the facts fit this better than pulmonary emboli. One comment is made that heart tones were inaudible at some examinations.

Dr. Smith: The heart tones were difficult to hear at all times. The respiratory sounds added to the difficulty. The heart sounds were never very strong.

Dr. Teats: Do these two successive transaminases speak a little against myocardial infarction?

Dr. Anderson: The transaminase never did go down to normal and, with this definite increase, infarction should be considered.

Dr. Huff: There is one thing here which suggests a *pericardial effusion* too—two things actually. One is the chest x-ray which suggests pericardial effusion or pleural fluid. The other is the radial pulse which was 100 and which showed obliteration of some beats with inspiration. This is a sign of pericardial effusion. Also it would be unusual for a patient with this much lung involved by infarct not to have hemoptysis.

Dr. Patton: Are there any other things that point to pericardial effusion?

Dr. Huff: The distended neck veins and the EKG. There is decrease in the amplitude of the QRS complex. It is very unusual to hear a friction rub bilaterally but a friction rub, to me, suggests pericarditis and then the disappearance of the friction rub would go with pericardial effusion. The etiology of pericarditis in this particular case is not clear.

Dr. Whitacre: Myocardial infarction?

Dr. Huff: I am thinking of that except you would think that there would be more changes in the electrocardiogram.

Dr. Whitacre: The electrocardiogram was

taken on the day of his collapse and changes might not yet be present. The one other he had on the day of his gallbladder operation or the day before. He had the second one on the day of his collapse and there was no follow-up. There certainly was a marked change in the size of his heart in these two films. How many days intervened between them?

Dr. Patton: Three days.

Dr. Huff: What about this pleural effusion he had too? Perhaps he had generalized involvement of all of his serosal surfaces.

Dr. Patton: Actually of course, this was read by the radiologist as edema and cardiac enlargement. The thoracentesis in the left chest produced only a few cubic centimeters of fluid.

Conclusion

Dr. Patton: At autopsy the man had a *massive pericardial effusion with diffuse purulent pericarditis.* An estimated 800 to 1000 cc. of rather thin but cloudy fluid were present in the pericardial sac. It was what gave the appearance of cardiac enlargement in the chest x-ray. A large subdiaphragmatic abscess was present in the midline. This was filled with creamy purulent material. I do not doubt that the pericarditis was due to extension of the inflammatory process under the diaphragm. The heart as you see it here is not significantly enlarged and there was no evidence of myocardial infarction. There were no pulmonary emboli. There was no pleural effusion. There were no pleural adhesions so these friction rubs were due to pericarditis. Why they were so prominent on the right or why they were heard in the right axilla I can not explain very well. The liver did not show infarction or evidence of damage, but it was congested. There was a large chronic inactive ulcer in the duodenum, about 4 cm. across, lying posteriorly on the pancreas. Biliary tract was intact and no stones were found in it. It was difficult to dissect out completely but it was examined thoroughly.

Dr. Herrmann: Was there leakage of the duodenal suture?

Dr. Patton: No. The upper right quadrant above the liver was all right. There was no evidence of peritonitis here.

Dr. Huff: Why was this patient without fever?

Dr. Patton: That is a good question. It was for this reason that I included in the protocol the antibiotic therapy this patient received. From a clinical standpoint there was no evidence of acute inflammation. There was no indication for massive therapy. Whether it would have done any good is a good question too. I might say that the smears of the material from the pericardial effusion were loaded with micrococci. The sequence of events is: an acute fibropurulent gallbladder was removed and following it a subdiaphragmatic abscess formed. This eventually spread upward into the pericardial sac and caused the tremendous effusion which depressed cardiac function to a point where the patient could not maintain his blood pressure. This was the cause of the distended neck veins, shock and friction rubs and chest pains. Because the pressure in the pericardial sac was not relieved, he died.

Dr. Smith: The patient had a marked paradoxical pulse.

Dr. Patton: What is the mechanism of paradoxical pulse?

Dr. Smith: Two things are involved. One is that in inspiration increased negative pressure in the chest pools blood in the vena cava so that more blood is delivered to the heart. At the same time the lungs expand and so do the chambers of the heart. In normal inspiration this phenomenon is present. With pericardial tamponade there is prevention of this increased filling of the heart from the vena cava so that it cuts down the output of the heart and you get a weaker pulse. In cardiac tamponade, venous pressure is frequently increased. This man had a very large tamponade. We noted the paradoxical pulse but we were looking for a subdiaphragmatic abscess.

Dr. Patton: The abscess in the abdomen was completely above the liver near the midline and there was no inflammation below the liver. •

Fibroma of the Diaphragm

Report of a Case

CHARLES E. LITTLEHALES, M.D.
PORTLAND, OREGON

Primary tumors of the diaphragm are rare. It is of interest that the first primary diaphragmatic tumor ever reported was a fibroma discovered at autopsy in 1868 by Grancher.[1] Clagett and Johnson,[2] Crimm and Kiechle,[3] and Nicholson and Whitehead[4] have reviewed the literature. The latter two authors prepared a list of primary tumors of the diaphragm (table 1).

Table 1. Primary tumors of the diaphragm.

Benign		Malignant	
Adenoma, adrenal cortical	1	Fibroangio-Endothelioma	1
Anedoma, liver tissue	1	Fibromyosarcoma	1
Angiofibroma	2	Fibrosarcoma	7
Chondroma	1	Hemangio-Endothelioma	1
Fibrolipomyxoma	1	Leiomyosarcoma	1
Fibrolymphangioma	1	Mesothelioma	1
Fibroma	1	Myosarcoma	1
Fibromyoma	2	Myosarcoma, undifferentiated	1
Hemangioma	1	Neurofibrosarcoma	2
Leiomyfibroma	1	Rhabdomyosarcoma	2
Lipoma	7	Sarcoma	1
Lymphangioma	1	Sarcoma, Endothelial	1
Neurofibroma	1	Sarcoma, mixed cell	1
Rhabdomyofibroma	1	Sarcoma, undifferentiated	1
Total	22	Total	22

It will be seen from table 1 that benign and malignant primary diaphragmatic tumors occur with equal frequency, lipomas and fibrosarcomas being the most common.

The following case report is that of a fibroma which arose from the central portion of the left diaphragm. This brings the total of reported cases to 45.

Case Report

A 60 year old white female was seen for the first time Oct. 23, 1956, because of shortness of breath of six years duration, precordial pain with exertion for one

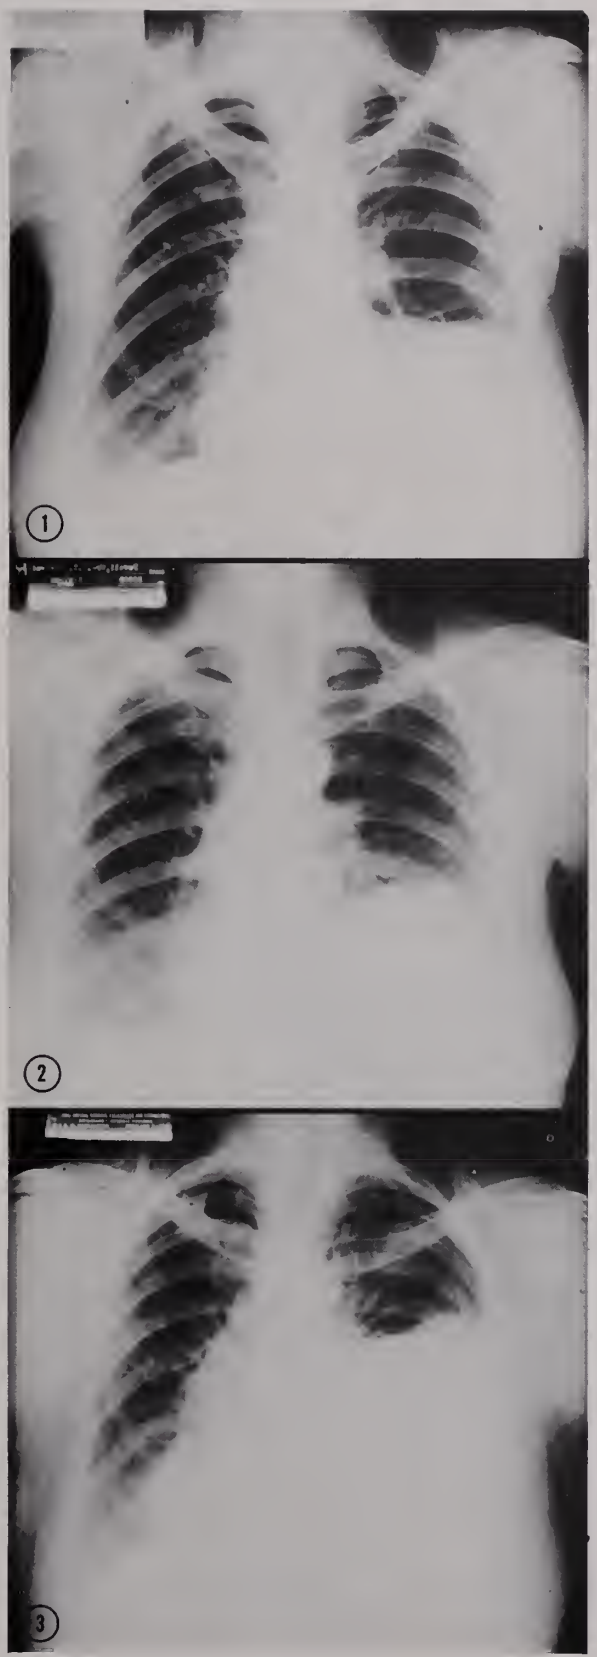

Fig. 1. Chest x-ray taken Nov. 11, 1950. Fig. 2. Chest x-ray May 31, 1952. Fig. 3. Chest x-ray Oct. 23, 1956.

year, and a sense of fullness in the chest for six months. X-ray examination of the chest elsewhere in 1950 had revealed what was interpreted as an elevated left leaf of the diaphragm. Subsequent chest x-rays in 1951, 1952, and 1956 showed progressive increase in the presumed elevation of the left leaf of the diaphragm (Figs. 1, 2 and 3).

Physical examination Oct. 23, 1956, revealed a 60 year old woman who appeared in no distress at rest. Mild exercise provoked moderate dyspnea, however, as well as aching left-sided chest pain which radiated to the neck and left arm. Blood pressure was 120/80. The pulses were of good quality, regular and 80 per minute. Temperature was 98.6 F. Her head and neck were normal. The left side of her chest was flat to percussion and breath sounds were absent below a level corresponding to the fifth rib in the mid-scapular line. The extent of flatness was not appreciably changed by respiration. The right side of the chest was hyper-resonant and breath sounds were vesicular. The heart was markedly shifted to the right. Its sounds were of normal quality. Abdominal examination was normal. Pelvic and rectal examinations were not done. No edema nor color change was present in the extremities. Routine hemogram and urinalysis were normal. The electrocardiographic tracing showed minimal depression of the T waves in leads I, III and AVL, suggesting mild myocardial ischemia.

Chest x-ray Oct. 23, 1956 (Fig. 3) revealed a density in the left chest that extended from the diaphragm up to the sixth rib posteriorly. Fluoroscopically it could be seen that the right side of the diaphragm moved well with respiration, whereas the density in the left chest was immobile. The heart and mediastinum were displaced to the right. Radiographic examination of the barium-filled esophagus and stomach revealed no evidence of indentation or other distortion of the cardia. Diagnostic pneumoperitoneum demonstrated the lower surface of the left diaphragm to be normal in contour and position (Fig. 4).

The above studies suggested the likelihood of an intrathoracic mass or a tumor arising from the thoracic side of the left diaphragm. Left thoracotomy was performed on Dec. 6, 1956. A large fibroma was found to occupy most of the left hemithorax. It was attached by a small pedicle to the central portion of the diaphragm. The tumor was removed without incident. However, on the day following surgery the patient developed left hemiplegia and expired 24 hours later. Autopsy was denied.

Pathology

Gross examination (*Fig.* 5): Large, rounded, solid mass weighs 1,360 Gm. The surface is fairly shiny and of a mottled pink, purple, white and cream color. On one surface it is moderately ragged and is attached to a segment of muscular diaphragm which measures 4 cm. in its greatest dimension. There are numerous fibrous adhesions over the surface of the mass and a few dense, thickened, hyalinized areas. A few small, soft, pink lobulations extend from the surface. On the edge these range up to 2.5 cm. in their greatest dimensions. On sectioning, the entire structure is made up of solid tissue of a mottled pink, cream and white color. No areas of necrosis are encountered. No hemorrhagic zones are found. There are minimal trabeculations but large vascular spaces are encountered. A few areas have assumed a purple coloration, as though infarcted.

Microscopic examination (*Figs.* 6 *and* 7): Multiple sections reveal uniform histologic pattern characterized by somewhat elongated collagen-producing cells. There is some variability in the amount of cellularity from field to field, but the individual cell appears quite uniform with nuclear regularity and no apparent mitotic irregularities. In some areas there is extensive hyalinization.

Fig. 4. X-ray of chest and upper abdomen following diagnostic pneumoperitoneum Nov. 31, 1956.

Fig. 5. A fibroma, weighing 1,360 Gm., was found to occupy most of the left hemithorax of a 60 year old woman.

Vascular channels are quite prominent within the tumor. At one point there is what appears to be a laminated, collagenous, fibrous capsular mass. Some well-differentiated muscle is seen opposing this which may be from the diaphragmatic origin. There is no evidence of malignancy in any of the sections studied.

Diagnosis: Large fibroma, histologically benign.

Discussion

Diaphragmatic tumors may be asymtomatic. Chest pain is the commonest complaint. This pain is most often stabbing or pleuritic in character but may be dull or aching. Respiration, change of position, or straining may alter or aggravate it. A sense of fullness in the lower chest is often noted. In certain instances pain radiates to the neck, shoulder, arm or abdomen. Depending upon the size and nature of the tumor and the resulting embarrassment of the cardio-pulmonary system, fatigue, dyspnea, cough or angina may occur. Protrusion of the upper abdomen is found occasionally.

The tumor may be seen to bulge through the lower ribs. A mass can sometimes be felt through the lower ribs or detected by abdominal examination as it moves with respiration. Dullness, flatness and diminished or absent breath sounds occur on the side of the tumor. Small tumors cause a negligible distortion of diaphragmatic contour. Large ones may even displace the heart and mediastinum to the opposite side. Destruction of ribs has been described. Pleural effusion may occur.

Scott and Morton[5] point out that intrathoracic tumors touching the diaphragm show motion synchronous with the normal respiratory excursion of the diaphragm. If the tumor lies underneath the diaphragm and protrudes through it into the thoracic cavity, a paradoxic movement of the tumor's shadow is noted. In the case herein described, no motion of the diaphrag-

Fig. 6. Low power photomicrograph (80x) of fibroma reveals a uniform histologic pattern characterized by somewhat elongated collagen-producing cells. Fig. 7. High power photomicrograph (350x) shows the individual cells to be quite uniform with nuclear regularity and no apparent mitotic irregularities.

matic tumor was seen, presumably because of pleural adhesions.

Tumors of the left side of the diaphragm are more readily recognized than those of the right. Distortion of the gastric gas shadow in a chest x-ray or the appearance of displacement of the cardia in the radiographic examination of the stomach may arouse suspicion of a diaphragmatic abnormality, as it did in this case. Tumors of the right side of the diaphragm may be confused with malignancy of the liver or other causes of marked hepatomegaly.

Pneumoperitoneum may be exceptionally useful in the recognition of this tumor, especially when it is on the right side. However, pneumothorax, thoracoscopy, bronchography—singly or in combination—may be necessary to define clearly the nature of the process.[6]

Summary

1. A case of primary fibroma of the diaphragm is presented.

2. A review of the literature discloses 44 previously reported primary diaphragmatic tumors. The present case brings the total to 45. Of this total, 23 were benign and 22 malignant. Lipoma is the most common benign diaphragmatic tumor, and fibrosarcoma the most common malignant form.

3. Whenever routine chest x-ray reveals an abnormality of diaphragmatic contour, tumor of the diaphragm should be considered. Radiographic examination of the barium-filled stomach should be done if disease of the left leaf of the diaphragm is suspected. Diagnostic pneumoperitoneum then may be employed to confirm the suspicion of tumor. In unusual cases, pneumothorax, thoracoscopy, and even bronchography may be necessary to make diagnosis more certain. A certain number of diaphragmatic tumors can only be proved by exploratory thoracotomy. •

AMA Plans Civil Defense Conference in November

More than 175 physicians and others interested in civil defense will gather November 8-9 in Chicago for the ninth annual County Medical Societies Civil Defense Conference. In an effort to promote test operations dealing with simulated disasters, the program will feature reports on several field tests conducted this year. "Test Exercise Star"—based on a mock earthquake of severe intensity—was conducted by the Alameda-Contra Costa (California) Medical Association in cooperation with local civil and military authorities. "Operation Prep Pitt"—dealing with a theoretical jet airplane crash into the Pitt Fieldhouse—was conducted by the Allegheny County (Pennsylvania) Medical Society in cooperation with local authorities. "Operation AFTA"—based on a simulated airplane crash on the Tulane University campus—was sponsored by the Committee on Medical Education for National Defense (MENS) of the Tulane School of Medicine to provide a realistic situation for the instruction of medical students in the principles of disaster medicine.

As in past years, the group will divide up into workshop sessions to consider various phases of civil defense: organization and training; reception, evacuation and emergency care; hospital disaster planning; supplies, transportation and communication.

The two-day meeting at the Morrison Hotel, Chicago, is being planned by the AMA's Council on National Defense. F. J. L. Blasingame, executive vice president, will welcome the conferees on behalf of the American Medical Association, and Gunnar Gundersen, AMA president, will speak on "The Profession's Responsibilities in Civil Defense." Officials of the newly-created Office of Civil and Defense Mobilization will report on the expanding role of the federal government's defense program and the medical and health aspects of civil defense as they pertain to the new program.

Dramamine-*D*™

brand of dimenhydrinate with dextro-amphetamine sulfate

adds the alertness factor to antiemetic therapy

Dramamine-*D* keeps patients alert and cheerful while it controls nausea and dizziness. Available on prescription only.

Indications: vertigo; nausea and vomiting of pregnancy, travel sickness and other conditions.

Adult dosage: one tablet every 4 to 6 hours.

Each scored, orange-colored tablet of Dramamine-*D* contains 50 mg. of Dramamine® and 5 mg. of dextro-amphetamine sulfate.

References on the combination of these two drugs available on request.

Upjohn

Make new Panalba*

(PANmycin† Phosphate plus ALBAmycin**)

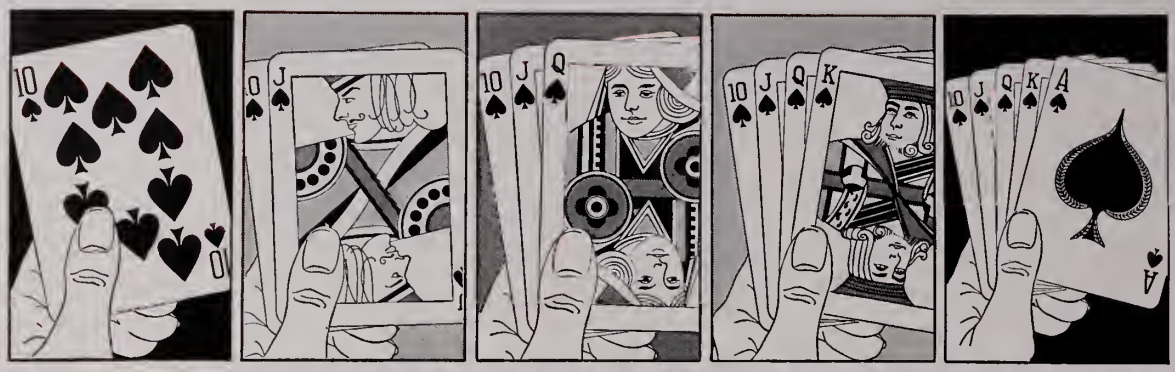
your broad-spectrum antibiotic of first resort

effective against more than 30 common pathogens, even including resistant staphylococci.

Available forms:

1. Panalba Capsules, bottles of 16 and 100 capsules. Each capsule contains:

Panmycin phosphate (tetracycline phosphate complex) equivalent to tetracycline hydrochloride .....250 mg.
Albamycin (as novobiocin sodium)...125 mg.



2. Panalba KM †† Flavored Granules. When sufficient water is added to fill the bottle, each teaspoonful (5 cc.) contains:

Panmycin (tetracycline) equivalent to tetracycline hydrochloride .....125 mg.
Albamycin (as novobiocin calcium)..62.5 mg.
Potassium metaphosphate .....100 mg.

Dosage:

Panalba Capsules
Usual adult dosage is 2 capsules q.i.d.

Panalba KM Granules
For the treatment of moderately acute infections in infants and children, the recommended dosage is 1 teaspoonful per 15 to 30 lbs. of body weight per day, administered in 2 to 4 equal doses. Severe or prolonged infections require higher doses. Dosage for adults is 2 to 4 teaspoonfuls 3 or 4 times daily, depending on the type and severity of the infection.

LEAVES NOTHING TO BE DESIRED

HYCOMINE®
Syrup

THE COMPLETE Rx FOR COUGH CONTROL

cough sedative / antihistamine / expectorant

- relieves cough and related symptoms in 15-20 minutes
- effective for 6 hours or longer • promotes expectoration
- rarely constipates • cherry-flavored

Each teaspoonful (5 cc.) of HYCOMINE contains:

Hycodan®		
Dihydrocodeinone Bitartrate	5 mg.	6.5 mg.
(Warning: May be habit-forming)		
Homatropine Methylbromide	1.5 mg.	
Pyrilamine Maleate		12.5 mg.
Ammonium Chloride		60 mg.
Sodium Citrate		85 mg.

Adult Dosage: one teaspoonful q. 6 h. May be habit-forming.
Federal law permits oral prescription.

ANNUAL MEETING
September 23-25, 1959
Medford

President, Herman A. Dickel, M.D., Portland
Secretory-Treasurer, Max H. Porrott, M.D., Portlond
Executive Secretory, Mr. Roscoe Miller, Portland

DeNorval Unthank Named "Doctor of the Year"

DeNorval Unthank, 59-year-old Portland negro physician, was selected "Oregon Doctor of the Year" for 1958, at the 84th Annual Session of the Oregon State Medical Society in recognition of more than 30 years leadership in the field of improving inter-race relations.

Dr. Unthank and his family were guests of honor at the Inaugural Ball and received a plaque from President Vern W. Miller of Salem.

The soft spoken medical graduate of Howard University served as a representative from the United States National Council of the Y.M.C.A. to the World Council in Germany in 1957, and was appointed by the Council to serve on the Commission on Inter-Racial Practices and Principles.

Dr. Unthank, a past-president of the Oregon Chapter of the National Association for the Advancement of Colored People, is vice-president of the Oregon Com-

(Continued on page 1320)

(Continued from page 1319)

mittee for Equal Rights and Chairman of the Portland Commission on Inter-Group Relations.

Dr. Unthank's long list of community activities includes service as a member of the Board of Directors of the Oregon Prison Association, leadership in developing the Urban White House Conference on Children and Youth in 1950, chairman of the Mayor's Committee on Inter-Group Relations, a member of the Governor's Committee on Children and Youth, vice-president of the Family Counseling Service and a member of the Board of Directors of the Urban League.

The 1958 Doctor of the Year was the first negro member of the Portland City Club, is active in the Chamber of Commerce and serves as Chairman of the Board of Directors of the North Branch of the Y.M.C.A.

Dr. Unthank is a charter and life member of the Blessed Martin Day Nursery. He is active in a number of religious organizations and from 1949-51 served as vice-president of the Portland Council of Churches.

A booster of the Republican party, he received a distinct honor in 1944 when the Young Democrats of Oregon selected him as "Negro First Citizen." In 1955 the Billy Webb Lodge No. 1050 sponsored a public testimonial banquet in recognition of his civic service.

Professionally Dr. Unthank is a member of a number of large hospital staffs, the American Medical Association, Oregon State and Multnomah County Medical Societies, American Geriatrics Society, American Trudeau Society, the American Heart Association, Mental Health Association and is a member of the Board of Directors of the Oregon Tuberculosis and Health Association.

Dr. Unthank's father was a cook. He was born in Allentown, Pa., one of eight children. His mother died when he was 9 years old and he was then reared by a physician uncle, Thomas C. Unthank, in Kansas City, Mo. He decided to become a physician when he was a junior in high school, because of his interest in sciences and partly due to the uncle's profession.

He and his wife, Thelma, have three sons and two daughters, DeNorval Jr., 28, a Eugene architect; Thomas, 21; Jim, 20 and Thelma, 18, all college students, and Lesley, 16, a Grant High School student.

The Society established the Doctor of the Year program in 1957 for the purpose of recognizing members of the profession who make outstanding contributions to community life beyond the time consuming practice of medicine. Nominations for the award are received each year from component medical societies throughout the state, and final judging is done by a panel of leading citizens from business, industry, labor, the clergy and the medical profession.

Last year's winner was Archie D. McMurdo of Heppner.

general use...
in general practice

fast, effective and long-lasting relief from...

BURNS — sunburn, cooking, ironing

PAIN — hemorrhoids and inoperable anorectal conditions, cuts and abrasions, cracked nipples

ITCHING — insect bites, poison ivy, pruritus

The water-soluble, nonstaining base melts on contact with the tissue, releasing the Xylocaine for immediate anesthetic action. It does not interfere with the healing processes.

Structure of State Society Changed Significantly

Oregon State Medical Society was completely reorganized by the House of Delegates at Portland last month. This important action was by far the most significant event of Oregon's eighty-fourth session and will govern the Society's activities for many years to come. Work of the organization will be expedited materially.

Members who do not attend sessions of the House probably do not realize the vast amount of work done by the Society. Oregon has 24 standing committees, 28 special committees and 5 representatives to other bodies. Each has specific duties and specific responsibilities. The aggregate volume of work done and the diversification of problems into which committees delve are remarkable. Past work load and the tendency in Oregon to name new committees rather frequently have made the situation considerably more complex than in the other northwest states. The plan has been under study for several years.

New organization follows recognized business principles. It is axiomatic, in business, that an executive can be most efficient when he has only a limited number of persons reporting to him directly. He cannot properly advise and guide more than five or six individuals. This has been taken into consideration by those who have planned the new structure of Oregon State Medical Society.

Under the new plan the President and his advisors, the Council, will have reports from five commissions. Committees have been grouped so that each commission will direct and report on work of several committees in one of the five broad fields of society activity. This provides not only much more efficient direction but offers better communication within the organization. In the past there has been some confusion when two or more committees have approached the same problem without being aware of the other work being done. The new structure offers a means of preventing such waste of effort and of preventing damage to public relations which has sometimes occurred as result of confusion.

The proposal was not accepted by the House without some debate but carried easily when the vote was called. Only serious criticisms were that interposition of the commissions removed the officers one more step from membership and would interfere with Society work if commissioners did not function adequately. These hazards were admitted but did not prevent acceptance.

Relationships with O.P.S. and Medical School Considered by House at Annual Session

Relationships with Oregon Physicians' Service and the University of Oregon Medical School dominated the business agenda of the House of Delegates at the 84th Annual Session of the Oregon State Medical Society held in Portland, September 3, 4 and 5.

Included among a number of resolutions dealing with O.P.S. were requests that the Society discontinue its sponsorship of the Blue Shield Plan in Oregon, that O.P.S. abandon the full service contract and that the schedule of allowances be revised to provide differential compensation for qualified specialists.

The House turned down these proposals.

However, the large number of resolutions relating to O.P.S. resulted in creation of a Committee on Prepaid Medicine to consider all matters of contention between the membership of the Society and O.P.S. Up for early consideration by the new Committee will be the advisability of continuing the "supporting physician" category.

The House also adopted a resolution submitted by the Reference Committee on New Business which expressed the Society's desire to retain and strengthen its voice in the affairs of O.P.S. The resolution further called upon the Board of Trustees of O.P.S. to present to the Council and, where feasible, to the House of Delegates all changes in by-laws and other changes in policy which might be under consideration by the Board.

A progress report submitted by the Committee on Medical Education indicated that an early meeting will be held with the Committee on Medical Education of the Oregon State Board of Higher Education. The report was adopted.

The action served as a vote of confidence for the work of the Committee in its numerous and lengthy

Presiding Officer At House of Delegates—Blair J. Henningsgaard of Astoria received vote of appreciation from members of the House of Delegates at 84th Annual Session of the Oregon State Medical Society for efficient handling of long and sometimes complicated business sessions. Members of the Society later re-elected Dr. Henningsgaard for second term as Speaker of the House of Delegates.

conferences with representatives of the University of Oregon Medical School in efforts to resolve long standing points of differences between the Society and the School.

Other Actions

Acting on a report of the Committee on Charitable Medical Care, the House recommended that the 1959 State Legislature consider an appropriate increase in the State Welfare medical budget to at least cover out-of-pocket expenses for physicians when treating welfare recipients.

The Delegates turned attention to problems involving "third parties" in medical care with adoption of a recommendation that the Committee on Patient-Physician Relations instigate a study and make recommendations regarding all circumstances under which a "third party" appears to interfere in relations between patients and physicians.

The Society revised its Constitution and By-Laws to provide for establishment of five commissions of three members each. The commissions—Judicial, Education, Public Health, Para-Medical and Public Relations—will supervise the activities of committees and serve as liaison between the committees under their jurisdiction and the Council. The President will appoint the commissioners with approval of the Council.

Other revisions in the Constitution and By-Laws included the establishment of Scientific Sections and approval of a new Section on Ophthalmology and Otolaryngology and a change in the name of the Committee on Cancer Study to the Committee on Cancer.

Educational standards for schools of osteopathy was the subject of a resolution adopted by the House which directs the Society's delegates to the American Medical Association to urge the AMA to cooperate with the osteopathic schools in every way possible to improve their educational standards.

The Delegates also authorized the Council to employ a public relations counsel at a yearly retainer not to exceed $2400 after study and recommendation by the Committee on Public Relations.

Additional matters considered by the House of Delegates and committee activities will be reported in future issues of NORTHWEST MEDICINE.

TRIBUTE TO MR. CLYDE C. FOLEY—Vern Miller, at left, retiring president of Oregon State Medical Society, receives on behalf of the State Society a plaque in tribute to Mr. Clyde C. Foley. Werner A. Zeller of Portland, president of Multnomah County Medical Society makes the presentation in the name of the County group.

Plaque Honoring Mr. Clyde C. Foley To Hang in State Society Offices

The name of the late Mr. Clyde C. Foley, the first full time Executive Secretary for the Oregon State and Multnomah County Medical Societies, has been inscribed on a plaque which will be hung in the State Society headquarters.

Mr. Foley died on Oct. 3, 1957, on the second day of the 83rd Annual Session, after more than 31 years of service to the two Societies.

The plaque was presented by Werner E. Zeller, president, in the name of the Multnomah County Medical Society to State President Vern W. Miller, during ceremonies at the 1958 Inaugural Ball.

The inscription reads as follows:

A tribute to Clyde C. Foley, 1897-1957, our first Executive Secretary, May 3, 1926-October 3, 1957. Presented to the Oregon State Medical Society by the Multnomah County Medical Society, September 4, 1958.

PRESIDENT'S GAVEL—Herman Dickel, at left, receives the symbol of office from out-going President Verne Miller.

Official Attendance Figures Announced

Although no new attendance record was established during the 84th Annual Session of the Oregon State Medical Society, held in Portland Sept. 3-4-5, observers reported the over-all program was one of the finest and most successful in history.

It was noted that scientific lectures, technical and scientific exhibits and meetings of the House of Delegates were well attended throughout the three-day period.

Official attendance figures compiled at the registration desk recorded 710 physicians, 69 medical students, 69 guests and 211 technical exhibitor representatives. Total attendance count was 1,059.

The 1959 Annual Session will be held in Medford on Wednesday, Thursday and Friday, September 23, 24, 25.

OATH OF OFFICE—Incoming President Dickel of Portland receives the oath of office from Blair J. Henningsgaard of Astoria, Speaker of the House of Delegates.

House Approves Full Cooperotion With Centennial Commission

Medical participation in the 1959 Oregon Centennial Program and World Trade Exposition was practically assured at the Annual Session of the Oregon State Medical Society when the House of Delegates unanimously approved a resolution urging full cooperation with the Centennial Commission.

The resolution introduced by the Multnomah Medical Society, and later amended by the Marion-Polk County Medical Society, authorizes the Committee on Public Relations to lend professional assistance to all interested official agencies in assuring that health and medical exhibits at the Exposition will be of the highest caliber in keeping with the standards of the Centennial celebration.

The amendment instructs the Committee on Oregon Medical History to prepare an appropriate exhibit at the Exposition depicting medicine's role in Oregon history and authorizes an expenditure for this purpose.

The Exposition, to be held in Portland for a period of 100 days commencing in June 1959, is expected to attract more than five million persons from throughout the world. A large area has been set aside for exhibits dealing with health and medicine.

Attendance Prizes Awarded

Valuable attendance prizes ranging from fancy fishing equipment to the latest in portable television were awarded to five winners on the last day of the 1958 Annual Session of the Oregon State Medical Society.

The grand prize, a new compact television set, went to J. B. Steward of St. Helens. Other winners were Ivan C. Jackson, Portland, a portable transistor radio; H. Clagett Harding, Portland, transistor pocket radio; Louis F. Michalek, Roseburg, spin reel, and Joe C. Much, Salem, plastic fishing rod.

Physicians received attendance prize cards at the time they registered. Cards were deposited in the drawing box after the physician obtained the signatures of 45 exhibitors.

House Estoblishes New Traditions

House of Delegates of the Oregon State Medical Society established two new traditions at its 84th Annual Meeting.

The Delegates unanimously adopted a resolution introduced by the Multnomah County Medical Society which provides for the reading of the Oath of Hippocrates as an official order of business at the first meeting of each regular and special session of the House, and also approved the reading of the Principles of Medical Ethics as an official order of business at the last meeting of each regular and special session.

The resolution reminded that the Oath of Hippocrates "clearly delineates the principles by which all physicians shall practice their careers in relation to their responsibilities to patients and colleagues." It further declared that, "the American Medical Association in June, 1957, adopted revised principles of medical ethics as standards by which physicians may determine the propriety of their conduct in relationships with patients, with colleagues, with members of allied professions and with the public."

THREE PRESIDENTS AT AUXILIARY MEETING—Among the dignitaries at the 1958 Planning Session for the Woman's Auxiliary to the Oregon State Medical Society were from left: Mrs. Merle Pennington, Sherwood, president of the Oregon Auxiliary; Mrs. E. Arthur Underwood, Vancouver, Washington, president of the American Medical Association Auxiliary, and Mrs. C. L. Lyon, Spokane, incoming president of the Washington State Medical Association Auxiliary. Business, educational and recreational program was held during same time as the State Society Session. This year's program received many words of praise from Auxiliary members throughout the State.

Mrs. Stenberg Awarded Certificate of Merit

Appreciation for outstanding leadership as President of the Woman's Auxiliary to the Oregon State Medical Society in 1957-58, has been expressed to Mrs. Oscar (Betty) Stenberg of Hood River in the form of a Certificate of Merit from the State Society.

State President Vern W. Miller, Salem, presented the Certificate during ceremonies at the 1958 Inaugural Ball. Mrs. Merle Pennington, Sherwood, current President of the Auxiliary, received the award on behalf of Mrs. Stenberg, who was unable to attend.

The Certificate was presented . . . "in recognition of Mrs. Stenberg's outstanding leadership and eminent service to the Society and its Woman's Auxiliary."

ACHROCIDIN

TETRACYCLINE-ANTIHISTAMINE-ANALGESIC COMPOUND LEDERLE

A versatile, well-balanced formula for treating common upper respiratory infections, particularly during respiratory epidemics; when bacterial complications are observed or are likely; when patient's history is positive for recurrent otitic, pulmonary, nephritic, or rheumatic involvement.

CHECKS SYMPTOMS: Includes traditional components for rapid relief of the traditional nonspecific nasopharyngitis, symptoms of malaise, chilly sensations, inconstant low-grade fever, headache, muscular pain, pharyngeal and nasal discharge.

Available on prescription only.

Adult dosage for ACHROCIDIN Tablets and new caffeine-free ACHROCIDIN Syrup is two tablets or teaspoonfuls of syrup three or four times daily. Dosage for children according to weight and age.

TABLETS *(sugar coated)*

Each Tablet contains:

ACHROMYCIN® Tetracycline	125 mg.
Phenacetin	120 mg.
Caffeine	30 mg.
Salicylamide	150 mg.
Chlorothen Citrate	25 mg.

Bottles of 24 and 100.

SYRUP *(lemon-lime flavored)*

Each teaspoonful (5 cc.) contains:

ACHROMYCIN® Tetracycline equivalent to tetracycline HCl	125 mg.
Phenacetin	120 mg.
Salicylamide	150 mg.
Ascorbic Acid (C)	25 mg.
Pyrilamine Maleate	15 mg.
Methylparaben	4 mg.
Propylparaben	1 mg.

Bottle of 4 oz.

Earphones Key To This Scientific Exhibit—An outstanding scientific exhibit at the 84th Annual Session of the Oregon State Medical Society, held in Portland, September 3-4-5, was display and report on The Effects of Prophylaxis on Rheumatic Heart Disease entered by the Oregon State Board of Health. Exhibit, prepared by the U.S. Public Health Service, provided earphones which permitted physicians to sit in on actual case histories and hear recorded heart beats of patients. In photo from left are Fred H. Bishop of Longview, Washington; Carl G. Ashley, Director of Maternal and Child Health Section for Board of Health, and Mr. John Wydro with the U.S. Public Health Service in Washington, D.C. Next stop for the exhibit is the Brussels Fair.

Oregon Ophthalmologist Association Holds Annual Session in Portland

Some 20 members and 60 guests from the Northwest, California, Alaska, and Canada attended the annual scientific session of the Oregon Ophthalmology Alumni Association September 5 in the University of Oregon School Auditorium, Portland. Association members are physicians who have taken residencies in ophthalmology at the UOMS Hospitals and Clinics.

Guest speaker was Francis H. Alder, professor of ophthalmology at the University of Pennsylvania Medical School and editor of the *American Medical Association Archives of Ophthalmology*. He spoke on New Aspects in the Management of Strabismus.

Portland Physician Heads National Group

Arthur C. Jones of Portland has been named president of the American Congress of Physical Medicine and Rehabilitation. Dr. Jones was elected at the group's recent annual meeting in Philadelphia to succeed Donald L. Rose of Kansas City, Kan.

Dr. Jones is director of physical medicine and rehabilitation, University of Oregon Medical School; director of physical medicine at Good Samaritan and Holladay Park Hospitals; medical director of the Portland Rehabilitation Center; and consultant in physical medicine and rehabilitation to Veterans Administration Hospitals in the San Francisco area and to the U. S. Army Madigan General Hospital at Ft. Lewis, Wash.

why all the fuss over potassium?

Many physicians will recall when safe but potent organomercurials were first introduced. At the time there was considerable worry about possible potassium loss. Patients were instructed to take foods rich in this mineral, and not infrequently potassium supplements also were advised. After enough experience was gained, it became evident that only the exceptional case could lose enough potassium to be concerned about. And with oral organomercurial diuretics this was practically never a problem.

Why revive the subject now? Because clinical experience with nonmercurial diuretics indicates most of them have such a specific effect on potassium that with their use very real problems must be faced. Enough potassium loss can lead to digitalis toxicity or to a classical overt hypopotassemia. Since a fair percentage of cardiacs who receive diuretics are also digitalized, this excess potassium excretion is clinically serious. Clinical experience is still too limited with some nonmercurial diuretics to say just how often such loss will occur—but warnings already have been sounded by some clinical investigators as to the need for potassium supplementation.

Experience in many patients, for many years, demonstrates that potassium loss is never a problem when NEOHYDRIN® is the oral diuretic. And there is no refractoriness to this effective oral organomercurial.

LAKESIDE

PHYSICIANS VISIT TECHNICAL EXHIBITS — Physician attendance at the 64 technical exhibits on display during the 84th Annual Session of the Oregon State Medical Society was considered to be the largest in recent years. In photo above, Miss Barbara Radmore of Eugene checks x-ray equipment with Mr. J. R. Friend of Keleket X-Ray Corporation of Oregon. The 1959 Annual Session will be held in Medford on Wednesday, Thursday and Friday, September 23, 24, and 25.

Guy L. Boyden, Department Head at UOMS, Dies September 9

Guy L. Boyden, 73, head of the department of otolaryngology at the University of Oregon Medical School, died at his home in Portland September 9. In June, Dr. Boyden was guest of honor of the otolaryngological section at the AMA annual meeting in San Francisco. He had been invited to be guest of honor of the Rhinological Society this month and was to have received the award of merit of the American Academy of Ophthalmology and Otolaryngology for his work in the field of education.

Dr. Boyden received his medical degree in 1911 from Northwestern Medical School and took his residency at the Mayo Clinic in Rochester, Minn. He started in private practice with his brother, the late Frank E. Boyden, in Pendleton in 1913. He practiced there until 1921, except for service during World War I.

After specialty training in otolaryngology at Northwestern, Dr. Boyden moved to Portland and became an associate of the late Frank B. Kister. He had been on the staff in otolaryngology at the University of Oregon Medical School since January 1922. In 1945 he was named clinical professor and head of the department, a position he retained until his death.

Offices held by Dr. Boyden in his professional affiliations included: presidency of Oregon Academy of Ophthalmology and Otolaryngology in 1935; presidency of Pacific Coast Opthalmology and Otolaryngology Society in 1946; vice-presidency and western chairmanship of the American Laryngological, Rhinological and Otological Society in 1953-54, and vice-chairmanship of the Section on Otolaryngology of AMA in 1954-55.

Lane County Medical Society

Guest speaker at the September meeting of the Lane County Medical Society was James W. Brooke of Eugene who had been in England for a year. He spoke on Medical Services in the Welfare States.

A motion passed at a recent Society Council meeting requests a $3,000 grant from the American Cancer Society for the purpose of establishing a radioisotope program at Sacred Heart General Hospital in Eugene for the benefit of patients of Lane County.

At the Lane County Medical Society booth at the Fair in Eugene, September 10-14, childhood immunizations, periodic physical examinations, and health information pamphlets were of main interest. The booth was prepared by the Society's Public Relations Committee, assisted by members of the Auxiliary.

Applicants for membership in the County Society are: David K. Hills of Eugene and Albert Brauer of Florence.

Oregon Society of Allergy Elects

New president of the Oregon Society of Allergy is Nicholas P. Sullivan of Eugene. He was elected at the annual meeting in Portland, September 3. Others named to office were Robert L. Cutter, Bend, vice-president and Alvin D. Wert, Portland, secretary-treasurer. Roy R. Matteri, Portland, is retiring president.

The Society has announced a Workshop in Allergy to be held in Portland on Friday, October 24, at the Medical Dental Building Auditorium. Guest speaker will be Lawrence J. Halpin of Cedar Rapids, Iowa.

Eugene Surgical Society

The first meeting of the Eugene Surgical Society for the 1958-59 season was held September 17 in the Sacred Heart Hospital Staff Room.

The program consisted of a case report of Adrenal Insufficiency presented by John Kirk. This increasingly common problem was discussed by Don Brinton and Nicholas Sullivan. A panel disucssion on Postoperative Convalescence Period followed. The panel members—C. D. Thompson, D. B. Slocum, A. P. Martini and G. M. Gordon—covered a variety of surgical procedures, the length of convalescence and problems concerning this period.

Medical Officer Named For Portland Area

Robert L. Zobel has assumed the duties of medical officer in charge of the Portland area office, division of Indian health. Through his appointment by the Public Health Service, Dr. Zobel will direct the medical care and public health services for approximately 31,000 Indians in Oregon, Washington and Idaho. He succeeds Ruth E. Dunham, who left last April for a position in Washington, D.C.

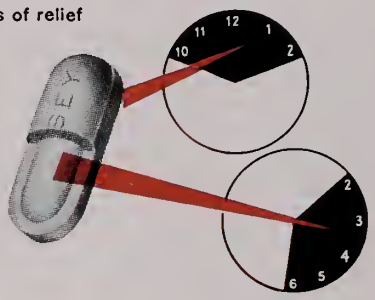
harmful cough – 6 to 8 hours with one timed-release tablet

A single, easily-swallowed Tussaminic tablet provides decongestion of the upper respiratory tract, non-narcotic control of the cough reflex center and effective expectorant action.

Nasal and paranasal congestion associated with cough is relieved by the oral respiratory decongestant action of Triaminic*. Non-narcotic antitussive action is provided by Dormethan, as effective as codeine but without codeine's drawbacks. The classic expectorant, terpin hydrate, helps augment the flow of demulcent respiratory fluids.



Each TUSSAMINIC *Tablet provides:*

TRIAMINIC®	100 mg.
(phenylpropanolamine HCl	50 mg.;
pheniramine maleate	25 mg.;
pyrilamine maleate	25 mg.)
Dormethan (brand of dextromethorphan HBr)	30 mg.
Terpin hydrate	300 mg.

Dosage: One tablet in the morning, mid-afternoon and at bedtime. The tablet should be swallowed whole to preserve the timed-release action.

how TUSSAMINIC timed-release tablets provide 6 to 8 hours of cough relief

first— the outer layer disintegrates in minutes to provide 3 to 4 hours of relief

then— the inner core releases its ingredients to provide 3 to 4 more hours of relief

Tussaminic *timed-release tablets*

for relief from harmful cough "around the clock"

On one tablet—the patient can work all day

On one tablet—the patient can relax all evening

On one tablet—the patient can sleep all night

*Triaminic *will* STOP *running noses*  *and open stuffed noses orally*

President's Page

HERMAN A. DICKEL, M.D.

The opportunity that the "President's Page" of the Oregon State Medical Society gives to the Society's President each month is a grateful opportunity on this particular occasion for me to express my thanks and appreciation to the individual members of the organization who make it possible for me to serve each member of our State Society in this capacity. I consider it an honor—one that I accept on a personal basis, but I also wish to express the gratitude that my own particular specialty feels for they, too, recognize it is not ordinary for such to occur.

As I expressed to the members who attended the dinner the evening that the gavel changed from Vern Miller to myself, I could not help but mention that even though the ability to serve you as an executive officer is a very honorable one, there is nonetheless a very serious implication that it is much more than just an honor. It is, if one is realistic, a post that requires a great deal of hard and concerted work. Further, any one who can or does take this post does so with the realization that the job requires, particularly at the present time, these fundamental prerequisites:

a. A willingness to contribute a full capacity of hard, trying and tiring work.
b. A belief in organizational medicine as an absolute need for our profession to maintain the standards, the reputation, and the contributions that it has made for the past 150 years.
c. A realization that we exist in an ever-changing culture, with those changes more apparent and perhaps more intent at the present time, and that we, as physicians, must adapt ourselves as individuals, and our profession as a group, to these changes in our culture without any loss of our fundamental principles.

You have chosen me and the other officers to serve you during the coming year. Whether or not we have the above prerequisites only the following year will tell. I can assure on behalf of all of us that we will serve you with the very best of our ability and capacity, and in so doing will try to continue the excellent and provocative caliber of service that the preceding presidents and officers have contributed to the Oregon State Medical Society.

In serving you we believe that it is important to improve the communication that exists between the Medical Society and the individual doctors. We believe that medicine must be more conversant with the individual physician so that the individual physician can in turn better inform his patients, his public, and his community as to the intent and need for the precepts of organized medicine. As physicians we must contribute something to our community, and only by being better informed can we do this. As your officers, we likewise believe that there must be an improvement in the centralization of our many, varied professional activities. We all have our individual interests and these interests should continue. Many of us have interests in our specialties and subspecialties and these must continue. However, there must be some one organization within the whole broad field of medicine that acts as the central coordinating, centralizing group so that we have a common front in our relationship as doctors to the other professions, to the labor group, to our public, and of course to the political fronts. Our Medical Societies are in a position to do this only if we as physicians will take a forward step in that direction. This is possible only if each of you as individual physicians contribute as much as you possibly can to your own local component societies.

During the past year's visits around the State with Dr. Miller, I have been interested in the greater amount of contribution that physicians in the smaller area make to their component societies. And I say very honestly that I think it is the physicians in the larger metropolitan areas that need to be thoughtful

(Continued on page 1336)

(Continued from page 1335)

when they consider their own specific contribution to their State Medical Society.

You have asked your officers to serve you during the coming year. You have asked us to give of our time and energies—to draw from our families and from our associates extra of their time and energies—to carry on the activities of the Medical Society. This we have willingly accepted as our responsibility, and we enter into it with a wholehearted desire to do the very best we can for you. However, we would do this only if we can expect from you one contribution—that when we call upon you as individuals or as a group to contribute some of your time and energies that you will sincerely cooperate and accept with the very best of your ability.

I would like to say this about the other officers. Any election brings with it certain feelings of intensity, as each group pulls for the individuals that they want to represent them. Not everyone can win, and those who might win today need always the strong minority to prompt progress tomorrow. I sincerely hope that with the passing of the annual convention that some of the feelings of distress pass too and that our ranks will close and our contributions as members will continue on a wholesome front throughout the year.

Your Society is pleased to announce that the president-elect for the coming year is Louis Feves of Pendleton. He joins me in willingly accepting the responsibility for the coming year. Vern Miller continues on our Executive Committee as our past-president and we need him in this continuity for he means a great deal to the Society. Verner Lindgren of Portland joins us as the vice-president and he will bring a great deal of stimulus and provocation to our Executive Committee in its plans for and its activities in carrying out the plans of the coming year. Max Parrott who has contributed so very much to the organization, not only as Secretary-Treasurer but as Chairman of our Annual Sessions, continues and I know that we will look forward to the Session that he puts on in Medford in September 1959.

Further committee announcements will follow next month.

Herman A. Dickel, M. D.

WASHINGTON STATE MEDICAL ASSOCIATION
1309 Seventh Avenue
Seattle 1, Washington

ANNUAL MEETING
Seattle
September 13-16, 1959

President, Emmett L. Calhoun, M.D., Aberdeen Secretary, Wilbur Watson, M.D., Seattle Executive Secretary, Mr. R. W. Neill, Seattle

State Activities of Particular Interest to the Medical Profession

HON. ALBERT D. ROSELLINI
GOVERNOR OF THE STATE OF WASHINGTON

In beginning this talk, which I assure you will cover a variety of subjects, it would be only proper that I commend the medical profession. The medical men in the State of Washington have provided leadership, guidance and cooperation in promoting the cause of health.

Hon. Albert D. Rosellini

The record of your Association and its member societies shows that you have become increasingly aware of the importance of organized medicine working with the people. This has been done not only through official agencies, but also through voluntary health groups and related organizations.

The private practitioner of medicine must not only be concerned with the care of the individual, but must also concern himself with the socio-economic aspects of medicine. This you have done with the development of the medical bureaus, your participation in such organizations as the State Health Council, on advisory committees to the several state agencies with a health or medical aspect, as members of state and local boards of health, by your support of the Basic Science Law in maintaining high standards for practitioners in the healing arts, and the regulation and control of your own members through the establishment of a Medical Disciplinary Board.

It was my pleasure to have worked with you, first as Senator and later as Governor, in creating the Disciplinary Board and establishing it as part of our state government. With you, I am proud that Washington has led the way for other states in this commendable development.

Health Problems Faced By Government

Despite the advances in many areas we are still confronted with increasing problems in conserving the health of our people. We firmly believe in the sytsem of free enterprise and the promotion of the doctor-patient relationship. While this is true, we must recognize that there is a role government is called upon to play in the health fields—and some of the problems we face are increasing ones. I have in mind the problems of environmental sanitation, industrial health, air pollution, radiation hazards, the problems of the mentally ill and the mentally retarded and health services to the indigent and aging.

In facing all such problems we have been able to call upon you in the past, and you have been most helpful. I know that those of us who have the job of administering these programs can continue to count on your sound judgment and assistance in framing the policies under which they are administered.

Legislation Needed

The State Legislature will soon be in session. I am sure I need not remind you of the importance of every member of the medical profession keeping abreast of legislative developments. We need legislation and we need government in the area of health, but as I said before, we do not want it at the expense of sacrificing our basic principles of democratic government. With your help I know we can, together, meet the needs of the people without jeopardy to these principles.

By working together, we in Olympia and you in your profession can do wonderful things. The finest result of this cooperation has been the establishment of the Health Sciences Division at the University of Washington.

The medical profession, of course, took the lead in establishing this new school. For many years leaders in the profession looked forward to the day when Washington would have its own medical school. The support of the profession was important in obtaining passage of two key bills.

The former Senator, Dr. Donald Black, and I, in 1945, introduced a bill to authorize the Health Sciences Division. This established the Schools of Medicine and Den-

(Continued on page 1338)

Address of the Governor, presented at the 69th Annual Convention of Washington State Medical Association, Spokane, Washington, September 17, 1958.

(Continued from page 1337)

tistry at the University and coordinated them with the already established School of Nursing and College of Pharmacy.

Until this bill was passed, Washington State was entirely dependent upon medical schools in other states for its supply of physicians. Since then our state has assumed its fair share of the job of providing new physicians to serve our people.

Teaching Hospital Created

In 1951 we in Olympia got another chance to help the new School of Medicine. In order to complete the facilities necessary for training young doctors and other workers in the health field, a specialized teaching and research hospital on the University campus was urgently needed.

Senator Bob Greive and I co-sponsored a bill which made it possible for the Regents to bond against future income from the Metropolitan Tract to help pay for this hospital. The money thus made available, together with University and federal funds and a supplemental appropriation by the last Legislature, enabled the University to start construction of the long needed hospital. This new hospital is now nearing completion and the first patients from all parts of Washington are expected to enter in May, 1959.

One of the hallmarks of a true profession is that it maintains a continuing and alert interest in the training of young people who will be entering it. In this the medical profession of Washington can be proud of the part it has played. At the present time 580 practicing physicians in this state give their time without pay to serve as instructors of medical students, interns and residents. This is an unselfish contribution made in a true professional spirit.

Agreements Achieved

Major policies and objectives of the medical school have been discussed between appropriate committees of the local medical society and the State Medical Association. Agreement on these policies has been reached through the give and take of mutual discussion on a voluntary basis. While new problems will arise to be faced as the school progresses, the history of discussion in the past gives confidence that these problems can be faced and resolved.

I am informed the Washington State Medical Association, through its Medical School-Teaching and Research Hospital Committee, will have an opportunity to review the budget request recently approved by the Board of Regents for the Medical School, the University Hospital and Health Sciences Division of the University. We will be happy to have you do this as we need your advice.

I can assure you that the budgets of all departments will be gone over with a fine toothed comb. While neither I nor my budget staff are experts on medical matters, we expect to give this problem the benefit of the best judgment of which we are capable. In order to do so, I will appreciate it if you scrutinize the budget carefully and give us the benefit of your recommendations. While we want an adequate budget to do a good job, we will not permit an exaggerated budget.

The opening of the new University Hospital next spring can be considered a real milestone in the progress of the new school. It will bring the care of selected patients under the same roof with laboratory and teaching facilities to the mutual benefit of each. It will help step up the production of nurses, medical technologists and a dozen other allied health professions. It will provide the medical profession of Washington with a referral hospital where special skills and equipment can be available to the unusual patient who cannot be adequately taken care of in his local community.

The Record And The Future

The accomplishments of the school and its future objectives might be summarized thus:

(a) A ninth graduating class went into internship this summer. The new school has now awarded the doctor of medicine degree to 557 young men and women. Graduates of the school are now in practice in 23 of our counties serving the health needs of their patients.

(b) The School has been able to obtain the service of a young and energetic faculty, many of whom have national reputations as teachers and researchers. The school emphasizes research by its faculty and students as the key to further medical progress, and the reduction or prevention of illness and disability among our people.

(c) The School seeks to be of service to the state by providing additional well-trained physicians, by research to further medical knowledge, and by building its program of postgraduate education for the practicing physicians, so that new advances in medicine can be at the command of every doctor.

State Institutions

I would be negligent today if I failed to mention our work and problems in the Department of Institutions.

The most serious problem in our mental health program has been the need to obtain adequate professional medical staff, around which improved and recognized treatment and training programs can be built.

One of the big objectives of my administration has been to obtain reaccreditation for our three mental hospitals. The first step is to recruit a nucleus of physicians and psychiatrists. Once we begin to obtain, and retain, this medical and psychiatric staff and establish the necessary training programs, more professional people will be attracted to work in our mental hospitals and we will improve our recruitment abilities as well as the quality of care and treatment.

Recruitment involves two major problems. One has been the establishment of salary levels which could compete. We had a long way to go. In April of this year competitive salary schedules were established which placed us close to the top in the country.

Since the adoption of the new salary schedules we have recruited 26 physicians and psychiatrists. We are close to obtaining three more excellent psychiatrists and one very able physician. This recruiting drive has been most successful at Northern State Hospital. Northern did not have as far to go as Eastern and Western. Consequently, we feel confident of obtaining full accreditation for Northern State Hospital about the first of the year, both for the three-year residency program and the patient care program.

The License Problem

Now, for the second major problem. As you know, under our present law a doctor must have a Washington

license to practice even in our institutions, although he may not be engaged in private practice. Agreements with other states, which allow granting credits for equivalents in the basic sciences, have not been very helpful. In too many cases there are so many differences in the basic science requirements of the various states involved that a prospective doctor is left in the position of having to bone up on his college textbooks before he can take the Washington examination and be employed in our institutions. For men who are in great demand throughout the country, this immediately eliminates incentive for the prospective doctor to pursue the matter further with our state. We have had to face up to the fact that we have lost a great many prospective candidates for work in our mental hospitals.

I am informed that the *Journal of the American Medical Association* in May, 1958, listed seven states with laws that allow the granting of temporary permits or licenses to physicians to practice in state institutions. These are Arizona, Georgia, Illinois, Massachusetts, New Mexico, New York and Rhode Island. In addition, three states have laws which allow the granting of temporary permits or licenses for emergency localities. These are Kentucky, North Carolina, and South Dakota. New Hampshire has a law which permits its examining board to grant permanent, temporary or restricted licenses according to the best interests of the state.

Arizona has a law whereby physicians who have licenses in other states are able to obtain an Arizona license and be exempt from the basic science examination, so long as the physician remains on the staff of the Arizona State Hospital.

We are perhaps not ready to recommend a specific proposal. Nevertheless, in view of the serious problem we have in this state with our present legislation, perhaps your Association and we in Olympia should consider legislation similar to the Arizona law. If a doctor has received his training from a recognized and accredited medical school, and is duly licensed by another state, under this solution he would be able to come to this state and work in our state hospitals and other institutions. If he should desire to go into private practice, he would first have to take and pass the Washington requirements for a license. The Department of Licenses has discussed these ideas with the legislative committee and staff of the State Medical Association. A fuller understanding of the problem has resulted. Various individuals of the State Association also are aware of the problem and have considered possible solutions. Again we want your advice.

Rehabilitation of the Mentally Ill

It is most important to facilitate progress in our state mental hospitals, as well as other institutions, and we are, therefore, asking the State Medical Association to consider solutions. The problem is becoming more serious. We must, of course, adhere to the concept of treating the mentally ill so that they can return to their families and be useful citizens, rather than to spend great sums of money for additional buildings to merely warehouse the mentally sick.

Labor and Industries

I would also like to review briefly some aspects of the medical program in the department of Labor and In-

(Continued on page 1340)

Vita-Metrazol

elixir and tablets

reactivates

A general tonic indicated in geriatrics, fatigue and senility—where apathy is the dominating symptom.

Contains Metrazol with selected vitamins.

KNOLL PHARMACEUTICAL COMPANY ORANGE NEW JERSEY

(Continued from page 1339)

dustries. Rules and regulations for a new fee schedule became effective April 15, 1958. The schedule was approved by the Board of Trustees and by the Executive Committee of the Washington State Medical Association. It was the result of deliberations by the Industrial Insurance Committee of the Association and the Department.

Since this is the first revision since 1953, the fee schedule shows a considerable over-all increase. The increase will be spread to practitioners throughout the state. Calls and office treatments represent a considerable portion of the increase.

The plan is, after a year or so, to take another look at the fee schedule and to review it more often in the future than every five years, which is too long a period. There should not be another lapse of five years.

The rules and regulations, likewise, will be reviewed with the aim of simplifying forms in order to decrease paper work.

In the past few weeks we have added more help and have speeded the processing and payment of claims. We expect to bring this process to a day to day basis, which will aid tremendously in function and in good will.

Traffic Safety

In the way of a general observation, may I say that we are coming closer to the day when we here in Washington will have to face another problem. I simply want to pose this problem now without recommending a solution so that many of you who have not come up against it can begin to consider what we should do.

I realize that with many physicians this is an explosive subject. But the situation is simply this. The men who are engaged in traffic safety, and more specifically in driver licensing, have no way of becoming aware of physical and mental infirmities which are decidedly hazardous to driving.

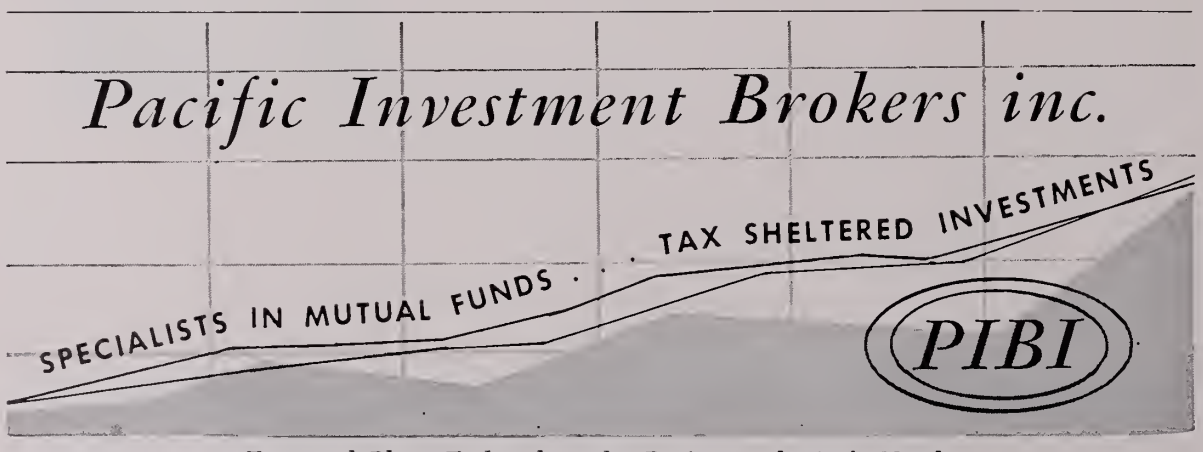
The day is not too distant in this state when we will see what has occurred in California—bumper to bumper driving on super highways at high rates of speed.

Such a situation is no place for an epileptic, a diabetic with insulin reaction, people with heart disease, mentally unbalanced persons and similar drivers. For a long time the State has attempted to re-examine the obviously handicapped, but we have no way of detecting these other individuals whom I mentioned. Our knowledge always follows seizures which occur and cause accidents. We are always one accident late.

A number of states now have laws which require doctors to report mental and physical infirmities. Oregon and California are two.

The Washington State Patrol has, on several occasions in the past, been unable to obtain this information. Here and there a doctor has objected because he wanted to keep the doctor-patient relationship confidential. Others felt they were legally bound to withhold the information. Some doctors have been reluctant to "turn in" a patient. A great many more resent the time they have to spend filling out government forms and "policing" an activity of government.

I think the result we seek is plain and simple—to prevent people from killing and injuring themselves and others. I do not doubt that many drivers with proper medication will be able to continue to drive.



The federal government, through its Department of Health, Education and Welfare, has of late shown interest in this problem. I think it is realistic to say that this federal interest will increase.

Perhaps we need legislation which would require reporting all cases of physical or mental infirmities which may cause temporary or prolonged lapse of consciousness.

I do urge the Washington State Medical Association to consider this problem and I leave its solution to your best judgment.

It is not too often that I get the opportunity to go over aspects of our medical progress and problems. I enjoyed the opportunity and it has been a great pleasure to take part in your meeting.

Thank you for the opportunity. May I offer my congratulations for what I understand has been a very successful convention. •

Selling The Pass

GUNNAR GUNDERSEN, M.D.
PRESIDENT, AMERICAN MEDICAL ASSOCIATION

From San Francisco to Washington to Chicago to Copenhagen to Los Angeles to Chicago to Spokane—this has been my itinerary already since my inauguration as AMA President. Already I am beginning to think my fellow townsmen in La Crosse, Wisconsin, are saying: "There goes medicine's John Foster Dulles!"

Gunnar Gundersen, M.D.

Nevertheless, I am delighted to be in the state of Washington, attending your association's 69th annual meeting this week. My visit here is the first to any state medical association in my new position as your AMA President.

Although meetings and speaking engagements have kept me away from home and the Chicago headquarters office, I have kept abreast of what's happening in our American Medical Association. I can assure you that a whole host of new projects are being planned or launched by your officers and staff in Chicago.

New AMA Projects

For example, on Monday of next week every AMA member will receive the first copy of our Association's new fortnightly publication, *The AMA News*. As you know, this newspaper is being published to keep all physicians abreast of developments in the socio-economic side of medicine.

Here is a sample copy printed last month. As you can see, it is compact and attractive. Having read the content, I can assure you that it is interesting and informative as well.

I also can report to you that work has begun on the air-conditioning and remodeling of the headquarters office. The purpose of the two projects, of course, is to step up efficiency and to make more productive use of the entire building.

According to Mr. Russell Clark, our business manager, the remodeled building will have a market value that will substantially exceed AMA's investment in it.

Simultaneously with the remodeling, Dr. Blasingame, our executive vice-president, has reorganized the AMA's administrative staff with the hope of creating a streamlined, effective organization. New lines of authority and responsibility have been established, and I believe that every member of the AMA will benefit directly or indirectly from Dr. Blasingame's administrative reorganization.

I could talk for at least another hour on other AMA plans and projects such as our current food faddism campaign, a new scientific publication called *Medicorama*, and our recent planning session on better medical care for the aged. However, I am sure you will have the opportunity to read about these plans and projects in the *Journal of the AMA* and in the *AMA News*.

Free Choice of Physician

So this morning let us spend a few minutes considering a most important issue—the right of the patient to patronize the doctor of his own choosing. Along with this, let us take a look at the quality of medical care received under free choice, the physician-third party relationship and the desirability of proper surveillance of medical practitioners by their confreres.

About a year ago an editorial appeared in the *Wisconsin Medical Journal* entitled the Third Man Theme. The Journal editorial quoted this paragraph from a labor union article:

> The organizational and collective bargaining process must be extended into a new dimension through negotiations, agreements and arrangements with *third parties—the providers of medical services and facilities*. Only in this way can the job of translating health and welfare funds into better medical care be effectively accomplished.

According to this article it is the *physician* who is the third party. Instead of the traditional patient-physician relationship, *we* are considered an incidental party to a relationship between health plans and patients.

More recently, another labor health leader declared that it is "the right of all labor health services to control their own medical care programs." This may sound logical on the surface, but in order to insure good medical care, patients and physicians alike must remain free individuals. How then can one group claim control over the other two?

We also have recently heard a labor health plan administrator contend that the principle of the patient to choose his own physician under labor health plan programs *has failed*.

Long before labor health plans, the fundamental principle of free choice operated successfully, protecting the rights, privileges, responsibilities and well-being of patients and doctors alike. Are we to believe that after only a few years of trial by a labor health group that this basic right of patients has failed?

Well, these are just a few examples from a wide variety of statements aimed at placing certain third parties *between, against* or *above* the patient and physician, and designed to limit the patient's selection of his own physician.

Individualism vs. Mass Man

A few decades ago I do not suppose many persons would have questioned the freedom of the patient to patronize the physician of his choosing, nor would they have sought to include an outsider in the close relationship of patient-physician—much less eliminate the physician almost entirely and substitute a health plan as the benefactor in his place.

But in recent years the ideal of individualism has lost

(Continued on page 1342)

Read at Washington State Medical Association, 69th Annual Session, Spokane, Washington, Sept. 16, 1958.

(Continued from page 1341)

a good deal of ground to the dogma of mass man. Consequently, the emphasis is no longer on the value of the individual and on the protection and guarantee of his rights; instead, Americans are told that it is the mass which counts, that the *plan* comes before the individual, and that personal selection and judgment are of a bygone era.

I completely disagree with this kind of thinking. Man as an individual is important; he does matter. And it is not too late to begin vindicating the worth of the individual, or to start strengthening the idea of his indispensability.

I believe that moral responsibility and personal character can only be the best when the individual himself has the opportunity to choose, and then proceeds to select and judge for himself. Any compulsion by an outsider—no matter to what degree—weakens the individual's freedom to satisfy his needs and to seek the best solution to them.

In the satisfaction of a person's health and medical care needs the individual must be free in the selection of the physician he wishes to patronize. To limit the individual's choice of physician is to place a lid on personal freedom.

As you can see, I wholeheartedly endorse the fundamental democratic principle of the right of the patient to choose his own physician. For patients and physicians it has been the foundation for the establishment of a close relationship; it has been a safeguard of rights and privileges on both sides, and it has been a guarantee of responsible action by both doctor and patient.

In obtaining the basic needs of life—food, shelter and clothing—Americans have the freedom to choose. Today most persons would include medical care in the list of essentials of life. I personally can think of no sound reason why the individual should not have free choice in the area of medical care.

Choice Is Essential

Recently I read a copy of a letter written by Mr. Bob Sarnoff of NBC to TV-radio editors in which he told of a complaint his network had received. It read:

> In the name of God whose idea is it to cut in on "Dragnet" with a United Nations session? Of all the ridiculous things, that boob wins the extra-large portion of fried cockroaches.

Another letter writer complained:

> I do like to make my own choice of what I watch on TV. This is a free country and I do not like to have things forced upon me.

The letter writers—both women—were griping about the long periods of coverage of the United Nations and Middle Eastern crisis during the summer. For these two TV viewers—and thousands of others—there was no choice of programs for many hours of the day.

In his open letter to the editors, Mr. Sarnoff suggested a plan to provide full coverage of important events plus a *choice* of other programs for viewers with other tastes.

Perhaps the analogy is not as good as it could be, but I think you see my point. Choice is essential. In medicine no physician—perhaps no handpicked list of physicians—can please all patients. This is exactly why I believe the patient should have the reasonable right to select his own physician from among all physicians who are qualified and willing to render the type of medical care indicated.

You realize as I do that among doctors there are degrees of experience, training, skill, ability and art. Patients on the other hand vary in their demands for physicians and medical care. When the patient chooses the medical talent to suit his demand, we have free choice in action.

I admit that the ideal of free choice does not always work satisfactorily, either because of inadequate care or because of unethical practices by a physician. But because there is some trouble a small percentage of the time is not a good reason to abandon the basic right of patients to patronize the doctor of their choice.

Self-Policing by Profession

When and where there are instances of unethical and dishonest actions by doctors the medical profession is willing and able to discipline its members. And I am convinced that our profession can, and will, deal firmly and fairly with the small percentage of doctors who do not conform with accepted medical practices.

Before outsiders suggest that medicine is unwilling and unable to clean its own house, I would ask them to give us the chance to prove our integrity in this matter. You are certainly proving it here in Washington. You and I know that the privilege of self policing cannot be taken lightly. The obligations and the responsibilities are heavy, but our profession is desirous of doing the best policing job with justice for the patient, physician and the third party administering the prepayment program.

Let me remind you that the third party most outspoken against the free choice principle has had most of its troubles—by its own admission—from only about 3 per cent of all participating physicians. I do not condone poor practices by any physician—if they can be substantiated—for I believe that even a single bad apple must be removed from the barrel. However, in this case I think the profession has every right to be proud of the good practices of the more than 97 per cent participating in the health plan.

Integrity of Profession Recognized

I might also point out that the relationship between our profession and others who pay medical benefits for patients has been excellent. Allow me to cite the experience of the Metropolitan Life Insurance Co. in its comprehensive medical-surgical benefits contract with General Electric. Because the provisions of this contract are so liberal and comprehensive, one might have expected a certain amount of exploitation by doctors. It did not occur. During the first year of operation (1955-56) Metropolitan did not have a single case of abuse by doctors.

Since the G.E. contract was set up, more than 500 similar contracts have been negotiated. Here then is proof that commercial insurance companies recognize the integrity of our profession.

I think it is also proof that medicine is ready and willing to practice with third parties the same as it does

without them. However, when certain third parties insist upon drastic changes that are detrimental to the patient, to the physician, to good medical care and to the third party itself, then we in medicine must object strongly—and with one voice.

Physicians Must Uphold Basic Rights

In the past, American medicine has opposed certain forms of health insurance and third parties when, after full study, it has been determined that the methods of operations of these plans and groups were, or might become, a deterrent to the provision of the best medical care to the beneficiaries of the plan. And I say to you that I hope we continue to oppose any and all efforts of third parties to *lower* the quality of medical care, or to *limit* the rights and privileges of those involved in providing and paying for medical care.

Perhaps many of you have read a book called The Ethical Basis of Medical Practice by Willard L. Sperry, dean of the Harvard Divinity School. As I reread the book enroute to Europe last month, I came across this paragraph:

> Once a doctor subordinates the claims of an individual patient under his care to the abstract claims of society in general, or to the hypothetical claims of some possible alternate patient, he has SOLD THE PASS. As the cricket players say in England, he has LET THE SIDE DOWN. What is at stake is both his own attitude toward his profession, and even more, perhaps, the confidence of the public in the profession. If, on the basis of a profession differently construed, the report gets abroad that doctors no longer have any sense of moral duty to the individual patient, the whole attitude of society toward the profession will be radically altered, and from my standpoint altered for the worse. The layman still believes that his doctor will stand by him to the end. Once let that faith be shaken, and the layman will approach the profession thereafter with his own skeptical reservations.

Let no man or woman here *sell the pass!* Let no one here *let the side down!*

The right of the patient to select the physician of his own choosing is fundamental to medicine and to democracy.

The judging of the professional qualifications of doctors is the right and responsibility of those of us who actively and properly practice medicine.

And the policing of our profession is the right and responsibility of medical practitioners who recognize the need for strict, intelligent, impartial action against the wayward.

There may be problems that arise from, or around, these rights and responsibilities of patients, physicians and the profession. But they can be solved without abandoning any of the basic rights. Indeed, I believe that such problems are trifling compared with the dangers and the exploitations that would occur without these rights.

Again I urge you: DO NOT SELL THE PASS! DO NOT LET THE SIDE DOWN! If these rights are lost by default or watered down by compromise, I hate to think of what rights, privileges and freedoms will go next. •

From left: Emmet L. Calhoun, Aberdeen, president of Washington State Medical Association, 1958-59; F. A. Tucker, Seattle, president-elect; and R. McC. O'Brien of Spokane, re-elected for a two-year term as Trustee from the Eastern District.

Richard Kegel Accepts Post in Iran

Richard Kegel of Aberdeen has accepted the post of visiting radiologist to the Shiraz Medical Center, Shiraz, Iran, for a period of two years. Dr. Kegel has been in the Near East before as head of the department of radiology and associate professor at the American University of Beirut, Lebanon. He will return to his practice in Aberdeen.

Attorneys Attend Lecture Series On Aspects of Medicine in Law

James C. Hampton, instructor in anatomy at the University of Washington School of Medicine, presented a series of eight lectures on medical facts and terminology to Eastern Washington lawyers during August. The sessions were held at the Yakima Valley Junior College.

The lecture series were arranged by the committee for continuing legal education of the Washington State Bar Association to better acquaint attorneys with medical terminology, theories and techniques often mentioned during personal injury cases.

High interest was indicated by the excellent attendance. Registration during the series showed that lawyers from nearly every Yakima Valley community and such distant towns as Colfax, Ritzville and Moses Lake were present at the lectures.

Dr. Hampton illustrated his talks with motion and slide pictures, a skeleton and a medical text.

A similar series of lectures had been conducted by Dr. Hampton in Seattle for Western Washington lawyers, earlier in the summer.

John R. Hogness of Seattle Named Medical Director of University Hospital

Appointment of John R. Hogness of Seattle as medical director of the University Hospital has been approved by the Board of Regents of the University of Washington.

In his new position Dr. Hogness will supervise teaching activities related to patient care in the hospital and will coordinate referral of patients by physicians in all parts of the state. He will also continue teaching and research activities in the Department of Medicine.

Dr. Hogness, who has been with the University's School of Medicine on a half-time basis in recent years, has begun work as medical director on that basis. He will assume full-time duties when the hospital opens next May.

Obituaries

Dr. Raymond E. Seth, 54, of Seattle died August 24 from an apparently self-inflicted bullet wound. Dr. Seth received his medical degree in 1929 from the University of Minnesota Medical School and served his internship at Swedish Hospital in Seattle. He was a public health officer for the Immigration Service for several years. During World War II he served four years in the Army Medical Corps. Dr. Seth had a private general practice in Seattle until 1953, when he established the Medical Safety Examination Center in conjunction with the Driver Safety Center.

GOLF TOURNAMENT WINNER—Louis J. Sarro, at left, receives his award for low net in the Medical-Dental Building golf tournament from Robert H. Barnes, who served as master of ceremonies. The annual contest, made up of physicians and dentists located in the Seattle building, was held August 29 at the Sand Point Golf Club in Seattle.

Oath Of Office—Homer Humiston of Tacoma, at right, speaker of the house of delegates, administers the oath of office to incoming President Emmett Calhoun of Aberdeen.

Locations

Charles South, Jr., has joined the office of Herbert Johnson and Floyd Levin in Everett. Dr. South reeeived his medical degree in 1953 from the University of Oregon Medical Sehool. He served his internship at Providence Hospital, Portland, and spent four years in specialty training in surgery at Veterans Administration Hospital in Portland.

Eugene C. Bond has opened offices in Everett for the practice of medicine and surgery. Dr. Bond was graduated from the University of Oklahoma School of Medicine in 1948 and took his internship at St. Anthony Hospital, Oklahoma City. From 1949 to 1953 he practiced in Fairfax, Okla. For the next two years, Dr. Bond served as flight surgeon in the Air Force. Following his discharge from service, he returned to St. Anthony Hospital where he was a resident in surgery for three years prior to moving to Everett.

Don Schwisow has become associated with H. W. Holderby and Robert Becker in the Goldendale Medical Clinic in Goldendale. He is a general practitioner. Dr. Schwisow received his medieal education at the College of Medical Evangelists, Loma Linda, Cal., from which he was graduated in 1952. He took his internship at the Portland Sanitarium and then practiced at Condon, Ore., prior to his recently terminated army duty.

Richard Elston has joined the staff of Tri-County Hospital in Deer Park. Dr. Elston is a 1950 graduate of the University of Nebraska College of Medicine. Following his internship in Minneapolis, he spent three years in the Navy. After his discharge from service, Dr. Elston served a surgical residency in a Veterans Hospital and then had a private practice for one year before moving to Deer Park.

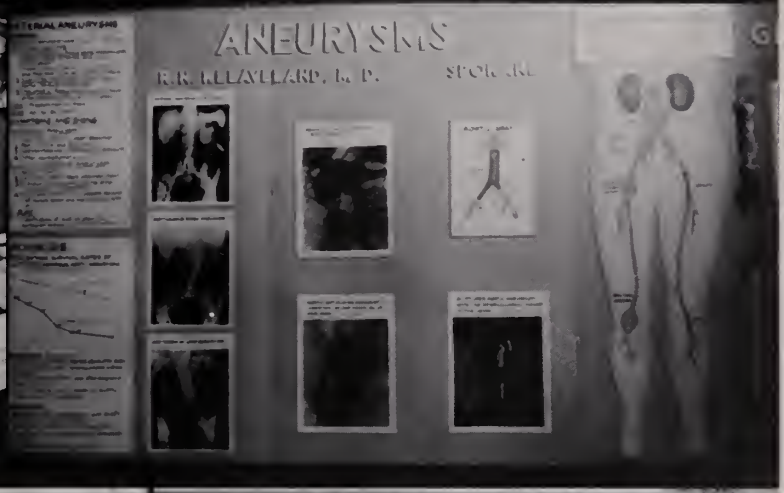
John B. Murphy has opened offices in Colfax for the practice of general medicine and surgery. Dr. Murphy received his medical degree in 1954 from the University of Ottawa Faculty of Medicine. He recently completed a year's residency at Sacred Heart Hospital in Spokane and had been in general practice in Carleton Place, Ontario. Dr. Murphy will practice also part-time in Washtucna.

Robert H. Leahy has opened offices in Everett for the practiee of cardiology, internal medicine and diagnosis. His wife, Mary Leahy, will begin her practice in January. Dr. Robert Leahy was graduated from the University of Roehester School of Medicine and Dentistry in 1954. He served his internship at Strong Memorial Hospital of the University Medical Center, Rochester, N. Y. and then took residency training in internal medicine at the University of Rochester Medical Center and was senior assistant resident at Barnes Hospital of Washington University, St. Louis. He was also a United States Publie Health fellow in cardiology at Rochester Medical Center Cardiac and Pulmonary Clinic and Laboratory. Before moving to Everett, Dr. Leahy was attending physician at the Cardiac Clinie, University of Washington School of Medicine.

Fifty-Year Club—Five new members received their 50-Year Club pins at the annual convention Family Dinner, Sunday night, September 14. From left: seated are F. L. Shepard, Winslow; Mary MacMillan Rodney, Spokane; and C. W. Knudson, Seattle. Standing are William C. Speidel, Seattle, and Thomas C. Paxton, Seattle.

Date of Strauss Lecture at U. W. Changed to Wednesday, November 5

Due to conflicting events, date of the Ninth Annual Alfred A. Strauss Lecture, sponsored by the Department of Surgery of the University of Washington School of Medicine, has been changed from November 7 to Wednesday, November 5. Physicians are invited to be at the Auditorium of the University Health Sciences Building at 8:15 p.m. to hear Professor Charles F. W. Illingworth, Regius Professor of Surgery at the University of Glasgow, Scotland, discuss Endocrine Aspects of Breast Cancer.



Professor Illingworth is president of the British Society of Gastroenterology and past-president of the Association of Surgeons of Great Britain and Ireland, and the Surgical Research Society. He will spend the entire week of November 2 in the Department of Surgery, where he will participate in ward rounds, operating room demonstrations and seminars at King County Hospital, Seattle. An invitation is extended also to physicians to attend these functions.

Scientific And Technical Exhibits—*Facing Page:* Scientific sessions and the seientific and technical exhibits were well-attended by those partieipating in the 69th An nual Convention of Washington State Medical Association at the Davenport Hotel, Spokane, September 14-17. Fift een scientific exhibits were displayed in the Hotel Lobby and Hall of Doges. Technical exhibitors numbered 67 fo r the 1958 annual session.

Washington Diabetes Association Opens New Offices in Seattle

Washington Diabetes Association, accredited affiliate of the American Diabetes Association, has opened new offices at 1000 Seneca Street in Seattle. Joseph H. Crampton of Seattle, president of the Washington Association, has announced that the office will be open from 10:00 a.m. to noon and from 12:30 p.m. to 2:30 p.m. daily, Mondays through Fridays. Physicians are invited to visit the new offices and become acquainted with Mrs. Gladys M. Barker, Executive Secretary, and the activities of the Association.

During the spring of 1959, the Clinical Society of the Washington Diabetes Association will conduct postgraduate courses for the medical profession. Nationally known speakers will present papers on subjects in the field of metabolism and endocrinology.

The affairs of the Diabetes Trust Fund and the Diabetes Teaching and Research Foundation will be conducted also through these same Seattle offices.

Problems and Treatment of Alcoholism To Be Discussed in Tacoma October 21-22

Physicians interested in the problems and treatment of alcoholism are invited by Mr. Robert Tatham, executive secretary of the Division of Alcoholism, Department of Institutions, to attend a conference on alcoholism at the Winthrop Hotel in Tacoma, October 21 and 22. Marvin Block, chairman of the AMA Committee on Alcoholism, will be the featured speaker at each evening session.

J. Lester Henderson of Seattle, chairman of the Seattle Committee on Alcoholism, urges a good turnout for this meeting. He states that since alcoholism is a public health problem of major magnitude, the skilled training and resources of the medical profession will be of corresponding importance in the formulation of an approach to the problem and the working out of a treatment program.

A detailed program of the conference may be obtained by addressing a request to Mr. Tatham in Olympia.

IDAHO STATE MEDICAL ASSOCIATION
364 Sonna Bldg.
Boise, Idaho

SIXTY-SEVENTH ANNUAL MEETING
June 14-17, 1959
Sun Valley

President, Donald K. Worden, Lewiston Secretary, Max D. Gudmundsen, Boise Exec. Secy., Mr. A. L. Bird, 364 Sonna Bldg., Boise

Resolutions Considered At 66th Annual Session

Following are some of the resolutions considered by the House of Delegates of the Idaho State Medical Association during the 66th annual session, Sun Valley, July 6-9, 1958. The action of the House is in italics.

RESOLUTION No. "A"

Whereas, the Idaho State Bar Association has adopted a Statement of Principles Governing Certain Physician-Lawyer Relationships, and

Whereas, the Statement contains essential principles which could lead to a much closer relationship with members of the legal profession,

Whereas, a liaison committee should be appointed from the medical association to work with members of a similar committee of the legal profession, and

Whereas, members of the two professions be encouraged to report to the liaison committee incidents and accidents that might lead to suit,

Now, Therefore Be It Resolved that the House of Delegates of the Idaho State Medical Association hereby adopt the Statement of Principles Governing Certain Physician-Lawyer Relationships, and

Be It Further Resolved that copies of the Statement be furnished all members of the medical profession in Idaho; that necessary costs for publishing the statement be shared with the Idaho State Bar Association on a pro-rated membership basis.

Resolution No. "A" was adopted by the House of Delegates.

* * *

RESOLUTION No. "B"

(Amended by the Reference Committee on Insurance, Medical Affairs and Welfare.)

Resolved that a Maternal Welfare Committee be established at a state level for the purpose of investigating and evaluating maternal deaths within the State of Idaho. That the purpose of the Committee be education only.

That the Committee be composed of five members, the Chairman of the Committee to come from the Idaho Obstetrical and Gynecological Society, and one member from each Councilor District to be appointed by the Councilor of each District.

That the mechanism of operation embody the principles as set forth in the publication, "A Guide for Maternal Death Studies," published in 1957 by the Committee on Maternal and Child Care, Council on Medical Service of the A.M.A.

Resolution No. "B", as amended, was adopted by the House of Delegates.

* * *

RESOLUTION No. "C"

Whereas, the State Civilian Defense Administration has prepared a new program of the organization including plans for medical and related services in the event of a disaster, and

Whereas, the plan divides the state into six districts to aid in handling personnel, reports and other matters in event of an emergency, and

Whereas, the State Civilian Defense Administration has requested the Idaho State Medical Association to designate a representative of the profession to serve as District Director in each of the six districts and the designation of a medical representative in each county to serve as County Civilian Defense Medical Director,

Now, Therefore Be It Resolved that the President of the Idaho State Medical Association designate six members of the profession to serve as District Medical Directors in the State Civilian Defense Plan in Coeur d'Alene, Lewiston, Boise, Pocatello, Shoshone and Rigby, and

Further, that the President designate the County Health Officer, County Physician, or private practitioner, to serve as County Civilian Defense Medical Directors in each of the State's 44 counties.

Resolution No. "C" was adopted by the House of Delegates.

* * *

RESOLUTION No. "D"

Whereas, there exists the possibility of the establishment of a two-year medical school in the State of Idaho, and

Whereas, residents and organizations within and without the State of Idaho may wish to support such a school by bequeathing or donating funds, real estate or objects of value to the establishment of such school and its operation, and

Whereas, a method of accepting, managing and administering such gifts should be established in accordance with Idaho law,

Now, Therefore Be It Resolved that the IDAHO MEDICAL SCHOOL FOUNDATION be established and that essential Articles of Incorporation be prepared and filed in accordance with Idaho laws, and

Further, that the Articles of Incorporation designate the Officers and Councilors of the Idaho State Medical Association as the perpetual Board of Trustees of the IDAHO MEDICAL SCHOOL FOUNDATION and that they be empowered to receive and administer all funds, real estate or objects of value bequeathed or contributed to the foundation, and

Further, that as the Board of Trustees, the Officers and Councilors of the Idaho State Medical Association

(Continued on page 1354)

(Continued from page 1353)

prepare rules and regulations necessary to carry on the purpose and objective of the Foundation, to administer, manage, and disperse all funds, real estate and objects of value received by the Foundation and to annually prepare a report of the Foundation's activities including but not limited to a financial report.

The House of Delegates voted to table this resolution to be re-introduced at some future time when feasible.

° ° °

Resolution No. "E"

Whereas, as Governor of the American Diabetes Association for the State of Idaho, I have had requests from two areas in the state for the formation of lay affiliates to that organization, and

Whereas, such lay affiliates cannot be formed until a professional affiliate has been organized for guidance, and

Whereas, an Idaho Diabetes Association could be instrumental in the education of the medical profession and lay public concerning diabetes, and diabetes detection,

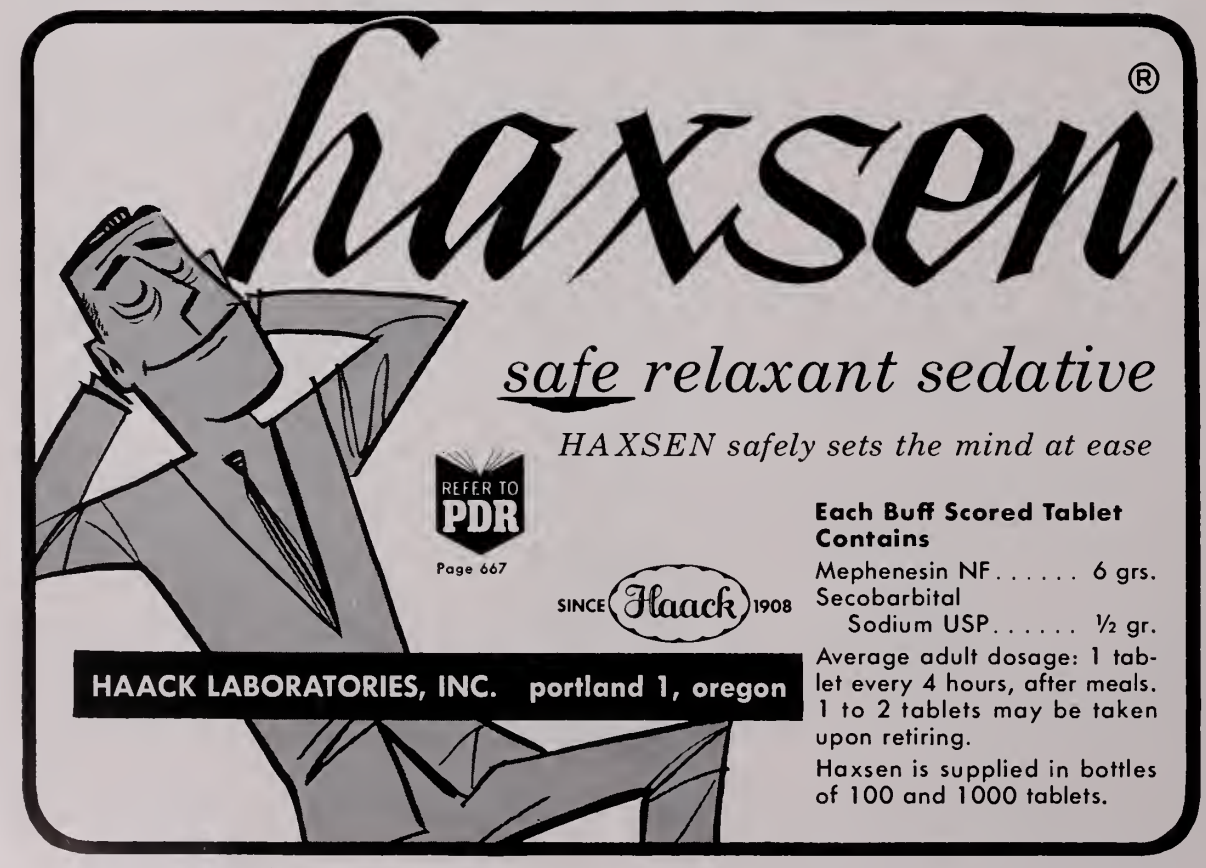
Therefore Be It Resolved that the Idaho State Medical Association approve the formation of an Idaho Diabetes Association, as an affiliate of the American Diabetes Association.

(The Reference Committee on Miscellaneous Business recommended rejection of the resolution for the reason that diabetes was represented on the Allied Medical Services Committee and felt a duplication would exist if the resolution were adopted.)

Resolution No. "E" was rejected by the House of Delegates.

In-State Meetings

A meeting devoted exclusively to Public Relations was sponsored by Southwestern Idaho District Medical Society in Boise on Thursday, September 25. The program for the session was arranged by the society's Public Relations Committee headed by Joseph M. Thomas of Boise. Guest speaker for the session was Mr. Leo Brown, Chicago, Director of Public Relations, American Medical Association.



° ° °

Utah-Idaho American College of Physicians and the Idaho Society of Internal Medicine, held a combined meeting at Sun Valley, September 26-27. Richard P. Howard, Pocatello, is Governor for the College of Physicians, and William D. Forney, Boise, is President of the internists' society.

° ° °

Seventh Annual Meeting of the Idaho Academy of General Practice will be held in Boise, October 9-10, Dr. Louis F. Lesser, Boise, President, has announced. Speakers for the session include Chester Swinyard, department of physical medicine and rehabilitation, New York University; William Hoffman, associate professor of neurology, Stanford University; M. Erick Wright, professor of psychology, University of Kansas School of Medicine; and Stuart Knox, associate clinical professor of psychiatry, College of Medical Evangelists, Loma Linda, Cal.

R. B. Robins, Camden, Arkansas, member of the Board of Trustees of the American Medical Association, and a Past-President of the American Academy of General Practice, will be banquet speaker.

The program for the session was arranged by a committee under the chairmanship of Joseph M. Thomas, Boise.

Louis F. Lesser of Boise, president of the Idaho Academy, has announced the annual business meeting including election of officers for the coming year, will be held Saturday, October 10 at 10:00 a.m. in the Hotel Boise.

Out-of-State Meetings

F. Wayne Schow, Twin Falls, Councilor, District No. Three, was the official representative of Idaho State Medical Association at the 63rd annual meeting of the Utah State Medical Association, Salt Lake City. He presided at the scientific program of the meeting on Thursday, September 11. The session was held in the Hotel Utah Motor Lodge.

Fred E. Wallber, Idaho Falls, Councilor, District No. Four, represented the Association at a two-day meeting in Chicago, September 13-14 called by AMA's Council on Medical Service Committee on Aging. Dr. Wallber has been appointed to serve as Chairman of a new Committee on Aging of the State Association by President Worden.

Secretary-Treasurer Max D. Gudmundsen, Boise, representing President Worden and the Association, was the banquet speaker at the annual meeting of the Idaho Practical Nurses Association, Simplot Hall, Caldwell, August 6.

State Board of Medicine

S. M. Poindexter, Boise, Chairman of the State Board of Medicine, has been re-appointed a member of the Executive Committee of the Federation of State Medical Boards to fill the unexpired term of Wilmot C. Foster, Portland, a former member of the Oregon State Board of Medical Examiners, deceased. Dr. Poindexter previously served a two-year term on the Executive Committee of the Federation which terminated in 1957.

* * *

Two Temporary Licenses were granted in August. Receiving them were:

Harold Pratt Sutherland, 1050 Memorial Drive, Idaho Falls. Graduate Northwestern University School of Medicine. M.D. degree 1954. Internship U.S. Public Health Service Hospital, San Francisco. Residency obstetrics and gynecology, Dee Hospital, Ogden, Utah; Kaiser Hospital, Oakland, Cal. Granted T-209, August 8. Obstetrics-Gynecology.

James David Ball, Sun Valley. Graduate Hahnemann Medical College, Philadelphia. M.D. degree 1954. Internship Robert Packer Hospital, Sayre, Pa., 1955. Residency in anesthesiology, Mary Hitchcock Memorial Hospital, Boston, Mass. Granted T-210 August 28. Anesthesiology.

ISMA Officers and Councilors Hold Meeting

The first meeting of the Officers and Councilors since the 66th annual meeting at Sun Valley was held at President-Elect Quentin W. Mack's summer home at McCall, September 18-19-20. A lengthy agenda, including such items as revision of the annual association meeting, committee appointments, insurance, minutes of the 66th annual meeting, the possibility of a mid-winter meeting of the House of Delegates, voluntary health agencies, visits to the component societies, legislature, medicare and many other items were considered by the Officers and Councilors.

Those attending the meeting were President Worden; Immediate Past-President Hoyt B. Woolley; President-Elect Mack; Secretary-Treasurer Max D. Gudmundsen; Councilors Robert E. Staley, Richard D. Simonton, F. Wayne Schow, Fred E. Wallber; AMA Delegate Raymond L. White; Alternate AMA Delegate Alexander Barclay, and the Executive Secretary.

American Hospital Association Plan for Government Payment to Hospitals

The House of Delegates of the American Hospital Association, meeting in Chicago last month, adopted a statement of policy with respect to meeting the hospital needs of the aged. The statement, which supercedes all previous actions taken by the association, follows:

1. The American Hospital Association is convinced that retired aged persons face a pressing problem in financing their hospital care.

2. It believes that federal legislation will be necessary to solve the problem satisfactorily. It has, however, serious misgivings with respect to the use of compulsory health insurance for financing hospital care even for the retired aged.

3. It believes that all possible solutions must be vigorously explored, including methods by which the dangers inherent in the Social Security approach can be avoided.

4. It believes that every realistic effort should be made to meet the hospital needs of the retired aged principally through mechanisms utilizing existing systems of voluntary prepayment. However, it is conceivable that the use of Social Security to provide the mechanisms to assist in the solution of the problem of financing these needs may be necessary ultimately.

5. It believes that any legislation developed to provide for government participation to meet the hospital needs of the retired aged should be so devised as to strengthen the voluntary prepayment systems, and should conform to the following principles:

a. Legislation designed to provide for the hospital needs of the retired aged should provide essential hospital services and should exclude custodial care provided for non-medical reasons.

b. Government participation should be restricted to persons over 65 who are not regularly and substantially employed. The voluntary prepayment system provides a satisfactory mechanism for the coverage of other persons, regardless of age.

c. Any program in which the federal government participates to meet the hospital needs of the nonindigent aged should emphasize individual responsibility and make the application of a means test unnecessary for obtaining benefits.

d. Such a program should be based on the service benefit principle and should provide benefits sufficiently comprehensive to remove the major economic barriers to hospital care for the retired aged.

e. Such a program should make benefits available through non-profit prepayment plans.

f. Hospitals should be paid fully for the cost of care rendered.

g. Such a program should not provide services in facilities operated by the federal government.

h. Such a program should provide reasonable criteria to determine the eligibility of hospitals to participate, but the federal government should be precluded from interfering in the administration and operation of hospitals providing the services.

i. Such a program should maintain the free choice of doctor and hospital by the recipient.

j. Such a program should permit and encourage continuous adaptation to new knowledge in the provision of services. •

From AMA Secretary's Letter of Aug. 25, 1958.

REVIEWS

Books reviewed in the columns of Northwest Medicine may be borrowed by any subscriber. Write Miss Ruth Horlamert, Librorion, King County Medical Society Library, Room 121, Cabb Bldg., Seattle 1, Wn. The library appreciates, but does not demand, reimbursement for postage.

DRUGS: THEIR NATURE, ACTION AND USE. By Harry Beckman, M.D., Director, Departments of Pharmacology, Marquette University Schools of Medicine and Dentistry. 728 pp. Illustrated. Price $15.00. W. B. Saunders Co., Philadelphia and London. 1958.

This is a superb textbook of pharmacology. It represents a very significant achievement by a man whose reputation in the field of therapeutics is indeed well established. The first portion of the book deals with the basic and general principles of pharmacology with excellent clinical correlation. It is presented in an interesting, easily readable fashion. The bulk of the book deals, of course, with specific drugs. The tedious descriptions of physical properties of drugs and historic data are omitted. And the categorizations seem so reasonable.

The material is entirely up-to-date. There is reference to that which is relevant in recent literature with adequate bibliographies. It is refreshing to find omitted the archaic drugs and therapies which are carried over, decade after decade, in each new edition of older textbooks of pharmacology. It is surprising to find that the proprietary names of drugs are not deliberately avoided.

In the preface the author describes this as a text for medical students. I feel that this book may very profitably be used by the practicing physician to supplement the very often superficial exposure to information regarding the nature and action of drugs.

Abby Franklin, M.D.

FUNDAMENTALS OF GENERAL SURGERY. By John Armes Gius, M.D., D.Sc. (Med.) Professor of Surgery, College of Medicine, State University of Iowa. 720 pp. Illustrated. Price $12.50. Year Book Publishers, Inc., Chicago. 1957.

This book lives up to its title. It does represent true fundamentals of surgery and is written by a man who has a long and useful career in teaching students of the undergraduate level.

The author is very deferential in his preface and in the philosophy of the book in that he does not

purport to present all the material that there is in the complicated ramifications of the surgical art. Instead, he says that he wishes to introduce students to the field with the anticipation that those who are interested will do additional reading to add to the foundation which he so effectively builds.

None of this is to suggest that Dr. Gius has written a primer. The book deserves a place on the shelf of any surgical library as a foundation book, one upon which the student may later build. The printing is excellent. The illustrations are clear and seem, at least to me, well to emphasize those points which the author wishes to make.

It is my impression that Dr. Gius' book fulfills the need which has been present for some time in surgical teaching. One cannot argue that a single philosophy provides an excellent foundation for the approach to any discipline, no matter how complicated and extensive that discipline may become. Dr. Gius is a general surgeon in the best sense of the word and gives a general surgeon's approach to physiologic principles underlying surgery to common surgical conditions and to surgical therapy. He has done a fine job.

Dean K. Crystal, M.D.

A SEARCH FOR MAN'S SANITY. The Selected Letters of Trigant Burrow with Biographical Notes. Prepared by the Editorial Committee of the Lifwynn Foundation, William E. Galt, Chairman. Foreword by Sir Herbert Read. 615 pp. Price $8.75. Oxford University Press, New York. 1958.

It may seem unfair for a psychoanalyst to review the work of a man who, though one of the founders of the American Psychoanalytic Association, was asked to resign, probably on the basis of his dissident views but actually for reasons less clear. However, many analysts, including myself, depart from Freud and I think most all of us agree that there is much to be learned about man's social and psychologic problems. I must say that I found little that could be called great, revealing or new in Dr. Burrow's writings in this area.

The book is an attempt to reveal the man and his thinking through a large collection of his letters since, as the foreword states, few could understand his scientific work and writings. Unfortunately, his letters do not make his ideas much clearer. The editors have helped to muddy the situation by including many letters that are mundane and not cogent to the purpose of the book, as if every word he uttered were of tremendous value. Most of the letters are wordy, often flowery and say very little. It seems as if he were perseverating in some attempt to explain himself and others without ever making anything very clear. Many phrases sound quite meaningful but further thought about them leaves one feeling frustrated, just as a child feels when he is about to capture a soap bubble only to have it explode into nothingness.

I can understand how some people would feel that his thinking was at least the beginning of an answer to all our problems. Here and there his letters reveal that he, like many others, had inklings of some great "truth" but I do not see that any real contribution has come out of this. Over and over I got the feeling that he was in search of his own "sanity," as so many of us are these days, and through his work succeeded in some measure. It is obvious that psychoanalysis originally held great hope for him but he was keenly disappointed as were so many in the early days. A more sympathetic review might well be written but I think it would be misleading.

Robert L. Worthington, M.D.

MOSBY'S REVIEW OF PRACTICAL NURSING. Ed. 2. 354 pp. Price $4.25. The C. V. Mosby Co., St. Louis. 1957.

Throughout the country there has been an increased interest expressed in the length of time necessary for both student nurses and student practical nurses to complete an education program which would enable them to become safe practitioners of nursing in their respective categories. Rapid

(Continued from page 1365)

changes taking place in health practices today, in conjunction with more and more emphasis on preventive medicine, are influencing the preparation necessary for practical nurses as members of the professional team and the functions they are being called upon to perform.

There has been, and no doubt will continue to be, an increased demand for adequately prepared licensed practical nurses. The second edition of Mosby's Review of Practical Nursing is an excellent tool for practical nurse educators and student practical nurses. It also provides excellent review material for the already licensed practical nurse. Content has been broadened and deepened with the inclusion of entirely new units on the administration of medications, rehabilitation nursing, and nursing of the mentally ill. The outline type of presentation should be helpful both to instructor and student.

Each unit is preceded by a concise but adequate list of references to be used in conjunction with the material presented and is concluded with a comprehensive and extensive set of review questions.

This book is not only abreast of the rapid changes taking place in health practices today but appears too comprehensive and advanced at this time for the category of nursing with which it deals. In recommending its use to those connected with practical nurse education, it should be pointed out that some of the content is advanced, requiring both carefully planned learning experiences and supervision as far as the individual student is concerned in order that she become a really safe practitioner of nursing at the level for which she is being educated to practice.

Frances H. Zaleski. R.N., M.N.

Miss Zaleski is a former instructor in Pediatric Nursing at the University of Washington School of Nursing and is now a candidate for a Ph.D. in nursing. Ed.

PRACTICAL ELECTROCARDIOGRAPHY. Ed. 2. By Henry J. L. Marriott, M.D., Associate Professor of Medicine, University of Maryland. Illustrated by Marci Ethridge Perry. 226 pp. Price $5.00. The Williams & Wilkins Company, Baltimore. 1957.

A review of this volume must begin with a statement by the author. "The text is designed to be digestible for beginners, yet not without value to those who already have a nodding acquaintance with electrocardiography."

This book is very readable and the main points in the interpretation of the electrocardiogram are covered. It is not intended to aid in interpretation of complicated graphs and does not do so.

The arrangement of illustrations deserves special commendation. Illustrative tracings are placed in such position as to make them easily followed as the descriptive text is read. The use of review tracings at the end of chapters and the inclusion of references here are excellent additions.

This volume would be a valuable aid to the beginner in electrocardiography.

Sydney Weinstein, M.D.

SURGERY IN WORLD WAR II: OPHTHALMOLOGY AND OTOLARYNGOLOGY. Colonel John Boyd Coates, Jr., MC, Editor-in-Chief; M. Elliott Randolph, M.D., Editor for Ophthalmology; and Norton Canfield, M.D., Editor for Otolaryngology; Elizabeth M. McFetridge, M.A., Associate Editor. 605 pp. Illustrated. Price $5.00. Superintendent of Documents, U.S. Government Printing Office, Washington 25, D.C. 1957.

The list of consultants, whose unbiased and critical reports give this book an integrity and stature uniquely its own, reads like a portion of Who's Who in ophthalmology and otolaryngology. Among the names to conjure with in ophthalmology are the following contributors: M. Elliott Randolph, Trygve Gundersen, Derrick T. Vail, James N. Grear, Jr., George M. Haik, and John S. McGavic. Norton Canfield heads an equally distinguished group of surgical consultants in otolaryngology. The book is divided into two parts; Part I (Ophthalmology)

dosage: one tablet before each meal and at bedtime.

SEARLE

(Continued from page 1367)

consists of 378 pages, edited by Col. M. Elliott Randolph; Part II (Otolaryngology), edited by Col. Norton Canfield, appears complete although limited to 227 pages.

It was refreshing to detect certain apparent frustrations that evidently irritated and upset these outstanding consultants brought in from civilian life to contend with the incredible demands of Army medicine in a wartime situation. Unhappily, administrative lessons learned in World War I were not applied in World War II. To quote Col. Canfield. "In World War II, in contrast to the early development of a section on otolaryngology, an otolaryngologic branch was not established in the Surgeon General's Office until July, 1944." Not until June 1944 was a section in ophthalmology created in the Surgery Division of the Office of the Surgeon General. Antiquated tables of organization from World War I made no provision for the proper staffing of officer personnel for the departments of ophthalmology and otolaryngology in station, evacuation, or general hospitals. Not until 1944 was this situation corrected.

Outstanding contributions in ophthalmology include the following chapters: the rehabilitation of blind casualties, the management of intraocular foreign bodies, nutritional amblyopia in American prisoners of war held by the Japanese, and visual disturbances associated with head injuries. Of particular interest in the otolaryngologic portion are these chapters: narcosynthesis in the management of functional deafness, auditory impairment due to battle-incurred acoustic trauma, and facial paralysis in military personnel.

It will take another war to learn if the lessons contained in this revealing book will help overcome some of the medical obstacles of total war.

Gilbert N. Haffly, M.D.

VIRAL ENCEPHALITIS, A Symposium. Fifth Annual Scientific Meeting of Houston Neurological Society, Texas Medical Center, Houston, Texas. Compiled and Edited by William S. Fields, Professor and Chairman, Division of Neurology, Baylor University College of Medicine. 225 pp. Illustrated. Price $7.00. Charles C Thomas, Springfield, Ill. 1958.

This is a brief, readable account of our knowledge and current research endeavors in this rapidly advancing field of medicine. Although this volume deals principally with encephalitis, it necessarily touches on the entire field of virology. The editors have condensed a large volume of information that cannot be easily digested in a single reading. The large section on pathology of inclusion body encephalitis is especially technical but well documented and beautifully illustrated.

Other contributors deal with classification, arthropod-borne encephalitis, clinical and laboratory diagnosis and post-encephalitic manifestations. The concluding chapter concerns the current advances in the control of rabies and poliomyelitis and serves to illuminate the research trend of thinking.

This book makes enjoyable and informative reading and should be available to all medical practitioners.

Phillip J. Suver, M.D.

ENDOCRINE PATHOLOGY OF THE OVARY. By John McLean Morris, M.D., Associate Professor of Gynecology, Yale University School of Medicine, New Haven; and Robert E. Scully, M.D., Clinical Associate in Pathology, Harvard Medical School. 151 pp. Illustrated. Price $8.50. The C. V. Mosby Co., St. Louis. 1958.

This is an interesting, consise monograph of 133 pages including 74 excellent photomicrographs. Its purpose is to correlate pathologic ovarian changes with clinical endocrine findings.

Chapter one nicely reviews embryology and physiologic endocrinology, pointing out common denominators possessed by both male and female gonads. How many readers know that female

1

2

pseudo-hermaphroditism is usually the result of prenatal hyperplasia of the fetal adrenal cortex? It is incorrect to strictly associate gonad, or cell type, with specific hormones. For instance, the follicle apparatus can produce masculinizing hormones.

Chapter two deals with non-neoplastic abnormalities of the ovaries, such as the adreno-genital syndrome, polycystic ovaries, cortical stromo-hyperplasia (twice as frequent in endometrial and breast carcinoma as in non-cancer) and hilar, Leydig-cell hyperplasia.

Functioning ovarian tumors, such as granulosa and theca cell tumors (more than 1,000 and 300 respectively reported to date), the authors remind us, show clinical symptoms mainly due to estrogen production and endometrial hyperplasia is practically routine. Sertoli-Leydig cell tumors, even less common than granulosa-theca tumors, are interestingly discussed in their histogenesis, pathology and endocrine effects, the classical clinical picture being defeminization followed by masculization.

The final chapters briefly summarize the lipoid tumors and their endocrine deviations. These are: adrenal-like tumors, luteomas, Leydig-cell tumors, etc. Elevation of urinary 17-Ketosteroids is the most consistent abnormal finding.

Germinomas (predilection for the right ovary) and teratomas are not accompanied by endocrine manifestations but may be associated with precocity and intersexuality.

Rarely, but occasionally primary in the ovary (40 to 50 cases reported), chorio-carcinoma shows nests of Langhans cells or endoplastic trophoblasts. Struma ovarii (thyroid tissue) is frequently accompanied by other teratomatous elements—i.e., dermoid cysts.

Tumors with functioning stroma such as cystadenomas, Brenner tumors, are suggested to have estrogen-producing capabilities accompanied by abnormal uterine bleeding though the authors state that endocrine manifestations are low.

The chronicle of symptoms, endocrine changes and general incidence of intersexuality is well, though briefly, outlined. This is a good book for the gynecologist who is, as he should be, an amateur pathologist. It may be viewed as slightly esoteric, however. If one is looking only for a classification of ovarian disorders which can be mentally tabulated, this is not the answer. Due to considerable theoretic discussion, it is not exactly a clinical text book, but the authors (Yale and Harvard men) demonstrate that the Ivy league can stir us out of routine thought-grooves and endocrine empiricism.

Donald Thorp, M.D.

SYMPOSIUM ON DISEASES AND SURGERY OF THE LENS. Editor, George M. Haik, M.D., Professor of Ophthalmology and Head of Department, Louisiana State University School of Medicine; Associate Editor, Elizabeth M. McFetridge, M.A.; and Art Editor, Don Alvarado, Assistant Professor of Medical Illustration and Head of Department, Louisiana State University School of Medicine. 260 pp. Illustrated. Price $10.50. The C. V. Mosby Co., St. Louis. 1957.

The combined knowledge of six ophthalmologists and one Ph.D. in ophthalmic chemistry has been compiled in this excellent book by Dr. Haik. It covers the proceedings of the Fifth Annual Session of the New Orleans Academy of Ophthalmology (1956). Although the discussions are extremely practical, the individual contributors include sufficient didactic material so that their reasons for doing things a certain way are better understood. For example, Irvine spends considerable time on the embryology, anatomy, physico-chemistry and pathology of the vitreous, a subject that is enjoying more popularity in recent years. Cordes starts the book off with his usual excellent review of embryology of the lens, follows it up with his popular

(Continued on page 1370)

3

4

(Continued from page 1369)
classification of congenital and juvenile cataracts and returns in a later chapter to consider surgery of congenital cataracts. Each ophthalmologist ably presents his own views and experiences on the subject to which he was assigned. Very few, if any, of the complications of cataract surgery are omitted. In the final chapter, some 38 pages are devoted to round-table discussions during which each essayist is allowed to add his views to any question that is being considered at the moment. This book has impressed me with its usefulness in the field of cataract surgery and would be a welcome addition to the library of any practicing ophthalmologist.

Louis J. Sarro, M.D.

DIETARY PREVENTION AND TREATMENT OF HEART DISEASE. By John W. Gofman, Ph.D., M.D., Donner Laboratory, University of California, Berkeley; Alex V. Nichols, Ph.D., Donner Laboratory, University of California, Berkeley; and E. Virginia Dobbin, Senior Dietitian, E. V. Cowell Memorial Hospital, University of California, Berkeley. 256 pp. Price $3.95. G. P. Putnam's Sons, New York. 1958.

This book represents a major shift in dietary policy from the authors' previous low fat-low cholestrol dietary recommendations. Several newer concepts have been incorporated to reach a "recommended diet" to be used both prophylactically and therapeutically in the treatment of arteriosclerosis.

The policy (not described as such) is to drop the saturated fats markedly to about 12 to 14 per cent of the day's caloric intake; increase the unsaturated fat to about 40 per cent of the day's caloric content and remain high in protein (at least 100 Gm.). Carbohydrates are reduced in line with the finding that in some patients it is not the fat intake which makes them more susceptible to arteriosclerosis, but rather excess carbohydrate intake which unduly raises the Sf 20 to 400 lipoproteins and thus contributes significantly to a higher atherogenic index.

The reader is asked to check his own diet, so he can compare it with a recommended diet paying particularly close attention to the unsaturated fat, saturated fat, carbohydrate, and protein content. Excellent food group charts, menu suggestions, and numerous recipes are given for reference. To carry through the suggested dietary program successfully would require an unusually intelligent, well motivated reader. Most people would require considerable additional coaching to put the concepts into practice.

Unfortunately, in some respects this book seems premature. It is designed for both the physician and intelligent public to read and take advantage of the knowledge we do have regarding arteriosclerosis. It is stated that inasmuch as the recommended diet is adequate from a nutritional standpoint no harm can occur.

Admittedly, this diet may change blood cholesterol and Svedberg units in a favorable direction in many patients. But it amounts to carrying laboratory conclusions into broad recommendations without confirmatory data from either large groups of patients or whole countries such as present ethnologic studies. For some years such studies have bemoaned the 40 to 55 per cent of our caloric intake from fat, whereas in other countries having little arteriosclerosis such caloric intake is from 12 to 30 per cent. It would seem more sensible to cut the saturated fat as done to 12 to 14 per cent of the day's calories, but not to use such large amount of unsaturated fat. To keep total fat calory intake from 25 to 30 per cent in the diet would seem more in line with our knowledge of this disease from ethnologic studies.

Nearly half of the daily protein intake is derived from milk protein. Readers with milk allergies might soon become too low in protein unless under medical supervision.

In treating arteriosclerosis in patients, the phy-

5

6

sician must have regard not only for the arterial wall but for the mind of the patient as well. These patients are living in a society where practically all their friends and commercial eating establishments serve a far different diet. To deny social dining entirely poses serious long-range psychiatric problems for the patient; on the other hand, frequent fudging of this diet results in no therapeutic effectiveness. No effort is made to clarify this important point.

This book is excellently written and effectively presents a new dietary concept which will be of interest to nearly all physicians. It is my opinion, however, that patients following the recommended diet should in all cases be under the care and observation of their physician.

Averly M. Nelson, M.D.

FUNDAMENTALS IN CARDIOLOGY. By John B. Wild, M.D., Assistant Professor, Department of Internal Medicine, Member of Cardiovascular Laboratory, University Hospital, Iowa City, Iowa. 83 pp. Illustrated. Price $4.50. Charles C Thomas, Springfield, Ill. 1958.

This book is a didactic compend of the basic science of cardiology which could well serve as an outline for a brief refresher course and worthy of many credits. The comparable and differential features of normal hearts and those with valvular lesions are compressed into 80 pages of print minus 16 pages of line illustrations.

If you feel you are getting into a cardiologic rut, knowing the clinical side but not the why and wherefores, I would recommend that you place your order post-haste.

For immediate cough control

CITRA FORTE SYRUP

...Most powerful and effective cough suppressant available! (5.0 mg. dihydrocodeinone per tsp. plus multiple antihistamines and expectorant). Prompt—prolonged—yet economical cough therapy.
Dosage = 1 or 2 teaspoonfuls every 3-4 hours.

CITRA SYRUP...For relief of minor coughs (contains 1.67 mg. dihydrocodeinone/teaspoon).
Dosage = 1 or 2 teaspoonfuls every 3-4 hours.

CITRA CAPSULES...For immediate relief from most cold symptoms. Most powerful, orally effective Decongestant...plus *three* Antihistamines...helps bring immediate relief from cold symptoms with minimum side effects.
Dosage = 2 capsules stat, 1 q. 4 hrs.

LOS ANGELES 54, CALIFORNIA **BOYLE** & COMPANY

†Trademark *Patent #2,841,971

NOW! THE SHEER ALL-NYLON STOCKING
THAT SUPPORTS WITHOUT USING RUBBER!

Supp-hose†*

FOR LEG FATIGUE AND MILD VARICOSITIES

Recent clinical research demonstrated the excellent value of Supp-hose for leg fatigue, and mild disorders where heavy surgical stockings are not prescribed. The advantage of Supp-hose is that it looks just like any sheer nylon stocking, thus it overcomes one of the main objections of the patient concerned about her appearance.

SO MANY WOMEN COMPLAIN ABOUT LEG FATIGUE!

As you know, expectant mothers, housewives, working women, and women with mild varicosities all complain about discomfort of the extremities. Supp-hose eases this leg fatigue and gives gentle support all day long. Yet Supp-hose contains no rubber! Every stitch is fine nylon with a special twist that provides an elastic quality.

A VERY ECONOMICAL STOCKING!

Patented Supp-hose costs a woman just one-third what she usually pays for heavier surgical stockings. And wear tests indicate Supp-hose should give five times the wear of ordinary nylons. Supp-hose is available in proportioned sizes in beige, natural and white. At drug and department stores.

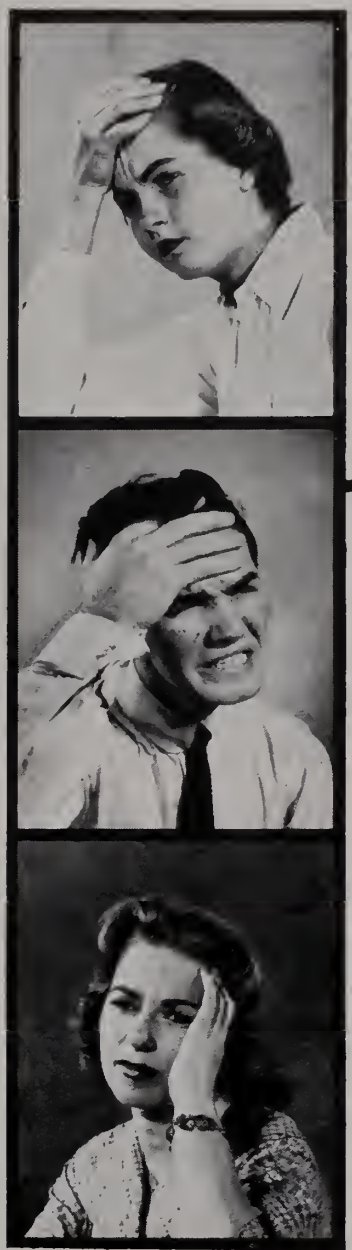
In Biliary Distress

ZANCHOL®

Improves Flow and Color of Bile

Zanchol (brand of florantyrone), a distinct chemical entity unrelated to the bile salts, provides the medical profession with a new and potent hydrocholeretic for treating disorders of the biliary tract.

The high degree of therapeutic activity of this new compound and its negligible side reactions yield distinct clinical advantages.



- Zanchol produces a bile low in sediment.
- Zanchol enhances the abstergent quality of bile.
- Zanchol produces a deep, brilliant green bile, regardless of its original color, suggesting improved hepatic function.
- Zanchol improves the flow and quantity of bile without increasing total bile solids.

Bile with these qualities minimizes biliary stasis, reduces sediment and debris in the bile ducts and discourages the ascent of infection.

For these reasons ZANCHOL has shown itself to be a highly valuable agent in chronic cholecystitis, cholangitis and care of patients following cholecystectomy.

Administration: One tablet three or four times a day. Zanchol is supplied in tablets of 250 mg. each. G. D. Searle & Co., Chicago 80, Illinois. Research in the Service of Medicine.

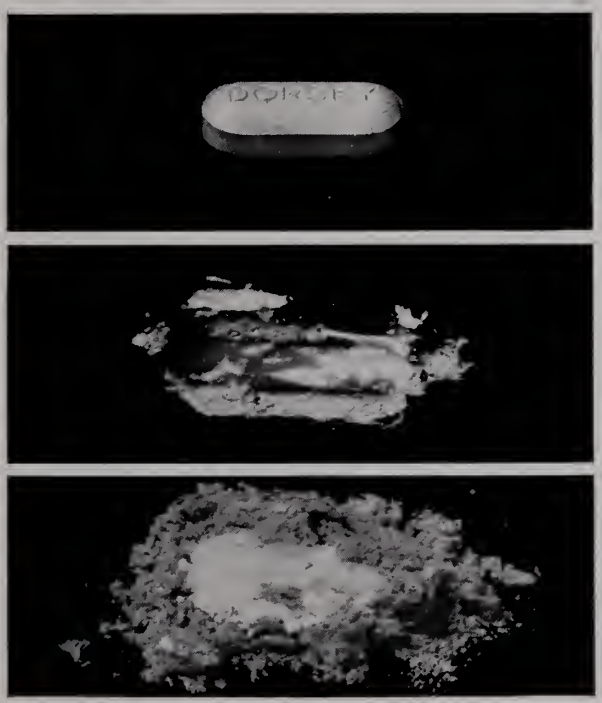
Consistent Gains in Functional Capacity Can Be Achieved with Conservative Therapy

The unemployable arthritic once again may undertake full employment and normal recreation. Patients once confined to the home or wheel chair often find it possible to engage in light work. And even bedridden patients can walk with comfort again. These are the benefits of conservative therapy as demonstrated in long-term studies.[1,2,3] In fact, in these four-year comparative studies of salicylate and cortisone, the corticoid showed no superiority over conservative therapy.

Superior Conservative Therapy Provided by Buffered Pabirin

Buffered Pabirin epitomizes modern, conservative therapy without the serious complications of corticoid therapy. Adrenal atrophy, peptic ulcers, moon-face, hypertension or psychotic reactions, a constant risk whenever corticoids are used,[4-7] will not occur with Buffered Pabirin. Month after month, Buffered Pabirin can be administered with a minimum of problems to patient and physician, and without the side effects common to the use of salicylates alone.



Buffered Pabirin combines new form and formulation for faster pain relief, improved gastric tolerance

Each tablet of Buffered Pabirin consists of an outer layer containing a buffer (aluminum hydroxide), para-aminobenzoic acid and ascorbic acid; an inner core of aspirin. The outer layer quickly releases aluminum hydroxide which affords superior buffering action and protects against gastric irritation. The core of Buffered Pabirin then disintegrates rapidly, permitting fast absorption of acetylsalicylic acid. PABA potentiates the acetylsalicylic acid and creates high salicylate blood levels. Ascorbic acid counteracts vitamin C depletion.

The new form and formulation of Buffered Pabirin provides high and sustained salicylate blood levels. It may be administered over long periods of time without the nausea, dyspepsia or other gastrointestinal symptoms so frequently experienced with salicylates alone.

AN AMES CLINIQUICK
CLINICAL BRIEFS FOR MODERN PRACTICE

For Speedier Return to Normal Nutrition

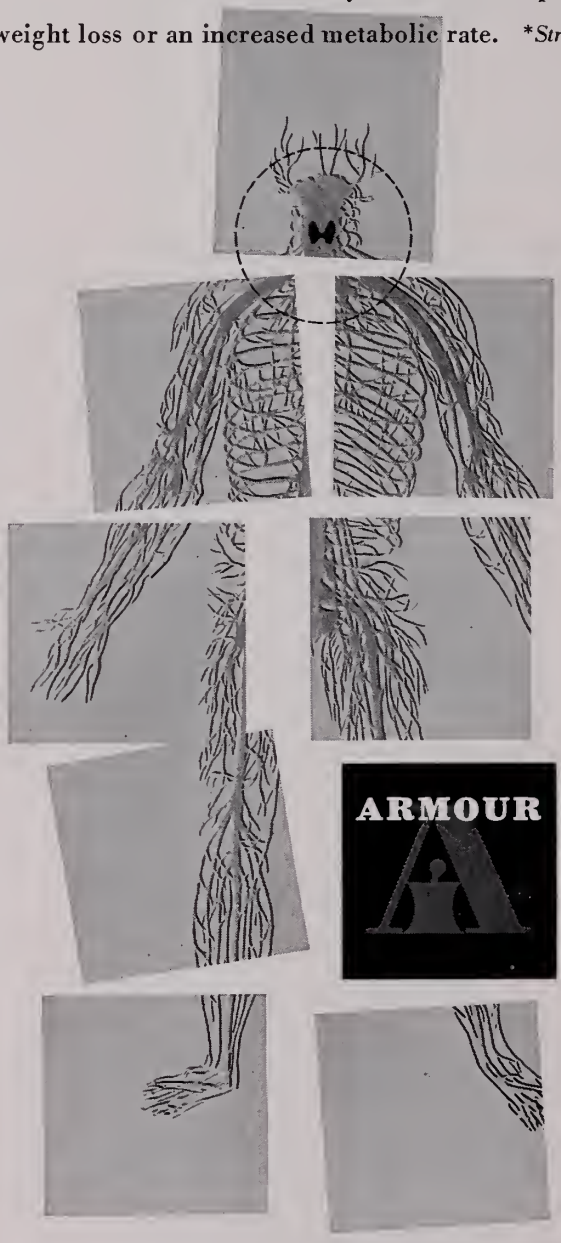
Meat...

for Well-Tolerated Protein In Infectious Hepatitis

A well-balanced, liberal diet—high in protein and calories, but moderate in fat—appears to shorten convalescence in uncomplicated infectious hepatitis.* Current opinion recommends that the patient be encouraged to consume between 1.5 and 2 grams of protein and 40 to 45 calories per kilogram of body weight daily.

Meat functions in several important ways in the dietary management of infectious hepatitis. It supplies large amounts of well-tolerated protein, and it makes meals attractive and appetizing, an inducement to adequate eating in the presence of anorexia.

During the initial stage, when the appetite is especially poor, one of the most acceptable sources of high quality protein is *broiled* ground lean beef. One authority* recommends broiled ground beef three times daily. (Each 3.5 ounces supplies approximately 30 grams of protein.) With the recovery of appetite, other attractively prepared meats also are served.



Meat also helps assure an adequate intake of B vitamins, as well as iron, phosphorus, potassium, and magnesium.

Serum lipids and thyroid medication Recognition of the significant relation between serum lipids and atherosclerosis has resulted in a new interest in the role of hormones in this picture. Desiccated thyroid may reduce serum lipid levels remarkably in many patients without appreciable weight change, as reported by Strisower and co-workers.* Daily dosage ranged approximately from 3 to 5 grains. The authors conclude that treatment with desiccated thyroid need not produce adverse effects such as undesired weight loss or an increased metabolic rate. **Strisower, B., et al.: Lancet 1:120, 1957.*

Hospital practice of infant feeding

Standard formulas for FEEDING REGULATION

Underfeeding is a common cause when infants fail to gain and thrive. In the earliest stage, when caloric intake is inadequate, the infant cries after feeding, remains constipated, and the restlessness from hunger is mistaken for colic. A changed or weakened formula appears to be indicated.

But clinical studies show that a young infant requires a formula of 2 ounces of whole milk (40 calories), a teaspoon of Karo Syrup (15 calories), and a half-ounce of added water *per pound of body weight per day*. Of the total calories, a successful formula yields about 15-20% in protein, 50-60% in carbohydrate, and 25-35% in fat. Whole milk must be reinforced by adding 5% to 10% carbohydrate (1) to provide protein-sparing effect which permits protein anabolism instead of energy production; (2) sufficient calories for tissue formation; (3) proper utilization of fat; (4) suitable acid-base relationships in the intestinal tract and (5) adequate weight gains.

WHOLE MILK FORMULAS

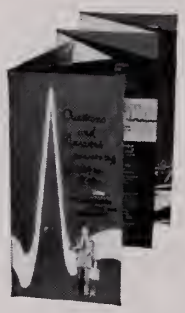
ADVANTAGES OF KARO® SYRUP IN INFANT FEEDING

Composition: Karo Syrup is a superior dextrin-maltose-dextrose mixture because the dextrins are non-fermentable and the maltose is rapidly transformed into dextrose which requires no digestion.

Concentration: Volume for volume Karo Syrup furnishes twice as many calories as similar milk modifiers in powdered form.

Purity: Karo Syrup is processed at sterilizing temperatures, sealed for complete hygienic protection and devoid of pathogenic organisms.

Low Cost: Karo Syrup costs 1/5 as much as expensive milk modifiers and is available at all food stores.



Free to Physicians—Book of Infant Feeding Formulas with convenient schedule pads. Write: Karo Infant Feeding Guide, Box 280, New York 46, N. Y.

ANSWERING DOCTORS' QUESTIONS . . .

about the SANBORN Model 300 Visette electrocardiograph

The text and pictures in this new 12-page booklet tell the story of the Sanborn Visette ECG in a unique way: *as answers to actual questions asked by hundreds of doctors* — at medical conventions, in correspondence, in conversations with Sanborn people. Many of these questions are probably ones you might also ask, to get a clear picture of just how a Visette might fit into *your own* practice and diagnostic procedures. Here are facts *you* can use, presented from the *doctor's* point of view.

On simplicity and ease of Visette operation, for example, the booklet pictures and describes such features as *automatic* stylus stabilization, as leads are switched; *pushbutton* grounding; *automatic* shut-off when the cover is closed; *quick, jam-proof* paper loading, in seconds. And graphic proof of *true portability* — that allows you to take a Visette on any call — is dramatically illustrated by the Visette's 18 pound weight and "brief case" size. Your nurse or technician can carry a Visette as easily as a portable typewriter, and this modern 'cardiograph takes the same space on her desk as a letterhead!

Your colleagues' questions — answered by those who designed and built this first truly portable ECG — can have special value to you. Send for your copy of this useful booklet now. And when you would like a Visette demonstration in your own office, or details of the no-obligation, 15-day Trial Plan, call the Sanborn representative in your area.

The familiar Model 51 Viso Cardiette—in use today throughout the world—is available as always. This larger, heavier (34 lb.) instrument is the "office standard" in thousands of practices. Price $785 delivered.

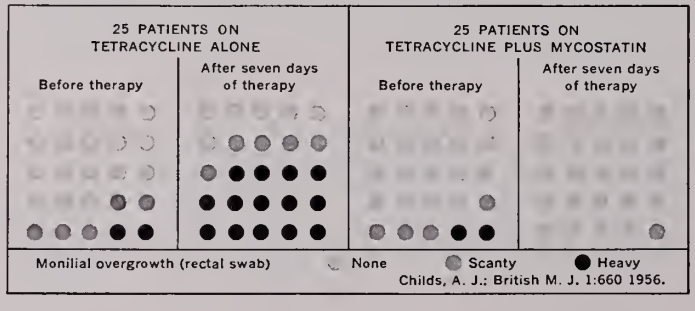
WHEN YOU TREAT INFECTIONS IN PATIENTS SUCH AS THESE

- debilitated
- elderly
- diabetics
- infants, especially prematures
- those on corticoids
- those who developed moniliasis on previous broad-spectrum therapy
- those on prolonged and/or high antibiotic dosage
- women—especially if pregnant or diabetic

the best broad-spectrum antibiotic to use is

MYSTECLIN-V

Squibb Tetracycline Phosphate Complex (Sumycin) and Nystatin (Mycostatin) — Sumycin plus Mycostatin



for practical purposes, Mysteclin-V is sodium-free

for "built-in" safety, Mysteclin-V combines:

1. Tetracycline phosphate complex (Sumycin) for superior initial tetracycline blood levels, assuring fast transport of adequate tetracycline to the infection site.

2. Mycostatin—the first safe antifungal antibiotic—for its specific antimonilial activity. Mycostatin protects many patients (see above) who are particularly prone to monilial complications when on broad-spectrum therapy.

MYSTECLIN-V PREVENTS MONILIAL OVERGROWTH

NEW DRUGS

Monthly report on most recent introductions by the pharmaceutical industry.

Rubramin PC Inj. (Squibb).
Pure cyanocobalamin, vitamin B-12. Hematogenic, specific for pernicious anemia; effective in certain megaloblastic anemias; and for a variety of neurological, liver and skin disorders.

Protalba Tablets (Pitman-Moore).
Pure protoveratrine-A, single alkaloid of veratrum; hypotensive. Also available—Protalba-R, combining protoveratrine-A with reserpine.

Ilopan-Choline Tablets (Warren-Teed).
Treatment of gaseous abdominal distension in the postoperative and ambulatory patient.

Sumycin Aqueous Drops & Syrup (Squibb).
Tetracycline, phosphate potentiated, in aqueous formulations; both drop-dosage and syrup available.

R-Gene (Cutter).
IV solution of L-arginine monohydrochloride in water; treatment of hepatic coma resulting from failure of liver function.

Pagano-Levin Medium (Squibb).
Nutrient agar for office use; for differentiation of *Candida (Monilia) albicans* from most other *Candida* species, saprophytic yeasts and other fungi.

Fibrinogen (Merck Sharp & Dohme)
Human whole blood fraction, fibrinogen; for treatment of hypofibrinogenemia and afibrinogenemia.

Sebulex Shampoo (Westwood).
Medicated shampoo; for dandruff and other seborrheic conditions.

Formatrix Tablets (Ayerst).
Estrogen-androgen combination with vitamin C; for osteoporosis due to menopause, malnutrition, atrophy of disuse or following corticosteroid therapy.

Tarcortin Lotion (Reed & Carnrick).
Hydrocortisone and special coal tar extract; for dermatoses.

Daranide (Merck Sharp & Dohme).
Dichlorphenamide, orally effective carbonic anhydrase inhibitor; for treatment of glaucoma.

Meti-Derm Aerosol w/ Neomycin (Schering).
Prednisolone and neomycin in aerosol spray formulation; for topical management of allergic and inflammatory dermatoses where secondary infection is a factor.

Duografin (Squibb)
X-ray contrast medium; for simultaneous visualization of the renal and biliary tracts.

Compocillin-VK (Abbott).
Potassium penicillin V; to be reconstituted with water to make a palatable oral solution. Prophylaxis against recurrence of rheumatic fever, management of rheumatic carditis, prevention of secondary infection.

Novo-Basic Tablets (Squibb).
High potency B complex with C, for therapeutic maintenance and support; for the convalescent stage of metabolic challenge.

Polaramine Tablets and Repetabs (Schering).
Dextro-chlorpheniramine maleate; treatment of allergic conditions responding to oral antihistamines.

Dextran 12% Solution (Abbott).
Dextran in sterile solution, salt-free and pyrogen free; for IV administration in treatment of nephrosis.

V-Cillin K Pediatric (Lilly).
Penicillin V potassium; for reconstitution to make a palatable oral solution.

Parafon Tablets (McNeil).
Chlorzoxazone and acetaminophen, analgesic-muscle relaxant combination; for musculoskeletal disorders. Also available with prednisolone.

Zactane Tables (Wyeth).
Ethoheptazine citrate; analgesic.

Clusivets Tablets (Ayerst).
Vitamin-mineral combination with trace elements. Comprehensive nutritional formula.

Deltasmyl Tablets (Roussel).
Prednisone with theophylline, ephedrine and phenobarbital; for asthma.

Mi-Cebrin T Tablets (Lilly).
Extended-range vitamin mineral formulation; for convalescents.

Metamine Sustained w/ Reserpine Tablets (Leeming).
Aminotrate phosphate with reserpine, combining coronary vasodilator with hypotensive, in sustained-action tablet. For control of angina pectoris associated with hypertension. Also available as Metamine w/ Butabarbital Sustained, indicated where emotional or nervous tension is a factor.

Dipral Tablets (Haskell).
Dipyrone with salicylamide, PABA and Vitamins B-12 and C. Antirheumatic.

Neosporin Topical Power (Burroughs-Wellcome).
Topical Polymixin B-bacitracin-neomycin; bactericidal.

Sterotril Tablets (Schering).
Prednisone and perphenazine; indicated for steroid-responsive conditions with stress overlay.

Prednis-CVP Capsules (Arlington-Funk).
Prednisolone with citrus bioflavonoid and vitamin C, buffered; anti-inflammatory and anti-allergic with capillary protectant. Also available—Prednyl Tablets; similar formulation with salicylamide added. Antirheumatic.

(Continued on page 1393)

(For more complete information on action, use and dosage, see the latest issue of *Pharmindex* available at your regular prescription pharmacy.)

Component Society Monthly Meetings

OREGON

BENTON COUNTY
Pres, Charles E. Reed, Corvallis
Sec, J N Furst, Corvallis
First Monday—6 30 p m —Benton Hotel, Corvallis

CENTRAL OREGON
Pres, Harry E Mackey, Bend
Sec, Eugene L White, Bend
First Monday—7 30 p m —Pine Tavern, Bend

CLATSOP COUNTY
Pres, William M Burget, Astoria
Sec, Charles K Linehan, Astoria
Meetings irregular

COLUMBIA COUNTY
Pres, Eugene P Tupker, St Helens
Sec, O L Zeschin, St. Helens
No regular schedule—7 p.m —St. Helens

DOUGLAS COUNTY
Pres, Robert R Mooers, Roseburg
Sec, William D Holst, Roseburg
Second Tuesday—6 30 p.m.—Roseburg Country Club

EASTERN OREGON
Pres, Jules F Bittner, Portland
Sec., J. Ralph McDonald, Pendleton
Annual Meeting Only—June—Pendleton

JACKSON COUNTY
Pres, Oscar A Heyerman, Medford
Sec, Earl L. Lawson, Medford
Wednesday—7 p.m.—Rogue Valley Country Club

KLAMATH COUNTY
Pres., William G Holford, Jr., Klamath Falls
Sec, Robert D Payne, Klamath Falls
Second Tuesday—7 p m —Klamath Falls

LANE COUNTY
Pres, Keith D. McMilan, Eugene
Sec, Virgil W. Samms, Eugene
First Tuesday—6.30 p.m.—Eugene Hotel

LINN COUNTY
Pres., H P. O'Neill, Albany
Sec, Robert i Daugherty, Lebanon
First Thursday—6.30 p.m.—Red Hat Cafe, Albany

MID-COLUMBIA
Pres., W. T Edmundson, Hood River
Sec., John M. Campbell, The Dalles
Second Tuesday—6 30 p.m.—Alternate between Hood River & The Dalles

MULTNOMAH COUNTY
Pres., Werner E Zeller, Portland
Sec, Verner V Lindgren, Portland
First Tuesday (Oct., Nov, Dec., Feb., Mar., May)—6 p m —Hotel Multnomah

SOUTHWESTERN OREGON
Pres, Paul E Parker, North Bend
Sec, Douglass S. Johnson, Coos Bay
Third Wednesday—8 p.m.—Coos Country Club

TILLAMOOK COUNTY
Pres, Howard Kaliher, Tillamook
Sec, J P. Brady, Tillamook
Third Friday—7 p.m.—Victory House

UMATILLA COUNTY
Pres, Louis J. Feves, Pendleton
Sec, Donald D. Smith, Pendleton
Third Tuesday—7.30 p.m.—Pendleton Country Club

UNION COUNTY
Pres, Donald F. Otten, La Grande
Sec., Webster K Ross, La Grande
On call of President

WASHINGTON COUNTY
Pres., Herbert Mason, Beaverton
Sec, N. D. Smith, Beaverton
First Monday—8 p.m.—Forrest Hills Country Club, Cornelius

YAMHILL COUNTY
Pres., Clifford C. Peterson, Newberg
Sec, Louis L. Geary, McMinnville
First Tuesday—7 p.m.—Oriental Garden, McMinnville

WASHINGTON

CHELAN
Pres, Donald Phillips, Wenatchee
Sec, Robert Bonifaci, Wenatchee
Monday—6.30 p.m —Wenatchee Golf & Country Club

CLALLAM
Pres, John Siemens, Port Angeles
Secy, K M Senz, Sequim
Third Monday—8 00 p.m.—Generally Olympic Memorial Hospital, Port Angeles

CLARK
Pres, G W. Turley, Ridgefield
Sec, Emil W Brocking, Camas
Tuesday—7 30 p m.—Royal Oaks Country Club, Vancouver

COWLITZ
Pres, Marion A Clark, Jr, Longview
Sec, Powell B Loggan, Longview
Third Tuesday—7 30 p m —Place not established

GRANT
Pres., R. M. Gill, Moses Lake
Sec, Wayne L. Piper, Ephrata
Second Monday—7:30 p.m.—Moses Lake or Ephrata

GRAYS HARBOR
Pres., E L. Calhoun, Aberdeen
Sec, James A. Moore, Montesano
Third Wednesday—6.30 p.m.—Grays Harbor Country Club

JEFFERSON
Pres., Bruce N Brydges, Port Townsend
Sec, Clayton M. Schaill, Port Townsend

KING
Pres, Dean K. Crystal, Seattle
Sec., Hugh W. Jones, Seattle
First Monday—6:30 p.m.—Norselander Hall, Seattle

KITSAP
Pres., E. J. Munns, Bremerton
Sec., J T. Turpin, Bremerton
Second Monday—8 p.m.—Harrison Memorial Hospital, Bremerton

KIDS LOVE IT!

ANELIX

ANALGESIC and ANTIPYRETIC

in TASTY liquid form

*safer . . . more effective than aspirin**

Use: to reduce pain, relieve itching, and lower temperature. Excellent adjunct to antibiotic and sulfanomide therapy.

Each teasp. of Anelix contains 120 mgm. of N-acetyl-p-aminophenol (Kirkman) in a raspberry flavored vehicle.

*R. C. Batterman & A. J. Grossman: Analgesic effectiveness and safety of N-acetyl-p-aminophenol, Federation Proc. 14; 316-317, March 1955.

KIRKMAN PHARMACAL CO. Seattle 99, Washington

Professional Classified

PRACTICE OPPORTUNITIES

GENERAL PRACTICE OPPORTUNITY

General practice available in Central Oregon. Good income, pleasant community, hunting and fishing, excellent schools. No initial investment. Write P. O. Box 5006, Eugene, Oregon.

UNUSUAL OPPORTUNITY IN CENTRAL WASHINGTON

Office suite available in new clinic designed for 2-physician practice. Present physician needs associate in general practice. Will share x-ray and lab work facilities. Excellent drawing area of over 5,000 in rich farming section of Central Washington. Twenty minutes drive to three modern hospitals. Comfortable 4-bedroom family home being held. Exceptional recreation area—hunting, fishing, golfing, skiing (water and snow). Personal financial assistance available. Write Box 66-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

GP PRACTICE AND EQUIPMENT FOR SALE

Well established general practice of recently deceased physician includes records, instruments, late model x-ray equipment, diathermy, and electrocardiograph. Seven-room office in Herald Building, Bellingham, Wash. For further information, write Mrs. C. V. Farrell, 723 14th St., Bellingham, Wash.

GP ASSOCIATE WANTED

Associate or assistant wanted in established general practice. Suburban area east of Seattle. Write Box 67-A, Northwest Medicine, 500 Wall St., Seattle, Wash.

GENERAL PRACTICE OPPORTUNITY

Physician is needed for a small town and community of 1,500 persons. New clinic available immediately on advantageous terms. Building of the clinic was supported by 340 families. Hospital within 20 minutes of town. Housing available. Good schools, churches, roads, and community facilities. Contact Mr. W. H. Ritchey, Lind, Wash.

WASHINGTON INSTITUTION OPPORTUNITIES

PHYSICIAN II—$11,916-$14,220; PHYSICIAN I—$10,908-$13,020. The expanded treatment program in Washington State Institutions continues to create new staff, specialty, and administrative positions in nearly all areas of the state. Specialty and administrative (Physicians II) are required to have four years experience in the practice of medicine or two years of supervisory medical experience, or two years of approved residency training, or four years in the practice of a specialty. Staff physicians (Physician I) need only have their license to practice in the State of Washington. For further information regarding these positions, contact: State Personnel Board, 212 General Administration Building, Olympia, Wash.

LOCATIONS DESIRED

PRE-MICRONIZATION assures particle size for maximum effectiveness

Medihaler-EPI®

For quick relief of bronchospasm of any origin. More rapid than injected epinephrine in acute allergic attacks.

Epinephrine bitartrate, 7.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.15 mg. free epinephrine.

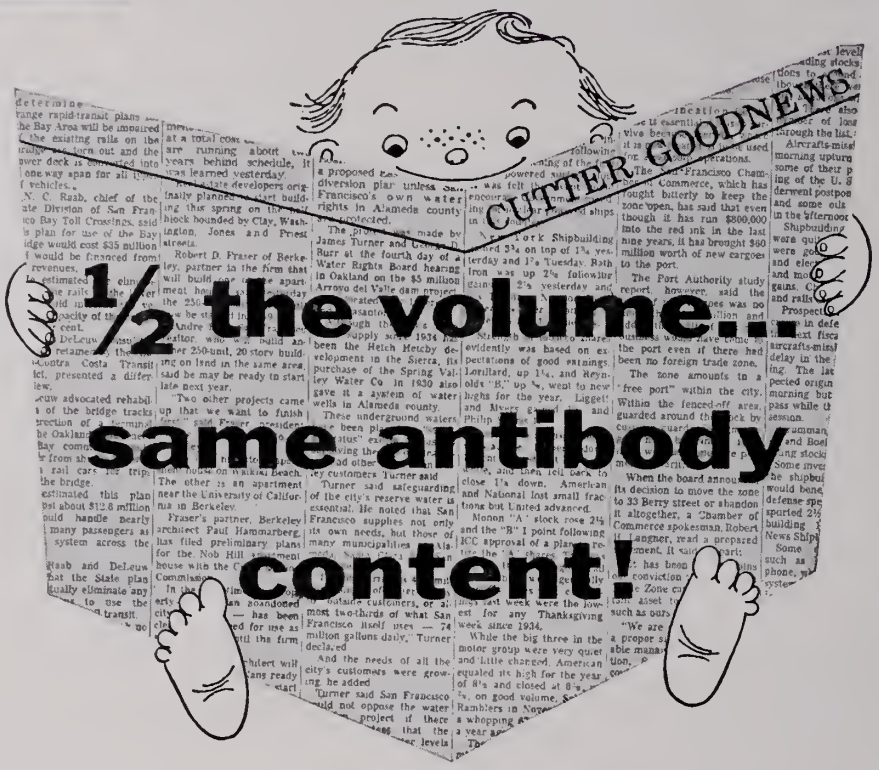
Medihaler-ISO®

Unsurpassed for rapid relief of symptoms of asthma and emphysema.

Isoproterenol sulfate, 2.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.06 mg. free isoproterenol.

MEDIHALER® *For Ample Air Right Now!*

Millions of asthmatic attacks have been aborted faster, more effectively, more economically with Medihaler-Epi and Medihaler-Iso. Automatically measured dosage and true nebulization...nothing to pour or measure...One inhalation usually gives prompt relief.



Prescribe Medihaler medication with Oral Adapter as first prescription. Refills available without Oral Adapter.

The Medihaler Principle of automatically measured-dose aerosol medications in spillproof, leakproof, shatterproof, vest-pocket size dispensers also available in Medihaler-Phen® (phenylephrine, hydrocortisone, phenylpropanolamine, neomycin) for prompt, **lasting** relief of nasal congestion.

HIGHLY EFFECTIVE AGAINST STAPHYLOCOCCI

CHLOROMYCETIN

Reports on studies of *in vitro* activity of CHLOROMYCETIN over the past few years indicate that this antibiotic has maintained its effectiveness against most strains of staphylococci.[1-4] "...Staphylococci do not acquire resistance to chloramphenicol [CHLOROMYCETIN] as they do to other antibiotics, in spite of heavy use of chloramphenicol [CHLOROMYCETIN]."[1]

These *in vitro* studies are borne out by excellent clinical results with CHLOROMYCETIN in treatment of patients for severe staphylococcal infections, including staphylococcal pneumonia,[5] postoperative wound infections,[6] postoperative parotitis,[7] and puerperal breast abscesses.[8]

CHLOROMYCETIN (chloramphenicol, Parke-Davis) is available in a variety of forms, including Kapseals® of 250 mg., in bottles of 16 and 100.

CHLOROMYCETIN is a potent therapeutic agent and, because certain blood dyscrasias have been associated with its administration, it should not be used indiscriminately or for minor infections. Furthermore, as with certain other drugs, adequate blood studies should be made when the patient requires prolonged or intermittent therapy.

when psychic symptoms distort the picture

Dartal helps the patient reintegrate his mental processes

In everyday office practice as well as under hospital conditions Dartal is consistent in its effects as few tranquilizers are.

Dartal promotes emotional balance

Dartal effectively decreases or relieves emotional hyperactivity and psychomotor excitement.

Dartal is unusually safe

At a recent symposium, leading hepatologists* concluded that Dartal is not icterogenic or hepatotoxic.

Dartal is effective at low dosage

One 2-mg. tablet q.i.d. or one 5-mg. tablet t.i.d. in neuroses; one 10-mg. tablet t.i.d. in psychoses.

a superior psychochemical
for the management of both major and minor emotional disturbances

for depression

▲Deprol▲†

Clinically confirmed in over 2,500 documented case histories[1,2]

CONFIRMED EFFICACY

Deprol ► acts promptly to control depression *without* stimulation

► restores natural sleep

► reduces depressive rumination and crying

DOCUMENTED SAFETY

Deprol is unlike amine-oxidase inhibitors

► does not adversely affect blood pressure or sexual function

► causes no excessive elation

► produces no liver toxicity

► does not interfere with other drug therapies

Deprol is unlike central nervous stimulants

► does not cause insomnia

► produces no amphetamine-like jitteriness

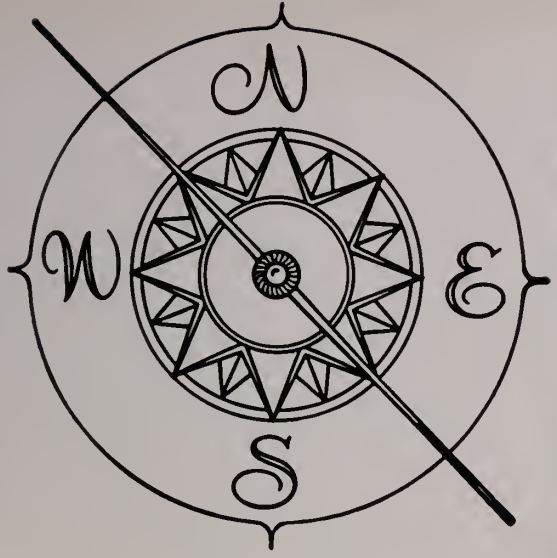
► does not depress appetite

► has no depression-producing aftereffects

► can be used freely in hypertension and in unstable personalities

Dosage: Usual starting dose is 1 tablet q.i.d. When necessary, this dose may be gradually increased up to 3 tablets q.i.d.

Composition: Each tablet contains 400 mg. meprobamate and 1 mg. 2-diethylaminoethyl benzilate hydrochloride (benactyzine HCl).



Supplied: Bottles of 50 scored tablets.

1. Alexander, L.: Chemotherapy of depression—Use of meprobamate combined with benactyzine (2-diethylaminoethyl benzilate) hydrochloride. J.A.M.A. 166:1019, March 1, 1958. 2. Current personal communications; in the files of Wallace Laboratories.

A NEW DIMENSION IN RESEARCH

This data deals with the results obtained by 1,988 physicians, treating 21,128 hypertensive patients with Unitensen. The "Proof In Practice" study validates, *in day-to-day private practice*, the findings of clinical trials conducted in hospitals and institutions. It proves that Unitensen affords safe, dependable office management for the majority of hypertensive patients. Unitensen lowers blood pressure . . . improves cerebral and renal blood flow... exerts no adverse effects on circulation . . . and, is virtually free of side effects.

COMBINES: Traditional components for relief of the annoying symptoms of early upper respiratory infections...

PLUS: Protection against bacterial complications often associated with such conditions.

TABLETS (sugar coated)
Each contains:

ACHROMYCIN* Tetracycline	125 mg.
Phenacetin	120 mg.
Caffeine	30 mg.
Salicylamide	150 mg.
Chlorothen Citrate	25 mg.

Bottles of 24 and 100.

SYRUP (lemon-lime flavored, caffeine-free)
Each 5 cc. teaspoonful contains:

ACHROMYCIN* Tetracycline equivalent to Tetracycline HCl	125 mg.
Phenacetin	120 mg.
Salicylamide	150 mg.
Ascorbic Acid (C)	25 mg.
Pyrilamine Maleate	15 mg.
Methylparaben	4 mg.
Propylparaben	1 mg.

Bottle of 4 fl. oz.

Adult dosage for ACHROCIDIN Tablets and new caffeine-free Syrup is two tablets or teaspoonfuls of syrup three or four times daily. Dosage for children adjusted according to age and weight.
Available on prescription only.

HYLAND'S PINK ASPIRIN FOR CHILDREN

Gives 27-56% higher blood levels of salicylate

THE ONLY ASPIRIN FORMULATED ESPECIALLY FOR INFANTS

In a recent test of three "infants' & children's" aspirin tablets*...results conclusively showed that Hyland's Pink Aspirin for Children produced blood levels of salicylate 27-56% higher than the other brands. • Here's why: Hyland's Pink Aspirin for Children is the only Triturate. Triturates, often used for injection, are absorbed more quickly...safely. Hyland's contains no starch or binder ...ingredients used in compressed tablets which retard assimilation. Controlled dosage for any age—no inaccurate breaking of adult-type tablets. • No "emotional trauma" for your infant patients...specify Hyland's Pink Aspirin for Children (they love the raspberry flavor)...the Triturate tablet that's specially formulated for them! *detailed report sent on request

J.A.M.A. *167*:433, 1958

STUDY OF
levo-1-phenyl-2-aminopropane alginate
LEVONOR, NEW ANORECTIC

RESULTS WITH LEVONOR

in a series of overweight patients (abstracted from a report in J.A.M.A. *167*:433, 1958)—LEVONOR was given to 80 patients as 5 mg. tablets, three times a day, one-half hour before meals. Many cases received an added dose at 8 or 9 p.m. to curb "television" or "before bedtime" snacks. *There were no signs of restlessness from this late-dosage schedule.* Many patients had previously been on stimulant type drugs with diet and had limited success. They were enthusiastic about control of appetite and relative lack of side effects (with LEVONOR). Patients were seen on an average of every two weeks. The average weekly weight-loss for patients taking LEVONOR was 2.0 pounds. There was a *remarkable absence of any serious side effects.* Since the studies revealed *no effects on blood sugar levels, nor on central vasomotor reflexes,* the new agent was *used in diabetes mellitus, hypertension* and *obstetrics.*

IN OBESITY

1 **a distinctly different appetite suppressant with virtually no analepsis**[1,2,6]

2 **even for "night eaters"—8 p.m. or later dosage cuts appetite without keeping patients awake**[1-3]

3 **and for weight reduction in hypertension (especially when controlled with rauwolfia),**[4] **diabetes**[5] **and pregnancy**[5]

FROM NEW PAPERS COMING UP!

... a highly effective adjunct to the reducing regimen ... unaccompanied by CNS overstimulation and other side effects associated with stimulant type drugs.

Feldman, H. S.: in press, 1958

... An average weekly weight loss of 2.8 pounds produced by an average daily dose of 3 or 4 tablets. No increase in blood pressure or pulse rate was noted.

Frohman, I. P.: in press, 1958

...Forty-one overweight patients on LEVONOR, ranging in age from 28 to 68 years, undergoing antihypertensive therapy that included rauwolfia derivatives, experienced excellent weight loss at the same time that their hypertension was controlled. This despite the well-known tendency of rauwolfia therapy to cause weight gain. Marked lack of CNS stimulation was observed.

Feldman, H. S., and Gadek, R. J.: in press, 1958

FROM THE SCIENTIFIC EXHIBIT

(A.M.A. Clinical Meeting, Dec. 3-6, 1957, Phila.)

...with some patients losing as much as 6 pounds a week, LEVONOR, in a series of 80 patients, *achieved an average loss of 2-2½ pounds per week* by patients on a daily dosage of 1 tablet at 11:00 a.m., 1 at 4:00 p.m., and 1 at 8:00 p.m.

...effectively combated nighttime eating syndrome without disturbing sleep...

...produced *none of the side effects* usually associated with appetite suppressants.

THREE TYPICAL CASE HISTORIES*

Case 1:—A 15-year-old girl, overfed during an appendectomy convalescence, then overate and underexercised, gained 42 lbs., and weighed 165 lbs. After previous reducing attempts failed, dietary re-education and therapy with LEVONOR lost her 24.5 lbs. in 11 weeks, with improvement continuing.

Case 2:—A 48-year-old male's frequent business meals and physical inactivity caused him to gain 28 lbs. in 12 years. With LEVONOR, he was able to follow his regimen and—as advised—not to mention it at meals and thus elicit no comment. In 10 weeks he lost 24 lbs. and has maintained the pattern.

Case 3:—A 44-year-old male found his "timed-release" appetite suppressant unusable for control of nighttime craving. 1 LEVONOR tablet daily at 7 p.m. allayed evening hunger and permitted restriction of caloric intake without emotional disturbance or sleeplessness.

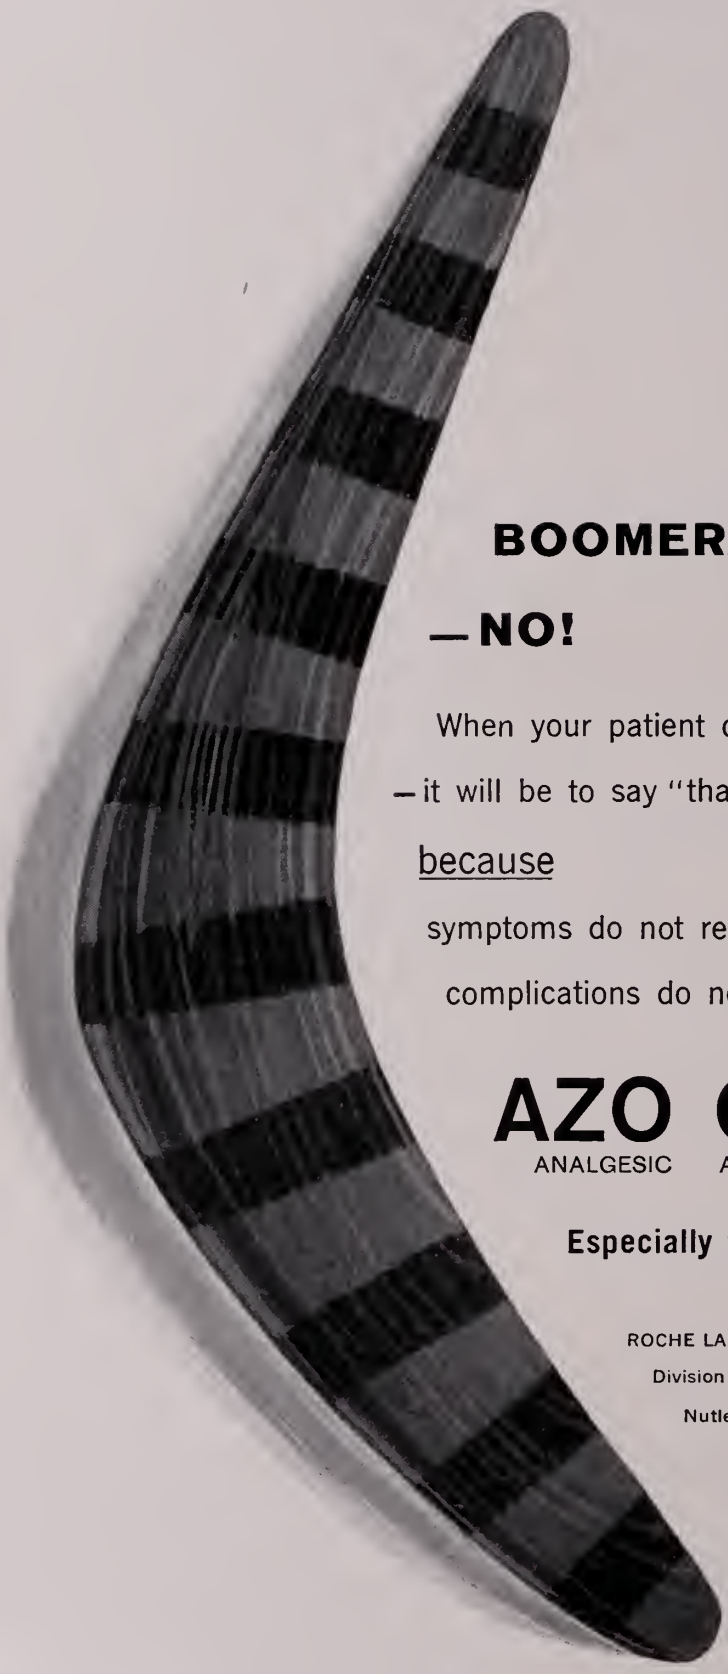
*J.A.M.A. *167*:433, 1958

WEIGHT LOSS WITHOUT SLEEP LOSS[1-3]

LEVONOR®*

2-2½ lbs.
loss per week

6,600[1-8]
clinical cases



Administration and dosage—Average dose: 5 to 10 mg. twice or three times daily, as indicated. Under proper supervision, LEVONOR can be given to obstetrical and pediatric patients as well as those with moderate cardiovascular disease, hypertension or diabetes. LEVONOR should not be given to patients with severe hypertension, thyrotoxicosis or acute coronary disease. Many physicians prefer their patients to take 1 tablet at 11 a.m., 1 tablet at 4 p.m. and 1 tablet at 8 p.m.

Packaging—Bottles of 100 tablets. Each tablet contains 5 mg. of levo amphetamine alginate (levo-1-phenyl-2-aminopropane alginate, Nordson)

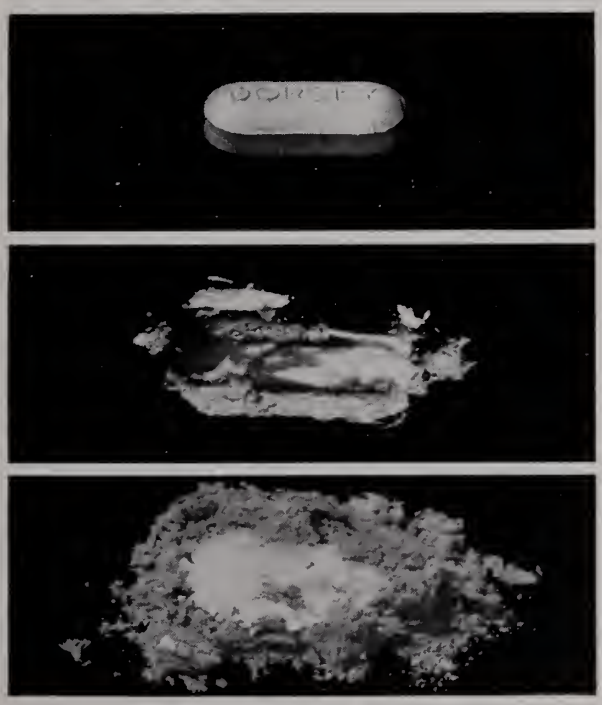
Consistent Gains in Functional Capacity Can Be Achieved with Conservative Therapy

The unemployable arthritic once again may undertake full employment and normal recreation. Patients once confined to the home or wheel chair often find it possible to engage in light work. And even bedridden patients can walk with comfort again. These are the benefits of conservative therapy as demonstrated in long-term studies.[1,2,3] In fact, in these four-year comparative studies of salicylate and cortisone, the corticoid showed no superiority over conservative therapy.

Superior Conservative Therapy Provided by Buffered Pabirin

Buffered Pabirin epitomizes modern, conservative therapy without the serious complications of corticoid therapy. Adrenal atrophy, peptic ulcers, moon-face, hypertension or psychotic reactions, a constant risk whenever corticoids are used,[4-7] will not occur with Buffered Pabirin. Month after month, Buffered Pabirin can be administered with a minimum of problems to patient and physician, and without the side effects common to the use of salicylates alone.



Buffered Pabirin combines new form and formulation for faster pain relief, improved gastric tolerance

Each tablet of Buffered Pabirin consists of an outer layer containing a buffer (aluminum hydroxide), para-aminobenzoic acid and ascorbic acid; an inner core of aspirin. The outer layer quickly releases aluminum hydroxide which affords superior buffering action and protects against gastric irritation. The core of Buffered Pabirin then disintegrates rapidly, permitting fast absorption of acetylsalicylic acid. PABA potentiates the acetylsalicylic acid and creates high salicylate blood levels. Ascorbic acid counteracts vitamin C depletion.

The new form and formulation of Buffered Pabirin provides high and sustained salicylate blood levels. It may be administered over long periods of time without the nausea, dyspepsia or other gastrointestinal symptoms so frequently experienced with salicylates alone.

CORRESPONDENCE

An Example of Illogic

Publication of the material below is intended to call attention to an unfortunately common type of thinking. Identifying names have been deleted. The state, city and individual are not important. Only the ability of a physician to think logically is important. The all too common willingness of physicians to indulge in illogic such as this is the subject of an editorial in this issue. Ed.

September 3, 1958

EDITOR, NORTHWEST MEDICINE:

I am sure that you will agree with us that many physicians are not utilizing the accumulated mass of the newer knowledge of nutrition in the care of their patients. One of the reasons responsible for it is the neglect of adequate nutrition courses in medical schools.

The Commission on Nutrition of the Medical Society ——— has endeavored to overcome this neglect by developing a dynamic nutritional education program for practicing physicians in our State. We are taking the liberty of enclosing, herewith, a reprint of an editorial from the ——— Journal, giving details of this program. We hope that you will find it feasible to republish this editorial in one of the issues of NORTHWEST MEDICINE in order to stimulate interest in clinical nutrition among practicing physicians in your State.

Very sincerely yours,
————————, M.D.
Chairman
Commission on Nutrition.

EDITORIAL

Nutrition and a State Medical Society

The ultimate goal of all research and clinical investigation in nutrition is the improvement of the health of the

(Continued on page 1420)

*Largest in Country!**

The Medical-Dental Building is the largest single medical-dental community under one roof in the country! And people know they can *depend* on finding the best in medical care here because only those with the highest ethical standards are accepted as tenants. You and your patients will enjoy the convenience of everything from a doorman to the best equipped facilities in the state.

(Continued from page 1419)

people. To this end several progressive state medical societies have established programs which vary in scope and objectives but which have as their fundamental philosophy the "practical application" of our newer knowledge of nutrition.

One of the leading examples of such a progressive viewpoint may be found in the report of the Commission on Nutrition ———. The Commission's report may well be studied by appropriate commissions of other state medical societies for it represents an admirable example of what can and should be done.

In brief, the Commission has had two objectives: (1) The stimulation of interest in clinical nutrition at state and county levels; and (2) the dissemination of factual information on nutrition to both practicing physicians and the laity.

* * * * *

As part of an education program, the State Nutrition Commission organized various symposia. These were held at State Medical Society meetings, and in cooperation with the National Vitamin Foundation, and with the ——— County Medical Society.

The Commission has also urged the establishment of nutrition clinics throughout the state and supported a pioneering nutrition clinic now in operation at the ——— General Hospital.

In cooperation with the Dietetic Association, a program will be prepared for the laity.

* * * * *

The writer has had an opportunity to see a proposal for the establishment of a Division of Nutrition within the Department of Public Health of the City of ———. Because it is felt that this may be of interest to some of our readers, the following is a brief summary of this proposal.

The purposes of such a Division of Nutrition within a City Department of Public Health are (1) the promotion of better public health through research and special clinics; (2) the prevention of diseases arising from public ignorance of this field; and (3) direct participation in programs both in prenatal clinics, maternal nutrition studies, and school nutrition projects; and finally (4) rehabilitation of those who are in medical need from the public health standpoint, such as obesity, nutritional anemia, diabetes, etc.

The recommended organization would be located in a large city hospital. The staff would consist of a director, three physicians, two dietitians, a psychiatrist, a laboratory technician, two social workers, and a clerk. A number of laboratory studies would be performed including, in addition to routine determinations, analyses of vitamin C, urinary thiamine, urinary riboflavin, and electrolytes.

The Nutrition Division could plan courses for members of the Department of Public Health, such as public health nurses, dietitians employed by other state and city agencies, general physicians, and school physicians. Furthermore, this division could furnish consultants to other departments within and outside the Department of Health, would engage in the nutrition and education in medical schools and hospitals, help improve dietary practices in various state institutions, and advise various industrial hygiene divisions.

———————, M.D.
————————
————————————
Dear Dr. ——:

Your letter and the editorial from the ——— Journal are very interesting. You are to be commended for your desire to disseminate information to the practicing physicians. However, we do not plan to use the editorial in our journal as you suggest.

I hope the plan to establish a division in the ——— health department did not originate with your commission or with the Medical Society. If any member of your group or any official of the state society believes this a matter for health departments, I believe he should reexamine his basic philosophy about the practice of medicine. Nutrition seems to me to be a personal matter, hence one about which the individual might well consult his personal physician. I do not believe, except under socialistic concept, that the nutritional problems of one person can endanger another person.

Public health departments are given authority under what is spoken of broadly as police power. The state, again in the broad sense, must protect the individual from being harmed by his fellows. This principle extends to prevention of communicable disease. Physicians who have embarked on careers in public health understandably do not wish to confine their activities to that field alone but are trying to expand into what might better be described as health of the public. Under such concept a public health officer could practice medicine without restraint. In general, I do not believe this is a desirable development.

Yours very truly,

Editor, Northwest Medicine

September 19, 1958

Editor, Northwest Medicine:

I agree with the precept that government should not engage in the private practice of medicine. It is neither the purpose nor the intent of our Commission to advocate such a course. However, the aim of the Commission as approved by the House of Delegates of the ——— Medical Society, is (1) The stimulation of interest in clinical nutrition at state and county levels; and (2) the dissemination of factual information on nutrition to both practicing physicians and the laity. In order to implement these objectives, the Commission has advocated the establishment of nutrition clinics as an integral part of the over-all nutrition program in the State of ———. This, however, is not to usurp private medicine, but rather to aid the practicing physician and to facilitate him in the care of those indigent patients in whom nutritional problems, either primary or secondary in nature, are concerned in his rehabilitation program. We also feel that through such means, we shall be able to combat, in a scientific and ethical manner, the fads and fancies in regard to nutrition as they are drummed into the general public by television, radio and the press. Furthermore, we are of the opinion that the average practitioner of medicine has long neglected the utilization of significant information of the newer knowledge of nutrition in the daily care and evaluation of his pa-

tient. It is for this reason that we established a nutrition clinic at the ——— General Hospital, which is an 1800 bed institution, on a strictly charitable basis, so that we can better train the house and general hospital staff in applied nutrition in its broad aspects. We have also been able to carry out some basic and clinical investigations by means of such facilities with funds placed at our disposal. Only by having such a unified program could we honestly and sincerely carry out the aims and objectives of the Commission on Nutrition as approved by the House of Delegates of the State Society.

We note your comments regarding the function of Public Health Departments in the prevention of communicable diseases. We fully agree with you in this. However, infectious and contagious diseases, once prime public health problems, have left their estate to the chronic degenerative diseases, in the development and care of which nutrition plays an important part. It was therefore felt that a well-rounded public nutrition program should be established in ——— through the creation of a division of nutrition within the Department of Public Health of the City of ———.

Sincerely yours,

————————, M.D.
Chairman
Commission on Nutrition.

New Drugs

Changes in the fields of pharmaceutical manufacturing, pharmaceutical dispensing and the practice of medicine now demand more prompt transmission of information. This need is recognized in the creation of a new department, the page on new drugs, inaugurated last month. Information carried on this page is received at the last possible moment before going to press and is the latest available anywhere. Notes on new products are brief but sufficient to give the physician an idea of usefulness. Complete, detailed information will be always available at prescription pharmacies in *PharmIndex*, a bi-weekly publication prepared primarily for pharmacists.

Developments in pharmaceutical manufacturing have outmoded the once great art of prescription writing. This has both simplified and complicated the problem of providing the best possible treatment for the patient. The physician no longer needs to remember compatibilities, solubilities, flavors, consistencies or vehicle characteristics. Modern chemistry being what it is, these considerations would now impose an impossible burden. What he does need today is a reliable guide through the profusion of products available. Above all, if he is to keep abreast of progress, he needs constant flow of information about action and uses of new drugs. His need is for communication.

Pharmaceutical manufacturers have assumed much of the responsibility for research and development in the field of therapeutics. Their laboratories are working virtually day and night to develop new compounds and test them for usefulness in clinical medicine. Developments in their field have not simplified their problems but have complicated them. Production of ingredients and distribution to pharmacists is no longer a major portion of their business. The pharmacist no longer decides which manufacturer's product will go into the prescription he is filling. He must supply the brand called for by the physician. The manufacturer, therefore, has urgent need for communication directly to the physician.

The pharmacist now spends little time in compounding but much in familiarizing himself with an enormous number of products. Physicians frequently ask him for information. He has become not only a dispenser of drugs but also a dispenser of information. A recent survey indicated that 95 per cent of physicians used such service from pharmacists. It is highly significant that most inquiries were about availability of products and next most frequently sought was information on sizes marketed. The pharmacist also leans heavily on communication.

Communication in today's complex world is of paramount importance. Nowhere is it more so than in the closely related fields of pharmaceutical manufacturing, pharmaceutical dispensing and the practice of medicine. The three are independent fields of activity but highly interdependent in their need for communication. The page on new drugs has been designed to help in meeting this need. It provides quick reference for busy physicians who are trying to keep up or are looking for new help in solving a problem in therapy. •

Policies of Present AAMC Leaders

The Association of American Medical Colleges should be watched carefully by those who are concerned about the future of medical education in America. Manner in which its present leaders conducted the meeting of that organization at Philadelphia last month should arouse considerable suspicion if not actual mistrust. From some of the policies pursued, and from some of those advocated, it is impossible to escape the conclusion that present leadership of the organization is bent on taking medical education, and medicine, directly into a socialized system.

The AAMC is generally considered to be the deans' organization. While this is no longer strictly true, since certain other public officials and a considerable number of individual medical educators have now been admitted, the association is still dominated by the deans of medical schools. This is particularly true of the secret sessions, conducted in advance of the regular annual meetings, to which only the deans and a few carefully screened individuals are admitted. Others have no chance of gaining admission to these secret sessions as was amply proven last month. From all that could be learned at Philadelphia it would appear that decisions reached behind the closed doors of these gatherings are merely given rubber stamp approval in the open meetings which follow.

Prior to the experience at Philadelphia last month, it had seemed regrettable that the AAMC has been regarded with such reserve by some physicians familiar with medical education and devoted to its promotion. However, this lack of confidence becomes more understandable when it is seen that those who hold positions of great responsibility in the organization find it necessary to resort to maneuvering behind closed doors and subsequently make open advocacy of moves leading directly into socialization.

Wishing only to obtain background information concerning problems and deliberations of the AAMC, particularly those connected with operation of a university teaching hospital, the Committee on Medical Education of the Oregon State Medical Society sent one of its members as a delegate to the Philadelphia meeting. It seemed particularly desirable that the representative be allowed to attend some of the pre-conference sessions merely as an auditor. Among other closed meetings listed were two sessions of the Medical School-Teaching Hospital Section of the Association (Section members and Deans only), and a meeting of the Executive Council, deans of medical schools and representatives of governmental agencies.

Since these were listed as "closed meetings" and attendance of not more than 90 was anticipated, it was felt that a non-participating auditor would offer no problem. Three separate efforts to obtain the courtesy of permission for the representative of the Oregon State Medical Society to attend as auditor were refused point blank by messages conveyed from the Association's president. No explanation concerning the secrecy of these pre-conference meetings was vouchsafed by the president or by those who relayed his curt refusal. His brusque and discourteously worded personal explanation was that these were "closed meetings" and he wondered if the inquirer knew "what a closed meeting represents."

The Oregon Committee on Medical Education, in directing one of its members to attend the sessions, realized that neither time nor the public nature of the regular session would permit full and free discussion of all subjects. Therefore it was felt that the "closed meetings" could provide a type of information not otherwise obtainable. The Committee felt that without more adequate understanding of the problems faced by the deans and wider background in the whole field of medical education, it would be handicapped in its efforts to solve some of its own problems in Oregon. It was for these reasons that the Committee persisted in its efforts to gain admission to the closed meetings in spite of repeated rebuffs.

The prospective Oregon auditor approached these meetings in anticipation of instructive and informative conferences with no thought that the serious intentions of a duly elected representative of an interested state medical society would be so rudely spurned. He was finally forced to conclude that the rigid, Prussian attitude, displayed in forbidding admission to a physician and teacher, was due to the fact that there was something to hide.

This suspicion was enhanced on the first day of the public meetings when the president of the Association stated clearly and unequivocally

his belief that federal funds for medical education are a desirable form of subsidization. Supportive argument was given this position in a brief historical review, dating from Thomas Jefferson, of governmental attempts to become involved in scientific disciplines. The president expressed the opinion that no danger of political control is involved if the medical colleges accept, as a permanent policy, increasingly large Federal grants as long as they are *without Federal control.*

Considering some of the applause that greeted this declaration, it is obvious that other deans also favor the socialization of medicine. It is as certain as night following day that socialization of medical education involves socialization of medicine. This, by its own weight, eventually will drag the entire economy—political, social and commercial—into the dreadful abyss of communism. The point at which increasingly high taxes and budget deficits caused by large Federal grants, cease to be socialism and merge into communism has never been clear, for no line of demarcation exists.

Certainly in the field of medicine there are now clearly audible among the medical school deans, some vociferous elements, wittingly or unwittingly serving the cause of communism with sonant skillfulness. It now becomes clear why the communion of medical school deans has been regarded so reservedly by some.

Rigidly closed meetings and the indirect advocacy of communism through socialization of medicine by way of Federal control through increasingly large Federal grants, as advocated by the president of the Association, leave little room for speculation as to where present leadership of the AAMC would take us.

Justice Robert H. Jackson was serious and without guile when he said, "It is hardly lack of due process for the Government to regulate that which it subsidizes." •

An Example of Illogic

At the risk of using paper and printer's ink in amounts disproportionate to the seriousness of the subject of correspondence, an example of a commonly met form of illogic is published in the correspondence section of this issue. Names of the writer of the first letter and the name of the journal in which was published the editorial praising his work have been deleted since it is desired only to point out a process of thought. The editorial tells a story of laudable effort until, suddenly, one comes to the point at which a public health department is brought into the picture. Surprise is not lessened by the knowledge that public health physicians have been intruding into the field of nutrition for several years.

If one holds to the principle of private enterprise and individual responsibility he must, in logic, assume that nutrition is something to be controlled by the individual and not by government. In this country, policemen are not expected to advise the purchaser what foods to buy at the supermarket or enter the kitchen to tell the housewife what to fix for dinner. Yet the physician who invites the health department to increase its activities in the field of nutrition is doing something no less foolish.

Health departments have power. They should have it. The medical profession has long insisted that they should. But it is power to keep one person from doing harm to another. That is what is spoken of, in the jargon of political science, as police power. And police power should not be permitted to intrude into anything which pertains so exclusively to the individual's responsibility for his own health.

It is at this point that confusion is presented by the writer of the letter of September 19. He agrees that a health department should not be concerned with non-communicable disease and immediately asserts that infectious and contagious diseases have left their estate to the chronic degenerative diseases. This is illogic, not only unworthy of a physician presumed to have had training in scientific thought but far more dangerous than outright propaganda for totalitarianism.

If physicians are willing to abandon to government one aspect of the practice of medicine, they have no logical basis upon which to oppose government taking over every other aspect. •

in respiratory infections

NEW V-KOR™

(penicillin V potassium compound, Lilly)

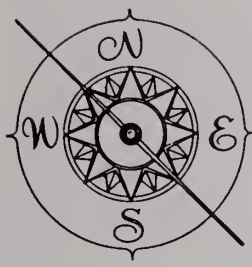
Therapeutic trio brings rapid relief

V-Kor combines in a single tablet:

V-Cillin K®—*destroys bacterial invaders*
Provides higher blood levels than any other oral penicillin; there are no "nonabsorbers."

Co-Pyronil™—*relieves congestion*
Provides quick and prolonged antihistaminic action plus vasoconstriction.

A.S.A.® Compound—*controls fever and pain*
Provides analgesia and antipyresis.



V-Kor is valuable in acute respiratory infections. It quickly eliminates susceptible organisms and controls annoying symptoms. Rapid recovery and patient comfort are thus well assured.

Usual adult dosage is 2 tablets every six or eight hours. Supplied as attractive green-white-yellow tablets.

V-Cillin K® (penicillin V potassium, Lilly)
Co-Pyronil™ (pyrrobutamine compound, Lilly)

Use and Abuse of Urethral Catheters

C. D. Creevy, M.D.
MINNEAPOLIS, MINNESOTA

Like most arts, that of catheterization requires knowledge of many small details and the patience to apply them carefully.

The urethral catheter can be an indispensable instrument or a deadly weapon. It has been used since before the dawn of medical history; curved bronze catheters were found in the ruins of Pompeii. Catalogs* list a remarkable assortment made of rubber, latex, woven fiber (silk, linen, nylon), molded plastic, glass, and metal. They take many forms. Their shafts may be flexible or stiff, curved or straight. Tips may be round, olive, or conical; any of these may be solid or hollow. Some have screw tips for attachment to filiform bougies. They are also available with mushroom (Pezzer) and winged (Malecot) tips to retain them in the bladder. These have been made obsolete for use in the urethra by the Foley balloon catheter, because it eliminates the pain and trauma which invariably accompany the removal of catheters with fixed lateral projections. They are, however, still useful for cystostomy and nephrostomy. Glass and metal catheters should be abandoned because their hardness and rigidity make them dangerous, and because of the danger of breakage of the former. The rubber catheters with tips which are solid back to the eye are a nuisance because they cannot be used with stylets.

One may fulfill all of the needs of an active urologic practice with five kinds of urethral catheters (Fig. 1). These include the red rubber or latex Robinson type with a hollow tip and two or more eyes near the vesical end; the rubber Thieman catheter with an angulated olive tip; the Phillips woven fiber instrument, with a conical tip terminating in a male screw for attachment to a filiform; the well-known Foley catheter and Alcoek's modification thereof with two lumina. Foley catheters have two advantages over all other types for continuous drainage: inflation of the balloon retains them in place without adhesive, and they permit escape of the urethral secretions invariably provoked by the long continued presence of a foreign body.

Stylets are used to stiffen hollow-tipped rubber or latex catheters and, if desired, to give them curves corresponding to those of the male urethra. They may be stiff or malleable and are made in straight and curved models. Proper use of the curved stylet obviates the need for the Thieman catheter in prostatism, but the latter eliminates the nuisance of inserting and removing the stylet. It is important to remember that

Presented at 66th Annual Meeting of Idaho State Medical Association, Sun Valley, Idaho, July 8, 1958.
*Those interested may profit by consulting the catalogs of the American Cystoscope Makers, New York, and C. R. Bard, Inc., Summit, N.J.

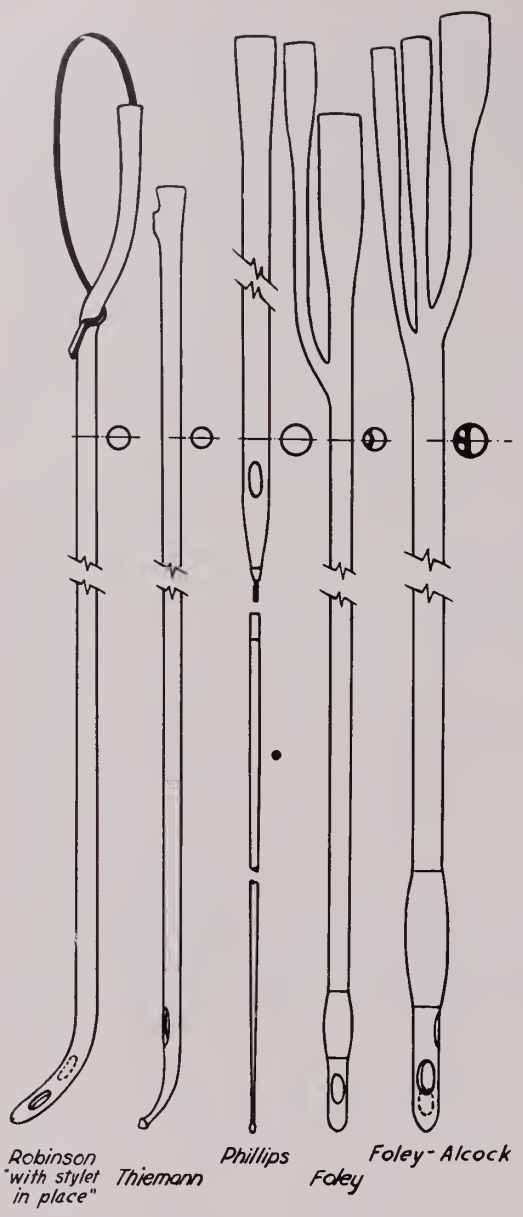

Fig. 1. Types of urethral catheters.

stylets are intended to guide the catheter through the curved and sensitive urethra, *not* to permit one to push through the substance of the prostate or the wall of the urethra. The use of force with urethral instruments is always a mistake.

A water soluble lubricant such as KY jelly is an indispensable accessory to the catheter. Vaseline and mineral oil attack rubber, are hard to wash off, and forceful injection of the latter into the urethra may cause oil embolism. While one ordinarily dips the tip of a catheter in lubricant, it is often helpful to inject 5 cc. lubricating jelly into the urethra, especially when some difficulty is anticipated. For this, one needs a glass plunger urethral syringe, the tip of which is longer and broader than that of the ordinary Luer syringe; it fills the external meatus so that the lubricant goes into rather than around it (Fig. 2). While this syringe may be used to irrigate the bladder, its manipulation requires two hands. For this reason a syringe with a rubber bulb and a tip that fits the flared end of the catheter is handier for this purpose.

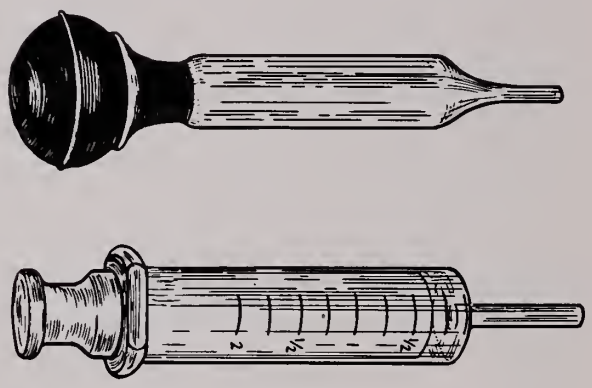

Fig. 2. Asepto and urethral syringes.

Another useful accessory is the bedside irrigator which, used with a Foley-Alcock catheter, permits continuous irrigation, particularly after transurethral resection; it may be a helpful temporary measure during bleeding of spontaneous origin (Fig. 3).

Munro's tidal irrigator is said to be useful for maintaining the tone of the detrusor during the phase of spinal shock following injuries of the spinal cord, but requires so much attention as to be impractical unless trained attendants are available 24 hours a day.

Infections of the bladder which resist good therapy with antibiotics or urinary antiseptics, particularly in the presence of residual urine, may sometimes be greatly improved by use of the "bladder splint" (Fig. 4). The small limb of a Foley-Alcock catheter is connected through a Murphy drip with a reservoir containing an antiseptic such as 0.8 per cent sulfanilamide. The large limb is connected, through an inverted Y tube attached to a bedside stand, to a urinary receptacle on the floor. Flow is controlled by a Hoffman clamp below the drip. If the open apex of the inverted Y is just above the level of the anterior wall of the bladder with the patient supine, or above the vertex when he is sitting up,

a small puddle of antiseptic in any desired concentration will bathe the bladder.

This method is particularly useful when resistant chronic inflammatory changes in the vesical mucosa are so severe as to conceal the ureteral orifices or a suspected neoplasm, as well as when symptoms do not yield to ordinary treatment. By using solution G** for the irrigation, it may be possible to dissolve the encrustations of a chronic ulcerative cystitis due to urea splitting bacteria. If the solution irritates the bladder, it may be diluted. The object is to convert the insoluble calcium salts in the encrustations to soluble calcium citrate, and to wash it out.

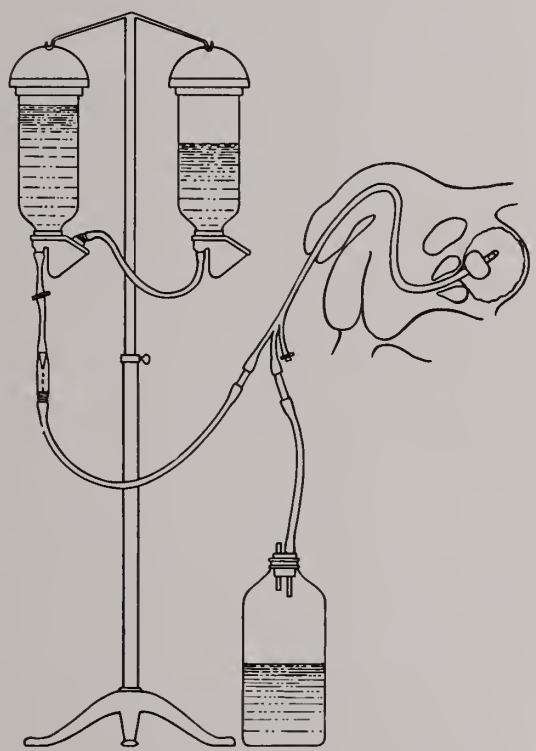

Fig. 3. Bedside irrigator.

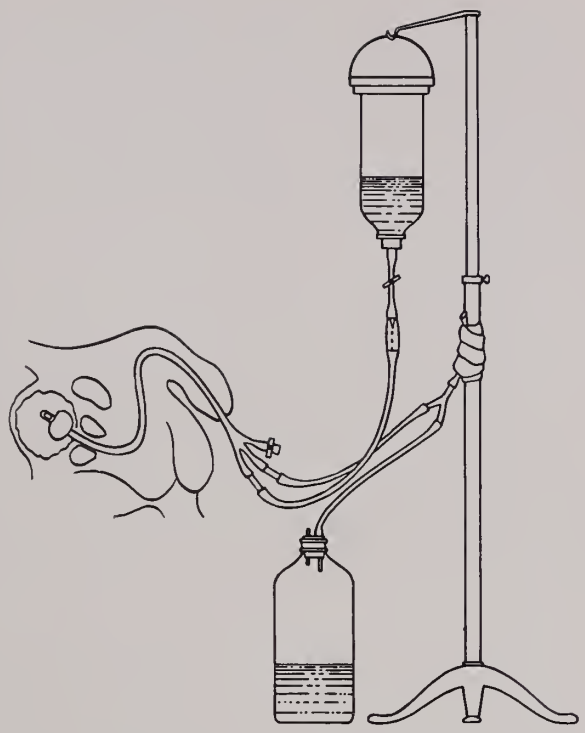

Fig. 4. Bladder splint.

Uses of the Catheter

A simple enumeration will suffice here. The catheter is indispensable for the measurement of *residual urine*, especially in the patient with a normal feeling prostate and increased frequency of urination in the absence of pyuria. Its use for the relief of *acute urinary retention* is obvious.

**SOLUTION G.

Citric acid monohydrate	32.25 Gm.
Magnesium oxide (anhydrous)	3.84 "
Sodium carbonate "	4.37 "
Water to make	1000.00 cc.

It is well to emphasize here that there is no evidence whatever that sudden emptying of the distended bladder is in any way hazardous. One should, however, strive to prevent redistention as well as infection. It is also obvious that use of the catheter will permit the *location of strictures* of the urethra, although other measures will be needed to determine their caliber and length. *Clots may be evacuated* from the bladder by the judicious employment of the catheter, although a larger than normal size will be required (see below). Smith, Toulson, *et al.* have found that the removal of clots is facilitated by leaving 20 cc. of saline containing 100,000 units of streptokinase and 25,000 of streptodornase in the bladder for 20 minutes. The dissolved clots are then usually easily washed out with a syringe. If clots are large or old, repetition may be necessary.

Catheters are left *inlying* for a number of reasons. Chief among these is *urinary retention.* In the acute form the purpose is to rest the detrusor in the hope that the retention was precipitated by active swelling of the prostate superimposed upon a pre-existing enlargement, and that the former will subside, permitting normal urination. In the case of acute *postoperative retention,* the objective is to prevent atony of the

detrusor from overdistention until the factors responsible for the inability to micturate (narcotics, pain in the incision, enforced rest in bed) have disappeared. *In injuries of the spinal cord,* the aim is to await the return of tone to the denervated bladder as a result either of recovery of the spinal cord or of the establishment of an automatic bladder.

Occasionally, rest of the detrusor with the inlying catheter will so increase its tone that the patient with residual urine from a *degenerative lesion of the spinal cord,* such as tabes dorsalis, will again empty his bladder completely, particularly if assisted by the cholinergic drugs and by urination at fixed intervals. He may have to supplement the feeble vesicle contractions by suprapubic pressure, and by trying to void in two stages. This is likely to fail if atony of the bladder is severe.

Perhaps the commonest indication for use of the inlying catheter is presence of *chronic incomplete urinary retention, due to prostatism* and complicated by impaired renal function due to "backpressure," or by an acute febrile infection. Objectives are improvement of the renal function and subsidence of the acute phase of the infection.

Another but less well-known use of the catheter is the *rapid dilatation of urethral strictures* when this is desirable to permit drainage of the distended bladder or cystoscopy. This is usually accomplished by first dilating the stricture as far as possible with a filiform and Phillips catheter. If dilatation cannot be carried far enough to permit insertion of a small Robinson or Foley catheter (the latter is available in 10 French) on a stylet, the largest acceptable Phillips catheter is tied in with strips of adhesive (Fig. 5). Twenty-four hours later enough softening of the stricture will usually have occurred to permit dilatation to two to four sizes larger, using the Phillips catheter and injected lubricant without withdrawing the filiform. This can be done daily until a size 12 Foley can be inserted. Thereafter a styletted Foley two sizes larger can be inserted each day until the desired caliber has been reached.

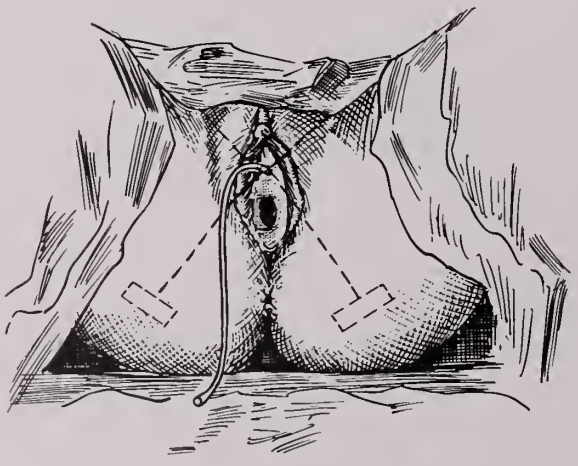

Fig. 5. Securing inlying catheter in the female.

Use of the inlying catheter for the local *application of antiseptics* has been mentioned in connection with the "bladder splint."

Lastly, the catheter may be used to achieve *cleanliness in irreparable urinary incontinence* in the female. An incontinence bag or clamp (Cunningham or Foley) is preferred in the male who can tolerate it because it avoids the infection that inevitably results from use of the catheter.

Technique of Catheterization

While it may seem very elementary to speak of this, the difference between good and poor technique in catheterization may make the difference between comfort and misery, or between health and protracted illness or even, in extreme cases, death. All catheters should be washed thoroughly inside and out with soap or detergent and hot water, and rinsed with plenty of hot water. Rubber or latex catheters should then be boiled for 15 minutes. They may also be autoclaved for 10 minutes at 15 pounds pressure and 250 F. A slower but effective alternative is to soak them for 30 minutes in 1 to 500 solution of oxycyanide of mercury (*not* cyanide of mercury). They may then be used without rinsing, unless it is desired to secure urine for culture, in which event the antiseptic should first be flushed out with sterile water. All accessories used with the catheter should be sterile.

The most convenient position for catheterization requires flexion and abduction of the thighs with the heels resting upon the bed or examining table; knee crutches are a great convenience in the office. A good light is essential for catheterization of the female.

The foreskin is retracted in the male and the labia are separated in the female. The penis or labia are washed with soap or a detergent, such as Phisohex, and rinsed with sterile water. It is desirable then to place a pledget of gauze soaked with 1 to 2500 aqueous Zephiran upon the glans or introitus, and to leave it for a few minutes. If

a male patient is apprehensive or hypersensitive, it is a humanitarian act to employ topical cocaine, provided no trauma has been inflicted first. Four and one half grains (270 mg.) of cocaine are freshly dissolved in 10 cc. of sterile distilled water, and injected *gently* into the urethra with a quarter ounce Asepto syringe (a vigorous injection may force the cocaine into the bloodstream with serious or fatal results); the solution can be retained in the urethra by wrapping a strip of gauze snugly around the corona. Ten to fifteen minutes should be allowed for the cocaine to act. Catheterization will be facilitated and pain lessened if 5 cc. of KY jelly are then injected gently into the urethra with an urethral syringe. One may, of course, mix the cocaine with the lubricant, but this takes longer than the above method. Preparation of the mixture beforehand is undesirable because deterioration of the cocaine may occur. There are preparations of other local anesthetics in lubricants on the market, but I have not been impressed with their effectiveness; xylocaine is effective but costly; cyclaine will serve.

Selection of Type

The type of catheter to be used depends upon the objective. For measurement of the residual urine or other single catheterizations, a Robinson catheter size 14 French is ordinarily preferred, but the Thieman is better for prostatics; if it is to be left inlying, a Foley catheter, size 16 to 18 French is satisfactory. If continuous irrigation is intended, a size 18 to 22 Foley-Alcock is used. Use of the filiform and Phillips catheter in strictures has already been mentioned. For evacuation of clots, one needs a comparatively stiff Robinson catheter size 20 to 22. It is helpful to cut a couple of extra eyes near the tip. A soft catheter will collapse when one tries to aspirate clots. Nevertheless, a soft catheter is preferred for continuous drainage in the absence of clots because its presence inflicts less trauma upon the urethra.

If no difficulty is anticipated, the catheter may be inserted with a sterile hemostat. Care should be taken that the open end of the catheter does not become contaminated (Fig. 6). If difficulty is expected, it is better to wear sterile gloves. It is of the utmost importance to be *gentle,* remembering that the object is to *follow* the curve of the urethra, not to alter it, and that the use of force can only do damage. If the catheter is arrested before the external sphincter is reached, one must assume that a stricture is the obstacle. One then resorts to the Phillips catheter.

If an obstruction is encountered in the region of the external sphincter, spasm is a likely cause. A narcotic given intravenously will minimize delay. When sedation appears, one may then use a catheter fitted with a stylet with a Van Buren curve, or use the Thieman instrument. If lubricant has not been injected, it should be used now. In difficult cases the styletted catheter has the advantage that it can be guided both with the handle and by a finger in the rectum, thus directing the tip forward over a protruding middle prostatic lobe. If this maneuver fails, one may resort to anesthesia (spinal or general), *not* to permit one to force the catheter in, but to secure relaxation which will permit instrumentation without force.

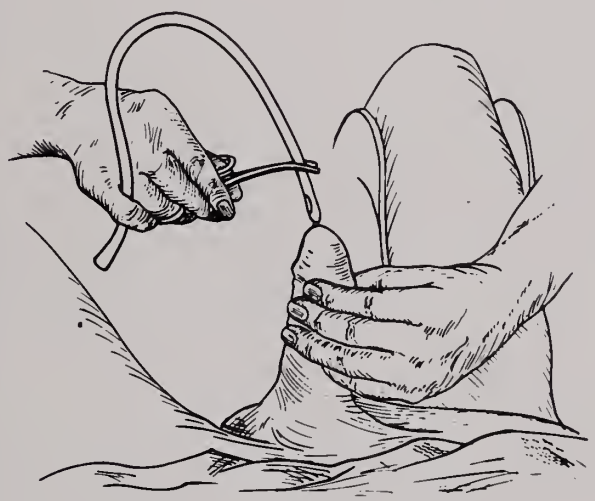

Fig. 6. Introduction of catheter using hemostat.

If this fails and the bladder is distended, one may aspirate it, first infiltrating with procaine a small patch in the midline directly above the symphysis pubis. A spinal puncture needle is convenient. Since most instances of impassable obstruction in the absence of stricture are due to spasm of the external sphincter from distension of the bladder, one may usually catheterize the patient with ease immediately after aspiration; a Foley catheter should be used and left inlying.

To recapitulate—instruments should be sterile; technique aseptic and gentle; and lubricant used freely, by injection if any difficulty is anticipated or encountered. Topical anesthesia is desirable

in apprehensive patients not previously traumatized. General or regional anesthesia may be essential to relax spasm of the sphincter.

Prolonged Catheterization

If repeated instrumentation is necessary, or if an inlying catheter is used, it is probably desirable to use an antibiotic with a fairly wide spectrum, avoiding those which are known to produce reactions frequently, particularly if a long period of treatment is expected. Gantrisin and the triple sulfonamides are probably to be preferred for ordinary use, reserving the more potent agents for complications. It is far more important to prevent redistension and infection than it is to worry about "sudden emptying" of the distended bladder. When inlying catheters are used for long periods, they are best changed every five to seven days to prevent plugging by encrustations of urinary salts, mucus, or thick pus. It is well to allow an hour to elapse between removal of the old and insertion of the new catheter so that infected material may drain out of the urethra. When a catheter is removed after a period of rest of the bladder instituted because of acute retention, it is desirable to measure the residual urine 12 hours or so later, lest a high grade chronic retention be overlooked. Catheters which have been left inlying in the presence of infection should be destroyed upon removal because they cannot thereafter be sterilized with certainty. •

University of Minnesota Medical School, (14).

(Washington AMA office has prepared Special Report 85-14 on legislation of medical interests introduced in the 85th Congress. This complete, detailed analysis will be sent to anyone requesting it from William J. Kennard, M.D., Washington Office, American Medical Association, 1523 L Street, N. W., Washington 5, D. C.)

From the AMA Washington Letter:

Complete Report on Last Session's Legislation now Available

The Special Report notes that in the past year the American Medical Association was fortunate in its legislative work. It supported most of the 19 major bills passed by Congress, and not a single major bill opposed by the Association became law.

In reviewing the year's legislative activities, the report declares:

"These pages are specific evidence, if any is needed, that medical legislation is one of the most popular areas of Congressional activity. Each year this Special Report is a longer document, because more and more health and medical bills are introduced. Ten years ago the Washington Office was following 200 measures through Congress; in the past Congress, we kept watch on 704 medical bills and resolutions of the 20,604 total legislative proposals introduced during the two years of the 85th Congress.

"This annual gathering together and tabulating of legislation serves a number of purposes. Its immediate value is as a sound source of information on exactly what measures were introduced and what happened to them during the past Congress. Its long-range value is its disclosure of legislative trends over the years. An issue seldom comes to the fore overnight, or even in a year; but with a complete record available, an issue's evolutionary process can be traced to inception of the idea . . .

"Successful opposition to the addition of compulsory health insurance to the social security system occupied more time and effort on the part of AMA employees and physicians everywhere than any other one assignment. This proposal was strongly supported by organized labor, and without question will be pressed again next year. To meet this issue, the Association has a positive program that will continue to bring private health care to all the population at a reasonable cost . . ."

Treatment of Injuries to Athletes

Don H. O'Donoghue, M.D.
OKLAHOMA CITY, OKLAHOMA

Athletic endeavor has from time immemorial been the natural inclination of our youth. In pre-high school this has been, until recently, of an unorganized type. By the time high school is reached, although a lesser proportion follow organized athletics, the degree of organization has increased. The college years find a still smaller but none-the-less considerable group to whom athletics is a major, sometimes the major, interest.

Whereas the spotlight of publicity has shone brightly on those facets of great reader interest, comparatively little attention, outside the confines of the sport itself, has been paid to injury and even less to conditioning. An occasional blare of publicity follows major injury to a stellar athlete or the untimely death of a budding prep school player. Occasionally this triggers a lay magazine article on the importance of proper equipment and the value of physical conditioning as important factors in the prevention of injury. In the final analysis, however, the lay public and, I fear, the majority of our own profession, has little knowledge of the actual mechanics of training or the treatment of athletes who are injured.

In order to realize what makes a given program superior and another inferior, it is necessary to set some criterion of perfection for any given situation. Obviously, all schools cannot have identical programs. Each must modify the ideal to best fit the realities of its particular situation. All should strive for continuous improvement.

It should be the ambition of any physician interesting himself in the treatment of athletes to do everything within his power to improve the preliminary training of these young men. This will accomplish two ends. It will diminish the total number of injuries, and, if injury does supervene, he will have a fit patient to treat.

Why is it important for young men to participate in athletics? Perhaps the solution of the problem of athletic injuries lies in the prayer of the timorous mother that her boy not compete. Abandonment of sports would certainly be the quickest way to prevent injuries to the contestants. Are there real benefits—true tangible benefits—to be derived from athletics? Let us examine for a bit the pros and cons of this question.

Benefits of Athletics to the Participant

Physical benefits.

No one can seriously doubt that athletics in its various phases serves to build a strong, healthy body better able to serve its possessor through a long and useful life. The myth of the "athlete's heart" has been dissipated. The ex-athlete who turns fat when his years of competition have ended at least has postponed his impending adiposity throughout the years of his vigorous training. The trained athlete is outstandingly superior to his more sedentary fellow in drive and in stamina, and is better fitted for both work and play.

Character building.

Under proper circumstances and surroundings, the athlete acquires or strengthens many attributes of character that will serve him well throughout his life. The fact that the word *sportsmanship* seems trite in no way has changed its reality as a trait of character. Team effort as opposed to individual glory; the ability to take a job and follow it through; the necessity to take it as well as dish it out; the sacrifice of immediate

Read before the 66th Annual Meeting of the Idaho State Medical Association, Sun Valley, Idaho, July 6, 1958.

gain to the final goal—all are basic lessons learned by the successful athlete. The development of desire provides its own incentive toward character building that will serve well throughout life.

Material benefits.

Much has been said about scholarships, especially by those who are the least informed. Suffice it to say that an athletic scholarship does permit many a lad to finish his education who otherwise would have dropped out of school long before. The athlete, scholarship or not, has a keen incentive to stay in school. I think a good estimate of the quality of the scholarship program of a given institution can be made from the proportion of the scholarship boys who go ahead to graduation. Every effort should be made to encourage the player to continue his education even if it requires his staying on in school after his athletic competition has terminated.

Later benefits.

So much for the benefits of athletics to the student in school. What about after graduation? It has been said that the athlete out of school is as a fish out of water. Not so! Many athletes make some form of physical education their career. We all know of the big name coaches. But what about the myriads of others in every crossroads and hamlet of our country? Look in the grade schools, the high schools, the YMCA programs, the sand lots, the boys clubs, the Boy Scouts, and you will often find an ex-athlete carrying on the program. The athlete irreplaceably fills a need in training of the youth of America.

On a more personal plane, many athletes make contacts during their school years with men who are seeking their very type to man the leading jobs in industry. In 30 years of knowing and working with athletes, I have seen most of them display the same fine enthusiasm and attain the same great success in life that they did in school. Many of them have very responsible positions for which the original contact was made in school.

Yes, I think we can make out a very strong case *for* the athletic program. What about the other side of the coin? How about the disadvantages?

Disadvantages of the Athletic Program

Does athlete participation interfere with studies?

Perhaps it does sometimes. Far more frequently, however, it provides incentive to the student to work harder in order to justify his athletic participation and permit its continuation. Undergraduate students must find time for both studies and athletics. They are encouraged to budget their time by the very necessity for study, practice and a good night's sleep.

Does the athlete get a big shot complex?

Not for long! With few exceptions his teammates take care of that. On the other hand, the cocky, smart alecky youngster is trained to the necessity of cooperation and to appreciate the true worth of his teammates.

Is the athlete pampered in school?

No. On the contrary, the spotlight of publicity prevents this in that the stars and the others have little opportunity or desire to be favored in any way.

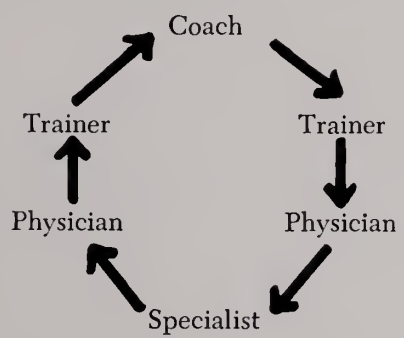
Does athletic training impair physique later in life?

Emphatically no. The exceptions prove the rule that athletes as a whole live longer, more active lives.

Do athletes get physical injuries?

Emphatically yes! Here is a very real objection to the athletic program. In fact, almost the only real disadvantage.

Here is our challenge: What has been done, is being done, and can be done to (1) prevent injuries, (2) minimize temporary disability, (3) prevent permanent disability?



Much, indeed, has been accomplished in the last 20 years toward these ends. Not too long ago the trainer in most institutions was either non-existent or was a graduate from the supply room, his major equipment being a roll of tape and a bottle of linament. His aim was to "keep 'em rollin'." The doctor was a necessary evil to be avoided if possible. The conviction was prevalent that, once the player reached the doctor his days as an athlete were over. Too often this was true, for two pertinent reasons. First, the player reached the doctor as a last resort and long after ideal treatment should have been instituted. Second, the doctor failed to realize the importance, to that particular individual, of 100 per cent rehabilitation, and tended to belittle his keen desire to return to athletic competition.

In the past, there has been a tendency on the part of the coaching staff to demand that the player continue in spite of injury or be labeled

yellow. The trainer was urged to slap on some tape and return the man to the game—often to the detriment of the player, the team, and the game! More enlightened consideration has revealed that *everyone* is better served by promptly and ably treating the injured player and so obtaining his recovery before he does himself irreparable damage. The successful coach is indeed the protector of his players and seeks to prevent permanent injury of either body or mind.

In the well run athletic program of today, the coach, the trainer, the team physician and the specialist all combine in one effective working unit designed to maintain the players in optimum physical and mental condition.

The time when the player, coach, trainer and physician are all working at cross purposes is rapidly becoming a thing of the past. Athletic injuries are becoming less frequent. Severity of injuries is less. Periods of disability are shorter. The degree of recovery is more complete. The essential ingredient is the complete confidence and cooperation of coach, trainer and physician if the program is to succeed. The familiar medical triad—prevention, treatment, rehabilitation—is doubly applicable here. The cycle of cooperation and responsibility runs:

So, we have set the theme. Athletics are important and should be continued. Conditioning is important and will decrease injuries. The injury should be prevented if possible. Once an injury occurs, it should be treated promptly and adequately. Recovery must be complete. One hundred per cent rehabilitation must be the goal.

A college trainer or a high school coach who finds it necessary to handle his own training problems (in addition to his coaching), or the local physician who helps out with the high school program will find that his duties in this respect are divided into these three fields: (1) prevention of injuries, (2) treatment of injuries, and (3) rehabilitation of the athlete following injury.

In the ideal training program more time will be spent on prevention of injuries than is spent on treatment. The average layman and many school officials fail to realize the time and effort that goes into preventive training in such a program. It should be emphasized that treatment is only part of the trainer function and indeed the less important part. The more injuries that can be prevented, the fewer there will be for treatment and rehabilitation. The most important phase of prevention of injury is conditioning. This is a major and vital part of the program. It has been aptly said by a famous trainer, "conditioning is more important than skill, because conditioning helps prevent injuries and the best halfback in the world is of no value sitting on the bench."

Conditioning Begins in Spring

The conditioning program for the fall season of football should begin with the close of school in the spring. Major portion of this conditioning program must be carried out by the athlete himself. He cannot be expected to do it without proper direction and instruction. Each boy should be given a set of exercises which he should use at least three or four times a week until the first of August and daily thereafter until fall practice begins. He is encouraged to supplement these exercises by jogging, running, endurance and sprints. He is also encouraged to maintain his training, at least to some degree, by getting plenty of rest and sleep, eating proper food and avoiding dissipation throughout the summer months. Furthermore, each boy should be assigned the weight at which he is expected to be when he reports for the first day of fall practice.

No team is any better than the physical condition of its players. If not in shape, an individual player is affected in (1) his ability to play, (2) his mental attitude, (3) his determination, (4) his team work, and (5) his spirit. Any, or all of these factors may be affected to the point that he is unable to reach his full capacity.

The late Red Sanders, head football coach at UCLA, recently made the statement that football is 40 per cent ability—60 per cent physical condition and mental attitude. Tom Harmon, former Michigan All-American and presently a sportscaster, went Red one better on a recent radio show when he stated that football these days is 90 per cent mental and physical preparation. It all boils down to the axiom, *no team is better than its physical condition.* The objective

must be to get the team, as a whole and as individuals, physically stronger and tougher than their opponents. The players must realize that many fail to make the team for no other reason than that they are unwilling to pay the price of getting themselves in tiptop physical condition.

Equipment

A second phase of prevention is good equipment. This is an absolute necessity for a sound program. Many schools have a limited budget with which to work and this of necessity handicaps them in the purchasing of quantities of equipment. Although the budget is limited, it is not advisable to purchase large quantities of second rate equipment because in most instances this would mean that none of the players has good equipment. Too much emphasis cannot be placed on proper headgear. The modern, light weight headgear is extremely protective but does little good if the suspension apparatus is not properly placed to keep the head from contact with the inside of the helmet. Once good equipment is supplied, the coach should insist that, in order to compete, the players must wear the equipment prepared for them. Rushing into the contest without properly placed shoulder pads and protective knee pads is to be condemned.

Proper equipment must be supplemented by adequate taping or wrapping. There may be some difference of opinion among trainer and team physician as to the advisability of wrapping or taping every player's ankles. There is no question but that every weak joint or any joint which has been previously injured should be protected adequately before competition is permitted. Time will not permit here the discussion or the description of the various types of taping and wrapping, but one who is responsible for the care of a team must provide himself with the necessary knowledge and skill to be able to supervise this phase of the training program.

Prompt Examination

If injury cannot be prevented, the first important step is early detection of the nature and degree of the injury. The golden time to examine an athlete for injury is at the time he is hurt. Frequently, this first examination is by the coach or the trainer. He must conscientiously and objectively examine the player to determine as well as is possible the extent of his injury. Is it serious enough that he should be removed from the game? Should he be seen by a physician? May he be strapped up and returned to competition? To err is human but the margin of error can be reduced drastically by realistic consideration of the individual injury. Wishful thinking has no place in evaluation of injury since too much is at stake. The player is eager to continue and should not be deprived unnecessarily of this privilege. Still it is better to err on the side of conservatism since a little time will usually solve the problem.

If the injury puts the player on the sidelines, what then? If the program does not include a skilled trainer, by all means the injured person should be examined by a physician at once. When you, the physician, are called, what then? If you are to treat injuries, you must form the habit of early examination. The too prevalent custom of packing in ice and compression wrapping until the next day is a dangerous one. Frequently, prompt, careful examination will make the diagnosis easy. Several hours, or days later, swelling, edema, hemorrhage and pain may make it very much more dificult to reach an accurate evaluation of the location and extent of the injury.

So, the first step in a successful program is early examination and prompt treatment. The habit of treating Saturday's injuries on Monday is to be deplored. Once treatment is decided upon, carry it out confidently. If consultation with a specialist is needed, seek it promptly so that the specialist too may be able to take advantage of the optimum time for treatment. Once treatment is instituted, it should be carried out to its completion, with no compromise because of extrinsic pressures.

Concepts

I have found the following concepts of treatment to be of great value:

1. *The goal must be complete recovery.* I have heard eminent physicians say that, following a severe injury a player should not expect nor indeed be permitted to return to competition. This is specious reasoning. To many an athlete, this means a complete change in his career. Would you blithely tell a medical student or intern to change his career if you, by a better effort, could make such a change unnecessary? These boys are entitled to medicine's best effort.

2. *Avoid expediency.* Too often the decision as to treatment may be unduly influenced by immediate considerations. The player's desire to

compete, over-optimism, failure to recognize impending permanent disability, interference with school attendance, even convenience, may be permitted to be the deciding factor when objective medical evaluation should rule.

3. *The best treatment must be done.* This seems rather obvious but often we find ourselves saying, "Well, that ligament should be repaired but—." That fateful "but" may make the difference between some lesser per cent of recovery and return to normalcy.

4. *Competitive ability should be restored.* The physician must acknowledge the importance of restoring competitive ability to the player. If he does not, he has no business treating athletic injuries. A concert pianist would not trust his hands to one who believes that piano playing is unimportant. A vital link is formed between patient and doctor when there is unanimity of opinion as to the importance of the goal sought.

5. *Treatment must be prompt.* Unnecessary delay, once decision has been reached, or in fact, unnecessary delay in making that decision is not compatible with good results. We have been able to show conclusively that delay very often spells the difference between success and failure of treatment.

Rehabilitation

An integral part of the treatment of any injury is rehabilitation. Rehabilitative exercises should be started just as soon as possible after an injury. In fact, it is advisable to continue exercising all parts of the body which are not directly affected by the injury. By this method, muscle atrophy can be prevented and it is much better to prevent atrophy than to have to relieve it. If the injured extremity is kept in relatively good condition throughout the proper period of immobilization, the rehabilitative period can be much shorter for the part itself since the other muscles of the extremity can take over some of the load. For example, if the knee is injured and requires splinting and protection, the ankle and hip can be kept in good condition by active exercise. So, also, if the ankle is immobilized, the knee and thigh can be exercised.

In so far as the injured part itself is concerned, along with necessary immobilization and protection, sitting type exercises can be done from the first day which may be quite effective in reducing atrophy. The time required for rehabilitation will be in direct proportion to the length of time of immobilization. Immobilization, while extremely important, should not be prolonged unnecessarily. As soon as the conditions of the injury permit, very active rehabilitation should be carried out on the part involved. We use an outline of knee exercises which we hand to each postoperative knee patient as soon as his splint is removed. (See table 1.)

TABLE 1.

AN EXAMPLE OF REHABILITATIVE EXERCISES TO THE QUADRICEPS MUSCLE FOLLOWING KNEE INJURY OR OPERATION

1. Sit on the side of the table with the legs hanging over in a verticle position.
   - A. Raise the foot on the involved side to the horizontal position slowly to the count of 3 seconds.
   - B. Hold in horizontal position to the count of 3 seconds.
   - C. Lower slowly to the count of 3 seconds.
   - D. Rest for the count of 3 seconds.
2. Repeat this ten times. Rest a little.
3. Do this through 3 series of 10 times each, i.e., thirty times total.
4. These exercises should be repeated two or three times a day depending upon your tolerance.
5. When you are able to complete the series of 30 elevations, add weight to the foot at the next period of exercise and raise this weight until you can do it the full 30 times.
6. Continue these exercises, adding weight successively according to your tolerance until you are raising 25 or 30 pounds through this series. You may use the opposite knee for control if you like to get some idea how much you should expect to raise on your injured leg.
7. Make a chart for your daily progress and record on it each period of treatment, noting the ascending curve of your weight lifting capacity.
8. These exercises should be continued until the circumference of the involved leg thigh is the same as the uninjured thigh and until you are able to raise as much weight as you can on the uninvolved side. As your strength increases, these exercises can of course be supplemented by other exercises, such as going up and down stairs, partial knee bends, single knee bends, etc.

Selling the Program

But hold! Will such a program be accepted? Certainly, but not without some time and effort on the part of the doctor. He must be able to show conclusively that the program is better, not for the doctor, but for the school, the coach, and especially for the player himself. This *may* require educative effort; it *will* require time. The doctor himself must be prepared to cooperate fully, with ability and with interest. Then, as the doctor improves his program, the trainers and coaches will see the result. The injured knee regains unimpaired function. The sprained ankle

responds to treatment and a short complete layoff is followed by normal function as opposed to the player having a limping, ineffectual season.

The coach will note that prompt treatment restores the player more rapidly in the long run. Usually, the alternate is a more effective player than the crippled star. So, complete rehabilitation of the star is worth a period away from the game.

The player will not fear the doctor who has a sympathetic and understanding attitude. He notes that his buddy gets well. He soon takes treatment for granted. He expects to get well. The player will accept your recommendation for treatment, and you must be prepared to take the responsibility for it.

These are not idle dreams of Utopia. This can be done and has been done. It must be our aim to make it the rule, not the exception. Nor does it require a full scale, university type training program. It does require an able, conscientious coach, and a physician who will interest himself in the peculiar problem of the athlete.

The physical condition of our youth is vital to the welfare of our country. We must push steadily forward toward its improvement. This cannot be done in America by European type health clubs or hiking clubs or sun worship. It can be done by well organized competitive type athletics, provided the proper emphasis is placed on physical examination, training, and adequate medical supervision. •

The author wishes to acknowledge the great help received from Mr. Ken Rawlinson, head trainer at the University of Oklahoma, in the preparation of that section of this paper pertaining to training.

University of Oklahoma School of Medicine, Dept. of Orthopedic Surgery and Fractures.

Property Condemnation

The constitution of the state of Washington safeguards private property rights and in so doing provides that no private property shall be taken or damaged for public or private use without just compensation having first been made, or paid into court for the owner. The state, of course, can take private property from its citizens through the means of condemnation. In doing so, the state must get a Court order to the effect that the property in question is needed for a public use. The state must then pay for the property it condemns.

Many lawsuits develop over what is the proper amount to be paid by the state for property taken in condemnation actions. If the property owner is not satisfied with the amount offered by the state, he may take his case to the Superior Court and have a judge or a jury pass on the question of what his property is worth. However, once a judgment is entered in the Superior Court, the state may take possession of the property by paying the amount of the judgment into the Superior Court for the property owner. This is true even though the property owner is still not satisfied with the amount awarded him and, therefore, wishes to appeal his case from the Superior Court to the State Supreme Court.

The state also can appeal. However, if the state appeals, it cannot take possession of the property pending the outcome of the appeal. In a recent case the state paid the amount of a Superior Court judgment into court for the property owner, took possession of the property, and then appealed to the Supreme Court contending that the amount of damages assessed by the jury for the property was excessive. Our state Supreme Court refused to hear the state's appeal and dismissed it saying that the state "cannot have its cake and eat it too." In other words, if the state wanted possession of the property, it had to pay the damages assessed into Superior Court, and once the state did that it accepted the award of the jury and waived its rights to appeal to the Supreme Court.

Treatment of Burns with Particular Reference to Local Care

Michael L. Mason, M.D.
Chicago, Illinois

I have chosen the topic of care of burns with particular reference to local care because it has seemed to me that so often the discussion of burn care has been devoted largely to control of the physiologic disturbances and to management of complications due to neglect of principles of good wound treatment.

I do not wish to minimize the tremendous significance of the basic studies in physiology and chemistry that have so advanced our knowledge of this most serious of injuries. Because of these studies, burn patients now survive extensive injuries which would probably have ended fatally 20 years ago, although actually statistics are not always clear on this point. However, death is not the only criterion by which to judge burn care. We must save our patient's life to be sure and that, of course, is the first consideration. However, we wish also to return the patient to a useful life as quickly as possible with the minimal amount of scarring, and psychic, physical and financial disability.

Some Reports Are Confusing

It has seemed to me that much of the discussion on the care of burns centers about a complicated mixture of chemical formulas and charts and graphs. The physician who cares for burn seems to be left in a state of confusion as to just what is essential and what the guiding and basic principles of burn wound care actually are. Certain facts have become well established and these should be properly emphasized. However, too often the reports of new experimental studies confuse the issue. The surgeon somehow is made to feel that unless he carries out all the various blood chemistry determinations, and administers the various electrolyte solutions as advised, he is not up-to-date.

It is important, I think, to distinguish between the valuable experimental work which is going on all over the country and the care of burns as it must be carried out in a clinical fashion. It is not necessary to verify all the experimental studies on every patient. What the surgeon needs however is a basic concept of the disturbances due to burn, and logical methods of meeting the requirements for care—both local and general.

It must be remembered that there are two important phases in burn care and that each has its own indications. I might take an example from the care of another type of open injury to illustrate the point I wish to make. Take, for example, an open fracture of the femur associated with great tissue damage and severe hemorrhage. Care of this injury is pretty well standardized and is on a logical basis. The surgeon knows that he must care for the open wound and that he must treat or prevent the shock which is certain to occur. He will immobilize the limb temporarily while intravenous fluid (preferably blood) is being started, and gauge the condition of his patient. As soon as shock is controlled he proceeds to care of the open wound. This is cleansed, debrided and closed. The fracture of the femur is reduced by whatever means seems indicated. There is never any question as to indications for care. The surgeon does not take innumerable blood samples for chemical determinations, but quickly replaces blood lost and

Sommer Memorial Lecture. Presented at meeting of the Oregon State Medical Society, Portland, Oregon, September 4, 1958.

thus forestalls the development of many physiologic complications.

The Wound May Be Forgotten

However when a burn, comparable in severity to the open fracture of the femur, is admitted to the emergency room the same logical system of care seems to break down. Fluids are started; a catheter is often but not always inserted; the patient is put to bed, and blood and urine samples are taken. This often constitutes the initial care. The wound is not cleansed; often it is simply left open as it is, and further fluids ordered according to some formula. Often nothing more is done locally for 24 to 48 hours. The initial fluid may or may not be enough, or it may be too much but no one checks the patient clinically every hour to see how things are going. Instead, a series of blood chemistries are ordered. Results are secured the following day. The value, meaning and therapeutic indications based on these chemistries may well be very confusing but the laboratory technician will tell the surgeon whether or not they are within normal limits. It is never exactly clear just what it is one is trying to accomplish or just what the indications are when the blood sodium is low or high. Nevertheless, the chart is full of blue and pink and yellow laboratory slips, while the patient complains of thirst, headache and nausea.

If the patient has passed the first two days, despite rather than because of care given him, attention finally is directed toward his burn. If it has been left open and uncleaned, it will now be covered with crusts. It is often weeping, red and painful. The patient will have been given antibiotics but somehow or other these have not controlled infection. Obviously nothing much can be done with the burn surface now. If it has been dressed the dressing is changed, causing great pain and bleeding. These dressings are then changed daily and the surgeon awaits separation of the slough.

Indications Are Clear

Now indications in the case of burn are as clear as those in the open fracture, and are practically the same—namely, to prevent shock or to treat shock if present by fluid replacement, and to cleanse and close the wound at the earliest possible moment. One factor in the burn which is usually not present in the open fracture is that the disturbed physiology in a burn is a continuing process which lasts for 48 hours or so. In other words, the loss of fluid in burn shock continues, and there is no way to stop it. In the case of the fractured femur the blood loss is usually soon stopped either by compression or ligation, or by natural clotting. Nevertheless, the surgeon watches the patient very carefully to be sure that bleeding is not continuing and he chooses the earliest time for surgery based on his observation of the patient.

I should like to outline the care of a large burn based upon what I conceive to be the basic principles of care. A burn is simply a large open wound due to heat and it affects tissues over a wide area, especially the skin. This extensive involvement leads to considerable tissue destruction, opens up the protective skin covering to bacterial invasion and leads to physiologic disturbance in body fluid distribution. Fluids are rushed to the site of injury, drawn first from the blood stream. As this source becomes depleted, fluid is drawn from tissues and tissue spaces. This fluid outpouring entails loss and redistribution of electrolytes. If this fluid loss is permitted to continue a condition of shock develops, in some ways similar to the shock of hemorrhage in that both are due to fluid loss. Other areas of similarity are present in that while the blood loss in mechanical traumata is due to actual loss of red cells, the loss in burn shock is due to actual destruction of red blood cells, plus trapping of cells in vessels where they cannot function as oxygen carriers.

Blood Is Best Fluid

Basic indications, therefore, in the two types of wounding are essentially similar. The life threatening emergency in each demands fluid administration to compensate for fluid losses. For a long while it was thought that in burn shock, in contradistinction to traumatic shock, the need was for colloids only—i.e., the plasma component of the blood since it was found that the cell pack tended to be very high in burn shock. However, it has come to be recognized that serious burns, just as serious traumatic shock, require blood replacement. Colloids, such as plasma, are very valuable in combatting shock but the actual loss of red cells demands making up that loss just as in traumatic shock with actual hemorrhage. It would appear also that the depression of hematopoiesis which follows a severe burn with its secondary anemia can be overcome more quickly if whole blood formed a significant part of the initial fluid intake.

Amounts of fluid required initially in the severe burn should theoretically be calculable from a knowledge of blood volume and the red cell pack. That would be fine if the fluid loss were sustained immediately, in one episode, and then controlled as it is when one ties off a large bleeding vessel. Unfortunately, however, this does not obtain. Burn shock is a progressive affair, which continues for 48 hours or so. Fluid loss is continuous and it is necessary for the clinician to seek some method for gauging the rate of loss and the fluid requirements based thereon. Much valuable information may be secured from hematocrit determination and red cell count, taken at frequent intervals. However, these are not always accurade guides. A more reliable method of making this determination is to measure the urinary output, for if the renal output is normal, usually taken to be 25 to 50 cc. per hour, the patient is getting enough fluids. Close clinical observation of the patient is likewise of great value and observations as to restlessness, thirst, nausea and vomiting are worth more, probably, than a host of laboratory tests. Harvey Allen once said that a flame photometer could not replace a good clinician.

Ordinary Wound Management Not Suitable For Large Burns

Indications for local care of the burn area are likewise similar in open fracture and burn. We are confronted with an open wound with tissue which has been destroyed or will soon become necrotic, and with other tissue so badly damaged that it cannot meet the demands of healing or combat infection. In the ordinary traumatic wound one would cleanse, excise the badly damaged tissue and secure closure. This is, of course, what one would like to do in a burn, and in fact is a procedure which can be carried out in small well localized and very definitely circumscribed burns. In the large burn, however, there are many factors which militate against this procedure.

First of all, one cannot accurately determine at first instance how deep or how extensive a burn is. One has, of course, a general idea and it is upon this that estimates are made as to the extent of burns. However, no one with any experience in handling burns would wish to excise a large area with such indefinite ideas as to extent. Another important factor which would contraindicate immediate excision is the fact that such an extensive excision would lead to marked hemorrhage. This further blood loss might well precipitate fatal shock or seriously aggravate shock already present or impending. If the surgeon attempted skin grafting at this time the further blood loss from this procedure would be a most serious hazard. It is true that immediate excision and grafting of large burns has been carried out, but the practice was soon discontinued.

The premises outlined above, if accepted, would determine the care of a burn somewhat as follows: Initial care for the burned area before hospital admission would be simply to cover it with a sterile dressing or clean cloth as first-aid. The less done the better because in these wounds, as in all open wounds, the dangerous contaminants come from human sources. While it is perfectly true that salves and ointments meet the demands of the victim and his family that something be put on—and they will control the pain to some extent—they cause additional harm and may seriously hamper definitive care.

First-Aid

Ordinarily at the time of first-aid it is not necessary to treat shock or impending shock if the patient is near enough to a place where proper care can be administered. However, if the burn is quite large, say 20 per cent of the body surface in an adult, and probably 10 per cent in a child, it may be advantageous to start intravenous fluids if the ambulance trip to the hospital may consume an hour or more. It is here that one of the plasma extenders may be very useful to tide the patient over the period when shock may develop if no treatment be given.

Except at the time of the actual burning and until the burn is covered, pain is not too great a factor in the acute burn. If a sedative is given it should be given at once, preferably morphine or meperidine in a small dose intravenously. The reason for intravenous administrations is, of course, well-known.

The Hospital Regimen

First-aid cared for, the patient is taken at once to a hospital for definitive care. At the hospital a definite regimen should be established for burn care. Few hospitals receive a sufficient number of large, acute burns to keep a burn ward occupied. However, hospitals in large centers, and especially public hospitals, receive a great number of burns each year and such institutions

should maintain a separate section where these injuries receive prompt and efficient attention. Of particular importance is the maintenance of strict asepsis. All personnel in the burn room wear cap, mask and gown. The patient, likewise, is masked.

On admission a rapid assessment is made of the burn. All clothes are removed, cutting them off rather than attempting to undress the patient, who is then covered with sterile sheets. Since this is a serious and extensive burn, an intravenous drip is started at once, after obtaining a generous sample of blood for hemoglobin, hematocrit, blood count and typing. A Foley catheter is inserted into the bladder and the urine withdrawn for analysis. The catheter is left in place and the urine collected for hourly measurement.

The type and amount of fluid to be administered intravenously will depend somewhat upon availability at first. It should be a colloid, preferably—plasma if suitable plasma is available, or a plasma extender if suitable plasma itself is not at hand. In an emergency an electrolyte may be given until such time as suitable colloid can be secured. In the meantime blood is being typed and cross-matched, so that whole blood should be available in a short time.

The amount of fluid to be given cannot be determined accurately at the start, but will depend upon the patient's response during the first 48 hours. It is well, however, to have some idea as to the possible amount, and for this the most used formula is that of the late Idris Evans. It is based upon the percentage of surface burned and the weight of the patient. The percentage of body surface may be conveniently estimated by the rule of nine. According to Evans' formula, 2 cc. of fluid are given for each percentage of surface burned times the patient's weight in kilograms. Thus, a 70 Kg. patient with 30 per cent burn would receive 70 x 30 x 2, or 4,200 cc. of fluid in the first 24 hours, and one half that amount in the second 24 hours.

This is intended to correct the fluid loss due to burn shock itself. There must be added 2,000 cc. of glucose solution to provide adequate fluid for normal physiologic metabolic requirements. This amount is static and represents daily fluid requirement of the individual regardless of the complicating conditions. This calculation is not to be taken rigidly since many variables enter into it. Calculation of burn area is by no means accurate and errors here may be very great. The tendency is to estimate too high. A burn the size of the palm is only 1 per cent, but looks pretty big. On the other hand, the initial estimate may be too low, since areas of burn frequently show up beyond the dressing 24 hours later. In general, however, the estimate is too high rather than too low.

Watching the Patient

Whether or not the estimated amount or more is given, however, must depend upon the clinical response of the patient and this calls for hourly observation by one conversant with burn care. Frequently the surgeon himself must take on this task if adequate help is not available.

The criterion for which one watches is the response of the patient—whether or not he is quiet and comfortable, or restless and irritable. The restless patient probably is not getting enough fluid and it should be increased. If the patient is restless it does not usually signify pain but dehydration, and fluid, not morphine, is the answer. Thirst, likewise, in the seriously burned patient is not an indication to force fluid by mouth. It may not be tolerated and may lead to vomiting with attendant further fluid and, incidentally, electrolyte loss. A very valuable measure of adequacy of fluid administered is the rate of urinary flow. With a Foley catheter in place the flow can be measured each hour and kept at 25 to 50 cc.

Other signs of shock, such as falling blood pressure and collapse of peripheral veins, should not be allowed to develop. For a number of years hematocrit determinations were made each hour and used as a guide to increase or decrease fluid administration, but we seldom rely upon them now. Our best guide is urinary output.

The type of fluid administered will depend somewhat on severity of the burn. There is more and more tendency today to give whole blood right from the start, possibly half whole blood and half plasma or extender. Very little electrolyte has been given at this time. Salt seems to be what may be needed and a small amount may be given as physiologic saline or preferably Hartmann's solution along with the blood and plasma.

Local Care

The local care of the burn starts just as soon as the patient's condition permits. If no shock is present and adequate fluid replacement is started at once, the burn may be treated immediately. If the patient's condition seems precarious, and shock seems imminent or is present, it is neces-

sary to wait. The patient is covered with sterile sheets until such a time as treatment is permissible.

Local care of the burn area is carried out in an operating room or other room, suitably equipped to insure strict asepsis. The room should be warm but not hot; there should be no drafts, and it should not be a thoroughfare for nurses and orderlies. Everyone in the room, including the patient, is masked.

The burn surfaces are first gently washed with soap and water. Where very extensive burns are concerned there is real advantage in having two or more individuals or teams at work so as not to take too much time in the process. After the burn has been cleansed the surgeon or surgeons change gloves and gowns. Using sterile instruments, skin tags and blisters are removed from the surface. Excision is *not* carried out at this time. This is simply a cleansing process and removal of epithelial tissue loosened by the burn.

Open vs. Closed Treatment

The patient is now ready for whatever type of surface treatment the surgeon elects. For several years a controversy raged, in a way, between advocates of open and closed treatment. Actually both schools of therapy were after the same result—namely, the closure of the burn surface, and its protection against secondary contamination. The closed school claimed that the open surface invited bacterial invasion; the open school claimed that such a surface soon closed itself by coagulation of exudate. Wallace has pointed out that both methods strive to secure a pellicle or crust under which the superficial and deep dermal burn will heal. The full thickness burn, as Wallace has pointed out, has a crust already of necrotic skin which should be kept dry. However, such a burn is usually surrounded by partial thickness areas or intermixed with them.

Certain body areas are almost always treated by exposure—the face and neck, and perineum—since dressings here are either difficult, as on the face and neck, or constantly soiled and wet, as on the perineum.

I do not wish to go into the argument in detail any further than to state that in my opinion open care must always be a hospital procedure and requires very careful nursing if it is to succeed. Circumferential burns are very difficult to care for, since they require frequent turning and special equipment. Under no circumstances should the hands be so treated. While open treatment seems to have been revived during a search for a treatment which would be applicable in case of mass casualties, it seems to me that this is just the place where open treatment would not be applicable. Finally, it has seemed to me, in cases which I have seen which have been treated by the open method, that this is a very dangerous method in untrained hands. It is not a method of neglect, but calls for as much or more meticulous observation than the closed treatment.

The closed treatment consists essentially in the application of a thick absorptive compression dressing over the burn area and beyond. Whether or not the compression adds anything to the dressing is a matter of controversy. We have thought that it might help to minimize the edema which occurs at the site of the burn. Many have denied this and experimental work fails to prove this effect of the compression. We feel that the compression does favor absorption and helps to keep the part splinted. It is a very comfortable dressing and if watched to see that it stays snug, requires little other attention. Pain is stopped almost immediately by this dressing This effect also is demonstrable when the dressing is applied as first-aid.

Proximate Dressing Material

There is some misunderstanding as to the dressing to be placed directly against the burn surface. For a long time it was customary to use fine mesh gauze thickly coated with vaseline. This led to maceration and surgeons gradually reduced the amount of vaseline in the gauze until finally it has come to be used either without vaseline at all or very lightly impregnated. We have found that rayon is excellent directly over the burn. A single layer, if lightly moistened with saline so as to make it conform to the surface, makes a covering that is transparent and is so fine meshed that granulations cannot grow up through it.

The absorptive layers may be made up of fluffed gauze, covered with abdominal pads and help in place with woven elastic bandages. There are now available burn dressings in various sizes, made up of cellucotton between gauze sheets, much like gigantic abdominal pads. These large burn dressings can be applied to any large surface very quickly—a whole upper or lower extremity, the abdomen or entire trunk—and save a great amount of time both in initial dressing and in later dressing care.

Immobilization of the burn area is accomplished by means of the bulky compression dressings plus splints on the extremities. It is essential to splint the parts in functional position. Foot drop or flexion contracture of the knee should never be allowed to occur. The hand must be carefully dressed on a splint in the position of function, or grasping position. Digits must be kept separated to prevent maceration.

With local care completed and general management of the physiologic disturbance under way, the initial stage or phase of burn care is completed. At the end of 48 hours the patient has usually passed the stage of shock or of fluid loss into the tissues, and diuresis starts. Intravenous fluids may usually be discontinued at this time and the surgeon can turn attention to the nutritional phase of general care.

Nutrition

By this time the patient is usually able to eat. A diet rich in protein, 150 to 200 Gm. daily, is given. In order to get this much protein in along with several thousand calories of carbohydrate and fat, interval feedings of protein hydrolysate are needed. The patient also needs large amounts of vitamins, especially of vitamin C, which may be administered in doses of 500 to 1000 mg. daily, along with one of the multivitamin preparations. It is not enough simply to order the high calorie-high protein feedings. It is neecssary to see that the patient actually consumes it. In some very severely burned patients, especially in children, it is often necessary to tube feed by nasogastric drip. This method of feeding will often persuade a lazy patient to eat normally.

Blood, which was given quite liberally during the first few days, is now given once or twice a week, the amount determined by keeping an eye on the red count and hemoglobin determinations. Secondary anemia is sure to develop in the severe burn, and while it cannot be prevented, it can be ameliorated by frequent transfusions. It will not subside until the burn area has healed. This tends to create a vicious circle. If the patient remains anemic the coverage of the surface with grafts is very difficult, since grafts will take very poorly. Until the surface is healed, correction of the anemia is difficult, if not impossible. Hence, it is imperative that the surgeon be very aggressive in combatting the nutritional disturbance and likewise in covering the burn surface.

Burns involving the face and neck are prone to lead to edema of the pharynx and larynx. These patients must be watched very carefully in order to detect development of laryngeal obstruction. Tracheostomy carried out early may be a lifesaving measure.

Dressing

The burn is examined on the fifth to eighth day, depending somewhat on the site of the burn, and the probability of deep, full thickness loss. Burns of the face, if they have been dressed, are usually uncovered by the fourth or fifth day, and are left uncovered unless there is full thickness loss. Burns of the hand are dressed about the same time, especially if third degree burning is expected, and if the patient is a probable candidate for skin grafting. These burns may often be excised on this day and skin grafted at once, since they may be operated upon in a bloodless field. Excision and grafting may be carried on with a minimum of blood loss.

Other burns are usually dressed by the seventh to ninth day. The initial dressing is taken down to the primary layer of fine mesh gauze. The surgeon can usually determine the extent of third degree loss without actually removing this final layer. The black hard skin of complete necrosis is easily distinguished and also the areas of wet necrosis with borders of partially separated skin. At this time the surgeon makes his decision as to the procedure to be followed in finally closing the wound. The problem is: first, is there only second or deep dermal injury, or second, is there full thickness loss? If the injury is only deep dermal, the dressings are simply reapplied and in another week to 10 days complete healing may be anticipated. If, on the other hand, full thickness loss is present, the surgeon must decide how he will remove this dead tissue, and how the resultant defect will be covered. With only small spotty areas of third degree loss it may be satisfactory to permit these areas to slough off and epithelialize spontaneously. Occasionally fairly good sized areas may be dressed every second day or so, and the slough permitted to separate. Free skin graft may then be placed over the defect. This decision of permitting slough to separate spontaneously, however, prepares a trap into which the surgeon may fall and which may lead to many weeks of delay in closure. At each dressing the amount of tissue removed is always less than had been hoped for, and what looked at first like a matter of a week, or at most 10 days, may stretch out to three or four, or more weeks.

Another hazard which waiting may bring with

it is that of converting areas of deep dermal burn into full thickness burns. The danger of the introduction of infection during the many dressing changes which may be needed is always present and the area of deep loss may be increased several fold. Hence, judgment as to permitting or encouraging spontaneous separation of slough must be very critical and not to be taken without full realization of its possibilities.

Hastening Separation of Slough

If the surgeon elects to permit spontaneous separation, the wound is dressed each day or every second day. At each dressing change the necrotic tissue that has separated since the last change is snipped away with scissors and a fresh compresion dressing reapplied. The dressing next to the burn surface is saturated with normal saline or with Dakin's solution. It is not entirely clear whether Dakin's solution promotes separation of slough, or whether it is just the moisture and compression that is helpful. This matter of daily dressings however is likely to prove a bomerang, since each day the surgeon hopes to find all necrotic tissue separated, only to be disappointed. At the same time the patient's threshold of pain gets lower and lower until he comes to dread the approach of the surgeon. Added to this is the increasing possibility of adding secondary infection and the prolongation of the period during which the wound remains open. All in all, the matter of frequent dressing changes for slough removal is a rather unfortunate decision in most instances.

Removal of slough by enzymatic debridement will probably come into its own some time in the future. The majority of surgeons who have had extensive experience in burn care have not yet accepted this technique. It is something which resembles nature's own method of slough removal, and as such should be ideal. At present these techniques are not perfected.

The most rapid method of slough removal is that of surgical excision. This is carried out on the fifth, to seventh or eighth day after the burn, which is about the first time the surgeon can accurately assess depth and extent of the burn. The surgeon, by this time, will have carried out the first dressing down to the initial layer of fine mesh gauze. It is sometimes advantageous, especially in children and apprehensive patients, to carry out this dressing under anesthesia. Things may be set up for slough excision at the same time.

Excision

Excision is done under a general anesthetic and with blood available since the procedure is likely to lead to a fair amount of hemorrhage. Sloughing tissue is excised with a knife, trying to keep just at the line of liquefaction between skin and subcutaneous tissue—or whatever the depth of burn loss may be. The procedure is not easy and the surgeon should resist the temptation of excising too widely. It is usually better to excise too little than too much, since after the bulk of dead tissue has been removed, the remaining tags will be found to have separated spontaneously by the time the patient is brought back to surgery a few days later, for skin grafting.

We have lately been using an electric dermatome for this excision, following the suggestion of William Snyder. The machine is set rather deep and the necrotic tissue may be removed in large sheets. We have found that it is usually necessary to go over an area two or three times before all deep slough is removed. This leaves an exceptionally fine surface for grafting.

Grafting is not often feasible at the time of the excision, largely because of the bleeding which occurs from the cut surface. It can lift the graft from the bed. Immediate grafting very frequently is possible on the hand. Here the surgeon can work under tourniquet control with a blood pressure cuff. Grafts may be laid over the surface and pressure applied before the cuff is released.

Ordinarily, however, it is best to apply a compression dressing after excision and bring the patient back for skin grafting two or three days later. By this time the surface will have cleansed itself, and bleeding will have stopped.

Grafting

It may be that the area to be covered is too large to excise at one time and that donor sites for proper amounts of skin are not available. The surgeon then will excise slough from only as much of the burn as he can reasonably hope to cover with available skin. Under these circumstances he will choose certain areas which should have priority in coverage. Such areas as face, hands and flexor surfaces of joints should be grafted first. Donor areas may be used over again if they have not been cut too deeply.

The use of homologous skin grafts is restricted to patients who, for one reason or another, cannot at the time furnish their own skin grafts.

This may be occasioned by the generally poor condition of the patient. Frequently such a patient may be a child, who could not withstand the additional trauma of graft removal but whose large burn desperately requires coverage. Homologous grafts under these circumstances are lifesaving, and should be applied. It is understood, of course, that these grafts are not permanent but require replacement later on. They may survive for several weeks or a month or more, but eventually they slough off.

The use of cadaver skin for homologous skin grafting has been a real advance in this phase of care of the seriously burned patient. We are especially indebted to Barrett Brown, of St. Louis, for this procedure and for working to establish it. Freshly removed cadaver skin may be used at once or preserved in the refrigerator at ice-box temperatures for several weeks. Studies are progressing in methods of preserving the skin for longer periods of time and when such are perfected, skin banks like bone banks will become S.O.P. in many hospitals.

Resume

I have tried to present the care of burn as a problem in the management of an open wound. It has not been my intention to deny the very great importance of the advances made in the general management of these cases. It has semed to me, however, that the surgeon may get so involved in the intriguing physiologic disturbances that may follow a large burn that he forgets the important principles of open wound care. Care of the burn tends to become a laboratory study in blood chemistries, the meaning of which may not always be clear. It has seemed to me also that open treatment is too often accepted as an easy way out of a difficult situation. In good hands, as has been reported from a number of clinics, open care yields excellent results. But open treatment is not a method of neglect, nor is closed treatment a simple matter of "cover up and forget." Either treatment, whichever the surgeon elects, will yield good results if it is carried out carefully and correctly.

I have said nothing about tetanus protection which should be given, of course, in most burns. It has seemed unnecessary to suggest that antibiotics may be indicated in many instances. However, they are given as commonly as aspirin nowadays. Their value cannot be denied. However, I think they may lead us to be a little less careful in our aseptic technique. The increase in hospital infections, both here and abroad, is evidence of this, and the penicillin-resistant staphylococcus is a valuable test of it. •

Serum Glutamic Oxalo-Acetic Transaminase and Lactic Dehydrogenase Levels and Their Clinical Significance

J. Edwin Wood, Jr., M.D., Nuzhet O. Atuk, M.D.,
James L. Camp, III, M.D., Julian R. Beckwith, M.D.
and Preston B. Lowrance, M.D.
Charlottesville, Virginia

Two enzymes can now be used to improve diagnostic accuracy in myocardial infarction and several other conditions. Final place of these tests in medicine is still to be determined but much is now known. There are hints that they may be useful in detecting presence of neoplastic disease.

Development of the use of enzymes has a long and complex history extending over some 36 years. It need not be recounted here except to note that the first enzyme was crystallized in 1926. Rapid progress followed with the discovery that enzymes were protein in nature and their so-called catalytic activity had to do with the chemistry of proteins.

In 1938 Braunstein and Kritzman discovered transaminase, later purified by Cohen who postulated the probability of transaminization of amino-acids. Early determinations were difficult but Cammarata and Cohen in 1951 devised a photometric method leading in 1955 to an accurate and reproducible method by Karmen *et al.* for transaminase values in human serum. Advances in chemical techniques, and particularly the development of photometric methods, allow clinicians to broaden their viewpoint in several fields.

Other enzymes related to various tissues have come along rapidly but we will consider only two today—namely, lactic dehydrogenase and glutamic oxalo-acetic transaminase.

It is our purpose to discuss the diagnostic value of these two enzymes with particular relationship to myocardial infarction and the differential diagnosis of other conditions as well—some occasionally confused with infarction, and some not.

It is fair in the beginning to state that both enzymes occur in liberal amounts in heart muscle but also in the kidney, skeletal muscle, liver, pancreas, brain, lung, and spleen. More particularly they occur in liver, skeletal muscle, and kidney in addition to the right supply of both SGOT and LDH in heart muscle, the former being the more active in that tissue.

Both SGOT and LDH occur in normal human sera within reasonably consistent ranges. With certain diseased states, noted below, their activity rises sharply in serum determinations made at appropriate time intervals and falls back to normal with recovery. This behavior in the sera of patients with myocardial infarction has strong diagnostic import.

SGOT is measured in a somewhat more complicated fashion than LDH. We have used the method of Karmen *et al.* (1955). Decrease in optical density (brought about by conversion of reduced diphosphopyridine nucleotide—DPNH—to diphosphopyridine nucleotide—DPN) of the final solution of agents as viewed in a Beckman D. U. Spectrophotometer at 340 millimicrons is expressed by the rate of fall in units per milliliter per minute, 1 unit being a decrease in density of .001. We have selected 40 units, as

Sommer Memorial Lecture. Presented by the senior author at 84th annual session of Oregon State Medical Society, Portland, Ore., Sept. 4, 1958.

have others, as the dividing line between normal and abnormal.

If calculated in this fashion, the SGOT activity for normal sera will run in a range from 5 to 40 with a mean of 20 and a SD±7. It is important to remember that all values in the literature should be compared on a similar basis. Confusion has already arisen in this regard.

On the other hand, determination of LDH is simpler and quicker and of equal value with the exception of certain liver affections. Lactic dehydrogenase catalyzes the reversible reaction as stated by White.

pyruvic acid + DPNH ⇌ lactic acid + DPN

Pyruvic acid and DPNH are used as substrates since the reaction favors lactate formation. This reaction is carried out in a .1 molar phosphate buffer solution at *p*H of 7.8. Therefore, only three solutions are used besides the serum and after setting these up, control readings are taken in the Beckman at 340 angstroms wave length; the solutions are incubated one-half hour at 38 C. and read again. The change in density (brought about by conversion of DPNH to DPN) of this was taken as the LDH activity of 0.01 millileter expressed as units per millileter.

White finds the range for normal healthy people to be 25 to 100 with a mean of 59 ± 19. Our normal young people are essentially the same. We also studied 66 patients in the hospital population not having conditions apparently related to changes in serum LDH and found a range of 26-116, with a mean of 80 and SD ± 22.65. All observers essentially agree.

Myocardial Infarction

We have used both enzymes SGOT and LDH in diagnostic studies on many diseased conditions. Lately it has appeared to us, as to others, that lactic dehydrogenase is more desirable in the study of myocardial infarction for several reasons:

1. It remains elevated in serum above normal activity for a longer time after infarction, 6 to 10 days, whereas SGOT is elevated a shorter time, 4 to 6 days.

2. It is an easier test with only two spectrophotometric readings at a specified interval of 30 minutes.

Wroblewski *et al.* do not agree and find the highest correlation between SGOT and myocardial infarction.

COMPARISON OF LDH AND SGO-T ACTIVITY IN A PATIENT FOLLOWING AN ACUTE MYOCARDIAL INFARCTION

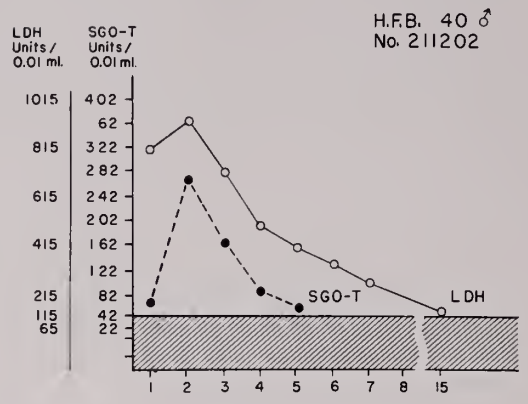

Fig. 1.

In both enzymes the curve rises promptly beginning within 6 hours after infarction and reaching a peak at about 24 to 36 hours, the curve of activity rapidly falling off in the ensuing days as stated above. This particular configuration is important diagnostically and different, as noted below, from the curve of hepatitis.

Given this behavior of enzyme activity in the serum following infarction, diagnostic accuracy for this condition is sharply improved. This is particularly true since there is good evidence that the enzyme does not rise in angina or coronary failure as noted in our own series and similar findings of others. Furthermore, the size of the infarct is roughly predicted by the elevation of enzyme activity in the serum. Both of these points have supporting evidence in the studies of Merrill *et al.* and Nydick *et al.* The latter, after opening the thorax and placing suitable ligatures around coronary arteries of dogs, allowed animals to recover and transaminase levels to return to normal following skeletal muscle injury of operation. After this the previously placed coronary artery ligatures were tied, producing varying sized infarcts and in one case ischemia without infarction of 45 minutes duration. Enzyme activity did not increase in ischemia, but was elevated in the infarction animals roughly in proportion to the size of the infarct. Study of the infarcted muscle and normal heart muscle of each animal indicated enzyme activity of infarcted muscle was only 2 to 10 per cent of normal muscle because the dying muscle had apparently lost its enzyme to the serum by leakage or increased permeability of the injured cells.

In our experience this has been a valuable test

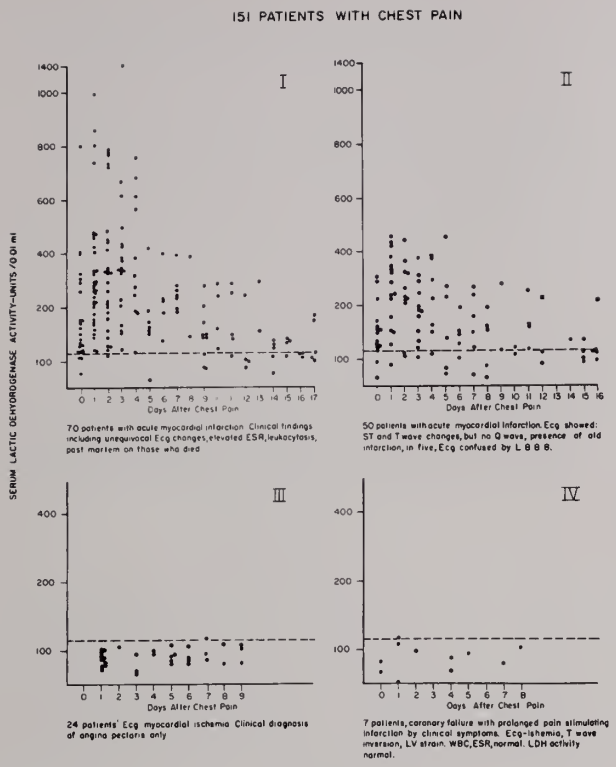

Fig. 2.

in regard to differentiation between myocardial infarction and angina or coronary failure. It may save the patient days in the hospital. It is wise, however, to have at least four tests over a period of 72 hours after the pain episode, particularly if it is prolonged.

False positive tests can, of course, occur but are generally explainable by the discovery of liver or kidney damage based on shock, anoxia, prolonged anesthesia or inflammation. Elevation of so-called "cardiac enzymes" are not then specific in the diagnosis of myocardial infarction but are extremely well correlated in rise and fall with the well-known and dramatic clinical events. Fortunately they are not elevated in angina as we shall repeatedly state.

One other difficulty exists but can be spotted easily by its dramatic expression—namely, a rapid heart rate. Serum elevations of either enzyme activity herein discussed may be elevated in almost any rapid arrhythmia—supraventricular or ventricular. Chinsky points out that this has a tendency to occur at ventricular rates of 180 or more. In one patient with ventricular tachycardia lasting over two months, we observed LDH level of 200 to 250 (normal 110) for the first month with normal figures the last month and no obvious explanation. Autopsy failed to demonstrate infarction. Other writers have noted absence of adequate explanation but some have suggested liver necrosis with inadequate circulation during a high ventricular rate.

Conversely, false negatives in true infarction are relatively rare if patients are well studied and, according to Conrad, in the case of transaminase do not exceed 2.4 per cent. This figure goes up to 8.5 per cent in inadequately studied cases where patients come in early and die before a chance of rise in enzyme activity or come in late after serum enzyme activity has subsided.

It is also stated that injection of codeine phosphate will cause elevation in some, but not all post cholecystectomized patients. We have observed no such effect from morphine injections in other patients.

In summary, it would appear that both serum glutamic oxalo-acetic transaminase and lactic dehydrogenase activity show a remarkably consistent behavior in the serum of a patient in the week following myocardial infarction.

Differential Diagnosis

Not uncommonly, myocardial infarction may be confused with pneumonia, pulmonary infarction, pleurisy or cholecystitis with cholelithiasis. Fortunately only slight increase in LDH levels occurs in pneumonia or pulmonary infarction and no increase of either enzyme occurs in cholelithiasis. In general other workers find the same for SGOT with only an occasional rise in pulmonary infection and infarction.

Another troublesome chest pain confused with myocardial infarction is pericarditis, often idiopathic benign pericarditis. Our experience here agrees with others—sometimes slight enzyme activity elevation and sometimes not. Kalmansohn and Kalmansohn found SGOT elevated in six of seven patients with pericarditis and conclude it is only of value in differentiation if normal. Apparently slight to moderate elevation of either enzyme may occur with the development of subepicardial myocarditis associated with pericarditis. On the other hand, Chinsky found no elevation of SGOT in pericarditis.

It is of interest to include at this point the striking rises of both (LDH and SGOT) enzyme activities in the sera of patients following cardiac surgery, such as aortic or mitral commissurotomy. A lesser rise comes from thoracotomy for lung surgery when the heart is not attacked and in abdominal operations.

Finally, congestive heart failure presents an ex-

pectedly confusing state. Some observers report no elevation of enzyme activity levels and some frequent elevations. This is expected for two reasons. Occasionally infarction occurs with no symptoms but heart failure, and commonly congestive failure leads to congestion of the liver which is often no doubt enough to raise enzyme activity in the serum from liver cell necrosis.

Liver Disease

Of the two enzymes under discussion, SGOT is probably the more valuable in the study of liver conditions. LDH follows a less consistent pattern, however, with values not as high in certain diseased states of the liver. SGOT appears to be more valuable in following the onset and course of hepatitis and it is said that sharp elevations occur weeks before other liver tests become positive. Wroblewski and LaDue were impressed in their study with the ability of this method to detect subclinical hepatitis. In one report, 16 of 20 patients with hepatitis returned to normal in four weeks and four required eight weeks to show normal enzyme activity in the serum, thus indicating an entirely different curve from that of myocardial infarction. Extremely high levels followed inhalation of carbon tetrachloride in two patients.

Our own experience with Laennecs cirrhosis has been varied in the case of both enzymes. In some patients, moderate elevations occur and in others the values are normal. One extremely ill patient, with advanced cirrhosis and hepatic failure for weeks, repeatedly had normal LDH values. Perhaps SGOT would have been elevated in this patient.

Observers are at variance on obstructive jaundice. Some find elevations; some do not, and some find elevations of enzyme activity, promptly corrected with relief of biliary obstruction.

Conrad summarizes the present situation by stating that most observers feel that surgical jaundice has a slower rise of serum enzyme activity (SGOT) which is longer sustained and that hepatitis has a quicker rise of SGOT activity of shorter duration. This differentiates these two to some extent but will not differentiate surgical jaundice from cirrhosis or carcinoma of the liver.

Anemias

Our own experience with five patients with pernicious anemia has been exciting and illuminating. As shown in figure 3, the LDH activity is up considerably before treatment and falls as

SERIAL DETERMINATIONS OF SERUM LDH ACTIVITIES AND PLASMA ZINC CONCENTRATIONS IN A PATIENT WITH PERNICIOUS ANEMIA BEFORE AND AFTER B_{12} TREATMENT.

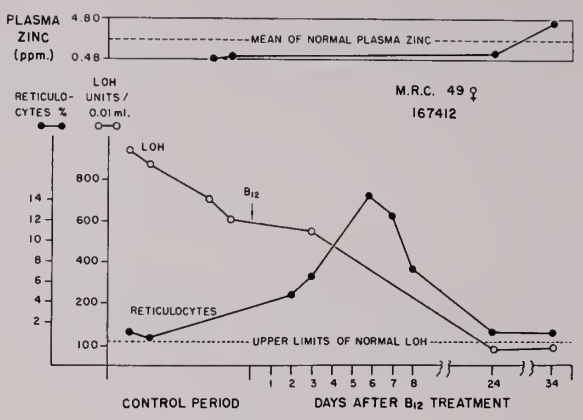

Fig. 3.

the reticulocyte count rises and the patient recovers following B_{12} therapy. Few others have commented on this phenomenon. Following the discussion of Wacker *et al.* on lactic dehydrogenase as a metalloenzyme (zinc) showing a fall in serum zinc following myocardial infarction, we have studied a patient with pernicious anemia in a similar fashion. The serum zinc, as expected, behaved in a reciprocal fashion being depressed low normal in untreated state of pernicious anemia and returning toward high normal following treatment and recovery.

The behavior of LDH in pernicious anemia is not fully explained by the hemolytic component of that disease.

Hemolytic anemias and sickle cell anemia likewise show elevation of both lactic dehydrogenase and SGOT during hemolytic periods.

Spinal Fluid Studies

Wroblewski *et al.* and others have pointed out that spinal levels of LDH activity vary independently of serum activity and are normally quite low.

Our observations agree that serum activity is normally about 10 times that of spinal fluid.

We have no strong convictions in a study of 35 patients concerning the diagnostic value of this enzyme in spinal fluid. However, Wroblewski *et al.* suggested that several preliminary observations stand out:

1) The enzyme is elevated in subarachnoid hemorrhage possibly because blood of known higher enzyme concentrations leaks into the intrathecal space.

2) In septic meningitis, enzyme spinal fluid activity is increased possibly through leakage of

plasma into spinal fluid. The enzyme activity falls with improvement.

3) In patients with either intracerebral or meningeal leukemia, or lymphoma or metastatic carcinoma, lactic dehydrogenase is elevated in the spinal fluid, the enzyme coming from malignant cells bathed by the spinal fluid. This finding may prove to be of considerable diagnostic value.

No general rule applies to cerebral thrombosis. In some, no elevation exists. In others with softening of the infarction, considerable spinal fluid enzyme (LDH) elevation is seen. Much remains to be done on this subject.

Serous Effusions

Recently Wroblewski and Wroblewski have introduced an interesting study of enzyme activity (LDH) in serous effusions related to serum enzyme activity at the same time in the same patient.

Numerous observations indicate certain generalizations not yet fully worked out. Having previously demonstrated that malignant neoplastic cells contributed in vitro and in vivo to LDH activity of the fluid medium bathing the cells, they tested this principle in pleural and peritoneal effusions containing and in contact with malignant cells in patients.

Serous fluid from patients without neoplastic disease were found to have lactic dehydrogenase activity lower than plasma (or serum) of the same patient. On the other hand, effusions from patients in contact with or containing malignant cells showed an LDH activity greater than plasma (or serum) of the same patient.

This new field appears promising and, as they point out, a great deal of additional work is necessary before this principle becomes established for diagnostic purposes.

Miscellaneous Disease

A number of other diseases have been studied by us and by others. The enzyme levels are usually within normal range. Myocardial infarction, necrosis or injury of liver and kidney, pernicious and hemolytic anemias, postoperative states particularly after cardiac surgery and finally severe trauma with hemorrhage or muscle injury. Exceptions to this rule generally find their explanation in some form of unexpected liver involvement.

Mention should be made of increased LDH and SGOT activity elevation in dermatomyositis. We have seen increased activity of both of these enzymes in the sera of two patients with dermatomyositis.

In muscular dystrophy, LDH activity was elevated early in the disease in two young patients but normal in another patient with long standing disease.

Summary

We have found serum lactic dehydrogenase activity extremely helpful in the diagnosis of myocardial infarction. It is not elevated in angina pectoris. When it is elevated in other diseased states the clinical picture is generally so different as not to cause confusion with myocardial infarction. This is particularly true if a curve is established by repeated determinations over several days. The characteristic curve then becomes quite evident.

There are other diagnostic uses of both LDH and SGOT which have been discussed briefly. •

Cardiac Tamponade

Lawrence B. Kiriluk, M.D.
and
William B. Hutchinson, M.D.
SEATTLE, WASHINGTON

Following a wound to the heart of any consequence, one of two things begins to happen. There is immediate production of either cardiac tamponade or rapid exsanguination.

The term *cardiac tamponade* or *acute cardiac compression* denotes interference with diastolic filling of the heart and with cardiac contraction due to increase in intrapericardial pressure. Acute tamponade may result following direct trauma to the heart, rupture of the myocardium after recent myocardial infarction, rupture of an aneurysm of the sinus of Valsalva, injury to the adjacent great vessels, or at times with rapid accumulation of fluid following infection of the pericardium. This paper will consider tamponade only as it results from direct cardiac trauma.

Those of us who are interested in traumatic injuries must agree that the mere fact that a sufferer of cardiac tamponade even is alive on arrival at a hospital makes him a potential survivor, provided our index of suspicion is sufficiently high. The purpose of this paper is to present the principal features in physiology, diagnosis and treatment of cardiac tamponade.

On considering the physiologic or hemodynamic aspect of this problem, it is noted that blood from the wound of the myocardium escapes into the relatively inelastic sac formed by the pericardium (Fig. 1). In acute tamponade this sac resists dilatation. Thus there is increasing pressure within the pericardium tending both to minimize bleeding and to collapse the chambers. The latter effect decreases filling of the heart. Pressure on the vena cava and pulmonary veins also impairs flow of blood to the heart. A reduction in the stroke and minute volume output is followed by lowered blood pressure in the peripheral arterial system where-

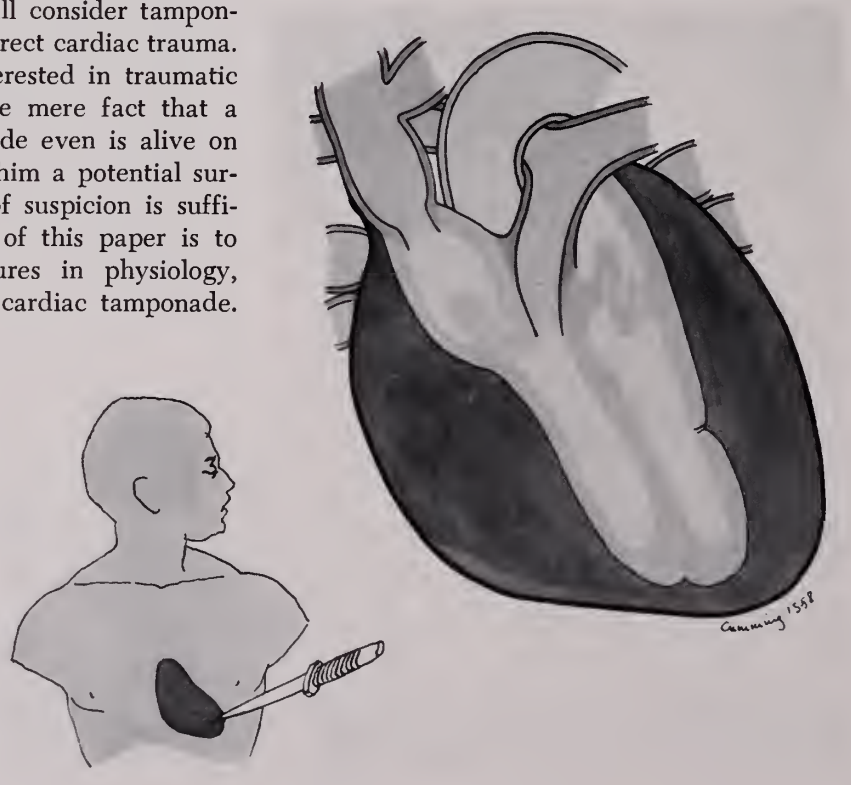

Fig. 1. Shows the filling of a relatively inelastic pericardial sac. As the volume of intrapericardial blood increases, the pressure rises, causing the chambers of the heart to collapse and obstruct the inflow from the vena cava. Thus the cardiac output decreases.

as venous pressure is increased. With further increases in intrapericardial pressure a critical level develops opposing the hydrostatic forces within the heart and great veins. The ventricles are unable to dilate during diastole and obstruction to the inflow of blood occurs. With elevation of intrapericardial pressure, there not only is increased pressure in the right atrium but also in the left atrium and pulmonary vein. Pressure rises to the same magnitude in all three, showing that the right and left side of the heart are affected simultaneously and equally by progressive increase in intrapericardial pressure. Thus adequate ventricular filling is impossible because of the decreased or absent pressure gradient between the intracardiac and intrapericardial pressures. Furthermore, forceful contraction cannot occur because of insufficient lengthening of the myocardial fibers. These factors are manifested by elevated venous pressure and decreased cardiac output.

Volume of blood found in the pericardial sac in cases of acute tamponade varies with size of the heart, size of the sac, and distensibility of the sac. Blalock and Ravitch,[1] reporting a series of cases treated successfully by aspiration, found the aspirated volume to vary from 12 to 305 cc. In some experimental work done in dogs by Sawyer, Johnston and Lambeth[2] it was found that approximately 60 cc. of fluid injected rapidly into the pericardial sac of a 12 to 14 Kg. dog would cause the right atrial, the pulmonary capillary, and the intrapericardial pressures to be nearly equal. All pressures were in the vicinity of 20 to 25 mm. of mercury. If an average of 100 to 120 cc. were injected, cardiac stand-still occurred. In the dog the pericardial sac is thinner and more distensible than in the human.

Diagnosis

Speed in making the diagnosis is of primary importance in management of cardiac tamponade. Wounds in the vicinity of the heart must be suspected. Plotting the course of missles may lead to the suspicion of cardiac injury and to an early diagnosis. A patient with cardiac tamponade will arrive in shock out of proportion to the obvious wound. Usually the classical Triad of Beck (Fig. 2) will present itself in the form of low or falling arterial pressure, high or rising venous pressure and a quiet heart. The patient will be bathed in perspiration and usually will be in varying degrees of delirium or wild excitement. Acute alcoholism is often present and that in itself will confuse the clinical picture. The pulse rate is surprisingly slow unless there has been considerable hemorrhage into the pleural cavities or to the outside. The pulse, if any is detectable, will be paradoxical—that is, have decreased amplitude during inspiration. This is due to the fact that during inspiration there is an increase in pulmonary vascular capacity and consequently a decrease in venous return to the left heart. Thus the combination of enhanced pulmonary capacity and reduced venous return during inspiration causes reduction in left ventricular filling and output which in turn is reflected in a reduced size of the pulse or pulsus paradoxus. Further evaluation will reveal decreased or absent cardiac pulsation as seen on fluoroscopy. The heart shadow may or may not be enlarged on fluoroscopy or chest x-ray, depending on the amount of bleeding into the pericardium and the amount of sac distention. Pulmonary evaluation would show decrease in vital capacity and circulation time would show impairment. An electrocardiogram may show signs of pericarditis and later of myocardial infarction, depending on size and location of the wound.

Treatment

Presumably most patients who arrive at the hospital alive after cardiac injury have a situation compatible with life, at least temporarily. Thus it is imperative for the attending physician to recognize the condition immediately and to evaluate the situation as to type of therapy to be instituted without delay. There are two possible forms of treatment to be considered.

Aspiration of the pericardial sac may be done by a number of methods and routes (Fig. 3). Most physicians prefer the apical route. A short bevel 18 gauge needle attached to a three way stop cock on a 50 cc. syringe is inserted in the left fifth interspace. The needle is cautiously directed porteriorly and toward the spine while maintaining suction on the syringe. Should the needle be felt to strike the heart, it is withdrawn a short distance. Aspiration is continued until no more blood is obtained. Another popular approach is to use a 16 or 18 gauge spinal needle and insert it through the skin just to the left of the xyphoid. It is directed upward just beneath the sternal margin until the pericardial sac is entered. The needle will be felt to penetrate the sac as one feels the penetration of the dura in doing a spinal puncture.

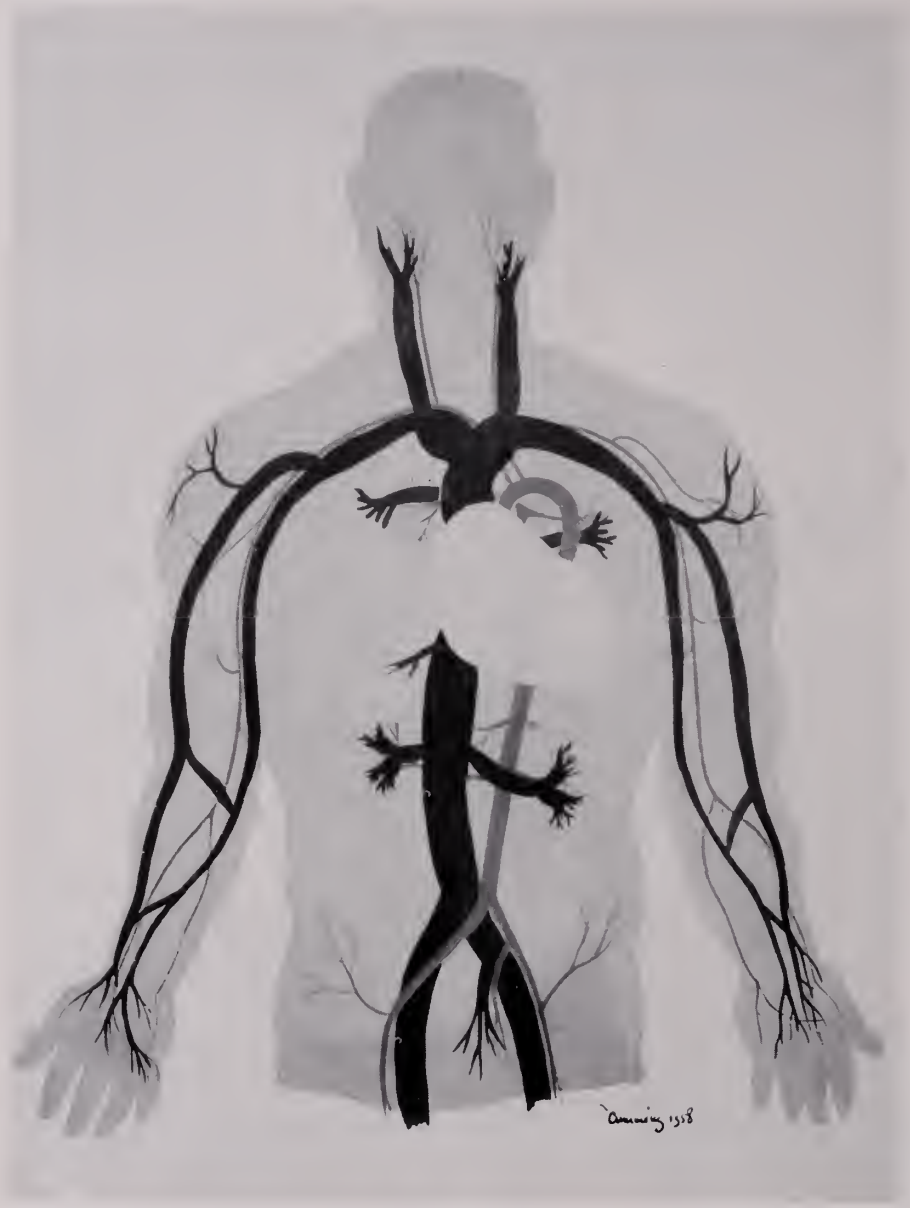

Fig. 2. Illustration of the classical Triad of Beck — the low arterial pressure, the high venous pressure, and the distant heart.

A more positive approach, considered by many, is the surgical attack. Again several approaches may be used. A C-shaped incision with resection of the fourth, fifth and sixth costal cartilages and removal of a centimeter of the sternum gives adequate exposure of the heart. Adequate exposure may also be obtained by resecting the costal cartilage of the fifth rib with a segment of that rib, then transecting the cartilages of the adjacent fourth and sixth ribs. After gaining exposure, the pericardium is incised longitudinally and a finger is placed over the laceration until interrupted 2-0 silk can be placed in the myocardium. Care must be taken not to ligate any of the major coronary vessels. The heart must be examined for multiple wounds, such as entrance or exit wounds. The pericardium is loosely approximated to allow decompression into the pleura and the pleura is drained by means of an inter-costal tube connected to an underwater seal.

The ancillary supportive measures in either the conservative aspiration approach or the direct surgical approach are difficult to evaluate.

Probably the best evaluation has been done in animals by Cooley and Brockman.[3] They evaluated intravenous fluids, drugs, respirators and anesthetic agents in a group of experimental animals with controlled, induced cardiac tamponade. They found that infusions increased venous return to the right heart and so were beneficial even if they increased venous pressure and pericardial pressure. Drugs such as caffeine, Coramine and Metrazol had no effect. Adrenalin and ephedrine were both effective but ephedrine seemed best since it had more effect on direct myocardial stimulation and peripheral vasoconstriction.

Norepenephrine, primarily a vasoconstrictor, given in a 4 per cent solution doubled the blood pressure. It produced venous and pericardial pressure increase but the animals withstood a pericardial pressure of 100 to 200 per cent greater than the predetermined critical level. In testing the respirators, Cooley and Brockman noted that a constant positive pressure respirator produced a drop in blood pressure and acted like a tourniquet. However, with positive-negative pressure insufflation there occurred a rise in blood pressure. Of the anesthetic agents used, they found that ether and nitrous oxide were best, whereas barbiturates had adverse effects and should not be used.

Pericardial aspiration is the most important initial treatment for cardiac tamponade. Facilities for open operation should be held in readiness, but it appears that with most wounds which cause cardiac tamponade, and are not immediately fatal, aspiration alone will suffice. It is generally conceded that the administration of fluids, blood and plasma is an important supplement.

Reported mortality rate from wounds of the heart treated by operative means is high. Most deaths have been ascribed to effects of the injury itself, but a good many are due to untoward incidents during the operative procedure or to complications which followed. However,

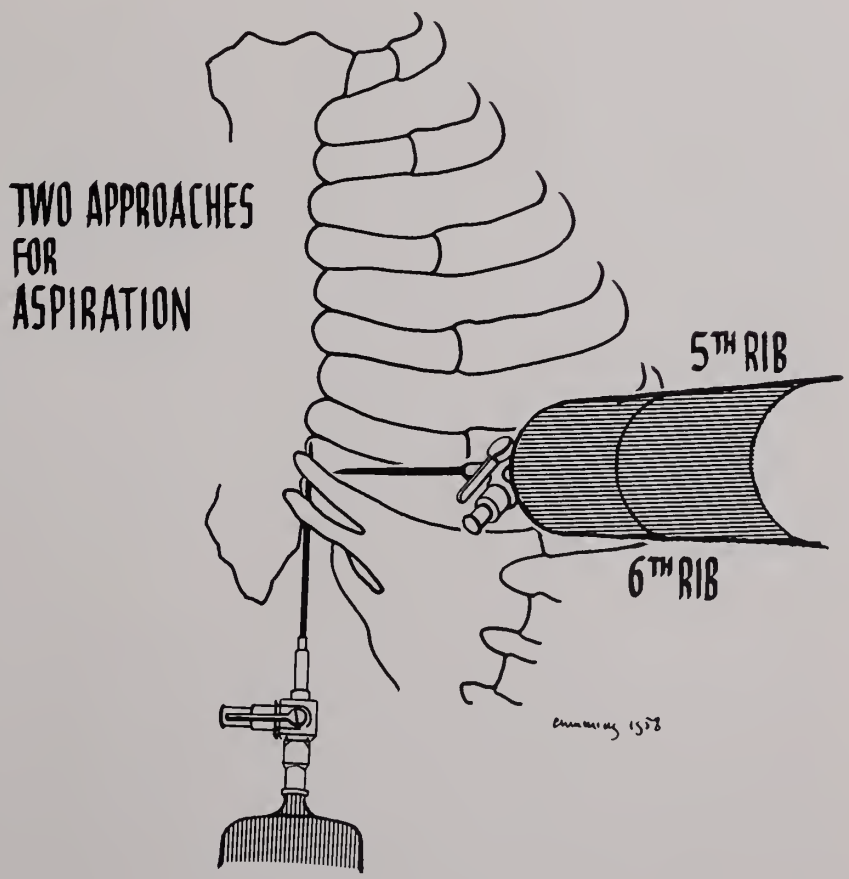

Fig. 3. The apical and the paraxyphoid approach to pericardiocentesis.

Fig. 4. Case 1. LEFT: Portable x-ray taken before pericardiocentesis was done. Note size and shape of the cardiac shadow. RIGHT: X-ray taken three days after aspiration.

in recent years there has been an improvement in mortality associated with operative treatment. In 1944 Linder and Hode[4] reported mortality of 43 per cent in 28 patients treated by operative means. An encouraging improvement is shown by Elkins[5] who reported mortality of 42 per cent in 38 patients in 1941, but only 22 per cent mortality in 23 patients reported in 1944.[6] More recently Jordan and Wilson[7] reported 30 cases of stab wounds of the heart. Twenty-four patients were treated by surgery. Three of these died, two in fibrillation and one due to ligation of a coronary vessel. Three were treated by aspiration and lived. Three received no treatment. Maguire and Griswold[8] reported a series of 33 patients with mortality rate of 8.3 per cent for those who lived 20 or more minutes after reaching the emergency room and who were treated. Ten died in the first 20 minutes.

In evaluating the methods of treatment it is well to remember that isolated unsuccessful cases are usually not reported, and also that the more complicated cases are the ones usually subjected to surgery. However, the question arises whether or not the total of successful end results would not be greater if a more conservative policy in regard to immediate operation be adopted in those instances in which there is no active bleeding through the chest wound or into the pleural cavity. In other words, is one not warranted in delaying operation and in using non-operative means, including aspiration, in those instances in which the patient's symptoms are due to tamponade rather than continued active bleeding? If blood reaccumulates rapidly following aspiration, it is agreed that exposure and suture of the heart wound is indicated. If more than one aspiration is necessary, one should allow 15 to 20 minutes between tappings in order that the chances of closure of the wound by clot may be increased.

CASE REPORTS

Case 1. A man, age 32, was admitted as John Doe. Emergency room admission note: Patient enters comatose with multiple stab wounds. Clothes soaked with blood. Physical examination: Patient cold and sweaty. Pulse and blood pressure unobtainable.

He was admitted directly to the surgical floor where he was found to be cold, clammy and responded only to pain produced by orbital pressure. He had a laceration on the chin, left upper arm, left groin and just below the xyphoid. Blood pressure was 45/35. The pulse, when obtainable, was 70 and paradoxical. Heart sounds were faint, but present. Only the first heart

sound could be heard. The chest was clear to auscultation and the heart was not enlarged to percussion. Neck veins were distended. A portable chest x-ray was taken and revealed an enlarged cardiac shadow (Fig. 4).

A paraxyphoid pericardial tap was done and 150 cc. of non-clotting blood was obtained. The blood pressure rose to 110/80; the venous pressure dropped, and the patient became alert. A second pericardial tap was done three hours later, but only 10 cc. of blood was obtained. Improvement continued on supportive therapy. He was discharged on the seventh hospital day.

Case 2. A man, aged 23, gave a history of being hospitalized previously in a mental institution because of episodes of severe depression. He stated that on the day of admission he had had a lover's quarrel and that he had stabbed himself in the left chest with a boning knife. On admission his blood pressure was unobtainable. He was cold, clammy and sweating, but rational and cooperative. There was distention of the neck vessels and a one-half inch wound in the left fifth intercostal space, 4 cm. from the mid-sternal line. There was a slight ooze from the wound. Heart sounds were distant and paradoxical. The rate was 60. The heart was enlarged to percussion. Portable x-ray revealed an enlarged cardiac shadow with normal appearing lung fields.

A paraxyphoid pericardial tap was done and 50 cc. of non-clotting blood was obtained. Blood pressure immediately rose to 110/80 and later stabilized at 134/82. He recovered uneventfully and on the sixth hospital day was discharged to a private psychiatric hospital.

Discussion

Pericardial tamponade is the immediate cause of death in many people whose situation goes unrecognized or in whom the tamponade develops so rapidly that death occurs before therapy can be instituted. If we assume that the associated injuries that may be present are not contributory to the course of recovery, then what are some of the complications of tamponade and its treatment?

A reduced or unobtainable blood pressure may lead to cerebral anoxia and later cerebral manifestations. Renal shutdown or liver failure may result following a prolonged reduction in blood pressure.

One of the major branches of the coronary system may be injured at the time of the initial injury or it may be injured at the time of surgical intervention. Some have been tied off at the time of placing sutures to control the myocardial hemorrhage. The result is the same as that following coronary thrombosis and subsequent myocardial infarction.

In doing the pericardial paracentesis the needle may inadvertently be pushed through the intercostal or internal mammary artery and again hemorrhage results. Associated with the operative treatment of tamponade there may occur a hemo- or pneumothorax. These are managed as in any other situation. Also it must be remembered that in cases where the myocardial trauma results from high velocity missiles, such as a bullet, trauma to muscle is much wider than the simple hole or rent. Missiles produce a concussion type of injury to the surrounding tissue. Thus, in suturing a laceration, the sutures must be placed widely enough to incorporate the injured tissue.

Emboli following injury to the myocardium are not to be disregarded. A thrombus forms over the laceration of the endocardium. Subsequently emboli may be released and lodge in the cerebrum, lung, or any part of the body, depending on which side of the heart was injured.

Infection must always be considered, especially in the operative cases. Since the situation is a dramatic one when the patient arrives, the surgeon may be compelled to disregard or overlook strict aseptic technique.

Cardiac tamponade in a patient arriving at the hospital is a condition which must be recognized promptly and treated immediately. The mere fact that the patient arrives alive may indicate that the more conservative approach of aspiration will suffice in the majority of cases. It is obvious that operation is necessary in those patients in whom active bleeding continues either into the pericardium or from the associated chest wounds. ●

Electromyographic Studies on Patients with Chronic Headaches

Herman A. Dickel, M.D.
Henry H. Dixon, M.D.
William Stoner, B.S.
and
James G. Shanklin, M.D.
portland, oregon

Realizing full well that it is presumptuous to try to add to the medical literature on the subject of headaches, we wish simply to recount briefly our experiences in observing and treating a large number of patients chiefly having chronic tension and anxiety reactions, complaining most frequently of headaches, and followed along by means of electromyographic studies during their contacts with us.

Wolff, Ostfeld, Becher, Friedman and others[1-6] have mentioned the use, mainly in research areas, of electromyographic studies in the headache problem. Shagass, Malmo and, of course, Jacobson[7,8] have used it in clinical and research instances. Others have used the electromyograph for studies of tension and anxiety. We have used and reported on the value of the electromyograph in clinical studies of the anxiety tension states and response of patients to drugs.[9,10]

Studies

For some 20 years we have confined our private practice in the psychiatric field to ambulatory treatment of these cases known variously as "anxiety tension states," "tension syndromes," and, as perhaps best labeled by Jacobson, "the neuromuscular hypertensions." During the past seven years we have used the electromyograph in studies of almost all patients for the following purposes:

1. To evaluate the relationship between neuromuscular hypertension and the anxiety noted in the patient.
2. To evaluate any relationship between the neuromuscular hypertension and the various physiologic or psychosomatic symptoms noted, or both.
3. To compare these electromyographic studies—considered objective studies—with our own clinical observations and the patients' subjective statements in regard to treatment progress, benefit of treatment and value of drugs.[10]

The electromyographic apparatus we use consists of electroencephalographic surface electrodes coupled to a Tektronic type 122 preamplifier coupled by coaxial cable to a Dumont cathode-ray oscillograph type 302A. Photo recordings are obtained by using a Dumont type 302 oscillographic Land camera. By means of this apparatus we may observe the moment to moment, hour to hour, day to day and beginning to end course of any patient we are evaluating or treating. We may simply observe by watching the oscilloscope or record permanently by using the camera. And by placing the scope properly we may utilize it as a means of demonstrating to the patient certain objective features of his case that previously he has had to take for granted because the physician said so, or because it was a "psychologic mechanism" and not usually thought of as observable. Jacobson has done this sort of thing previously.[8]

May I emphasize that we use this apparatus not for the detailed or intimate study of muscle abnormality or neuromuscular disease but as an objective means of studying patients with emotional distress. We employ it for those in whom

Read by senior author at AMA 107th Annual Meeting, San Francisco, California, June 27, 1958, in Section on Nervous and Mental Diseases.

neuromuscular tension may be considered as a primary or secondary factor (depending on one's orientation) but certainly a factor not to be overlooked, as it has been at times in the past.

Inferences

At present we have many photographic recordings from patients in chronic anxiety tension state who have been studied in various ways during treatment. In at least 500 of these patients there has been some form of headache as the chief complaint. From the studies done on all of these patients, including those with headaches, we have come to certain conclusions which we state here briefly:

1. Along with Jacobson, Shagass, Malmo,[7,8] and others we have found individual variations in degrees of neuromuscular tension with hypertensive levels in those patients making complaints.
2. Chronic neuromuscular hypertension invariably leads to muscle fatigue and spasm, as evidenced by ductility and lowered phosphocreatines.[11]
3. In the anxiety tension states the degree of neuromuscular tension and the severity of fatigue in the muscular apparatus are related directly to the degree of anxiety.
4. Most frequently the particular symptoms of which the patient complains can be correlated to increased tension and fatigue in the skeletal musculature of the specified area—i.e., pre-cordial pain is often due to skeletal muscle hypertension, fatigue or spasm in the pectoral, intercostal or diaphragmatic areas.
5. Reduction or elimination of neuromuscular hypertension (or fatigue) locally and generally in these patients, whether done pharmacologically, physiotherapeutically, or psychotherapeutically, results in some relief of symptoms.
6. No one of these agents is as effective as a combination program. The patient with chronic neuromuscular hyptertension needs re-education. Permanent relief will be obtained when he learns to live without tension.

Use

In the cases with specific complaint of headaches, we use the electromyograph in the following manner:

1. Either during the initial interview or immediately following it, we demonstrate a degree of neuromuscular tension greater than the patient had noted or could eliminate by himself.
2. Usually we are able to demonstrate that the tension or the state of fatigue is greater in the area about which the patient complains.
3. We can demonstrate, for example:

    a. That in chronic occipital headache there is tension or fatigue in the trapezius in all areas of the muscle, not just the occipital area.

    b. That in temporo-parietal aches the temporalis or auricularis muscles are at fault. (We do not mean to imply that all headaches in the occipital or temporo-parietal area are due to tension but in people with a state of chronic tension it can be shown that the chronic neuromuscular tension parallels the symptoms complained of.)

4. That as therapy progresses, the tracings show us and the patient the real gains. This puts response to therapy on an objective plane.

It is noted at this point that we have already been told, "Oh, you fellows are just using a lot of mechanical gadgets to pull psychologic tricks on these neurotic patients who will go for any mumbo-jumbo!"

Convictions

There is, of course, always that possibility. But we have tended to pursue a more logical and plausible line of thinking. We believe that the patients with so-called tension headaches actually do have chronic neuromuscular tension. Since only muscular tissue can be tense or show effects of being tense, it seems wise to demonstrate the finding to patients. Today they expect tangible evidence of what is being accomplished or of what is really known about them.

As a result of such use of the electromyograph equipment we have become convinced of these points:

1. As has been pointed out by Brazil, Blumenthal and Otheco,[12,13] a number of the head muscles are primary in the alerting reaction of the human. The eyes cock and

the head sets. These patterns are designed to aid the sense organs to receive stimuli.

2. Further, we feel that this normal pattern of reaction to environment is not the fundamental cause of the tension or fatigue. Rather, we feel that as the original contraction of any large group of muscles takes place, there is an accompanying variation in the visceral-glandular setup. Change is induced in bodily physiology and an emotional reaction takes place. In some this is pleasant, in others quite unpleasant. In this latter group there are many who because of earlier training, limited experiences or trauma, will literally try to fight it off. As they attempt to cope with environment, they bring about greater muscle tension by sheer power of will. We can demonstrate progressive tightening of muscle groups with each wave of emotional distress until tension is constant. Headache ensues. A vicious circle is established when, in turn, the patient tries to fight off the headache. Psychologically this is an obsessive-compulsive pattern. Physiologically, it can be shown that the patient is simply trying too hard with the wrong technique for control.

The same mechanism is at work in the charley-horse of the young athlete. He rushes in with muscles entirely too tight and tries too hard. The resulting muscle spasm is always treated with physical means and never considered to be neurotic or psychologic in origin. His re-education consists of teaching him how to do it correctly the next time.

Essentially there is little or no difference between that athlete and the patient with headache problems. They both mean well. They are trying too hard. They only know that they must keep fighting. They both pull the muscles too tightly and for too long a period. Distress results. We know it sounds inappropriate, but many headaches are nothing more than charley-horses of the muscles in and around the head. This includes the trapezius, the sterno-cleido-mastoid, the temporal group, the full contingent of the ocular muscles, and the levator group in the posterior throat.

Our own experiences, and especially those with the electromyographic equipment, have convinced us that in the large group of people who have chronic headaches, and in whom no tangible organic illness is found, that chronic neuromuscular tension involving the musculature of the head, neck, and related areas, is the major factor in production of the headache.

Typical electromyographic tracings are reproduced in figures 1 and 2. They show that, even when neuromuscular hypertension is general, it is highest in the area about which the patient complains.

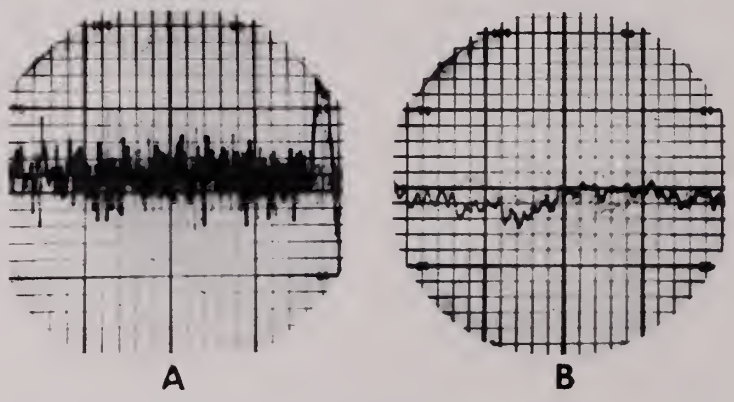

Fig. 1. Typical electromyographic tracings showing: (A) the findings when neuromuscular hypertension is present and (B) when a fair degree of relaxation is appearing.

Recently in the *Journal of the American Medical Association* we came across this commentary by E. D. Adrian,

> When Sherrington was examining the stretch reflex the general theory of feed-back circuits had not risen to its present mathematical dignity. His treatment of the subject was on a physiological level. But recent work has shown that the physiological circuits are more highly organized than he supposed. The muscle spindle, the main source of information about the forces within the muscle, does not act merely

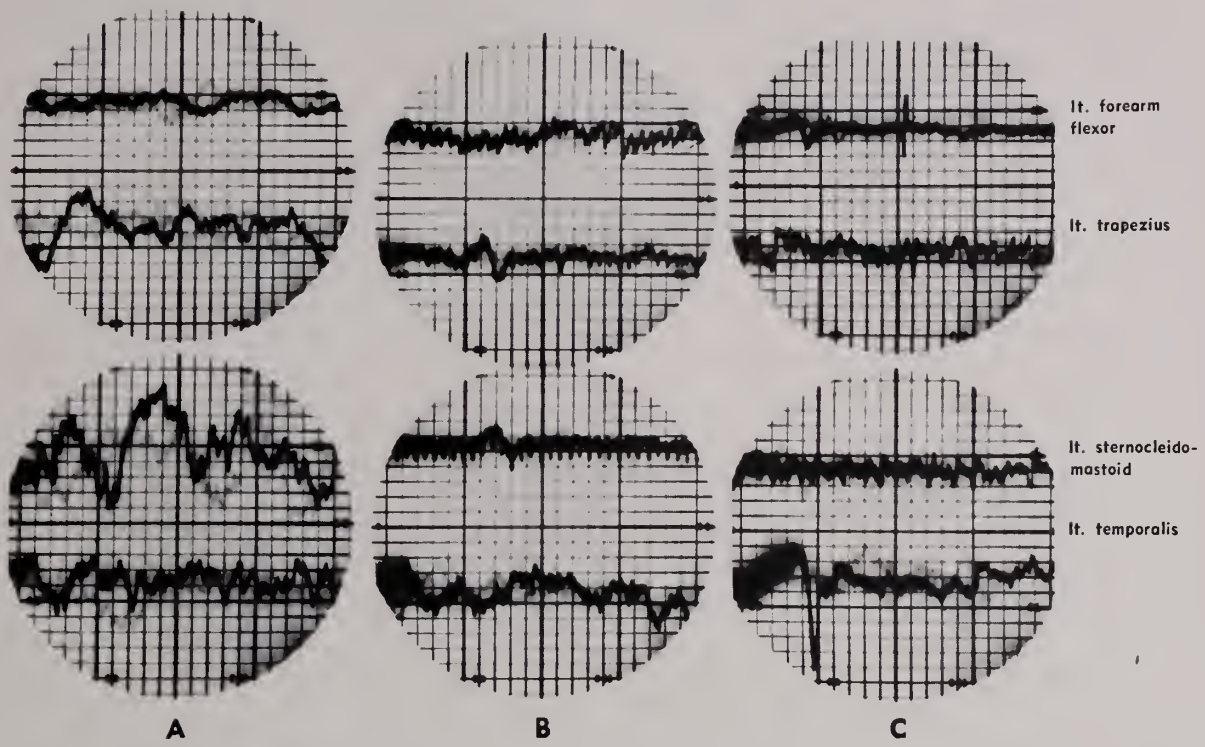

Fig. 2. Electromyographic findings in three patients, from muscle groups as noted, showing: (A) patient with severe generalized headaches, (B) patient with severe temporal headaches, and (C) patient with both occipital and temporal headaches.

as a passive strain gauge. Its sensitivity is under constant adjustment by the spinal centers, for there are special motor nerve fibres to the muscular part of the organ: these can vary the tension of the sensitive region independently of the variations of tension in the whole muscle. The operation of this additional control has been worked out in the laboratories of Granit and Kuffler and it can be regarded as yet another example of a general principle of sensory physiology, the principle that the sense organs would be of much less value to us if they were not constantly focused and adjusted by the central nervous system. They control its activity but they are themselves controlled by it and made more or less sensitive to suit the circumstances. The control may involve widespread movement: shading the eyes against too strong a light, turning the head to catch a sound, or sniffing to identify a smell: it may depend on special accessory muscles attached to the organ, and in some cases there is evidence of efferent nerve fibres running directly to the receptor apparatus. Even the flexion reflex of the spinal animal might be regarded as an example, for its aim is the removal of the pain receptors from the stimulus which has set them in action.[14]

Because of these experiences and orientation in our thinking about headaches in the chronically tense person, we have decided that a combination-type treatment serves the patient best and gives the beneficial results both patient and doctor desire.

In treatment of these cases, we feel these points exist:

1. The person is emotionally distressed and is tense, fearful, anxious, often depressed.
2. The person has real, tangible demonstrable, physical distress.
3. The person, with both these, has need for psychotherapy to alter the manner in which he is handling these and other problems.

To bring both deficiencies into a therapeutic program we usually do these things:

1. Because these people have so much fear, anxiety and physical distress, we usually give very adequate amounts of pharmacologic agents. In our own experience the best agents have been combinations of mephenesin and short-acting barbiturates and some combinations of caffeine, ASA, acetophenetidin and short-acting barbiturate. Other drugs are often needed, in dosage adequate to bring real and sustained relief.

In all cases of muscle fatigue the use of betaine and glycocyamine to raise phosphocreatine levels is urged.

2. We make adequate use of physical therapy, such as muscle stretching, proper massage and contrast baths. Recently we have found that rhythmic, peripheral stimulation of these fatigued, spastic muscles by faradic current will lead to most rapid energy recovery and give beneficial results more quickly.

3. In the psychotherapeutic area we feel that these people need particularly to:

a. Learn what is wrong. They should be told in simple language, easily understood, with a maximum emphasis on the physiologic mechanisms taking place.

b. See it demonstrated so that it is tangible.

c. Know what can be done on a temporary and permanent basis to correct it. This, too, must be told simply and repetitiously until it is thoroughly understood.

We conduct frequent interviews in which we discuss, instruct, re-educate, briefly "analyze and re-synthesize" his pattern of life for the patient. Also, we make use of a modified type of Jacobson's progressive relaxation, which actually has more real value than is generally recognized.

Conclusions

As a result of many electromyographic studies on patients with chronic headaches, and usually with chronic tension, we feel that neuromuscular hyptertension, fatigue and spasm are the major factors in producing symptoms. Further, we feel that any treatment program for chronic headaches must be a common-sense application of many therapies integrated into a sound method. This must include adequate physical and medicinal therapy. It must also include full emotional, intellectual, and physical re-education so that tension techniques are not used erroneously by the patient to combat his own tension. It is also our conclusion that a simplified type of electromyographic equipment is useful to the physician to watch the progress of his patient, the effect of any therapy, and on occasions to study etiology of the condition. It is of significant value to the patient to allow him to see the nature of his symptoms on a more realistic level and to watch his progress with greater understanding. Any technique that does this for patients, is, in our opinion, a real aid in treatment. •

Surgery of Peripheral Arteriosclerotic Occlusive Disease

Richard N. Kleaveland, M.D.
Spokane, Washington

Tremendous strides have been taken in the surgery of chronic arterial occlusions. Prior to the era of reconstructive arterial surgery, lumbar sympathectomy was the chief surgical treatment. This is an indirect approach to restoration of circulation to an extremity since it is not directed toward the causes or the organic disease. The mechanism of action is to produce dilatation of those collateral vessels which remain functionally active in the extremity. Lumbar sympathectomy is of benefit in some cases of obliterative vascular disease in increasing the circulation to the skin and thus forestalling gangrenous changes. However, it has been demonstrated to have less benefit for intermittent claudication.

With the advent of arteriography and clinical pathologic studies performed by Leriche,[1] the true nature of chronic arterial occlusions became apparent. It was found that the arteriosclerotic process could be segmental in a vessel, such as the aorta, iliac or femoral arteries, with patent vessels above and below the damaged zone. This knowledge permitted direct approach to the occlusive process with thromboendarterectomy, to restore arterial flow. This, too, has limitations. By-pass grafts using homografts and, later, prosthetics have extended the limits of reconstructive surgery. The purpose of this communication is to review some of the knowledge of chronic arterial occlusions below the renal arteries with case reports demonstrating various procedures.

Diagnostic Considerations

When a patient comes to the office, decisions must be made as to the cause of his complaints and as to treatment. Fortunately, with chronic arterial occlusive disease, the diagnosis can be established quite definitely by history, examination and x-rays. Most patients in whom occlusive disease is considered have pains, cramps and weakness in the lower extremities or back. Many pathologic states may cause these symptoms, such as osteoarthritis of the spine, spinal cord tumors, disc syndromes, postphlebitic syndrome, neuritis and many others. None of these should be confused with chronic arterial occlusions when it is realized that in arterial obliterative disease the symptom complex—aching pain, fatigue, cramps and numbness—comes with exercise and is relieved by rest.

The basis for these symptoms is that the occlusive process develops very gradually over a period of time, with gradual reduction in the intraluminal diameter secondary to the arteriosclerosis. When this reduction of the blood vessel reaches a critical state, the pulse volume diminishes[2] and the volume of blood flow through the vessel is reduced. Thus the stenotic or blocked vessel will not permit an adequate blood flow to the extremity during exercise when the need increases.

The collateral circulation developed to compensate for the narrowing and final occlusion of the major vessel may deliver an adequate supply of blood, maintaining viability of extremities at rest and for walking short distances without developing intermittent claudication. However, the collateral channels cannot supply sufficient blood to the extremities for vigorous prolongated exercise without developing symptoms.

Careful interrogation is necessary as to how fast and far a patient can walk before symptoms develop, and how long a rest is needed to relieve symptoms. It has been noted that walking up an incline or carrying a heavy load, which increases

the demand for blood secondary to muscle work, causes symptoms to develop more rapidly.

Examination

Much has been written on examination of an extremity to ascertain the status of the circulation. Fundamentally, two items can establish the presence or absence of the arterial occlusive process. These are the examination of the pulses and the exercise tolerance test.

The aortic pulse can be felt between the umbilicus and the ziphoid. Femoral pulses should be palpated in the groin with the patient supine. Occasionally, having the patient hold his breath helps eliminate interference from abdominal movement. Popliteal pulses can be felt by flexing the knee slightly and palpating the artery behind the tibia as it goes between the lateral and medial heads of the gastrocnemius. The posterior tibial pulse posterior to the medial malleolus at the ankle and the dorsal pedal pulse on the dosum of the foot are readily accessible to examination.

It is important for the examiner to be relaxed and not to confuse his own pulsation in his finger tips with the patient's pulse. The pulses may be present but diminished, indicating partial occlusion or stenosis of the lumen. The femoral pulses may be absent and a feeble dorsal pedal or post tibial pulse may be present indicating good collateral circulation. Usually pulse of this origin is substantially weaker than that on the unobstructed side.

The second item of importance in the examination is test of the patient's ability to walk. A more accurate evaluation can be made if the examiner walks with the patient at a brisk rate, recording the number of steps or distance traversed before symptoms develop which cause limping and finally require rest. Location of the pain, numbness and cramps should be noted. It is of interest that previously absent arterial pulsations often can be felt after exercise. Most patients will have significant symptoms after walking 100 to 200 yards, depending on location and extent of disease. Patients with histories suggestive of intermittent claudication but with adequate arterial circulation will soon wear out the examiner by walking a long distance without producing symptoms.

Other indices of arterial insufficiency, such as incomplete venous filling, lowered skin temperature and trophic changes of the extremity, have their prime importance in evaluating the extent of disease once the diagnosis is established. In aorto-iliac occlusions, significant trophic changes are seldom present unless extensive arteriosclerosis involves the femoral arteries also.

X-Ray

X-ray, in conjunction with the history and physical examination, is useful in office evaluation. The anterior-posterior and lateral view of the lumbar spine will often show calcium deposits in the atheromatous portions of the aorta and iliac arteries. This may be seen in the presence of apparently normal circulation in asymptomatic patients. However, if history and examination support the diagnosis, this calcification has significance. Calcification of the aorta brings the diagnosis of arterial occlusive disease to the mind of the doctor examining a patient for back and leg pain and stimulates re-evaluation of the pulses and history. Extensive calcification in the peripheral vessels serves as a warning of diffuse arteriosclerosis to the surgeon, suggesting that difficult problems may be faced if surgery is undertaken.

Localizing Symptoms

Localization of the segmental block in the arteries can be established with the evaluation above. In chronic aortic-iliac thrombosis (commonly referred to as the Leriche Syndrome[1]), back pain and pain in the hips and thighs, with associated weakness and easy fatiguability of the extremities, are the most common symptoms.[6] Inability to maintain erection is occasionally present in the male. If the aorta is completely occluded, symptoms are bilateral. If the predominant occlusive process is in one iliac artery, unilateral claudication results. Often the femoral pulse will be absent on one side and diminished on the other, indicating disease on both sides even though the symptoms may be unilateral. Generally the arteriosclerotic changes start in the common iliac arteries and progress up toward the aortic bifurcation.[3]

In the lower extremities the most frequent site for arteriosclerotic changes of the superficial femoral artery is at the adductor hiatus where the vessel leaves Hunter's canal and enters the popliteal fossa. The occlusive process spreads from this point up toward the common femoral artery. Intermittent claudication involves all distal parts, such as the calves and feet, with aching cramps, numbness and weakness. On examination the femoral pulse will be present and all distal pulses absent or markedly diminished.

In arteriosclerosis of small vessels, as seen with

diabetes, the popliteal pulse may be present, indicating patency of the femoral vessel but distal pulses—i.e., posterior tibial and dorsal pedal—are absent. These cases are unsuitable for reconstructive surgery since the distal arterial bed is occluded. They benefit most from lumbar sympathectomy.

Prior to surgery, arteriography is performed to determine location and extent of the block and patency of distal arterial bed. As pointed out in cases that follow, arteriograms have to be interpreted in light of the clinical examination.

Surgical Treatment

Since the advent of reconstructive surgery, knowledge of the disease condition and techniques of therapy have advanced remarkably. DeBakey[4] has demonstrated that 75 per cent of his patients, with intermittent claudication as the only indication of inadequate circulation, have a satisfactorily patent peripheral arterial bed allowing restoration of the circulation. The aorto-iliac blocks are more favorable for remedial measures than femoral occlusions as they are more likely to have a well localized arteriosclerotic process and are larger vessels to operate upon. Even those patients with inadequate circulation at rest, have been operable in 55 per cent of DeBakey's cases.

In the selection of patients for operation, severe cardiac and renal disease is the main contraindication. Those patients faced with impending loss of limb are operated upon in lieu of an amputation, with the hope of restoring the circulation. The prime indication for arterial grafting has been intermittent claudication which prevents them from leading a normal life. The objective of treatment is to restore the normal pulsatile flow to the peripheral arterial bed. This should be done without sacrificing the existing circulation in the event of graft failure. Saving the collateral circulation and all patent vessels is important.

For localized blocks of the aorta and iliacs, thromboendarterectomy is suitable (Fig. 1). This procedure is less satisfactory for the external iliac and femoral vessels because of their small caliber and likelihood of postoperative thrombosis. For extensive aorto-iliac occlusions, excision of the aorta, insertion of a bifurcation graft and end-to-side anastomosis of the limbs of the graft to the femoral arteries is the accepted treatment (Fig. 2). The end-to-side anastomosis permits blood flow proximally through the iliacs left in situ to the pelvic vessels and distally into the femoral vessels.

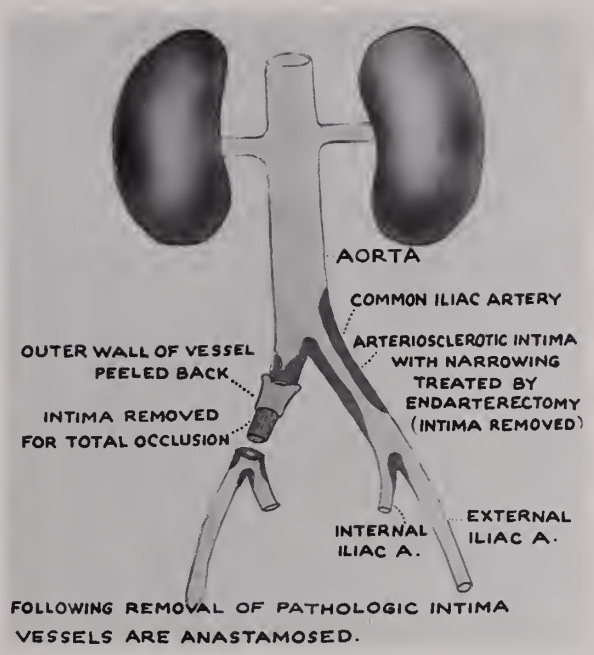

Fig. 1. Endarterectomy of iliac arteries as performed in case 4.

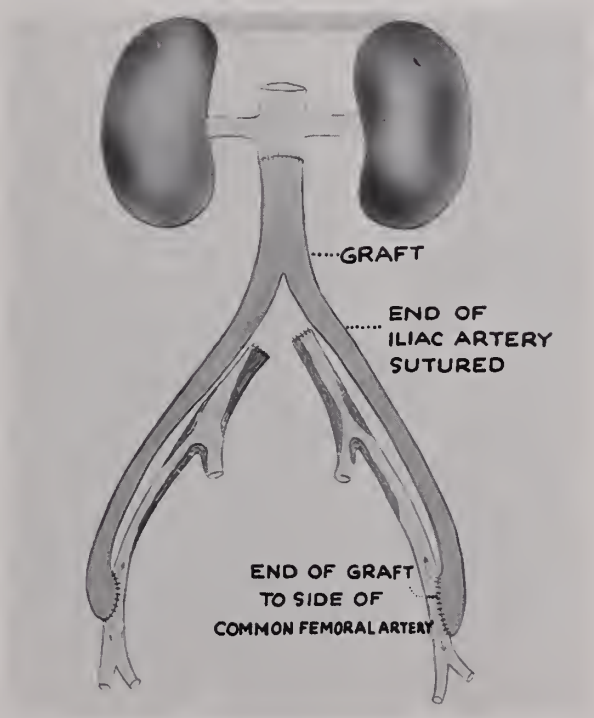

Fig. 2. Aortic resection and graft with end-to-side anastomosis into femoral arteries.

Linton[5] and Crawford[7] have demonstrated that end-to-side anastomosis is less likely to thrombose than end-to-end suture. This technique permits anastomosis of the graft to small diseased

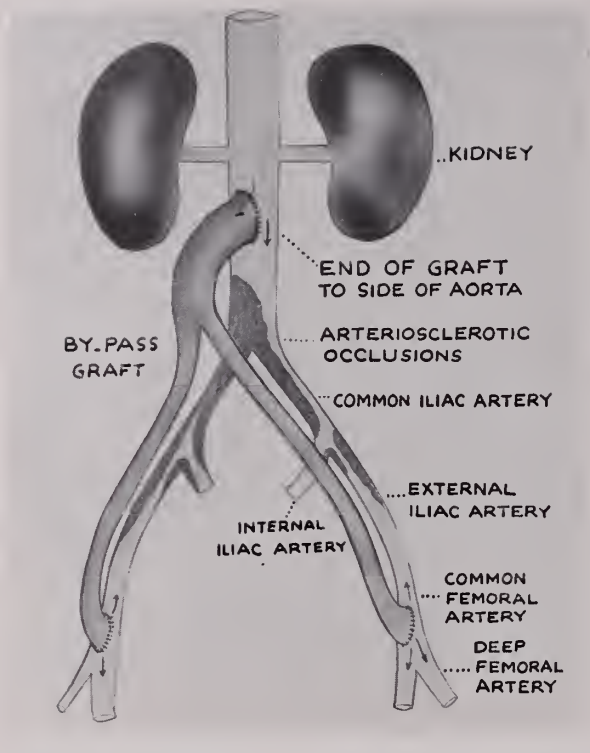

Fig. 3. By-pass graft as performed in case 3 utilizing end-to-side anastomosis.

arteries which would be impossible with the end-to-end method. Also, the occluded segment of the vessel need not be excised in the by-pass graft thus reducing trauma to the concomitant vein and saving the existing collateral circulation. The end-to-side by-pass principle can be applied to the aortic anastomosis as well as the femoral, giving a pulsatile collateral channel around the obstruction without damaging the existing circulation (Fig. 3). This is especially useful in diffuse arteriosclerosis. (See case 3.)

By-Pass Graft

In femoral artery obliteration it is the consensus of vascular surgeons that the by-pass graft (Fig. 4) is ideally suited for the small vessels. Disease in the vessel may extend from superficial femoral artery origin in the groin to the bifurcation of the popliteal. Endarterectomy over this distance involves a long incision and excessive operative trauma with significant hazard from thrombosis during the immediate postoperative period. The by-pass graft does not disturb the collateral circulation. The graft is passed down the leg by tunneling between the femoral and popliteal incisions. When the patent distal vessel is small, end-to-side anastomosis is the only type which will function. (See case 6.)

A few examples of various reconstructive procedures are presented in the following case reports.

CASE REPORTS

Case 1: This 44 year old male had had easy fatiguability of his legs and associated back pain for one year. At onset, severe intermittent claudication had been present in both legs, noticed especially as he walked up 199 steps to his job.

The only pulse palpable in the lower extremities was a faint left femoral pulse. Venous filling was normal and trophic changes were present. Just prior to operation a left popliteal embolus occurred following attempted left femoral arteriogram.

At surgery an open arteriogram was performed. Block was present in the popliteal artery. At laparotomy, complete thrombosis of the aorta from the renal arteries down to the external iliac arteries was present. The aorta was resected and endarterectomy of the proximal aorta was performed to allow end-to-end anastomosis with the aortic bifurcation homograft which was sutured into the external iliac arteries in an end-to-side technique (Fig. 2). Bilateral lumbar sympathectomy was performed. Left popliteal embolectomy was performed for the embolus occurring just prior to surgery.

Complete restoration of pulses resulted. The patient has been asymptomatic and working for the past 18 months.

Comment. Since the aortic occlusion was complete, extensive aortic resection and graft was performed. The end-to-side technique used distally allows for a larger lumen at anastomosis and is less likely to thrombose. It is of interest that he was 44 years old and that the distal vessels were free of disease.

Case 2: This 44 year old female had had aching pains in the back, hips and thighs induced by exercise, such as volley ball, and relieved by rest. Her walking ability was reduced because of weakness in the right hip and thigh. A small abrasion on her foot had been slow to heal. A faint left femoral pulse was the only pulsation in the lower extremity. There were no significant trophic changes. Just prior to surgery, complete occlusion of the aorta occurred with loss of the faint left femoral pulse.

At surgery, complete occlusion of the aorta from the renal arteries to the external iliac was present. An aortic and common iliac endarterectomy was performed with restoration of circulation to the lower extremities. Two weeks after operation the patient had pain in the left chest consistent with pulmonary embolus. She was treated with anticoagulants.

Since surgery the patient has been able to exercise without limitation, even playing 18 holes of golf without difficulty.

Comment. Thrombosis was confined to the aorta and common iliac artery with the external iliac artery free from arteriosclerosis. The outer wall was of good quality and served as a good conduit for blood.

Case 3: This 49 year old female had severe aching in the legs for one year with associated tightening in the back and right hip. The patient had had one ovary and half of the other removed at the age of 21. The right femoral pulse was barely palpable and the other poor. Faint posterior tibial pulses were palpable with exercise.

Serum cholesterol was 350 mg. per 100 ml. Aortogram demonstrated diffuse arteriosclerosis.

At surgery, diffuse arteriosclerosis had caused narrowing of all vessels distal to the aortic bifurcation. An aortic by-pass was performed with end-to-side anastomosis of the aorta to a knit dacron prosthesis (Fig. 3) and end-to-side anastomosis to the femoral vessels. Right common and internal iliac endarterectomy was done to increase the blood flow to the pelvis. Bilateral lumbar sympathectomy was performed. This patient has been relieved of previous symptoms.

Comment. This operation did not destroy any collateral branches and added to the patient's blood flow into the distal vessels. The knit dacron has ideal characteristics for this type of anastomosis.

Case 4: For one year prior to surgery this 44 year old male noticed left hip and thigh pain induced by walking. Walking up an incline or carrying a heavy load caused the symptoms to appear more quickly. No symptoms were noted in the right leg. The femoral and distal pulses were absent on the left and present on the right. Discomfort of the left hip and thigh came with walking 120 steps at a brisk rate and was relieved by rest.

At operation the aortic bifurcation and both common iliac arteries were endarterectomized (Fig. 1). The right common iliac had extensive arteriosclerosis. Because of the likelihood of further stenosis and probable occlusion, it was treated also. This patient has had restoration of his pulsations and has unlimited walking tolerance.

Comment. Endarterectomy was selected here because the disease was localized in the common iliac arteries and the external iliacs were normal. Generally the external iliac artery is unsuitable for endarterectomy because of small size and inaccessibility which makes thrombosis more likely. It is of interest that the lumen of the right common iliac was reduced approximately 50 per cent but pulses were still good in the right leg. This supports Hanovici's[2] findings that pulse volume does not change until the diameter is reduced 70 per cent or more. It is likely that the patient would have had symptoms in the right leg if he had not been limited in his walking by the occluded left iliac artery. He was informed prior to surgery of the possibility of arteriosclerosis in the right common iliac artery and permission was obtained to treat this even though he did not have symptoms. This has saved a repeat operation in the near future. Because of complications, such as thrombosis of the endarterectomy segment, the patient should have an honest presentation of the facts and the risks. If the operation is not completely successful, he will have been forewarned of the possibility.

Case 5: This 40 year old male had noticed cramps, weakness and numbness in the left leg for one year. Ten days before surgery his left leg became numb, cold, white and painful to walk upon. He was hospitalized and given paravertebral blocks with improvement in his circulation until discharge.

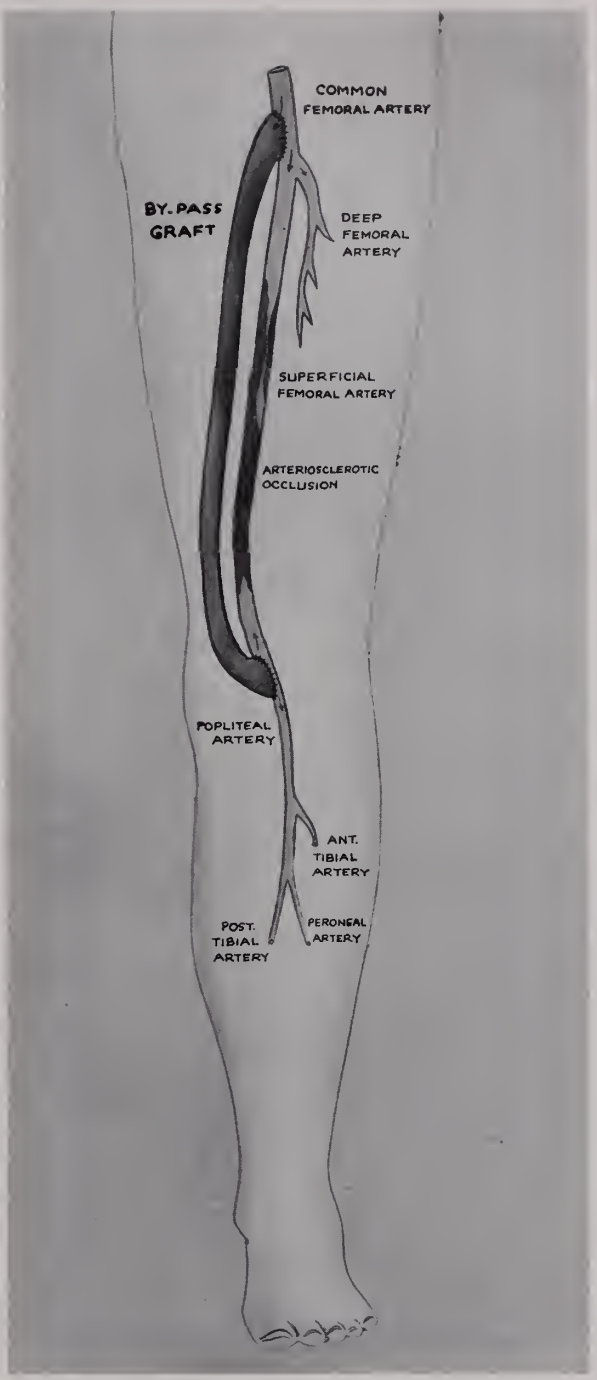

Fig. 4. Femoral by-pass graft as performed in case 6.

At age 10 he had stabbed himself in the left thigh and developed an arteriovenous fistula of the superficial femoral artery and vein. In 1938, at age 20, a physician at Hot Springs, South Dakota, performed a left femoral arteriogram demonstrating the fistula with false aneurysm. He did an end-to-end suture of the femoral artery and a lateral venorrhaphy with an excellent result for 19 years.

On examination, the left femoral and distal pulsations were absent and there was marked pallor with elevation

and delayed venous filling. The pulses in the right extremity were fair. Numbness in the left leg came after walking 40 steps and weakness with limping after 60 steps.

Aortogram demonstrated a block from the aortic bifurcation to the popliteal artery on the left with patent internal iliac and deep femoral branches. At surgery, extensive arteriosclerosis with recent clot was demonstrated. Endarterectomy from the origin of the left common iliac artery to the area of previous fistula in the lower left superficial femoral artery was performed. It was necessary to remove thickened intima from the aortic bifurcation and right common iliac because of significant narrowing. Because of extensive calcification of the fistula repair in the superficial femoral artery, endarterectomy could not be carried into the popliteal. Therefore a long, 3/8 inch internal diameter teflon graft was inserted from the common femoral to the popliteal artery in a by-pass type of graft.

Because of thrombosis of the graft, exploration was done the day after initial surgery. Clot was removed. This restored the posterior tibial and dorsal pedal pulses.

Three weeks after operation this patient walked five blocks to my office without limitation and with normal distal pulsation. Patient has returned to work.

Comment. Here endarterectomy was used in combination with a graft because of extensive length of occlusion. A long graft from the aorta to the popliteal would be likely to thrombose and all the structures between these two points would be deficient in blood. Endarterectomy was performed because these vessels were larger than usual. Blood flow was restored to the internal iliac and deep femoral branches. It seems likely that the early stress on the vessel, due to the A.V. fistula, may have induced premature arteriosclerotic changes in a patient who had this tendency.

Case 6: This 48 year old white male had intermittent claudication for six months. Severe cramp developed in the left calf after walking 100 yards. Diagnosis of arterial occlusion of the superficial femoral artery was substantiated by the findings of absent popliteal, tibial and dorsal pedal pulses. Pulsations of the left femoral artery were excellent. The right extremity had normal pulses.

Arteriogram demonstrated very small popliteal vessel distal to the superficial femoral artery occlusion which seemed too small for grafting.

Since the possibility of a patent vessel existed, popliteal artery exploration was done. A small but satisfactorily patent popliteal vessel was found. A 22 inch homograft was inserted from the common femoral artery to the open segment in the popliteal space (Fig. 4). This restored the posterior tibial and dorsal pedal pulses. Three weeks after operation the patient walked five miles without discomfort in his leg. Pulses have remained good and the patient is working without difficulty.

Comment. Exploration, even though the arteriogram suggested an unsatisfactory distal vessel, proved valuable for this patient.

Discussion

The cases sited are examples of reconstructive procedures for aorto-iliac and femoral occlusion. These patients have been in the fifth decade of life. They have been completely rehabilitated and thus able to support themselves. Each patient has had his own unique anatomic and pathologic situation requiring various techniques. Generally the by-pass graft is favored whenever possible since it is easier to perform, does not damage the existing circulation and is less likely to thrombose.

Homografts and synthetic arterial substitutes have been used in the above cases. Because of the difficulty in procurement and preparation of homografts, the arterial prostheses are favored. Excellent results of DeBakey and Crawford[8] using the knit dacron prosthesis indicate that this is a most desirable arterial substitute. Knit teflon of the Edwards-Tapp design is a great improvement over their braided nylon tubes.

Lumbar sympathectomy has been used at time of grafting on these patients with diffuse disease in the hope of opening the collateral circulation. Its greatest value is in patients younger than 50 who have a popliteal artery block and intermittent claudication. For extensive occlusions it is less effective in relieving the intermittent claudication. However, sympathectomy will improve the circulation to the skin and possibly forestall the onset of gangrene in many cases. •

The Fistula Is a Fine Fellow

R. O. Diefendorf, M.D., bremerton, washington

I do not believe that any book has ever been written on the general subject of fistulas, and I doubt if one ever will be. A fistula, by definition, is an abnormal communication from one viscus to another or to the exterior. It may involve any portion of the body. It may be relatively simple or extremely complex. Because of their pathologic features and anatomic vagaries, fistulas are not easily relegated to the domains established by modern day specialists or to the limited confines established by the various specialty boards.

Why are so many fistulas such complicated problems? The answer is quite simple when fistulas are viewed from the standpoint of etiology. In general, fistulas have four origins. First, we see those of congenital origin often following a more or less definite pattern but not infrequently deviating considerably from the classical or expected form. As Hamlet says, "Aye, there's the rub."

Second, we have fistulas resulting from unpredictable extensions of acute or chronic infection or from the relentless progress of invasive malignancy. Such fistulas do not follow any specific pathologic pattern and do not respect any anatomic boundaries.

Third, we see fistulas arising from trauma—sometimes blunt, more often sharp and penetrating. The initial injury may be trivial, such as the wound from a small knife blade, or it may be very complex, such as a bullet wound traversing one or several body cavities. These are the injuries from which obvious fistulas may form almost immediately or from which a spectacular recovery may be followed by the insidious development of severely altered physiology, such as may occur in a relatively small arteriovenous communication.

Fourth, we have fistulas resulting from surgical error—such as direct injury, recognized or unrecognized; inadequate or poor closure of a hollow viscus; disturbance of blood supply; injudicious use or abuse of foreign materials used in a surgical procedure. The list and types of man-made fistulas is, of course, extensive and a source of very great self-reproach.

On occasion a fistula may represent a happy circumstance. Thus, a biliary or duodenal fistula would be welcome as compared to a diffusing chemical peritonitis; and the rupture of an abscess into the bowel is often fortuitous and very desirable. A pancreatic-enteric or pancreatic-gastric fistula is a happy solution to a pancreatic cyst that cannot be removed and, of course, recently the construction of certain vascular fistulas has been extremely rewarding.

In approaching the problems of fistulas, great judgment must be exercised. Unfortunately, and far too often, the unwise or inadequate approach not only fails to cure the condition but renders the situation worse and even more complicated for, in general, each attempt to irradicate a fistula is more difficult than the preceding one. How well this is appreciated by those who have had to operate on thyroglossal, branchiogenic or biliary fistulas (to mention a few) operated upon for the third, fourth or fifth time.

Some fistulas, as far as the patient is concerned, can be classified as only a nuisance and the risk of operation outweighs the benefits. Such a fistula had better be left alone.

Since the operation for fistula is rarely easy, often inadequate, and not infrequently makes the patient worse, it follows that the conscientious surgeon must at times exercise judicious restraint, at other times aggressive action, and always careful planning. Then, when indicated, a well-executed operation may save life or at least make it more livable.

Several cases of difficult fistulas will illustrate the complexity of this problem.

CASE REPORTS

Case 1. A 30 year old male had had a small draining sinus in his neck since birth. Several drainage operations had been performed in childhood. The sinus presented at the anterior edge of the left sternocleidomastoid muscle and below the level of the hyoid bone. It was considered a branchial fistula.

Because the lesion was a nuisance, operation was encouraged. At the time of operation the sinus passed beneath the strap muscles on the left and then ascended in the midline. It was quite obviously a thyroglossal fistula. The central portion of the hyoid bone was removed and then a core of tissue, including mylohyoid, geniohyoid and genioglossus muscles, excised. At this point the specimen was hanging by a few strands to the right of the midline, at the base of the tongue. As these strands were divided, there was a sudden terrifying hemorrhage, which could be controlled only by local

pressure. The source of this hemorrhage was the lingual artery coursing over the genioglossus and geniohyoid. When the central core of tissue to be removed is large, this vessel can be injured easily, and when the vessel retracts, ligation is difficult at best. In this case it was felt wise to expose the external carotid artery quickly and ligate this vessel. This was done and the original dissection then completed.

On the day following operation, it was noted that the patient had a motor paralysis of the left hand. The only plausible explanation was a cerebral vascular disturbance, secondary to impaired circulation in the right common carotid artery at the time of surgery. A traction tape had been placed around this vessel prior to ligation of the external carotid and both vessels had gone into marked spasm. Fortunately, motion returned in the left hand within several wecks and full strength after several months.

To date there has been no recurrence and the final result is classified as excellent. The patient was cured of his annoying cervical fistula, but both life and limb were threatened seriously.

Case 2. A 12 year old boy was seen with an abscess in the right lower abdomen, following febrile illness of five day's duration. Despite the presence of abdominal pain, the history and physical findings were so atypical that he was treated with antibiotics by an excellent pediatrician.

Incision and drainage of the abscess was performed. A sinus tract developed following this operation, which persisted for six months. At this time a secondary operation was performed and the findings were quite remarkable. The tract extended through the various abdominal muscle layers down to a mass covered by omentum. When the latter was divided the appendix was seen to run into it. The appendix was divided at the cecum and the stump inverted. It was then seen that the mass was intimately associated with the bladder and could not be separated from it. Therefore, a portion of the bladder was removed. The mass was then freed from the right ureter. At this point the right vas deferens entered the mass. The greatest care was taken to salvage this structure for it was remembered at this moment that the patient two years previously had been operated upon for a left undescended testis and the functional status of the left testis was therefore uncertain. The vas on the right could not be dissected free, and was divided in removing the boy's disease. He made an uneventful recovery with no recurrence to date, possibly at the expense of sterility.

Case 3. A 69 year old woman was seen in consultation with a history of abdominal pain of various types and degrees for 20 years, intermittent purulent vaginal discharge and intermittent passage of gas through the urethra. Cystoscopy and retrograde pyelograms were non-revealing, but barium enema showed a fistulous tract, the nature of which was not clear. Treatment was refused and the patient was not seen again until one year later, at which time she presented herself acutely ill with high fever, chills, malaise, pelvic discharge, and still passing gas per urethra. A transverse colostomy was performed to exclude the bladder and genital tract from the fecal stream. The patient's acute symptoms subsided but she continued to pass gas per urethra. This was difficult to explain. A second barium enema was then performed which showed the sigmoid colon communicating with the right colon, a communication with the bladder, and a number of blind tracts passing to the region of the hip, sacro-iliac joint and left groin.

Several months after the transverse colostomy, a second operation was performed. The sigmoid colon communicated with the terminal ileum and the terminal ileum communicated abnormally with the cecum. The latter was fixed to the bladder and probably communicated with it. A number of blind fistulas involved the sigmoid. Operation was long and difficult. The terminal ileum was resected with end-to-end anastomosis. The sigmoid was resected with end-to-end anastomosis. The cecum was detached from the bladder and the rectosigmoid from the vagina. A posterior colpotomy was done for drainage.

Considering the magnitude of the procedure, the patient did fairly well, although she did develop postoperative pneumonia and a persistent left inguinal-sigmoid fistula. After six months, when the latter failed to close, a re-resection of the sigmoid was performed and three weeks later, when everything appeared to be going well, the transverse colostomy was closed.

This patient's status was greatly improved at considerable cost and prolonged morbidity.

Conclusion

My purpose in discussing fistulas has not been primarily to add information to this very broad subject, but rather to use this subject as a background for discussing difficult surgery in general. The day of carrying out routine operations is gone. For many years there has been a tendency to classify surgical procedures as major, minor and intermediate. Such a classification is based upon the erroneous assumption that surgery comes in sizes—large, medium and small. Nothing could be farther from the truth.

Most of us realize that surgery must be defined as an area of responsibility rather than technique. In viewing surgery for a number of years, I have observed that the best surgeons are usually those who, for one reason or another, get the best exposure. This may mean a larger incision or multiple incisions. It may mean a second, third, or even fourth assistant. It may mean a special instrument or special retractor, although the simple ones usually suffice. It may mean postponement of a case until local or general conditions improve, or it may on occasion mean a staged procedure.

Good surgery is safe surgery—unhurried, gentle, and in most cases, remarkably simple.

Last, but not least, and completely separated from technique and skillful manipulation, there never has been, nor will there ever be, a substitute for sound knowledge in anatomy, physiology and pathology, combined with a surgical conscience. Herein lies the difference between the safe operator and the clever tchnician.

These, then, are the factors of importance in dealing with complicated fistulas, for more often than not, the fistula is a fine fellow. •

Psychosomatic Medicine

Part I. The Basic Mechanism

WALTER J. GARRE, M.D.
SEATTLE, WASHINGTON

Basic anxiety is characteristically human because only the human can feel rejection with its implication of threat to existence.

The term *psychosomatic* is derived from the ancient Greek: psyche for the mind, the soul, and soma for the body. Psychosomatic is usualy used to indicate the influences of the mind—or better, the emotions—upon the body.

An emotion can be defined as the mood or feeling that is experienced before, during, or after an event to which we are exposed or even as the feeling that surrounds a thought process. It is obvious that only to the extent that an occurrence has bearing on us will we be affected. The word *affect,* another term for emotion, indicates this relationship. Anything that directly or indirectly even remotely tends to jeopardize our existence will, if perceived as such a threat, provoke a basic physiologic reaction, one that operates throughout the animal kingdom: the well-known fight-or-flight principle. Danger must be overcome or avoided.

Normal and Pathologic Response

The autonomic nervous system prepares us for the stress; it is alarmed by the cerebral cortex, influenced through the hypothalamic centers, and vicariously stimulated by the endocrine glands. The accompanying feeling of fear and apprehension is a well-justified reaction to external stress, since it represents the subjective awareness of the need for protective measures. As long as the reaction is commensurate with the danger, it is physiologically normal. The situation changes basically when stress reactions occur out of all proportion to the real or fancied danger. It is obvious that overmobilization of energy resources is wasteful, weakening, and potentially deleterious from the viewpoint of body economy.

The weakening of the organism that results from overreaction, if this occurs only occasionally, may leave only minimal organic changes, too small to be measured unless on a humero-chemico-cellular basis. If, however, the stress is repeated, these changes may aggregate and cause the microscopic and even gross disturbances that we term organic changes. Thus we see that the demarcation between functional and organic disturbances is only arbitrary; we call a disturbance functional if we cannot detect any changes microscopically or grossly, but with more modern and refined techniques we are able to discover changes at the intercellular level.

The more realistic a human being is, the better he will be able to distinguish real from fancied dangers. This is what we call good judgment. The situation is appraised realistically, and there is no unnecessary expenditure of body energy, with consequent ill-effects. The animal—and I speak here of the animal in its normal habitat, undisturbed by human attempts at domestication—is realistic. It is alert for stress and is prepared to meet it, if necessary, in its own specific way, whether through fight or through flight. It expends no more energy than the situation merits.

Only the Human Infant Can Feel Rejection

In the human being, the situation is somewhat changed. It is inconceivable that the animal in its natural habitat should have a pregnancy that is unwanted or even partially unwanted. The female animal mates with the equally prepared

male only when she is good and ready, fulfilling in the pregnancy the original intention of nature —the preservation of the species. At the same time, the male and female animal will fulfill all of the species requirements for reproduction. In other words, the wild female animal, and at times the male, will if necessary risk its own life to protect and preserve its young. The animal cub in its natural habitat cannot conceivably feel the emotional fearfulness—anxiety—surrounding the question, "Are my mother and father prepared to risk their very own lives to protect mine?" Inasmuch as a pregnancy occurs in the wild animal only when totally desired, the cub will never be exposed to a sensation amounting to something like this: "My mother does not want me, at least to a certain degree, and therefore I am not sure that, although I am totally dependent on her, she will not decide to do away with me." We can well speculate that such feelings might—on an affective level, to be sure—pervade a human infant. This I call the basic anxiety.

All React but in Varying Degrees

The only question is the degree to which a human infant will be pervaded by this fear of destruction and death. It is inconceivable that a human pregnancy should be totally desired; a remnant of hesitation and resistance is unavoidable. If nothing else, the awareness of the hardships and sacrifices entailed in bringing up children would be enough to work as a retarding factor. This would be the very least resistance we could expect. At the other extreme, if a pregnancy is unwanted or wanted only for ulterior purposes, we can only speculate on the amount of resentment that the significant person—generally the mother—will harbor against the offspring, the child that is unknowingly and unwillingly inflicting such hardship. The wish for the destruction and elimination of this encumbrance is unavoidable. Little does the infant know that legal and social inhibitions are at work to preserve his existence. He is only aware of the feeling that his life is threatened. To this he reacts with the well-known physiologic pattern, but he is unable, of course, to either flee or fight.

If the child's anxiety reactions are overwhelming, they can even in one form or another be incompatible with life. This is the extreme case. Every degree of reaction will be found, from the mildest to the most severe that still permits existence. Occasionally, the anxiety will remain unadulterated, free-floating; then it is termed an anxiety neurosis. In many cases the subjective feeling of anxiety will be converted; the physiologic autonomic reactions will be channelled inward upon the organism itself, and specific organs will be singled out according to their vulnerability. Another mechanism available is to project the basic anxiety upon actions, events, and objects with which we come in contact. The rationale is clear: we were dependent upon the support of that person who we felt threatened our existence. We had to maintain that person as a source of our existence. Therefore, we transferred the fearful features to somebody or something else.

Contact with events, actions, or objects that are so unduly endowed with danger will bring about a defensive reaction of the autonomic nervous system that is all out of proportion to their real significance. In the attempt to project the anxiety out of ourselves, we are only exposed reversely to its effects through the objects, events, actions that we have invested with such fearsome meaning. The body again reacts excessively and uneconomically, and we thereby prematurely abuse our resources. We see, therefore, that we can classify ailments as psychosomatic to the extent that they represent excessive reactions to situations unrealistically endowed with danger. •

1300 Spring St., (4).

Medical Preparedness

Major General Silas B. Hays
SURGEON GENERAL, U.S ARMY
WASHINGTON, D.C.

When we use the term *medical preparedness,* just what are we talking about? Words and phrases frequently connote different ideas to different people, hence the speaker often finds it advisable to delineate exactly what he means. By *medical preparedness* I mean the preparation, through training and through posture, to meet medical emergencies resulting from natural disasters, such as earthquake, fire, flood and tornado—and also resulting from war. Inherent in this definition is the idea that *many* individuals will be affected. It seems to me to be axiomatic that preparedness to deal with an emergency involving many individuals will automatically result in preparedness to handle an emergency involving a single or a few individuals.

Needs

Why is it desirable to improve our medical preparedness? Haven't we always handled our medical emergencies both in peace and war reasonably well? The answers to these questions are important. If we are already doing all right then let us forget about the whole thing.

On the war combat side the answer is obvious —things have changed and are changing rapidly. Newer weapons of war can inflict casualties on a scale previously impossible. On the natural disaster side the answer is not so obvious but it is clear. We have not always done a good job in handling medical emergencies. Advances in medical knowledge in the last quarter century have not always been put to use. It is important that the medical profession realize this and furthermore realize that a peacetime medical emergency can occur any place. We have not learned how to prevent bus, train, or airplane crashes, hurricanes, tornados, floods or fires. If the local medical community will prepare itself to cope adequately with these, it will have gone a long way toward preparing itself for wartime disaster.

The elements of medical preparedness are people—people trained, equipped and organized. Hence, it seems reasonable to discuss the problem under these three headings—training, equipment and organization. I will not attempt to evaluate the relative importance of the three. They are all essential to a successful program.

What are the medical problems for which people must be trained? The list is small: physical trauma, thermal burns, radiation, infection and chemical agents. None of these is peculiar to a peacetime or to a wartime disaster.

Principles Not Always Followed

The principles and procedures of handling physical trauma are known and widely publicized. But too few members of the medical profession are familiar with them and, sad to say, many who do know them fail to follow them in an emergency. I will mention a few: control of hemorrhage, including proper use of the tourniquet; splinting fractures *prior* to transport; resuscitation; proper debridement; proper surgery and secondary (not primary) closure. Time and again in emergencies all of these principles have been violated by physicians who knew better.

Our knowledge of the treatment of burns still leaves much to be desired. Too few physicians are up-to-date on the knowledge we do have, yet the mortality in seriously burned cases can be reduced markedly with modern methods.

With the increasing use of radioactive substances in medicine and industry and with the transport of these substances from place to place, the hazard of accidents involving radioactive materials is increasing to the point that every physician should acquire some basic knowledge in the handling of such accidents.

Secondary infection is always a problem in physical trauma and in burns. The principles of its prevention and treatment are well known, but all too frequently they are not applied. Primary infection or infectious disease are problems

Reprinted with permission from The Journal of the American Medical Association, volume 168, September 20, 1958, pp. 254-257.

Chairman's address, Section on Military Medicine, presented at the 107th Annual Meeting of AMA, San Francisco, California, June 25, 1958.

in peacetime disasters where water supplies and sewage systems are comprised. The same applies on a larger scale to wartime situations, plus the possibility, however remote, of biologic warfare.

Chemical agents are becoming increasingly important as hazards in our industrial society. Those physicians with a practice involving industrial workers are alert to these hazards and are familiar with their prevention and treatment. But a large segment of our profesion has at most a sketchy knowledge in this field. In peacetime and wartime emergencies, particularly involving explosions and fires, chemical agents may be an important problem. In wartime there is also the ever present hazard of the use of toxic chemicals including the newer, fantastically potent nerve gases.

Others Will Help

So far I have tried to stress the need for the training of the medical profession of this country to be better prepared to meet emergencies. I have tried to point out the similarity of the problems to be faced in these emergencies whether they be peacetime accidents or the result of enemy action. This is important because, if we hope to get members of our profession to devote time to these problems, they must first be convinced of the possibility that they as individuals may sometime be in a position where they need this knowledge. Experience in the last decade has demonstrated that a large proportion of our profession believes the possibility of war to be so remote that training in civil defense for medical emergencies is not worth the time and effort required.

Experience in both peacetime and wartime emergencies has shown that a large proportion of the care of casualties must be performed by individuals who are not doctors of medicine. In mass casualty situations the number of casualties may be out of all proportion to the number of physicians available at the time and place, and may in fact be out of all proportion to the number of para-medical personnel available. This means then, that on the injured individual himself or his neighbor or buddy may fall the responsibility for emergency live-saving care. It is clear that the need for training must include not only the medical profession itself and paramedical personnel, but also the population as a whole, each group trained to a different level of competence.

MEND Program

Within the medical profession a good start has already been made but it is only a start. The MEND (Medical Education for National Defense) program has now been in existence since 1952. Beginning in five medical schools, it is now in 45 schools and it is hoped that within four years all of the medical schools of the country will be active participants. The Army, Navy, Air force, U.S. Public Health and Federal Civil Defence Administration have contributed funds to help support this program. They also furnish assistance in the form of lectures, literature, films, short courses for school coordinators, and various other aids. Participation in the program by the schools is voluntary and each school carries out the program in its own way as it deems best. I have no doubt that some are better programs than others. However, as more experience is gained it is reasonable to expect that the over-all level of quality will be raised. The two objectives of the MEND program are to convince the embryo physician early in his career of the importance of preparing himself to handle medical emergencies and to give him specific knowledge and specific skills which he can use.

Chronologically, next in the young physician's career is his internship. Here he usually is faced with emergencies involving one or a few individuals and he has the chance to apply his knowledge. Next, he usually enters one of the military services for two years. In my opinion it is the clear-cut responsibility of the Army, Navy and Air Force to train these young men for peacetime as well as wartime medical emergencies. All three services are now doing this, but I am convinced that they can and should be doing a better job.

Keeping Interest Alive

On return to civil life the young physician enters practice or begins additional and usually specialty training. The thought of an emergency involving many casualties becomes remote. He is too busy to concern himself with additional training or with the training of others. Occasionally his local or state medical society may include on one of its programs something concerning medical preparedness and occasionally he may read an article along this line in one of his journals. The knowledge and skills he has previously acquired are not lost, but they will become rusty. If he was properly trained in medical school, in his internship, and in the

military service, he can probably be depended upon to give a good account of himself as an individual physician in a medical emergency, even though for years his professional interest may have been so far afield as, for example, allergy or geriatrics. But in a mass casualty situation, competent performance as an individual physician is not enough. He must be a leader—directing and supervising the work of para-medical personnel—if the maximum number of lives are to be saved. I believe that the physician in practice—and this comprises the bulk of our medical profession—presents the most fertile field to till if we are to improve national medical preparedness.

Still on the subject of training, para-medical personnel must be considered. In a mass casualty situation it is on these groups that will fall the bulk of the actual medical work. In this over-all broad categorization are: dentists, veterinarians, nurses (both registered and practical), dieticians, physiotherapists, pharmacists, and medical technicians of various types. Not to be excluded are those engaged in the administrative facets of medical care—hospital administrators, medical record librarians, supply men and a host of others.

By and large these groups are clamoring for guidance. What will be their functions in an emergency situation? Unless they know, they are at a loss to prepare. In my opinion, the medical profession—and in this indictment I include both civilian and military medicine—has been remiss in failing to give guidance to these groups.

Medical Leadership Needed

In a mass casualty situation are dentists to be limited to the teeth, the mouth, and the maxillofacial? Will they be called on to administer anesthesia—local or general? Are they to do debridements? Unless they know the answers to these questions they cannot prepare. A similar situation exists regarding nurses. What will they be called upon to do in a mass casualty situation? Unless the medical profession of this country lets them know they, likewise, cannot prepare.

I believe the MEND program is an important step toward medical preparedness. Furthermore, I believe a DEND (Dental Education for National Defense), a VEND (Veterinary Education for National Defense) and a NEND (Nursing Education for National Defense) program would be of inestimable value. These professions are willing and anxious to institute such programs in their schools but we in the medical profession have failed to furnish guide lines and to delineate functions. I realize the problem is not simple. It involves traditions, creeds, jealousies, licensing laws and the quality of medical care. But an ostrich-like position is untenable. The medical profession must face it.

What is to be expected of these para-medical groups in a mass casualty situation? If the medical profession does not tell them, who is to? The Congress? The state legislature? Their own national organizations? These groups need guidance. Are they going to get it from the medical profession or will they get it elsewhere? In all probability they will accept guidance from organized medicine but it must be enlightened and realistic. If no answer is forthcoming, or if the only answer is one which, in their eyes, is degrading, they will not accept it. These are strong words but I believe they are true. Today American medicine can give the answers. It can call the shots. If it gives the wrong answers or if it continues to give no answer at all, then some other tribunal may fill the void.

I urge upon American medicine that this problem be faced forthwith and that a determination be made of the functions to be performed by the professions in emergencies which involve masses of casualties. Once these determinations are made, then the problem of training becomes, perhaps not an easy one, but at least one which can be grasped. In undergraduate schools there can be DEND, VEND, and NEND programs. In postgraduate life there can be short courses, symposia and community exercises involving these groups, as well as the medical profession, on a stimulating and realistic basis.

Equipment

So far I have been talking about training. Basically, training applies to the individual and what knowledge and skills he can be taught. Next I would like, for a few moments, to discuss equipment. Repeating an earlier statement, the elements of medical preparedness are people—people trained, equipped and organized. In the usual peacetime medical emergency, equipment and supplies are adequate—if not in the immediate area at least close enough to be brought in by air or surface transportation. In a wartime emergency, equipment and supplies will be critical but never, in my opinion, as critical as trained manpower. This is no reason to neglect the

importance of supplies and equipment. In planning for peacetime emergencies, emphasis can and should be placed on inventories of existing material—i.e., knowing how much is available locally and where. In those instances where shortages exist—for example, whole blood—plans must be made for procurement and distribution. In planning for wartime emergencies, envisioning the destruction of hospitals and warehouses of supplies, emphasis must be on national stocks and national production. In essence, supply planning for peacetime disasters is a local matter—for wartime disasters both a local and a national matter.

Organization

The final element in national medical preparedness is organization. Organization is one of the bugbears of any large effort whether it be General Motors or the Department of Defense. It has been a particularly difficult one in any civil defense effort. One of the principal stumbling blocks has been, in my opinion, the fact that the assumption of an enemy attack on our country presents such a staggering problem that many people tend to throw up their hands in despair and say that the only solution is martial law. The military, on the other hand, says that even if martial law is declared, there are too few military personnel to do all the work which will need to be done.

Many authorities or organizations believe that an organization should be built from the bottom up and not from the top down. To me this is a sensible approach to the problem of medical preparedness. Local communities, under medical leadership, can organize to meet local civilian disasters. Assignments can be made covering members of the medical profession and of the para-medical professions. Supplies, equipment and buildings can be located and earmarked for use; and a realistic training program undertaken, including realistic exercises involving hospitals, clinics, emergency aid and evacuation units. In some communities this is already being done, but in most it is not.

If there are adequate local organizations it will not be too difficult to weld them together under a state organization, whether it be through the mechanism of the state government or of the state medical association. The prime hurdle is the local one and it is basically a lack of motivation. People will organize and train voluntarily if they believe the need is real. To date, with some outstanding exceptions the communities of this country apparently believe the need to prepare is remote and that it is not worth the time and the effort.

Recommendations

This paper would not have a proper military tone unless it included recommendations. I propose the following.

1. Emphasize desirability of local preparedness for peacetime disasters as serving the dual purpose of preparing for such disasters and of being the best method to build toward national medical preparedness for war. Encourage this through the national, state and local medical, dental, veterinary and nursing associations. Likewise through educational associations, such as the Association of American Medical Colleges.

2. Encourage acquisition and stockpiling of additional supplies and equipment by local agencies, such as hospitals, and by FCDA.

3. Determine the role of dentists, veterinarians, nurses and para-medical groups in the event of emergencies involving mass casualties. The AMA should take the initiative in this and should consult with the respective national professional associations. When agreements have been reached they should be published.

4. Stress training for medical emergencies through: the expansion and improvement of the MEND program; establishment of similar programs in schools of dentistry, veterinary medicine and nursing; improvement of training in the military of medical, dental, veterinary officers, nurses and enlisted men on active duty; improvement of training programs for military reservists; and expansion and improvement of emergency-care training programs for the lay public through public schools, Red Cross Chapters, hospitals, factories and civil defense organizations. Again here the impetus must come from the medical profession. Physicians must not only preach the necessity of these training programs and help organize them but also carry much of the load of actual teaching.

These actions require leaders—leaders at all levels who are convinced that our medical preparedness must be improved and who are willing to devote time and effort to the job. This is not something like a community chest drive that is over in a few weeks. This is a continuing need. We will never be prepared to do a perfect medical job in an emergency, but if we are trained, equipped and organized, we can save the lives of many who otherwise will die. •

Department of Army.

IN DEBILITATING DISEASE

Patients receiving

NILEVAR®

Eat more...
Feel better...
Recover faster

Compared to control patients, those receiving Nilevar (brand of norethandrolone) have repeatedly demonstrated more rapid and more complete recovery from serious acute illness and increased comfort and well-being in chronic illness.

A multitude of case histories are now adding individual clinical color to the earlier controlled investigations which defined the actions of Nilevar as an effective aid in reversing negative nitrogen balance and in building protein tissue.

In typical case reports such gratifying comments as these appear:

Underweight —"Appetite considerably increased within one week. Sense of well-being and vigor increased along with increased appetite."

Prematurity (Birth weight: 2 pounds, 4 ounces) — "Gradual improvement in appetite and capacity for formula. . . . Excellent progress and weight gain for a very immature infant."

Carcinoma of the Uterus —"Within four days appetite became excellent, took full diet. . . . More ambition while on Nilevar. Enjoys life. Takes part in church and other social affairs."

Third Degree Burn —". . . soon began eating all that was offered. . . . Began to show signs of hope for recovery. . . . Perhaps one of the greatest changes was in the appearance of his wounds which were so very much improved."

The dosage for adults is 20 to 30 mg. daily in single courses no longer than three months. For children the daily dosage is 0.5 mg. per kilogram of body weight, in single courses no longer than three months.

Nilevar is supplied in tablets of 10 mg. and ampuls of 25 mg. (1 cc.).

Fostex® degreases the skin and helps remove blackheads

Fostex contains a combination of surface active agents (Sebulytic*) which:

◂ Completely emulsify excess oil so that it is quickly washed off the skin.

◂ Penetrate and soften comedones, unblocking the pores and facilitating removal of sebum plugs.

Fostex dries and peels the skin

◂ The Sebulytic base of Fostex dries and promotes peeling of the skin . . . actions enhanced by the keratolytic effects of micropulverized sulfur and salicylic acid.

*(Sodium lauryl sulfoacetate, sodium alkyl aryl polyether sulfonate, sodium dioctyl sulfosuccinate.)

FOSTEX CREAM
for therapeutic washing of skin in the initial phase of acne treatment, when maximum degreasing and peeling are desired.

FOSTEX CAKE
for maintenance therapy to keep skin dry and substantially free of comedones.

Fostex is easy for your patients to use

◂ Patients stop using soap on affected skin areas. Instead they use Fostex for therapeutic washing of the skin. The Fostex lather is massaged into the skin for 5 minutes—then rinse and dry.

BONADOXIN®

STOPS MORNING SICKNESS, BUT..

Highest percentage of relief: In *Drugs of Choice*[1], clinical data on several therapies for nausea and vomiting of pregnancy is summarized. BONADOXIN afforded the highest percentage of relief in the "excellent" (79%) and "good" (16%) combined categories. The majority of cases were completely controlled in the first week of treatment, almost all on one tablet nightly.

Safe, too:
BONADOXIN doesn't "stop" the patient. It is free of side effects commonly associated with overpotent antinauseants. Goldsmith, reporting on 620 controlled cases, states that "toxicity and intolerance [are] zero."[2]

BONADOXIN

DOESN'T STOP THE PATIENT!

Now available in tablet or drop form.

Dosage: usually one tablet or one tsp. (5 cc.) at bedtime. Severe cases may require another dose on arising.

Supplied: tiny pink-and-blue tablets, bottles of 25 and 100. Bonadoxin Drops in 30 cc. dropper bottles.

Each tiny pink-and-blue Bonadoxin tablet contains:
Meclizine HCl (25 mg.)
...for symptomatic relief
Pyridoxine HCl (50 mg.)
...for metabolic action and prompt antinauseant effect.

Infant colic?
Non-narcotic Bonadoxin Drops stop colic in about 85% of cases.
Each cc. contains:
Meclizine Dihydrochloride...8.33 mg.
Pyridoxine Hydrochloride...16.67 mg.

Dosage:

under 6 months	0.5 cc.	2 or 3 times daily, on the tongue, in fruit juice or water
6 months to 2 years	1.5 to 2 cc.	
2 to 6 years	3 cc.	
adults and children over 6 years	1 teaspoon (5 cc.)	

Supplied:
fruit-flavored, clear green syrup in 30 cc. dropper bottles.

OREGON STATE MEDICAL SOCIETY
1115 S. W. Taylor Street
Portland 5, Oregon

ANNUAL MEETING
September 23-25, 1959
Medford

President, Herman A. Dickel, M.D., Portland
Secretary-Treasurer, Max H. Parrott, M.D., Portland
Executive Secretary, Mr. Roscoe Miller, Portland

D. M. Brinton Named to Executive Committee at October Council Meeting

Election of a new member to the Executive Committee, national policy, consideration of suitable location for the headquarters office, an expanded postgraduate program and re-employment of the Executive Secretary were among the important matters considered at the October meeting of the Council of Oregon State Medical Society.

Elected by unanimous ballot to fill an unexpired term on the Executive Committee was Donald M. Brinton of Eugene, Councilor for District No. 6. Dr. Brinton replaces Carl H. Holm of Salem whose term as Councilor expired at the close of the 1958 Annual Session. Dr. Brinton's term will expire in 1959.

The following matters were referred to the Committee on National Policy for study and recommendation to the Council at its November meeting:

1. That the American Medical Association be requested to establish an "ad hoc" committee to study the problem of physicians who consistently make what is considered to be unreasonable charges for their services particularly for services rendered to patients who are known to have the benefits of pre-paid medical care insurance.
2. That the American Medical Association be requested to sponsor a Joint Council on Prepaid Medical Care Plans.
3. That the American Medical Association be requested to exert leadership in the establishment of a loan fund for medical students.

The Executive Committee reported that preliminary consideration is being given to a future location of the Society's headquarters office at the termination of the present lease on May 1, 1961. In the months ahead it is planned to explore the advisability of constructing or leasing more suitable quarters, possibly in cooperation with professional societies allied to medicine.

In a step to coordinate postgraduate programs throughout the state, the Council voted that the Society assume leadership in this field of education for practicing physicians and requested the Executive Committee to formulate preliminary plans to coordinate the program.

The action followed a suggestion that the Society join with voluntary health agencies in the employment of a Director of Postgraduate Education. Responsibility of such a director would be to plan and coordinate all professional education programs for physicians in Oregon.

The Council also re-employed Mr. Roscoe K. Miller as Executive Secretary for a two year period commencing on January 1, 1959. Mr. Miller was employed on a one year basis in 1957 to succeed the late Mr. Clyde C. Foley.

In other actions the Council voted to hold a mid-year meeting of the House of Delegates in 1959 on a Friday and Saturday rather than on Saturday and Sunday as was the custom, and recommended that the Committee on Public Policy give consideration to holding the 1959 Component Society Officers Conference and Key Man Conference in Salem on a date when the State Legislature will be in session. The dates and location of the House of Delegates meeting will be established later.

Legislative Bulletin To Be Published in 1959

A new Legislative Bulletin prepared and distributed by the Oregon State Medical Society will make its debut when the 1959 State Legislature convenes early in January.

The Bulletin, appearing at intervals during the Session, will provide component society officers, legislative "key men" and "key women" with late reports on activities in Salem.

Gerald E. Kinzel, Portland, new chairman of the Committee on Public Policy, outlined the aims of the Bulletin at the October meeting of the Council. The Bulletin will offer regular reports on the status of legislation dealing with health and medicine along with comments regarding the Society's position on key bills and the attitude of legislators considering the measures.

The Committee on Public Policy also recommended that the Woman's Auxiliary again be authorized to host a tea for the wives of the State Legislature sometime during the Session.

North Pacific Pediatric Society

Scott H. Goodnight and J. Arthur May, both of Portland, are the new president and secretary-treasurer respectively of the North Pacific Pediatric Society. Elections were held during the Society's recent annual meeting in Sun Valley, Idaho.

The Society will hold its winter meeting in Portland next February or March, and the 1959 summer meeting is scheduled in Victoria, B.C. The membership is composed of more than 250 pediatricians from Oregon, Washington, Idaho, Montana and Canada.

OSMS Approves Plan To Reduce Cost of Penicillin to Rheumatic Fever Patients

Rheumatic fever patients requiring long-term prophylaxis will soon get a big break in the cost of penicillin when a new Rheumatic Fever Commission swings into statewide operation.

Council of the Oregon State Medical Society approved an invitation from the Oregon Heart Association to join in the project that figures to reduce the cost of penicillin tablets to selected patients from 23 cents to about 3½ cents. Next step in winning full approval of the plan will be to seek endorsement from component medical societies.

According to Roger H. Keane, Portland, Chairman of the Society's Committee on Heart Disease, programs similar to the one suggested by the Heart Association's Committee on Prevention of Rheumatic Fever already are operating in 36 states. In at least one state the public health department purchases and distributes penicillin without charge to patients and by-passes the family physician.

The program recommended for Oregon proposes that the penicillin for rheumatic fever prophylaxis should be purchased by the patient through normal channels. Special prescription forms will be supplied to physicians upon request. The patient will take the prescription to the pharmacist of his choice who would order the penicillin from the selected drug distributor.

It is proposed to create a Rheumatic Fever Control Agency to administer the program. The Agency would advertise for bids among pharmaceutical manufacturers and arrange for penicillin to be stocked by one or more wholesalers who would fill orders from prescription pharmacists.

The overall program will be supervised by a Rheumatic Fever Commission composed of representatives from the State Society, Heart Association, Oregon State Pharmaceutical Association and other interested agencies.

The Commission will be authorized to appoint a physician to serve as medical coordinator. Initial clerical staff and facilities for a case registry will be provided by the Heart Association.

Oregon Academy of General Practice

Annual scientific session of the Oregon Academy of General Practice was held October 16 and 17 at the Multnomah Hotel, Portland. The program was arranged under the chairmanship of Robert H. Tinker of Portland, president-elect of the Academy. Fourteen speakers, who discussed topics chosen especially for the family physician, appeared on the program.

Guest speakers included: E. Gray Dimond, professor of medicine at the University of Kansas; Abou D. Pollack, assistant professor of pathology at Johns Hopkins University, and John Armes Guis, professor of surgery at the University of Iowa.

Fred Richardson, coordinator of professional affairs for Pennsylvania Hospital, spoke at the dinner meeting Thursday, October 16, on The Future of General Practice. Luncheon speaker that same day was John G. Walsh of Sacramento, Calif., who spoke on Proper Relationship Between Medical Profession and the Third Party.

Council Hears Report on School Bus Driver Physical Examination Program

A report on the status of Oregon's new school bus driver physical examination program and plans to publicize hospital admissions of persons injured in auto accidents were presented at the October meeting of the Council of the Oregon State Medical Society by Arthur A. Fisher of Salem, past chairman of the Committee on Traffic Safety.

Dr. Fisher, who now is a member of the Society's new Commission on Public Health, stated that approximately 40 per cent of the State's 2,200 school bus drivers have satisfactorily completed physical examinations and received special driver permits. The permits are issued by the State Department of Motor Vehicles.

The Committee has been faced with a number of administrative problems during the first year of the bus driver program, Dr. Fisher said. He indicated that the currently approved physical examination possibly will be re-evaluated at the end of the initial year. Any revisions in the standards, such as the frequency of the examination, are expected to be made prior to the opening of schools in the fall of 1959.

Completed examinations are forwarded to the Oregon State Board of Health by the attending physician. All special medical problems are reviewed by the Committee on Traffic Safety prior to acceptance or rejection of the applicant. Examining physicians are provided with a list of conditions considered by the Committee to be non-acceptable for school bus drivers.

The Committee expects to re-evaluate the standards annually.

The Council approved a Committee recommendation which supports a plan now under consideration by the State Department of Motor Vehicles to publish monthly news releases on the number of persons who have been admitted to hospitals with injuries sustained in automobile accidents.

The program, patterned after one in Rhode Island, seeks cooperation from hospitals in collecting data on accident admissions, diagnosis and number of days of confinement. The Oregon Traffic Safety Division would utilize the reports in news stories pointing up the human suffering, loss of income and financial hardships that often accompany needless motor vehicle accidents.

Safety officials estimate that these stories may be more impressive than the usual impersonal releases on traffic fatalities.

The newly appointed chairman of the Committee on Traffic Safety is Otto C. Page of Portland.

Lane County Favors Fluoridation

Lane County Medical Society has reaffirmed its stand in favor of adding fluorides to Eugene's water supply. The issue will be voted on this month by city residents who two years ago turned it down at the polls. The county society also has complimented the Eugene Junior Chamber of Commerce, sponsors of the proposal, for "the work done in thus attempting to help raise the health standards of the community."

In Asthma

NOTHING IS FASTER

NOTHING IS MORE EFFECTIVE

PRE-MICRONIZATION assures particle size for maximum effectiveness

Medihaler-EPI®

For quick relief of bronchospasm of any origin. More rapid than injected epinephrine in acute allergic attacks.

Epinephrine bitartrate, 7.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.15 mg. free epinephrine.

Medihaler-ISO®

Unsurpassed for rapid relief of symptoms of asthma and emphysema.

Isoproterenol sulfate, 2.0 mg. per cc., suspended in inert, nontoxic aerosol vehicle. Contains no alcohol. Each measured dose 0.06 mg. free isoproterenol.

MEDIHALER® *For Ample Air Right Now!*

Millions of asthmatic attacks have been aborted faster, more effectively, more economically with Medihaler-Epi and Medihaler-Iso. Automatically measured dosage and true nebulization...nothing to pour or measure...One inhalation usually gives prompt relief.

Prescribe Medihaler medication with Oral Adapter as first prescription. Refills available without Oral Adapter.

The Medihaler Principle of automatically measured-dose aerosol medications in spillproof, leakproof, shatterproof, vest-pocket size dispensers also available in Medihaler-Phen® (phenylephrine, hydrocortisone, phenylpropanolamine, neomycin) for prompt, lasting relief of nasal congestion.

Riker NORTHRIDGE, CALIFORNIA

OSMS Re-Affirms Support of Medical Examiner System Supervised by State Police

The Oregon State Medical Society, already on record in support of a medical examiner system to replace the State's outmoded coroner plan, probably will seek at least one revision when proposed remedial legislation is presented to the 1959 Legislature.

After months of study a legislative interim committee recommended that the medical examiner program be administered by the Oregon State Board of Health. In supporting the examiner program the Society endorsed a recommendation of the Oregon Pathologists Association that administrative authority be vested in the State Police.

According to a report of the Committee on Public Policy the State Police are best qualified to administer a broad investigative program of unattended deaths and at the same time this agency has facilities to properly train special police examiners. The Society's report also supports the establishment of a department of forensic medicine at the University of Oregon Medical School.

Arch W. Diack, a member of the interim committee and former chairman of the Society's Committee on Public Policy, reported at the October meeting of the Council that he has received permission to file a "minority statement and comment" when a Legislative committee studies the proposed new statute.

Dr. Diack's statement emphasizes the Society's support of the proposed medical examiner system which would utilize the expert services of qualified pathologists. However, he pointed out that the Society still believes the best plan would be one supervised by the State Police.

"The interim committee recommends that the local medical examiner shall be the county health officer," Dr. Diack explained. "The Society merely says the local medical examiner shall be a physician who resides in the community without specifically designating the county health officer," he nodded.

Dr. Diack urged the Society not to obstruct the establishment of a medical examiner system.

"This does not mean we should sit on our hands when the Legislature convenes, but rather that the Society should appear at committee hearings in support of what we feel will be the best medical examiner system," Dr. Diack concluded.

Following Dr. Diack's presentation, which was included as part of the report of the Committee on Public Policy, the Council re-affirmed its previous support of an examiner system supervised by the State Police.

OB-GYN Specialists Meet in Portland

Fifth annual interim meeting of district VIII of the American College of Obstetricians and Gynecologists was held in Portland at the Multnomah Hotel October 13 through 15. District VIII is comprised of California, Arizona, New Mexico, Nevada, Utah, Colorado, Oregon, Idaho, Wyoming, Washington, Montana, British Columbia, Alberta, Alaska and Hawaii.

Oregon Society of Allergy

New officers of the Oregon Society of Allergy are: Nicholas P. Sullivan, Eugene, president, and Robert L. Cutter of Bend, vice-president.

Multnomah County Physicians Hear Talk On Medicine's Role in TV, Radio and Movies

Members of Multnomah County Medical Society heard an inside report on Hollywood's interest in medical subjects at the October meeting when Eugene F. Hoffman of Los Angeles spoke on Medicine's Role in Television, Radio and Motion Pictures.

Dr. Hoffman, who is chairman of the American Medical Association's Physician Advisory Committee on TV, Radio and Movies, outlined the work of the nine-member committee in reviewing dramatic scripts for the nation's leading television presentations.

The speaker also revealed that the National Association of Broadcasters has adopted a Committee recommendation which prohibits the use of a "man in a white coat" in TV commercials unless the person is an accredited physician. The new code will become effective on Jan. 1, 1959.

The program featured a special "Pay-By-Your-Weight" exhibit and corsage sale conducted by the Woman's Auxiliary which raised more than $100 for the American Medical Education Foundation. The corsages were assembled by an Auxiliary Committee under the direction of Mrs. J. Richard Raines. Assisting were Mrs. J. Clifton Massar, President; Mrs. Greg Nichols, Mrs. Howard C. Emmerson, Mrs. Daniel C. McDonald, Mrs. Wayne Gourley, Mrs. D. J. Molenkamp and Mrs. George Nash.

A brief history and report on accomplishments of the American Medical Education Foundation was presented by Walter C. Reynolds, Chairman of the Society Committee responsible for physician contributions.

Council Appoints New Liaison Committee To the Oregon Nursing Home Association

In keeping with a long standing policy to improve relationships with organizations allied to medicine, the Council of the Oregon State Medical Society has authorized the appointment of a new Liaison Committee to the Oregon Nursing Home Association.

The action was recommended at a recent meeting of the Committee on Public Policy by Mr. John P. Misko, the Society's legislative representative.

The new committee will be added to the list of at least a dozen other committees which now deal with professional and lay organizations interested in medical matters.

Some Society committees dealing with other groups are the Committee on State Industrial Affairs, Liaison Committee to the University of Oregon Medical School Chapter of the Student American Medical Association, Liaison Committee to the Oregon Association of Hospitals, Liaison Committee to the Oregon State Nurses Asscoiation, Liaison Committee to the Oregon Branch of the American Pharmaceutical Association, Liaison Committee to the Oregon State Dental Association and Liaison Committee to the Insurance Industry.

Jackson County Medical Society

Harvey W. Baker, Portland surgeon, was guest speaker at the October 8 meeting of the Jackson County Medical Society at the Rogue Valley Country Club, Medford. Dr. Baker discussed Tumors of the Oral Cavity.

Recent Faculty Appointments at University of Oregon Medical School

Myron R. Grover, Jr., Portland, has been named assistant medical director and administrator of the University of Oregon Medical School Hospitals and Clinics. He will also be an instructor. Dr. Grover received his medical degree in 1954 from Cornell University Medical School. He served his internship at UOMS and completed a two-year residency in internal medicine at that school in July. He also held a research fellowship in neurology in 1955 and received a master of science degree in neurophysiology upon completion of that work.

Victor D. Menasche has been appointed assistant director of the UOMS Crippled Children's Division. He will hold the faculty rank of instructor in pediatrics. Dr. Menasche, a 1953 graduate of UOMS, was recently discharged from the U.S. Air Force where he was chief of pediatrics clinics at the 6510th USAF Hospital at Edwards Air Force Base, Calif. Dr. Menasche served both his internship and residency at the UOMS Hospitals and Clinics.

Otto R. Emig, who has received assistant professorship appointments in both the departments of pathology and obstetrics and gynecology, was graduated from UOMS in 1944. He interned at University Hospital, Baltimore, and took residencies at St. Vincent Hospital, Portland, and at UOMS Hospitals and Clinics. He was formerly chief of the obstetrics and gynecology staff at Sacred Heart Hospital, Medford, and most recently was a teaching fellow in pathology at Harvard Medical School.

Kenneth D. Gaver, appointed assistant professor of psychiatry, was formerly director of education and research at Oregon State Hospital, Salem. He received his medical degree from the University of Tennessee College of Medicine in 1948. He took his internship and residency during service in the Navy from 1948 to 1953. Dr. Gaver was formerly resident instructor in psychiatry at Indiana University Medical Center, Indianapolis, and staff psychiatrist at the Veterans Administration Hospital in that city. He has been a consultant at the alcohol rehabilitation clinic of the Oregon Alcohol Education Committee in Portland.

Frank Shubeck, appointed assistant professor of obstetrics and gynecology, is a 1953 graduate of the University of Michigan Medical School. He served his internship and residency at University Hospital, Ann Arbor, where he has most recently been a senior clinical instructor in his specialty.

Harold Tivey, former assistant professor of medicine at UOMS, has returned as assistant professor of radiology. He has recently held a similar post at Baylor University College of Medicine, Houston, Texas, where he was a John and Mary Markle Scholar. He received his medical degree from UOMS in 1952, following undergraduate work at the University of Oregon and Reed College and graduate work at the University of Washington. He is a consultant to the Teletherapy Evaluation Board of the Atomic Energy Commission, and a member of the advisory committee on research on lung cancer of the American Cancer Society.

Howard J. Tatum, formerly faculty member at Louisiana State University School of Medicine in New Orleans, has been appointed associate professor of obstetrics and gynecology. On leave of absence during the past year, Dr. Tatum has been visiting professor at the University of Valle School of Medicine in Cali, Colombia, under Rockefeller Foundation sponsorship. Dr. Tatum was graduated from the University of Wisconsin Medical School in 1943. He served his internship at San Francisco County Hospital and took his residency at Wisconsin General Hospital.

Instructors recently appointed are: Theodore H. Lehman, urology; Eugene A. Lentini, physiology; Robert D. Michel, medicine; Bernard Pirofsky, medicine; Leo A. Pirojnikoff, medical psychology; John Gordon Roth, neurosurgery; Robert C. Schaan, pediatrics; Rex J. Underwood, anesthesiology; and Yong H. Yang, pathology.

Alternates To Attend AMA Clinical Session

For the first time in several years, alternate delegates for the Oregon State Medical Society to the American Medical Association will attend a Clinical Session.

The Council voted to authorize a full complement of two delegates and two alternates to attend the forthcoming 1958 Clinical Session in Minneapolis. Authorization followed a report at the October meeting by Alternate W. Wells Baum of Salem, who described many important duties of alternates when the AMA House of Delegates is in session.

Making the trip as members of Oregon's official delegation will be A. O. Pitman of Hillsboro and E. G. Chuinard of Portland, the delegates, and Dr. Baum and John G. P. Cleland, Oregon City, alternates.

Oregon also will be represented in Minneapolis by Raymond M. McKeown of Coos Bay, who was re-elected to the AMA Board of Trustees at the Annual Meeting last June in San Francisco.

James L. Wooden Beloved Clatskanie Physician Passes

Dr. James L. Wooden, in practice in Clatskanie, Oregon, for more than 50 years passed away on Oct. 6, 1958 at the Emanual Hospital in Portland. Dr. Wooden had been in ill health for several months.

Dr. Wooden began his practice in Clatskanie on Aug. 12, 1907 shortly after he completed his internship at Good Samaritan Hospital in Portland. He had purchased the practice of Frank Wood and with the exception of a year in the U.S. Army Medical Corps during World War I and brief periods away for postgraduate study his practice in that community has been continuous until his death.

Dr. Wooden was devoted to his community and beloved by its citizens. The high esteem in which he was held by the people of Clatskanie was demonstrated on Aug. 14, 1957 when that date was proclaimed "Dr. J. L. Wooden Day" by Mayor Jerome Puzey. The day's program included brief talks by representatives of the Oregon State Medical Society, the City of Clatskanie and many of the organizations of which Dr. Wooden was a member. Featured also was a potluck picnic attended by 600 persons and a parade of the "Wooden babies" led by the first "baby" delivered by Dr. Wooden on the day of his arrival in Clatskanie.

Born of pioneer parents near Ness City, Kansas, in the western Kansas farm country, Dr. Wooden came West

(Continued on page 1492)

(Continued from page 1491)

with his family at the age of 9 and settled in the Mt. Tabor area in 1891. He received his early education there and then with the family moved to Ashland where he completed elementary school and received his high school diploma. He entered the University of Oregon and later the University of Oregon Medical School from which he received his medical degree in 1906, as one of the 16 graduates of that year's class. He was awarded a Certificate of the "Golden O" in 1956 by the University of Oregon Medical School Alumni Association, an honor received by those 50-year graduates of the University of Oregon Medical School who are still in practice.

During his 50 years in medicine, Dr. Wooden practiced "kitchen table surgery" in homes and used the ultra modern facilities of the present day hospital. To see his patients he traveled by foot, by horseback, by buggy and by boat. When Dr. Wooden purchased the practice of Dr. Wood the sale among other items included a horse, a saddle and a buggy and these, with the exception of the rented boat, were his only means of transportation until 1911 when he purchased his first automobile.

Dr. Wooden was a member of the Columbia County Medical Society, the Oregon State Medical Society to which he was elected a Life member in 1952 and the American Medical Association.

Always active in community life, Dr. Wooden was a member of the Presbyterian Church, the Clatskanie Masonic Lodge, the Shrine, the American Legion and Kiwanis International.

Dr. Wooden was 76 years of age at the time of his death.

Oregon Academy of General Practice Holds Annual Session October 16-17 in Portland

Incoming president Robert H. Tinker of Portland, at left, presents a plaque to retiring president, B. L. Trelstad of Salem, for his year of service to the Oregon Academy.

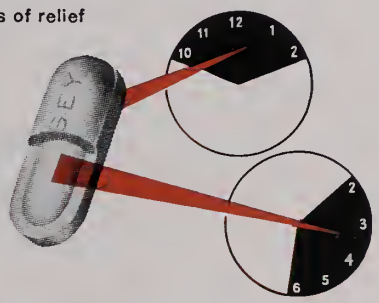
Fred MocD. Richardson of Philadelphia spoke at the annuol banquet on The Future of General Practice

At left: Scientific sessions during the two days were well ottended by general proctitioners from throughout Oregon.
At right: The congress of delegates met each morning of the session.

harmful cough – 6 to 8 hours with one timed-release tablet

A single, easily-swallowed Tussaminic tablet provides decongestion of the upper respiratory tract, non-narcotic control of the cough reflex center and effective expectorant action.

Nasal and paranasal congestion associated with cough is relieved by the oral respiratory decongestant action of Triaminic*. Non-narcotic antitussive action is provided by Dormethan, as effective as codeine but without codeine's drawbacks. The classic expectorant, terpin hydrate, helps augment the flow of demulcent respiratory fluids.



Each TUSSAMINIC *Tablet provides:*

TRIAMINIC®	100 mg.
(phenylpropanolamine HCl	50 mg.;
pheniramine maleate	25 mg.;
pyrilamine maleate	25 mg.)
Dormethan (brand of dextromethorphan HBr)	30 mg.
Terpin hydrate	300 mg.

Dosage: One tablet in the morning, mid-afternoon and at bedtime. The tablet should be swallowed whole to preserve the timed-release action.

how TUSSAMINIC timed-release tablets provide 6 to 8 hours of cough relief

first—the outer layer disintegrates in minutes to provide 3 to 4 hours of relief

then—the inner core releases its ingredients to provide 3 to 4 more hours of relief

Tussaminic *timed-release tablets*

for relief from harmful cough "around the clock"

On one tablet—the patient can work all day

On one tablet—the patient can relax all evening

On one tablet—the patient can sleep all night

*Triaminic *will* STOP *running noses*  *and open stuffed noses orally*

OREGON ARTHRITIS AND RHEUMATISM FOUNDATION—Hans Selye, seated at left, was guest lecturer at the Foundation's annual scientific session October 11 at the Medical Dental Building Auditorium in Portland. Dr. Selye is director and professor of the Institute of Experimental Medicine and Surgery at the University of Montreal. R. E. Rinehart of Wheeler, Oregon, program chairman, is seated beside Dr. Selye. Others who appeared on the program are, standing from left: Norman A. David, professor of pharmacology, University of Oregon Medical School; Henry H. Dixon, clinical professor of psychiatry, UOMS; and Marvin Darrach, professor of Biochemistry, University of British Columbia, Vancouver, B.C.

Stress and Diseases of Adaptation Discussed by Hans Selye at Arthritis Foundation Meeting

The Oregon Arthritis and Rheumatism Foundation proved a point at the annual scientific program held in Portland October 11. The point is that clinicians are very much interested in basic research and will attend a meeting at which clinical features of disease are largely eliminated. Headlined guest speaker, Hans Selye, provided much of the proof in two informal but highly informative lectures. He spoke without notes and from tremendous background of knowledge gained from painstaking research.

First of his lectures was entirely basic. He outlined the concept of stress and the characteristics of what he has called the diseases of adaptation. His presentation of the subject revealed both his penetrating thinking and his ability to transmit his ideas to others. They are the two factors which have enabled him to put the word *stress* into the medical vocabulary of the world.

Dr. Selye's afternoon discussion, still on basic research, came a little closer to clinical medicine. He outlined current research on myocardial infarction. After using 33,000 rats in experiments on the results of stress, he has been able to produce infarcts and to study ways of preventing them. The animals are given a steroid compound, an excess of one of several salts and then subjected to stress. Infarcts result in a high percentage of the animals. Potassium and magnesium salts seem to have a protective effect. This report was based on research of the past two years only and the work is not complete although some of his findings are being tested by others in preliminary clinical investigation.

Norman A. David of Portland also presented a basic discussion on the effect of a number of drugs on muscle. He outlined the characteristics of several of the quinoline series and reported on effects. The salicylates were discussed in the same manner.

Marvin Darrach of Vancouver, B. C., presented a highly informative discussion on the metabolism of several of the steroids and pointed out the directions being taken by chemists to produce inflammation-reducing steroids with reduced undesirable effects.

Closest to clinical application was the very interesting discussion on tension states by Henry H. Dixon of Portland. Findings of his electromyographic studies of muscle tension and spasm could be applied to many of the cases commonly diagnosed as rheumatism.

Registration considerably in excess of the numbers anticipated and the obvious interest of the audience in the papers given, proved the fact that clinicians do enjoy discussions of basic research. •

Now—the most widely prescribed tranquilizer[1] in sustained release capsules

Meprospan*

meprobamate (Miltown®) capsules

q. 12 h.

Two capsules on arising **last all day**
Two capsules at bedtime **last all night**
relieve nervous tension on a *sustained* basis, without between-dose interruption

"The administration of meprobamate in sustained action form [Meprospan] produced a more uniform and sustained action . . . these capsules offer effectiveness at reduced dosage."[2]

Dosage: 2 Meprospan capsules q. 12 h.
Supplied: 200 mg. capsules, bottles of 30.

1. Meprobamate is more widely prescribed than any other tranquilizer. Source: Independent research organization; name on request.

2. Baird, H. W., III: A comparison of Meprospan (sustained action meprobamate capsule) with other tranquilizing and relaxing agents in children. Submitted for publication, 1958.

President's Page

HERMAN A. DICKEL, M.D.

At the 1958 Annual Session and the House of Delegates Meeting of the Oregon State Medical Society, changes in the Constitution and By-Laws were adopted. They consisted of two fundamental changes establishing (1) five Commissions somewhat comparable to the AMA Councils and composed of three members each; and (2) the necessary structure for our Society to create scientific sections. Both of these new enactments are improvements over the former arrangement. Both will require some experience to iron out the "bugs."

The Commission system should eventually produce more effective committee activity. It should make "streamlining" possible where necessary, eliminate duplication, improve coordination and generally be extremely more efficient. The system, however, will require hard work on the part of the Commissioners and, on our part, patience and encouragement.

The Commissions, five in number, will this year be labeled and manned as follows:

JUDICIAL COMMISSION:
- Merle Pennington, Sherwood, *Chairman*
- Leon F. Ray, Portland
- Edward L. Stevenson, The Dalles

PUBLIC RELATIONS COMMISSION:
- Alfred J. Kreft, Portland, *Chairman*
- Willis B. Shepard, Eugene
- David B. White, North Bend

PUBLIC HEALTH COMMISSION:
- S. Gorham Babson, Portland, *Chairman*
- Arthur A. Fisher, Salem
- James A. Riley, Corvallis

EDUCATION COMMISSION:
- Verner V. Lindgren, Portland, *Chairman*
- George D. Massey, Klamath Falls
- Bertram L. Trelstad, Salem

PARA-MEDICAL COMMISSION:
- Bradford N. Pease, Bend, *Chairman*
- Herbert E. Mason, Beaverton
- Jacob J. Enkelis, Portland

Each of the chairmen this year are members of the Council and will easily coordinate the activities of the Council with the several committees which will be grouped under each of the Commissions. It will be the duty of each Commission "to make for each committee suggestions for activity in their respective fields; to attend committee meetings where and when necessary, advise the committees of Society policy, to report to the Council a summary of committee activities; and in general to coordinate all Society activity."

You will note that the Executive Committee has seen fit to appoint these men above with an attempt to get as many areas of the State, and specialties, represented. Each of the commissioners has a long record of devoted service to the Society with many committee appointments and chairmanships. They will be advising you soon of their procedures, and how you as committee members or as Society members can aid them.

The establishment of Sections, made possible as noted, will require a lot more time to put into actual effect. Already several specialties have shown interest and the ophthalmology and otolaryngology group may lead the way in a few weeks.

The Executive Committee of the Council was recently filled by the election of Donald M. Brinton of Lane County. He joins Vern W. Miller, Louis J. Feves, Max H. Parrott, Blair J. Henningsgaard, Merle Pennington and the President in filling that group.

Each year as officers change places the activity and momentum of the Society stills for a moment. But stimulus, new drive and new interests rapidly develop. One of the first duties of the President to discharge is an early visit to your component Society. Here the interests of your local group can be discussed. We will try to get to you soon and will appreciate your contacting the State offices if you have a special reason or purpose in wanting us at a special time.

Herman A. Dickel, M.D.
President

Washington

WASHINGTON STATE MEDICAL ASSOCIATION
1309 Seventh Avenue
Seattle 1, Washington

ANNUAL MEETING
Seattle
September 13-16, 1959

President, Emmett L. Calhoun, M.D., Aberdeen Secretary, Wilbur Watson, M.D., Seattle Executive Secretary, Mr. R. W. Neill, Seattle

Improved Layout of Exhibits Planned For 1959 Convention of WSMA

An improved layout of scientific and technical exhibits has been planned for the 1959 convention of the Washington State Medical Association, which will be held at the Olympic Hotel in Seattle, September 13-16, inclusive, according to Emmett L. Calhoun of Aberdeen, Association president and chairman of the Scientific Work Committee.

Scientific exhibits will be located in the hotel's Spanish Lounge. Part of the technical exhibits also will be in the Spanish Lounge, and the remainder will be in the Convention Hall. The Physicians' Art Exhibit, which has been a very popular convention feature since its revival in 1957, will be on the stage of the Convention Hall. The physicians' registration booth also will be in the Convention Hall.

Both the Spanish Lounge and the Convention Hall open into the hotel lobby, and between them is the Spanish Ballroom, which will be used for scientific and general meetings and social events. This will make it very convenient for physicians to view the exhibits when they register, as well as when on their way to meetings and during recesses in the scientific sessions.

The Scientific Work Committee will meet in the near future to begin shaping plans for the 1959 convention program. Chairmen will be named for the Scientific Program and Scientific Exhibits Committees, which will start to work immediately.

Annual Diabetes Detection Drive To Be Held November 16 to 23

During the week of November 16 to 23, the American Diabetes Association and its local affiliate, the Washington Diabetes Association, will hold the annual diabetes detection drive. Purpose of the drive is two-fold: 1) to detect the unknown diabetic as early as possible in the development of his disease, and 2) to educate the public about diabetes.

The drive will be accomplished through a widespread publicity campaign urging all persons to have their urine tested during this week. All persons having positive urines or elevated blood sugars will be referred to their physician for further diagnosis and appropriate treatment.

The Washington Diabetes Association urges all physicians, insofar as possible, to test the urine and, where indicated, the blood of all patients entering their office during this week to rule out diabetes.

NEW PRESIDENTS—Pictured at the Annual Banquet of the 1958 convention of Washington State Medical Association are, from left: Dr. and Mrs. Emmett L. Calhoun of Aberdeen and Dr. and Mrs. Clarence L. Lyon of Spokane. Dr. Calhoun is president of the State Association and Mrs. Lyon is president of the Woman's Auxiliary.

WSMA Members Urged To Take Interest In Political and Legislative Matters

Every member of the Washington State Medical Association was urged by the House of Delegates at its recent session in Spokane to take an active interest in political and legislative matters.

The House adopted a recommendation by the Public Laws Committee that "each member of this Association interest himself in the coming general election, and continue his interest throughout the 1959 Legislative session."

The Public Laws Committee recommendation was included in a report of the many problems facing the medical profession in the State Legislature. These problems include a proposal to extend the sales tax to professional services which was specifically opposed in a resoultion adopted by the House.

Aagaard Addresses Educators

George N. Aagaard, Dean of the University of Washington Medical School, participated in the meeting of the Association of American Medical Colleges at Philadelphia last month. He spoke on the subject of "A Method of Handling Professional Fees for a Full Time Medical Faculty."

Health Department Appointments

Wallace Lane has been appointed chief of the Washington State Health Department's division of chronic disease and adult health. For the past year Dr. Lane has been in charge of similar services for the Seattle-King County Health Department. He has held the post of director of the Kansas City, Kas., City-County Health Department.

J. L. Jones, who has been with the state health department since 1945, has been named head of the chronic disease section under Dr. Lane.

Eighty Physicians Hear J. E. Dunphy

Eighty physicians from Island, Skagit, Whatcom and Snohomish counties met at Providence Hospital in Everett September 2 to hear J. Englebert Dunphy, professor of surgery at Harvard University. Dr. Dunphy was brought to Everett by the American Cancer Society. His talk was on Newer Concepts in Cancer Therapy.

James Otto, medical adviser to the Snohomish County unit of the American Cancer Society, was in charge of arrangements for the session.

High Posts Go To Yakima Surgeons

At the reecnt meeting of the Washington Chapter of the American College of Surgeons in Spokane, two Yakima surgeons were installed in high offices. W. Shuler Ginn was installed as president of the state chapter and H. Harlow Skinner, Jr., was installed secretary-treasurer. During October, Dr. Ginn attended the national convention of the American College of Surgeons in Chicago.

Locations

Lloyd R. Lichty and *Russell L. Shaw* have opened offices in Edmonds for the practice of general medicine. Both received their medical degrees from the University of Washington School of Medicine and both are veterans of World War II. Dr. Lichty served his internship at Bremerton Naval Hospital and Dr. Shaw took his internship at a St. Louis hospital.

Elton Kessel, who recently returned from three year's association with the Basic Educational School in Sevagram, India, has opened offices in Forks. Dr. Kessel was graduated from Chicago Medical School in 1953 and served his internship at Cook County Hospital, Chicago.

Charles W. Watkins has opened offices in Vancouver for the practice of dermatology. Dr. Watkins was graduated from St. Louis University of Medicine in 1951.

Seminar on Cancer Held in Longview

Fifty-four physicians from Cowlitz, Lewis, Thurston, Pacific, Clark and Skamania counties gathered in Longview recently for a seminar conducted by J. Englebert Dunphy, dean of surgery at Harvard University. Dr. and also reported on the discovery of several effective anti-cancer drugs.

During his visit to Longview, Dr. Dunphy met with members of the cancer committee of the Cowlitz County Medical Society; Neal R. Kirkpatrick, Charles E. Buck, Henry D. Fuesner, William A. Johnson, L. L. Maas, Powell B. Loggan and R. L. Smith.

Satisfied with the usual cough remedies?

—do you find that the local soothing effect of cough syrups is not enough?

—are you concerned about the side effects of codeine?

—do you find that many remedies decrease cough productivity?

—do you have patients who do not cooperate fully because of cumbersome forms of issue and too frequent dosage?

SUMMIT, N. J.

Seattle Physician Takes Top Prize in Art Show at San Francisco

Edmund H. Smith of Seattle won the favorite-of-the-show award in the 21st annual art exhibition of the American Physicians Art Association. The exhibition was held at the Civic Auditorium in San Francisco during the AMA's 107th annual meeting last summer.

Dr. Smith's oil landscape painting received the most votes from the physicians and guests who attended the exhibit. As his award, Dr. Smith was presented with an original painting by Norman Rockwell.

Other awards going to Seattle physicians were: The Joseph Garrison Parker Award for the intern or resident submitting the best painting to Thomas J. Payne for his work, The Red Barn; first prize, beginners' category in water colors, Morton Palken; honorable mention, beginners' category in drawing, Albert J. Bowles; and honorable mentions, category two for advanced artists in both drawing and non-objective, Knute Berger.

Physicians Participate in Defense Exercise

During the recent civil defense test, "Operation Crash," involving 500 persons in east Vancouver, A. E. Underwood, civil defense coordinator for Clark County Medical Society, directed local physicians in exercise staffing at Vancouver Memorial and St. Joseph hospitals. The test involved the military, police and civilians in handling an imaginary disaster in which a plane carrying a nuclear armament crashed and burned. The exercise started at 6 a.m. and was concluded by 9:30 a.m.

WINNER OF TOP PRIZE IN ART SHOW—Edmund H. Smith of Seattle is shown holding his original painting by Normal Rockwell which he received as winner of the favorite-of-the-show award at the 21st annual art exhibition of the American Physicians Art Association held during the June AMA meeting in San Francisco. Dr. Smith's prize-wining oil painting entitled, Desert Quiet and Solitude, is directly above the picture in his hands.

If not... here's why you should try new Tessalon Perles

- controls cough by dual action—in the chest as well as at cough centers of the brain.
- 2½ times as effective as codeine[1] without the side effects of codeine.
- controls cough frequency without decreasing productivity or expectoration.
- Perles offer convenient, precise dosage and relief for 3 to 8 hours.

AVERAGE ADULT DOSAGE: 100 mg. t.i.d.
In refractory cough, up to 6 perles (600 mg.) a day may be given.

AVERAGE DOSAGE FOR CHILDREN UNDER 10:
One Pediatric Perle (50 mg.) t.i.d.

SUPPLIED: TESSALON *Perles*, 100 mg. (yellow).
Pediatric Perles, 50 mg. (red).

Pediatric Perles available Oct. 1, 1958.

1. Shane, S. J., Krzyski, T. K., and Copp, S. E.: Canad. M.A.J. 77:600 (Sept. 15) 1957.

Obituaries

Dr. Charles V. Farrell, 64, died in a Bellingham hospital August 14 of an acute coronary thrombosis. Dr. Farrell was graduated from St. Louis University of Medicine in 1924 and had practiced in Bellingham for the past 37 years. He was a past president of the Whatcom County Medical Society.

Dr. Carl W. Stomberg, 56, of Lake Stevens died August 2. While water skiing on Lake Stevens, Dr. Stomberg suffered a heart attack, fell into the lake and drowned. Dr. Stomberg received his medical degree in 1925 from the University of Minnesota Medical School. He had practiced in Everett from 1926 to 1932 when he re-located in Seattle. He had been Everett city health officer from 1928 to 1932.

Dr. Charles E. Watts, 68, died October 12 in a Seattle hospital of a cerebral thrombosis due to cerebral arteriosclerosis and essential hypertension. Dr. Watts was a past-president of King County Medical Society and Washington State Medical Association. He was graduated from Rush Medical College, Chicago, in 1918 and took his intern and resident training in Chicago before moving to Seattle in 1920. For 29 years Dr. Watts was consultant at the United States Public Health Service Hospital in Seattle. He was a Navy veteran of World War II, serving as chief of medical services at Aiea Naval Hospital in Honolulu and later as chief of medical services at the Seattle Naval Hospital. He was clinical professor of medicine at the University of Washington. Dr. Watts was a former president of the Pacific Interurban Clinical Club, first president of the Washington State Health Council, and had been a vice-president of the American College of Physicians.

Dr. Arthur B. Petersen, 37, Spokane internist, died September 5 in Seattle. He received his medical education at the University of Oregon Medical School, graduating in 1947. After serving his internship at Wesley Memorial Hospital, Chicago, Dr. Petersen took his residency training at the Mayo Clinic in Rochester, Minn. He had practiced in Spokane since 1954.

Dr. Orme R. Nevitt, 79, pioneer Raymond physician, died September 6 at a South Bend hospital. Dr. Nevitt attended the University of Minnesota Medical School from which he was graduated in 1900. He had practiced in Raymond since 1905 and had served as the town's health officer for several years. He was a member of the 50-Year Club of Washington State Medical Association. Dr. Nevitt was named general practitioner of the year for the state of Washington in 1951. He was a past president of Pacific County Medical Society. The Dr. Nevitt Memorial swimming pool in Raymond was built and dedicated to his service to the community.

Dr. Laurence A. Quaife, 79, of Rosalia, died September 6 in a Spokane hospital. Dr. Quaife received his medical degree in 1906 from the State University of Iowa College of Medicine. He came to Washington as medical director for the Chicago and Milwaukee railroad and opened his practice in Rosalia.

Dr. Russel S. Reed, 70, general practitioner and arthritis specialist, died October 4 in a Seattle hospital of a myocardial infarction. Dr. Reed was graduated from Bennett Medical College, Chicago, in 1913. He had practiced in Seattle for 42 years.

Joint Medical-Bar Meeting in Everett

Snohomish County Medical Society and Snohomish County Bar Association held a joint no-host social and dinner meeting October 7 in Everett Golf and Country Club. Principal speaker was Judge Thomas Stiger of Snohomish County Superior Court. Judge Stiger spoke on physician and lawyer relationship and the conduct of medical witnesses.

State Obstetricians Set Meeting Date

Glenn G. Rice of Seattle, president of Washington State Obstetrical Association, has announced that the group's next meeting will be held April 11 in Seattle at the Washington Athletic Club. Guest speakers for the spring meeting will be S. Leon Israel of Philadelphia, associate professor of gynecology and obstetrics, University of Pennsylvania Graduate School of Medicine, and Milton McCall of New Orleans, professor of obstetrics and gynecology, Louisiana State University School of Medicine.

Skagit County Medical Society

Guest speakers at Skagit County Medical Society's regular September meeting were Richard Czajkowski, Ph.D., director of King County Central Blood Bank, and Eloise R. Giblett, associate director. Dr. Czajkowski gave a general resume of the operation of the King County Blood Bank since its inception. He pointed out that in 1944 the average number of transfusions was about 8,000 a year, whereas now the yearly county average is between 33,000 and 37,000 transfusions, exculsive of the large additional amount used in open heart surgery. Dr. Giblett discussed the potential hazards of blood transfusions and methods taken to prevent reactions.

THE 69TH SESSION
of Washington State Medical Association

Medical meetings are like people. They have personality. You can tell from the start that it is going to be a warm, enjoyable friendship or something to make you wish you had not left the office.

The meeting at Spokane was one of the warm, friendly kind and you could feel it in the air when you first walked into the Davenport Hotel to register. What it takes to give a medical meeting a pleasing personality is just as difficult to identify as it is to tell why you like one person more than another. But whatever it is, the 69th session of Washington State Medical Association had it.

The hotel was a busy place with its famous lobby filled with exhibits and the mezzanine providing room for many more. Scientific exhibits were up this year in quantity and also impressively in quality. The physicians' art exhibit demonstrated growing interest of physicians as well as surprisingly high level of talent. Scientific sessions were well attended and the sports events were rewarding to those who participated.

Delegates discuss an issue.

The meeting was opened with a session of the House of Delegates, Sunday afternoon, September 14. This was the usual routine assembly at which committee reports and resolutions are admitted. George Lull, Assistant to the President of AMA, was introduced and gave a short discussion of some AMA activities. Amendment to the constitution relative to qualification of those admitted to membership was introduced. It will be voted on at the 1959 session. Amendment to the by-laws raising dues from $35 to $45 per year was adopted.

Sunday evening was devoted to the No-Host Family Banquet, an informal affair without speeches. A solo entertainer captured his audience by dint of hard work and considerable ability as a gagster and tap dancer. Names of new members of the Fifty-Year Club were announced and those present were given pins. They were F. L. Shepard, Winslow; Mary MacMillan Rodney, Spokane; C. W. Knudson, Seattle; William C. Speidel, Seattle, and Thomas C. Paxton, Seattle. Others admitted but not present were, Herbert E. Coe, Seattle; Howard

Family banquet was held Sunday evening.

President Milo Harris awards a pin to a 50-year member of the State Association.

I. C. Munger, Jr., of Vaucouver, a past-president of WSMA, at left, and F. A. Tucker of Seattle, president-elect of the State Association, at the luncheon meeting of the Washington Academy of General Practice.

L. Lull, Yakima; J. W. Johnson, Cardiff, Calif.; William N. Keller, Steilacoom; C. A. Magnusson, Seattle; E. C. Ruge, Palm Desert, Calif.; and E. W. Stimpson, Bellingham.

Monday, traditional day for the golf and fishing derbies, was enjoyed by more participants than ever. Prize fish, a 2 pound cutthroat, was caught by Merritt H. Stiles of Spokane. R. McC. O'Brien repeated his customary capture of the golfing crown with a low gross of 76. This was his fifth such win.

Activities at the Davenport went into high gear on Tuesday with reference committee meetings, scientific sessions, luncheon meetings, general assembly and annual banquet. Reference Committees of the House of Delegates worked most of the day in hearings on committee reports and resolutions. These sessions were fairly well attended although apparently many members of the Association still do not realize that they should participate in deliberations by offering testimony at these hearings. The general assembly heard President Milo Harris give his message and welcomed Gunnar Gundersen, AMA President who delivered an address titled, "Selling the Pass," published in the October issue.

The banquet Tuesday evening was another event without speeches but with enjoyable entertainment. It was followed by dancing.

R. B. Robins of Camden, Arkansas addressed the luncheon meeting of the Washington Academy of General Practice on Tuesday. Dr. Robins is a trustee of AMA and former president of the American Academy.

Left: H. D. Fritz of Cathlamet conducts the Washington Academy of General Practice luncheon meeting on Tuesday. Right: Harold Laws of Seattle speaks at the Public Relations luncheon.

Final meeting of the House of Delegates was held Wednesday afternoon. Business was conducted smoothly by Speaker Humiston and the session concluded more promptly than expected. There was some discussion of the report of the Committee on Graduate Medical Education concerning admission of osteopaths to postgraduate sessions at the medical school. No action could be taken because of a legislative provision making it mandatory for the school not to discriminate.

The Public Relations luncheon on Wednesday was well attended.

Public Laws Committee called attention to the fact that an amendment to the Basic Science Act, considered sound when enacted, had been converted to a loop hole by a number of cultist practitioners because of an attorney general's opinion. The House requested the committee to make attempts to correct the situation. The rather lengthy report, which contained much significant information, was concluded with a recommendation that each member of the Association interest himself in the November election and continue his interest throughout the 1959 legislative session. The Committee on Aging Population instituted a number of studies during the year and recommends further effort to keep county societies, physicians and community groups interested in problems of the aging and possibilities for rehabilitation.

The Hardy brothers attended the annual session as delegates. At left is William H. of Aberdeen and at right, John L. of Endicott.

The House directed the School Health Committee to develop a standard, state-wide school health physical examination program. The House also directed AMA delegates to urge AMA to make further studies on the problem of helping osteopathic colleges improve the quality of their instruction. A new committee to study staphyloccic infections was created and directed to work with hospital authorities and public health officials.

The House adopted a resolution strongly condemning strikes against hospitals and another calling for study of the legal aspect of optometry, particularly in regard to prescription of contact lenses and diagnosis and treatment of ocular muscle imbalance. Also passed was a resolution calling for modification of legislation regulating labeling of hazardous substances. The House went on record as opposing any extension of the state excise tax to include personal services.

Complete record of official action, including committee reports and all decisions of the House, will be carried in a subsequent issue. It is recommended that all members study the reports when published in order to avoid ignorance of affairs of vital concern to all physicians in the state. •

"Much better-

thank you, doctor"

COSA-TETRACYN*

GLUCOSAMINE-POTENTIATED TETRACYCLINE

CAPSULES
(black and white)
250 mg., 125 mg.

ORAL SUSPENSION
(orange-flavored)
125 mg. per tsp. (5 cc.), 2 oz. bottle

NEW! PEDIATRIC DROPS
(orange-flavored) 5 mg. per drop,
calibrated dropper, 10 cc. bottle

Proven in research

1. Highest tetracycline serum levels
2. Most consistently elevated serum levels
3. Safe, physiologic potentiation (with a natural human metabolite)

And now in practice

4. More rapid clinical response
5. Unexcelled toleration

COSA-TETRASTATIN*

glucosamine-potentiated tetracycline with nystatin

antibacterial plus added protection against monilial superinfection

CAPSULES (black and pink) 250 mg. Cosa-Tetracyn (with 250,000 u. nystatin)

ORAL SUSPENSION 125 mg. per tsp. (5 cc.) Cosa-Tetracyn (with 125,000 u. nystatin), 2 oz. bottle

COSA-TETRACYDIN*

glucosamine-potentiated tetracycline—analgesic—antihistamine compound

For relief of symptoms and malaise of the common cold and prevention of secondary complications

CAPSULES (black and orange) Each capsule contains: Cosa-Tetracyn 125 mg. • phenacetin 120 mg. • caffeine 30 mg. • salicylamide 150 mg. • buclizine HCl 15 mg.

IDAHO STATE MEDICAL ASSOCIATION
364 Sonna Bldg.
Boise, Idaho

SIXTY-SEVENTH ANNUAL MEETING
June 14-17, 1959
Sun Valley

President, Donald K. Warden, Lewiston | Secretary, Max D. Gudmundsen, Boise | Exec. Secy., Mr. A. L. Bird, 364 Sonna Bldg., Boise

Resolutions Considered at 66th Annual Session

Following are additional resolutions considered by the House of Delegates of the Idaho State Medical Association during the 66th annual session, Sun Valley, July 6-9, 1958. Action of the House is in italics.

RESOLUTION No. "F-1"

Whereas, it is generally recognized that facilities for medical education must be considerably augmented to insure adequate medical care for our increasing population, and

Whereas, the Southeastern Idaho District Medical Society has recently presented to the State Board of Education and to the physicians of Idaho the results of a study pertinent to the establishment of medical education in Idaho,

Therefore, Be it Resolved, that the Idaho State Medical Association issue an invitation to the Association of American Medical Colleges and to the Council on Medical Education and hospitals of the American Medical Association, to send singly or jointly, a delegation to our state for the purpose of studying our resources in order to advise the Idaho State Medical Association as to the feasibility of the establishment of a two-year medical school in Idaho.

Resolution No. "F-1" was adopted by the House of Delegates.

* * *

RESOLUTION No. "G"

Whereas, the Idaho State Society of Pathologists wholeheartedly supports the program of cytology examinations for cancer screening purposes, and

Whereas, the Idaho State Obstetrical and Gynecological Society enthusiastically approves the cytology program as a routine diagnostic procedure, and

Whereas, the American Cancer Society, Incorporated, Idaho Division, has endorsed this as a lifesaving program, and

Whereas, the success of such a program will be dependent upon the cooperation of all groups concerned,

Now Therefore Be It Resolved, that the Idaho State Medical Association approve this program, and

Be It Further Resolved that the Idaho State Medical Association recommend the cooperation and participation of all practicing physicians in this lifesaving procedure.

Resolution No. "G" was adopted by the House of Delegates.

* * *

RESOLUTION No. "H"

Whereas, fees paid by life insurance companies for insurance application examinations, which include history, physical examinations and certain laboratory procedures in most cases do not meet the cost of the examination, and

Whereas, more life insurance is issued without physical examination, leaving the higher risk applicants as the only group to be examined, thus increasing the value of the examination and emphasizing the need of a most careful examination, and

Whereas, the costs for such services provided by members of the Idaho State Medical Association have increased appreciably

Now Therefore Be It Resolved, that the Idaho State Medical Association requests all life insurance companies doing business in Idaho to increase the fees allowed for insurance examinations to a minimum of $15.00 effective January 1, 1959, and

Be It Further Resolved that copies of this resolution be forwarded to the Insurance Commissioner of the State of Idaho and to all life insurance underwriters and companies doing business in Idaho.

Resolution No. "H" was adopted by the House of Delegates.

* * *

RESOLUTION No. "I"

Whereas, there is a gradually developing need in Idaho for more physicians, and

Whereas, the anticipated population increase in the United States indicates that even greater numbers of well-trained physicians will be required in the years to come, and

Whereas, the State of Idaho has no facilities in its educational system for the training of these physicians, and

Whereas, the people of Idaho have in the past been entirely dependent upon the private and tax supported institutions in other states to educate medical personnel to care for the people in Idaho, and

Whereas, the Idaho Legislature has ratified the compact of the Western States and has made Idaho an active member of the Western Interstate Commission for Higher Education, which program, if properly implemented by appropriated funds will adequately supply the needed educational facilities and thereby furnish a continuing source of medical education for Idaho residents.

(Continued on page 1510)

The Achievements of Arist

...in Skin Diseases: In a study of 26 patients with severe dermatoses, ARISTOCORT was proved to have potent anti-inflammatory and antipruritic properties, even at a dosage only ⅔ that of prednisone[1]... Striking affinity for skin and tremendous potency in controlling skin disease, including 50 cases of psoriasis, of which over 60% were reported as *markedly improved*[2]...absence of serious side effects specifically noted.[1,2,3]

...in Rheumatoid Arthritis: Impressive therapeutic effect in most cases of a group of 89 patients[4]... 6 mg. of ARISTOCORT corresponded in effect to 10 mg. of prednisone daily (in addition, gastric ulcer which developed during prednisone therapy in 2 cases disappeared during ARISTOCORT therapy).[5]

ocort®

Triamcinolone LEDERLE

...in Respiratory Allergies: "Good to excellent" results in 29 of 30 patients with chronic intractable bronchial asthma at an average daily dosage of only 7 mg.[6]... Average dosage of 6 mg. daily to control asthma and 2 to 6 mg. to control allergic rhinitis in a group of 42 patients, with an actual reduction of blood pressure in 12 of these.[7]

...in Other Conditions: Two failures, 4 partial remissions and 8 cases with complete disappearance of abnormal chemical findings lead to characterization of ARISTOCORT as possibly the most desirable steroid to date in treatment of the nephrotic syndrome.[8,9]... Prompt decrease in the cyanosis and dyspnea of pulmonary emphysema and fibrosis, with marked improvement in patients refractory to prednisone.[10,11,12]... Favorable response reported for 25 of 28 cases of disseminated lupus erythematosus.[13]

Depending on the acuteness and severity of the disease under therapy, the initial dosage of ARISTOCORT is usually from 8 to 20 mg. daily. When acute manifestations have subsided, maintenance dosage is arrived at gradually, usually by reducing the total daily dosage 2 mg. every 3 days until the smallest dosage has been reached which will suppress symptoms.

Comparative studies of patients changed to ARISTOCORT from prednisone indicate a dosage of ARISTOCORT lower by about ⅓ in rheumatoid arthritis, by ⅓ in allergic rhinitis and bronchial asthma, and by ⅓ to ½ in inflammatory and allergic skin diseases. With ARISTOCORT, no precautions are necessary in regard to dietary restriction of sodium or supplementation with potassium.

ARISTOCORT is available in 2 mg. scored tablets (pink), bottles of 30; and 4 mg. scored tablets (white), bottles of 30 and 100.

(Continued from page 1507)

Now Therefore Be It Resolved that the Idaho State Medical Association hereby re-affirm itself as in favor of Idaho's participation in the Western Interstate Commission for Higher Education, and

Be it Further Resolved that the House of Delegates of the Idaho State Medical Association hereby request the Governor of the State of Idaho and the Legislature to make an adequate appropriation for the implementation of a medical student program under the Western Interstate Commission for Higher Education.

Resolution No. "I" was adopted by the House of Delegates.

* * *

RESOLUTION No. "J"

Whereas, it has been proven that excessive radiation is harmful, and

Whereas, the use of fluoroscopes has been accessible to children in the fitting of shoes without regulation of x-ray dosage with its destructive effect on growing tissue, and

Whereas, the laws of the State of Idaho do not regulate the indiscriminate use of such x-ray equipment,

Now Therefore Be It Resolved that the Idaho State Medical Association sponsor legislation for the prohibition of the use of x-ray equipment for the fitting of shoes unless such equipment is operated by a competent radiologist.

Resolution No. "J" was adopted by the House of Delegates.

COOK COUNTY GRADUATE SCHOOL OF MEDICINE

INTENSIVE POSTGRADUATE COURSES

STARTING DATES—WINTER 1958-59

SURGERY—Surgical Technic, Two Weeks, December 1, February 2.
Surgery of the Colon & Rectum, One Week, December 1, March 2.
Fractures & Traumatic Surgery, Two Weeks, December 1.
Treatment of Varicose Veins, Two Days, December 15.
American Board Review Course, Two Weeks, April 6.
Blood Vessel Surgery, One Week, March 2.

GYNECOLOGY & OBSTETRICS—
Office & Operative Gynecology, Two Weeks, February 9.
Vaginal Approach to Pelvic Surgery, One Week, November 17, February 2.
General & Surgical Obstetrics, Two Weeks, February 23.

MEDICINE—Electrocardiography, Two-Week Basic Course, March 16.
Gastroscopy & Gastroenterology, Two Weeks, March 2.
Board Review Course, One Week, April 20.

DERMATOLOGY—Clinical & Didactic Course, Two Weeks, November 3.

UROLOGY—Ten-Day Practical Course in Cystoscopy, by appointment.

RADIOLOGY—Diagnostic X-Ray, Two Weeks, December 1.

TEACHING FACULTY—ATTENDING STAFF OF COOK COUNTY HOSPITAL

ADDRESS: Registrar, 707 South Wood Street, Chicago 12, Ill.

State Board of Medicine

S. M. Poindexter, Boise, Chairman of the State Board of Medicine, has been notified of his election as a member of the Executive Committee of the North Pacific Society of Internal Medicine during the society's recent annual meeting in Victoria, B.C.

Temporary licenses were granted in September to the following physicians:

Claude W. Barrick, Boise. Graduate of Jefferson Medical College, Philadelphia, M.D. degree 1945. Internship King County Hospital, Seattle, 1945-46. Residency King County Hospital, Internal Medicine, 1948-49, University of Chicago Clinics, Radiology, 1949-53. Granted T-211 September 2. Radiology.

Warren R. Rupper, Idaho Falls. Graduate University of Kansas School of Medicine, M.D. degree 1948. Internship Indianapolis General Hospital, 1948-49. Residency University of Utah School of Medicine Hospitals, Anesthesiology, 1950-52. Granted T-212 September 12. Anesthesiology.

Frank J. Coram, Bonners Ferry. Graduate George Washington University School of Medicine, M.D. degree 1955. Internship USPHS Hospital, Seattle, 1955-56. Granted T-213 September 25. General.

The period for renewal of Idaho licenses to practice medicine and surgery expired October 1. A total of 549 physicians practicing within Idaho renewed their licenses and 270 out-of-state physicians paid the yearly renewal fee.

Twenty-three physicians failed to pay the yearly renewal fee and their licenses have been cancelled.

Pioneer Idaho Falls Physician Harry D. Spencer Dies September 17

The brilliant and colorful career of Dr. Harry D. Spencer, 83, pioneer Idaho Falls physician and surgeon, came to an end on September 17 when he died in an Idaho Falls hospital. Dr. Spencer had been a patient for several days following an automobile accident.

Dr. Spencer graduated from the Iowa State University Medical School in 1897 and had practiced in Idaho Falls since 1908.

Long active in civic and medical affairs, Dr. Spencer played an important role in the growth and development of Idaho Falls.

In 1930 Dr. Spencer served as President of the Idaho State Medical Association. During the July meeting of the Association at Sun Valley, Dr. Spencer was awarded a 50-year certificate for outstanding service to the people of Idaho and the medical profession.

An ardent sportsman in his younger days, Dr. Spencer confined his relaxation in recent years to golf and travel.

J. W. DePree of Moscow Passes

Dr. John Warren DePree, 49, died September 4 in a Spokane hospital after being in failing health for several months. Dr. DePree received his medical degree from Rush Medical College in 1939 and served his internship at Washington Boulevard Hospital, Chicago. He moved to Potlatch in 1941 and then re-located in Palouse in 1944. Dr. DePree maintained offices there until his death. During 1952 he had moved his family to Moscow and was on the staff of Gritman Memorial Hospital in Moscow.

For more certain control of virtually **ALL DIARRHEAS**

DONNAGEL WITH NEOMYCIN

Robins

ANTIBIOTIC • ADSORBENT • DEMULCENT • ANTISPASMODIC

Diarrheas due to neomycin-susceptible pathogens are effectively treated by the highly efficient intestinal antibiotic in DONNAGEL WITH NEOMYCIN, whose other ingredients serve to control toxic, irritative and emotional causes. *Result:* Early re-establishment of normal bowel function.

SUPPLY: Bottles of 6 fl. oz.

ALSO AVAILABLE: DONNAGEL, the original formula, for use when the antibiotic component is not indicated. Bottles of 6 fl. oz.

Each 30 cc. (1 fl. oz.) of the comprehensive formula of DONNAGEL WITH NEOMYCIN contains:

Neomycin sulfate (Equal to neomycin base, 210 mg.)	300 mg.
Kaolin (90 gr.)	6.0 Gm.
Pectin (2 gr.)	142.8 mg.
Dihydroxyaluminum aminoacetate	0.25 Gm.
Hyoscyamine sulfate	0.1037 mg.
Atropine sulfate	0.0194 mg.
Hyoscine hydrobromide	0.0065 mg.
Phenobarbital (¼ gr.)	16.2 mg.

SPECIAL ARTICLE:

Current Problems in American Medicine

R. B. Robins, M.D.
TRUSTEE, AMERICAN MEDICAL ASSOCIATION
CAMDEN, ARKANSAS

You doctors here today—members of the Academy of General Practice and the Washington State Medical Association—make up a perfect audience for me.

As some of you may know, I am a former President of the American Academy of General Practice and a present member of the Board of Trustees of the American Medical Association. For many years I have been actively interested in the work and objectives of both organizations. I always am pleased to note that the Academy supports the efforts of the AMA, which is the parent organization in policy matters, and I am heartened by the increasingly close cooperation between the two.

R. B. ROBINS, M.D.

This is the way it should be. After all, the primary objective of both organizations is to help provide the best possible medical service to the American people. Furthermore, in these trying times of social, economic and political change, medicine needs greater unity than ever before. We must speak and act as one, if we are to achieve dynamic success in solving the problems that confront the medical profession as a whole.

Many, Varied and Complex

What *are* the current problems in American medicine? What are the challenges that demand positive, progressive effort by all of us? As you realize, they are many, varied and complex. I would not impose on your time and good nature by attempting to cover all of them in this brief address. That would be presumptuous on my part and, furthermore, it would keep us here the rest of the day and far into the night. Instead, I should like to highlight a few major problems which, by their nature and magnitude, involve medicine's position in our changing society. They are predominantly socio-economic in character, and they also concern our relations with the American public.

Internal Problems

This is not to say that they are our only difficult problems. We have many others—thorny and complex—which are primarily scientific or professional in nature. Among these are the promotion and coordination of medical research, the expansion and improvement of all phases of medical education, relations between general practitioners and specialists, relations between physicians and hospitals, relations between medical societies and medical schools, and similar problems that might be classified as *in*ternal.

Many of these, of course, have socio-economic overtones, and sometimes they unfortunately are caught up in the snare of bad publicity. But fundamentally they are "family" problems which can be worked out in comparative quiet by medical people of good will. Despite any obstacles or personalities, I am confident that these internal problems will be solved on a basis of common sense, high professional standards and sincere concern for the welfare of the patient. They demand constant study and liaison but, in my opinion, they do not constitute our most serious, most dangerous challenges.

External Problems

I think that our area of gravest concern involves what we might call *ex*ternal problems—those in which our policies and actions are subject to the bright glare of public interest. These socio-economic problems involve the ways and means of organizing and financing medical services. Year by year they attract growing attention from labor, business, industry, the general public—*and* politicians with one eye always on the ballot box. These problems cannot be solved by medical efforts alone. They require the help, understanding and cooperation of all segments of our society.

Presented at luncheon meeting of Washington Academy of General Practice, Spokane, Wash., Sept. 16, 1958. This was part of the 69th Annual Convention of Washington State Medical Association.

One of the most immediate and compelling is the health care of the aged. This problem, of course, is just one major part of the over-all issue of whether private or governmental programs can best meet the medical needs of the American people. However, the health problems of our senior citizens have come rapidly to the fore in recent years, and they have been seized upon by planners and politicians who recognize the value of humanitarian appeal in furthering the social security approach to all welfare problems.

It Is Our Baby

We must begin by admitting that a big problem exists and that we must face up to it. After all, we physicians —along with our co-workers in the field of public health— have created this problem. It is simply one of the prices of medical progress. If you accept the premise that an honorable man does not leave his baby on somebody else's doorstep, then you will agree that we have a serious responsibility in this matter.

Because of the medical advances in the past half-century, average life expectancy at birth in this country has increased from 47 years in 1900 to almost 70 years at present. At the turn of the century there were only three million Americans age 65 or older. Today there are 15 million and by 1975 there will be 20 million. As a general trend, medical emphasis is shifting from the infectious, communicable diseases—which used to be the great killers during infancy, childhood and youth—to the cardiovascular diseases, cancer, arthritis and other ailments which occur mainly during middle and old age.

Medicine long has recognized this trend, and it now is actively conducting or cooperating in a variety of activities to meet both the medical and the socio-economic impact of longer life. Very briefly, I want to sketch some of these developments. We physicians not only must give active support and implementation to such programs, but we also must be vigorous in telling the public about medicine's positive, constructive efforts to improve the health care of our senior citizens. Here are just a few examples.

Chronic Illness

In 1946 the American Medical Association was instrumental in founding the organization which later became known as the Commission on Chronic Illness. Although the Commission was disbanded about two years ago, the AMA still publishes the *Newsletter on Chronic Illness.*

Increasing attention is being given to new treatments, surgical procedures and rehabilitation measures for the aged.

The enrollment of older people under voluntary health insurance has doubled in the past seven years, and almost half of those over age 65 now have some form of health insurance. Our big job in this area now is to improve both the quantity and *quality* of coverage.

Hospitals are actively experimenting in new concepts of design, construction and organization with the objective of assigning the patient to the particular type of care he needs.

AMA Committee on Aging

Following a recommendation by the House of Delegates at the 1954 Clinical Meeting in Miami, the AMA established a Committee on Aging. That committee, steadily increasing its activities, has in the past year or so conducted several regional conferences. Last June, at the AMA Annual Meeting in San Francisco, the House of Delegates approved the committee's Suggested Guides for Medical Society Committees on Aging, which provide a blueprint for state and county action. And just yesterday and the day before in Chicago, the AMA Committee on Aging sponsored a national planning conference to mobilize and coordinate medical society action on health care for the aged. I urge all of you to give close attention to the proceedings of that meeting.

Standards for Nursing Homes

For the past year, through a liaison committee with the American Nursing Home Association, the AMA has been working for the establishment of improved medical care standards for nursing homes. To help achieve that goal, the AMA Council on Medical Service this summer has been making a field survey of about 25 nursing homes in various parts of the country. The findings and recommendations of that study probably will be published sometime this fall.

In a major move last spring, the American Medical Association joined with the American Hospital Association, American Dental Association and American Nursing Home Association in forming the Joint Council to Improve the Health Care of the Aged. Studying needs, resources and program development in this entire area, the new Council will give particular emphasis to increasing and improving voluntary health insurance coverage of older people, expanding health care facilities tailored to the needs of the aged, regardless of their economic status, and developing more community health services for our senior citizens.

Hill-Burton

Your AMA also has taken an active interest in sound national legislation which would help further these objectives. For example, in approving extension of the Hill-Burton hospital construction program, we also suggested a number of changes which would have given the states greater flexibility in meeting their needs—including the need for more nursing homes and chronic illness facilities. The program was extended without the amendments we wanted, but we shall continue to press for the ideas involved.

The same applies to our position urging Federal Housing Administration mortgage guarantees to stimulate construction of both proprietary and nonprofit nursing homes. I had the personal privilege of presenting the AMA testimony on this subject before two congressional committees. Although the legislation providing FHA-insured loans passed the Senate, it died in the House, but we shall continue to support it as part of our long-range program for better care of the aged.

White House Conference

The AMA also supported a bill calling for a White House Conference on Aging, to be held in January 1961. This bill passed Congress in the closing days of the recent session, after a strong AMA plea to prevent postponement of action in the Senate. Purpose of the national conference will be to "arrive at facts and recom-

(Continued on page 1514)

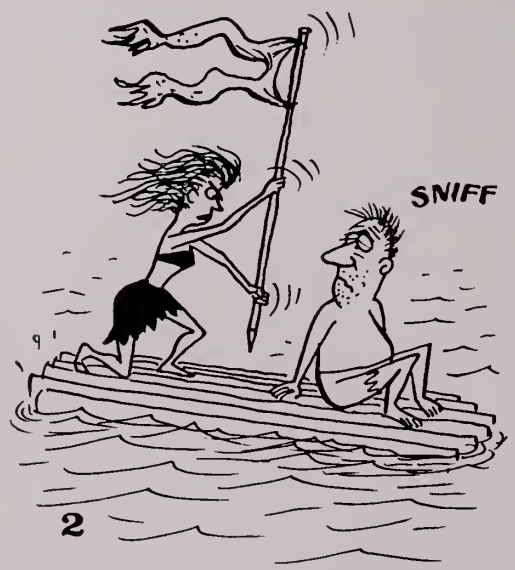
(Continued from page 1513)

mendations concerning the utilization of skills, experiences, and energies and the improvement of the conditions of our older people."

We are, as you can see from these various examples of medical activities, doing something to improve the health care of the aged. It is a growing problem, and we physicians accept our full share of responsibility in helping to solve it. But we must be vigorous, progressive and imaginative. And we must work with the utmost speed. For, as I mentioned earlier, this problem now is being used as a timely lever to force expansion of the Social Security program into the fields of hospital and medical care.

Outstanding example of this tactical trend is the Forand Bill, which had the full support of organized labor in the 85th Congress. This bill would have provided certain hospital, surgical and nursing home benefits for an estimated 12 to 13 million persons who are recciving—or are eligible for—Social Security retirement or survivorship payments. I do not intend to go into detail on the many reasons for medicine's opposition to the Forand Bill, but I should like to emphasize two major points: First—with its emphasis on hospital, surgical and *limited* nursing home benefits, this kind of proposal offers an unsound, illogical approach to the basic problems of chronic illness. Second—by providing socialized, tax-paid care for over 6 per cent of the people, any program of this kind would . . . by the familiar process of amendment, liberalization and expansion . . . simply prove to be an entering wedge for a complete system of national compulsory health insurance.

Social Security Expanded



Congress did not adopt the Forand amendments, but it once again passed an election-year expansion of the over-all Social Security program—increasing the benefits, the tax rate and the amount of taxable income. However, the Forand approach is by no means a dead issue. It will be back again next year. Senator Morse of Oregon and Senator Humphrey of Minnesota tried to revive the idea in the Senate debate on the Social Security bill. President George Meany of the AFL-CIO has declared that labor will urge adoption of the Forand proposal and other social security measures as soon as the 86th Congress convenes next January.

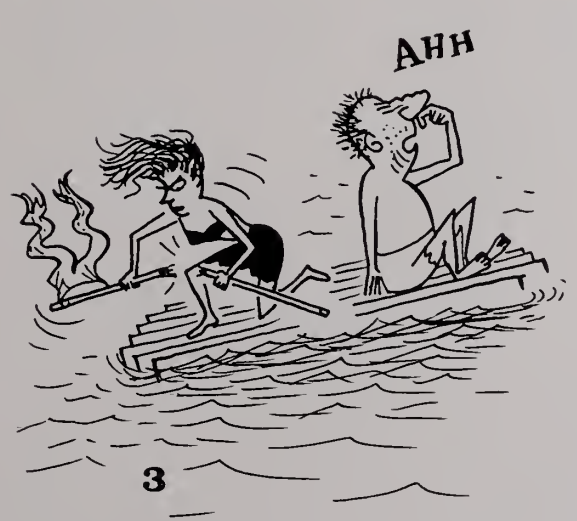
Furthermore, the House Ways and Means Committee has called upon the Secretary of Health, Education and Welfare to report by next February on a study of the various possibilities for financing the health care of the aged. Among the suggested areas of study is the idea of adding to social security taxes and using the money to buy "private or nonprofit" health insurance which would take effect upon ordinary retirement at age 65 or disability retirement at age 50. This, of course, is a dangerously deceptive idea which already has confused some of our friends in Congress. So, I think you will agree, medicine has a tremendous amount of work to do on just this one problem.

Other Problems

But while I have deliberately emphasized the health care of the aged, because of its importance and urgency, I also want to call your attention briefly to a few other current problems.

As both physicians and citizens, we must give serious concern and study to all aspects of our expanding Social Security system. Some day soon the American people will have to make a decision on the philosophy, scope and cost of that entire program.

Likewise, the public and the members of Congress soon must make a similar decision concerning the steady expansion of the Veterans Administration hospital and medical care program, which now is operated mainly for the care of non-service-connected disabilities. The AMA believes that the program's only purpose should be to provide unstinting care for veterans whose disabilities are caused or aggravated by military service. The people must be given the facts.



The physicians of America also must take a more active interest in legislation, and to help promote such interest the AMA now is studying ways and means of improving the profession's entire legislative information system. The need for increased effort is demonstrated by the fact that in the 12-year period from the 79th Congress to the 85th Congress, the number of bills involving medicine and health increased from about 200 to more than 700.

Another major problem facing medicine today is our relationship with so-called third parties involved in the provision and financing of medical care—such groups as the insurance industry, labor unions, business and industry, consumer groups, and many others. In some areas there have been serious differences of opinion over such issues as free choice of physician and the right of third parties to judge the qualifications or competence of doctors and hospitals. While we in medicine must be firm in defending basic principles and ethics, I believe that we must work hard for mutual understanding and effective liaison with all such groups. After all, they are trying to do a job under the private enterprise system which we value, and I think we should resolve our differences in such a way that we can be allies in the much bigger fight against government control. There is, however, need for a clear, definitive policy in this area of third party relationships. It is hoped that such a policy may be worked out of the findings and recommendations of the AMA Commission on Medical Care Plans, which has been at work for almost four years and which is expected to present its final report at the Association's Minneapolis Clinical Meeting in December, this year.

Conclusion

Gentlemen, I could go on at great length about current problems in medicine, but I think I have given you enough to worry about today. In closing I should like to repeat a point that has been stressed in recent months by Gunnar Gundersen, President of the AMA; F. J. L. Blasingame, the Executive Vice-President, and other medical leaders. If medicine is to meet the challenges of the day constructively and successfully, it must have the help of the best available men throughout the ranks of the profession. The task will require not only time and effort, but also a sense of dedication. I hope that a large share of that time, effort and dedication will come from you physicians of the State of Washington. •

Bacterial and Mycotic Infections of Man. 3rd Ed. Edited by Rene J. Dubos, Ph.D., The Rockefeller Institute, 820 pp. 116 Illustrations. Price $8.50. J. B. Lippincott Company, East Washington Square, Philadelphia 5, Pennsylvania. 1958.

Diagnostic Anatomy. By Weston D. Gardner, M.D., Associate Professor of Anatomy, Marquette University School of Medicine, Director of Medical Education, Evangelical Deaconess Hospital, Milwaukee, Wisconsin. 376 pp. Illustrated. Price $10.00. The C. V. Mosby Company, St. Louis, Missouri. 1958.

Diseases of the Liver and Biliary System. 2nd Edition. By Sheila Sherlock, M.D. (Edin.), F.R.C.P. (Lond.), M.R.C.P. (Edin.), Physician and Lecturer, Department of Medicine, Postgraduate Medical School, University of London. 719 pp. Illustrated. Price $11.50. Charles C Thomas, Springfield, Illinois. 1958.

The Gang—A Study in Adolescent Behavior. By Herbert A. Bloch, Professor of Sociology and Anthropology, Brooklyn College; and Arthur Niederhoffer, Lieutenant, Police Department, N.Y.C. 231 pp. Price $6.00. Philosophical Library, 15 East 40th Street, New York 16, N.Y. 1958.

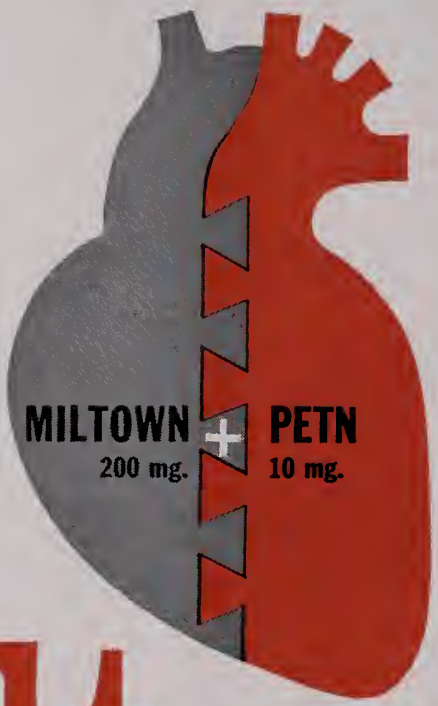
Hemophilic Arthropathies. By Henry H. Jordon, M.D., Orthopaedic Surgeon, Lenox Hill Hospital; Chief of Hemophilia Clinic, Lenox Hill Hospital, O.P.D., New York City; Consulting Orthopaedic Surgeon, Manhattan State Hospital; Orthopaedic Surgeon, National Hemophilia Foundation. 255 pp. Illustrated. Price $8.50. Charles C Thomas, Springfield, Illinois. 1958.

Ideals In Medicine—A Christian Approach To Medical Practice. Edited by Vincent Edmunds, M.D., M.R.C.P.; and C. Gordon Scorer, M.B.E., M.D., F.R.C.S. 192 pp. Price $3.00. Christian Medical Society, 127 S. Wacker Drive, Chicago 6, Illinois. 1958.

Infectious Diseases of Children. By Saul Krugman, M.D., New York, N.Y., Associate Professor of Pediatrics, New York University College of Medicine; Visiting Pediatrician, Bellevue Hospital; Director, Communicable Disease Unit, Bellevue Hospital Center; Attending pediatrician, University Hospital; Formerly Assistant Visiting Physician, Willard Parker Hospital; and Robert Ward, M.D., Los Angeles, Calif., Professor and Head of the Department of Pediatrics, University of Southern California; Physician-in-Chief, Children's Hospital, Los Angeles, California; Formerly Professor of Pediatrics, New York University College of Medicine, and Visiting Pediatrician, Bellevue Hospital, New York, N.Y. 340 pp. Illustrated. Price $10.00. The C. V. Mosby Co., St. Louis, Mo. 1958.

Lumbar Disc Lesions—Pathogenesis and Treatment of Low Back Pain and Sciatica. 2nd Ed. By J. R. Armstrong, M.D., M.Ch., F.R.C.S.; Orthopaedic Surgeon to the Metropolitan Hospital; Orthopaedic Surgeon to Lambeth Hospital, Visiting Orthopaedic Surgeon to Manor House Hospital, (Industrial Orthopaedic Society); Honorary Consulting Orthopaedic Surgeon to Royal Waterloo Hospital for Children and Women, Late Visiting Orthopaedic Surgeon to the Ministry of Pensions Hospital; Stoke, Mandeville, Late Orthopaedic Specialist, Royal Air Force Medical Service; Foreword by H. Osmond-Clarke, C.B.E., F.R.C.S., Orthopaedic Surgeon, London Hospital, Senior Visiting Surgeon, Robert Jones and Agnes Hunt Orthopaedic Hospital, Oswestry; Civilian Consultant in Orthopaedic Surgery to the Royal Air Force. 340 pp. Illustrated. Price $10.00. The C. V. Mosby Company, St. Louis, Missouri. 1958.

The Practical Use of the Microscope—Including Photomicrography. By George Herbert Needham, M.S., F.R.M.S., Past President of the New York Microscopical Society; Past President of the San Francisco Microscopical Society (Reorganized 1946); Lecturer in Microscopy and Photomicrography, University of California Medical School, University Extension, San Francisco, California, Consultant in Microscopy and Photomicrography. 493 pp. Illustrated. Price $15.50. Charles C Thomas, Springfield, Illinois. 1958.



Radiation Protection. Edited by Carl B. Braestrup, Director, Physics Laboratory, Francis Delafield Hospital; Associate, Department of Radiology, Columbia University, New York, N.Y.; Member, Executive Committee, National Committee on Radiation Protection and Measurements; and Harold O. Wyckoff, Chief, Radiation Physics Laboratory, National Bureau of Standards, Washington, D.C., Secretary, International Commission on Radiological Units and Measurements. 361 pp. Illustrated. Price $10.50. Charles C Thomas, Springfield, Illinois. 1958.

Systemic Ophthalmology. 2nd Ed. Edited by Arnold Sorsby. 682 pp. Illustrated. Price $25.00. Butterworth & Co. (Publishers), Ltd. London, England; The C. V. Mosby Company, St. Louis, Mo. 1958.

The Cervical Syndrome. 2nd Ed. By Ruth Jackson, B.A., M.D., F.A.C.S., Clinical Assistant Professor of Orthopaedic Surgery, The University of Texas Southwestern Medical School, Dallas; Attending Orthopaedic Surgeon, Baylor University Hospital; Formerly Chief of Orthopaedic Surgery, Parkland Hospital; and Instructor in Orthopaedic Surgery, Baylor University College of Medicine, Dallas, Texas. 197 pp. Illustrated. Price $6.50. Charles C Thomas, Springfield, Illinois. 1958.

ANOMALIES OF INTESTINAL ROTATION AND FIXATION (INCLUDING MESENTERICOPARIETAL HERNIAS). By Roberto L. Estrada, B.Sc., M.D., C.M., D.Surg. (McGill), F.R.C.S. (C), F.A.C.S., Demonstrator in Surgery, McGill University, Montreal, Canada. 161 pp. Illustrated. Price $6.50. Charles C Thomas, Springfield, Ill. 1958.

This monograph describes the various types of malrotation, anomalies of intestinal position, and the rare retroperitoneal hernias. The author presents a new classification (his own) of the various types of intestinal malrotation. It is, of course, necessary to understand exactly how the malrotation came about and what its position is in relation to other abdominal organs in order to relieve the various symptoms which are encountered. Case histories are presented and operations described for the various types of malrotation and hernias herin described.

It is possible to get interested in this book and read it all in one evening, although the chances of encountering the conditions described, are exceedingly rare.

Van K. Hillman M.D.

MEMOIRS OF A GOLDEN AGE. By Maurice Davidson, 140 pp. Illustrated. Price $3.75. Basil Blackwell, Oxford. 1958. Distributed by Charles C Thomas, Springfield, Ill.

This short book is a series of reminiscences by an Englishman who spent his undergraduate days at Oxford just as the twentieth century dawned.

Now, a half century later, he looks back on the development of his school and thinks kindly of the giants who peopled it during his formative years.

Such men as Burdon-Sanderson, Acland, Collier, Ellis and a host of others who built a solid base in the preclinical years for later generations are paid their just respects. Their personalities are stressed and their contributions to the Oxford Medical School are presented.

Those of us who are not old-school-tie are apt to find this book quite dull. Locally, we are preoccupied with clearing the timber to erect clinics of aluminum and glass and vinyl tile. We are not quite ready to look back, or at any rate, not there.

Meaning no disrespect, reading this book is a bit like looking at your wife's family album. You really should be more interested because there, for better or worse, is the stock from whence your progeny spring and your own world progresses.

Actually, you could not care less. Lovable characters though they may be, the only ones you remember are the ones who leave something in the way of tangible assets.

It is the same with men of learning.

Eric R. Sanderson, M.D.

DR. W. C. ROENTGEN. Ed. 2. By Otto Glasser, Ph.D., F.A.C.R. (Assoc.), Professor of Biophysics, Frank E. Bunts Educational Institute Head, Department of Biophysics, Cleveland Clinic Foundation, Cleveland, Ohio. 169 pp. Price $4.50. Charles C Thomas, Springfield, Ill. 1958.

Charles C Thomas is now offering what is purported to be a second edition of Otto Glasser's "W. C. Roentgen." Careful comparison of this book with the first edition reveals that the only new material is a list of 18 references to articles and books that have come out since the first edition was printed. None of this material is reflected in the body of the book itself. Three illustrations have been improved. Some original typographical errors are repeated. That there has been no change is not surprising because one would find it extremely

difficult to improve upon the very thorough job done by Glasser in this biography.

Anyone even remotely interested in the subject of x-ray radiation should possess one of these volumes. The reader will gain almost personal satisfaction in the "Horatio Alger" situation wherein Roentgen is offered and refuses a professorship in the school that denied him admission when a student. Here is another example of the rewards that come to a man who has thoroughly prepared and disciplined an alert mind. The account of the actual recognition of the properties of the emissions from the various vacuum tubes studied by Roentgen is extremely thorough and well done.

The general make-up of the book reflects the expected pleasing quality of a Thomas Publication.

Ivan M. Woolley, M.D.

ABNORMAL LABOR. By L. A. Calkins, M.D., Department of Gynecology and Obstetrics, University of Kansas Medical Center, Kansas City, Kansas. 70 pp. Price $2.75. Charles C Thomas, Springfield, Ill. 1958.

The author has had extensive experience in evaluating normal and abnormal labor. By and large, the book Abnormal Labor is an excellent summary of the normal pattern of labor and its deviations. I have used Calkin's method for predicting the length of labor and have found it quite accurate.

The author discusses management of various complications of different stages of labor. The discussions are quite brief but in keeping with good obstetrics.

I disagree with a statement made by the author in his disucssion of abruptio placenta. The author states, "It is usually ill-advised to induce labor promptly as most of these patients will go into labor within a matter of hours. The need for later induction will depend upon the circumstances then present." Most authorities agree that in definite cases of abruptio placenta the membranes should be ruptured for the following reasons:

1—To iniate labor if the patient is not in labor.
2—To facilitate labor if the patient is in labor.
3—To reduce intra-uterine pressures hoping to reduce the likehood of afribrinogenemia.

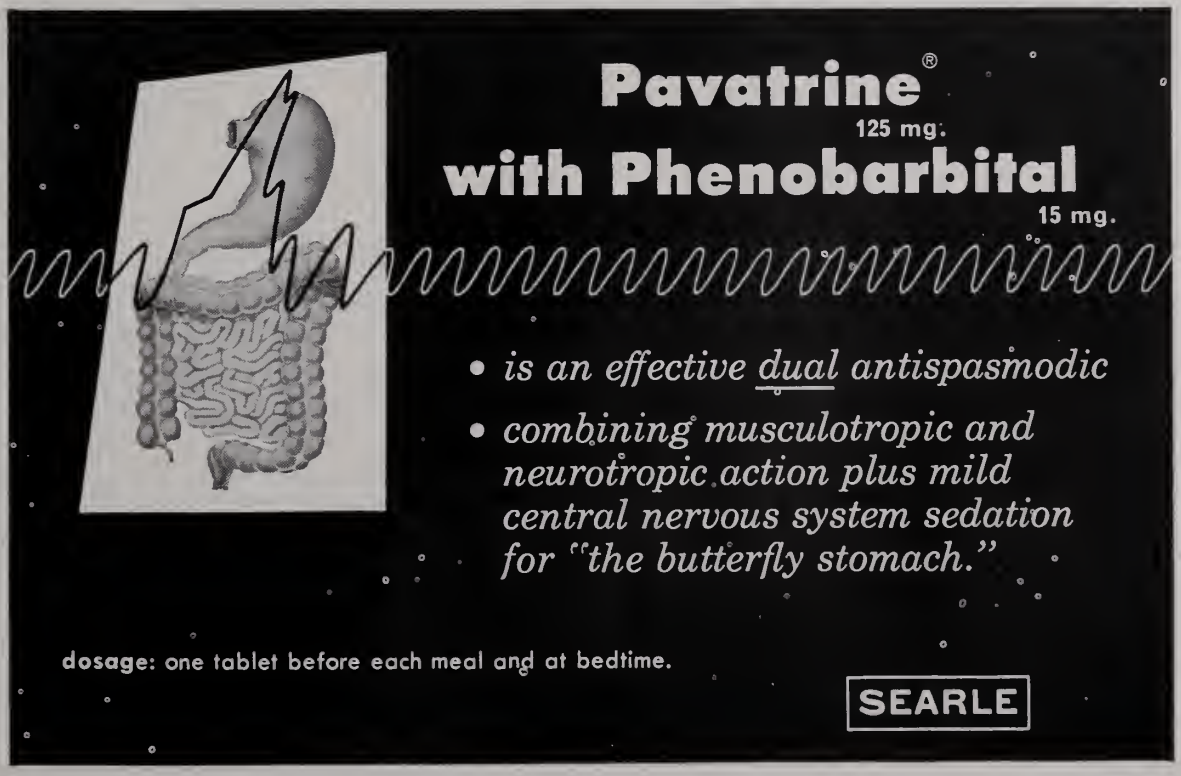
The discussion of the third stage of labor is excellent.

The author has accomplished his purpose in providing a ready reference guide for management of and therapy for abnormal labor.

Donald M. McIntyre, M.D.

HANDBOOK ON DISEASES OF CHILDREN Including Dietetics & Common Fevers. Ed. 8. By Bruce Williamson, M.D., (Edin.) F.R.C.P. (Lond.), Physician, Children's Department, Royal Northern Hospital, London; Physician Children's Hospital, Northaw. 483 pp. Illustrated. Price $6.00. E. & S. Livingstone Ltd., Edinburgh and London. 1957. Distributed by The Williams and Wilkins Co., Baltimore.

Diseases of Children by Bruce Williamson has gone through eight editions. It is a small, attractively bound handbook with a very readable format; it is written in a concise manner and is well illustrated.



The reader may not agree with the author that, "Repeated bronchitis, anaemia, backwardness, or any local condition of importance, e.g., middle-ear infection or deafness, are absolute indications for operation if the tonsils show chronic infection." The reader may also wonder at the lack of mention of antibiotics in treating tonsilitis and the emphasis placed on salicylates, potassium chlorate, gargles and local paints.

Nevertheless in general the text provides an epitome of most of the diseases of childhood and should serve as a rapid refresher for anyone who treats children. In addition, it provides information on the incidence of childhood diseases in England.

APSEALS®

Help protect her now, and you help insure better future health for her and her baby. A single NATABEC Kapseal each day provides all the vitamins and minerals the gravida or nursing mother needs to supplement a well-rounded diet.

each NATABEC Kapseal contains:

Calcium carbonate	600 mg.
Ferrous sulfate	150 mg.
Vitamin D	(10 mcg.) 400 units
Vitamin B_1 (thiamine) mononitrate	3 mg.
Vitamin B_2 (riboflavin)	2 mg.
Vitamin B_{12} (crystalline)	2 mcg.
Folic acid	1 mg.
Synkamin® (vitamin K) (as the hydrochloride)	0.5 mg.
Rutin	10 mg.
Nicotinamide (niacinamide)	10 mg.
Vitamin B_6 (pyridoxine hydrochloride)	3 mg.
Vitamin C (ascorbic acid)	50 mg.
Vitamin A	(1.2 mg.) 4,000 units
Intrinsic factor concentrate	5 mg.

dosage As a supplement during pregnancy and throughout lactation, one or more Kapseals daily. Available in bottles of 100 and 1,000.

MANAGEMENT OF COMPLICATIONS IN EYE SURGERY: Avoidance of Pitfalls and Treatment of Difficult Situations in Ophthalmologic Operations. Edited by R. M. Fasanella, M.D., Chairman of Section of Ophthalmology, Yale University School of Medicine. 422 pp. Illustrated. Price $16.00. W. B. Saunders Co., Philadelphia. 1957.

This compilation of material by 22 well-known authorities in the field of ophthalmology is full of practical suggestions and discussions on the prevention and treatment of most of the complications encountered in ocular surgery.

Each chapter is a complete entity in which an author considers the management of his particular problem. In addition, the last chapter is the Report to the Council of Industrial Health of the American Medical Association by Edmund Spaeth, Bruce Fralick and William F. Hughes, Jr., on "Estimation of Loss of Visual Efficiency."

The format of the book is very good; the printing is excellent, and the illustrations are clear and good.

This volume is highly recommended to the ophthalmic surgeon. Its study and possession as a reference will be of great value and render much aid when confronted with the inevitable complications seen by almost everyone who does ocular surgery.

Frederick F. Ackerman, M.D.

CLINICAL OBSTETRICS AND GYNECOLOGY. A Quarterly Book Series, Vol. I, March 1958: Medical Problems in Pregnancy, edited by Curtis J. Lund, M.D.; and Management of Endocrine Problems, edited by Allan C. Barnes, M.D. 288 pp. Illustrated. $18.00 per year. Paul B. Hoeber, Inc., New York. 1958.

This is the first in a series of books to be published quarterly, designed to fill the gap between the journals in obstetrics and gynecology on the one hand and the textbooks and monographs on the other. If one acknowledges that such a gap exists, then its publication is completely justified. As the title suggests, the clinical approach to specific problems in obstetrics and gynecology are discussed with the emphasis on diagnosis and treatment.

The book is divided into two main sections, each having an editor. The first concerns medical problems in pregnancy, and the second, endocrine problems in the female. Generally, the articles dealing with endocrine problems are better handled than most of those covering the medical problems. The chapters on urinary tract infection and poliomyelitis complicating pregnancy are the exceptions. Both are well written, informative, and original in their scope. There is some overlapping in subject matter, however, with a chapter in each section on diabetes and pregnancy.

The medical problems discussed range from the more commonly seen anemia in pregnancy, to the fortunately rare association of multiple sclerosis and pregnancy. Each topic is treated concisely and directly, stressing the practical approach toward therapy. As can be expected, since the articles are the products of different authors, there is a wide variation in style and effectiveness of presentation. This is particularly noticeable when comparing the two main divisions of the book.

That half of this issue devoted to endocrine problems is unusualy good, for this complex subject is reduced to its essentials, in a succinct and informative manner.

The list of contributors to this issue is a formidable one and should command respect, but a list of important names does not make a book. One gets the impression that the material was hastily assembled and, in the first half, but briefly edited. Subsequent issues could be improved by more thorough editing and closer coordination of the editors.

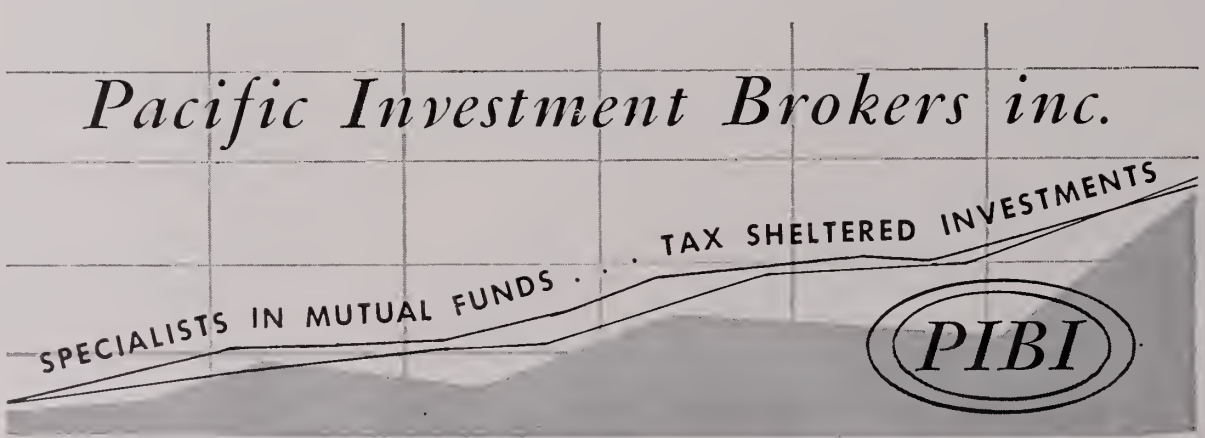
Taken as a whole, however, the general idea for a book of this type is a fresh approach to aid the general practitioner and the specialist in the management of obstetric and gynecologic problems.

Charles S. Williams, M.D.

HOW TO LIVE WITH DIABETES. By Henry Dolger, M.D., Chief, Diabetes Clinic, Mt. Sinai Hospital, New York; and Bernard Seeman. 192 pp. Price $3.50. W. W. Norton & Co., Inc., New York. 1958.

This is a very readable account of diabetes, which describes all phases of diabetic instruction. With each chapter there is the fascinating story of discoveries that provide today's diabetic patients with measures for good control. This sweep of history gives the diabetic patient a feeling that he is a part of a long tradition and as background for instruction it materially helps him to come to terms with the regimen of his disease.

Howard M. Hackedorn, M.D.



CANCER AND THE ATOMIC AGE. By Clement A. Tavares, M.D. 198 pp. Price $3.50. Vantage Press, Inc., New York. 1958.

For those physicians who have not gathered information for their own use about the history of cancer this book will be informative.

That energy exists in the animal cell has been evident for years, otherwise we would not be here. To my mind this book does not prove that increased or decreased energy of any type in the cell produces malignant disease.

Donald V. Trueblood, M.D.

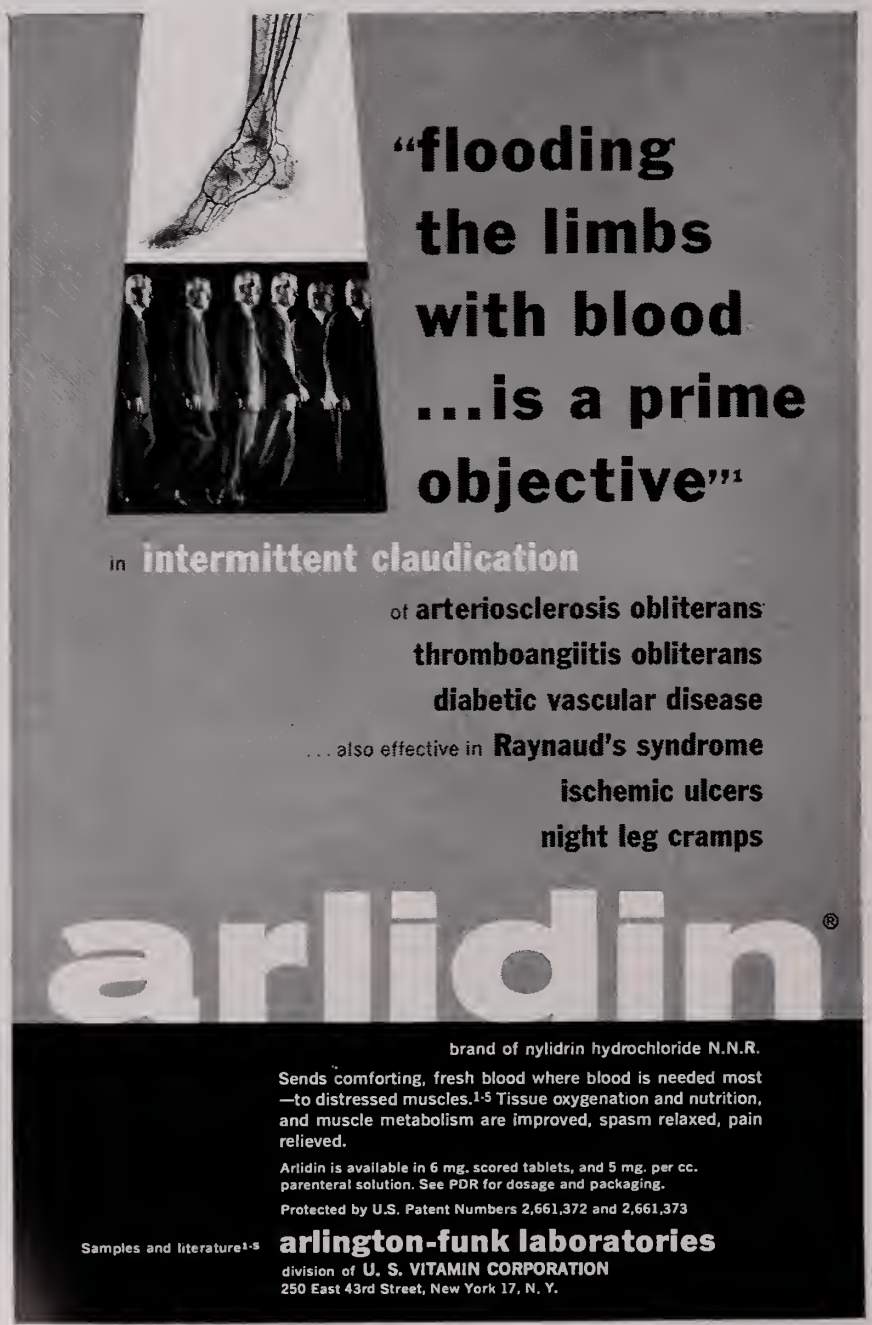
YOU CAN INCREASE YOUR HEART-POWER. By Peter J. Steincrohn, M.D. 381 pp. Price $4.95. Doubleday & Co., Garden City, New York. 1958.



As may be guessed from the title, this is a book for the patient with heart trouble or his family. The author, a cardiologist, writes a syndicated column, and has written eleven other books for the laity.

Every good physician recognizes that most of his patients have many questions about their illnesses, and that adequate answers to these questions are time consuming. In addition many patients fail to ask their physician some of the questions that bother them. Heart disease seems to provoke more fear in patients than most illnesses and by the same token requires more explanation from the doctor and more reassurance. This book is a compilation of questions about heart disease which have been asked Dr. Steincrohn by his patients and by readers of his column with his answers to same.

I get the impression that Dr. Steincrohn is a good cardiologist who is particularly well oriented to the emotional needs of his patients. His explanations and comments are on the whole reasonable and medically acceptable and should be understandable to the patient. He stresses the need for the unhurried, thorough discussion between physician and patient and awareness by the doctor of the emotional problems that so often are associated with heart disease. As he admits his inability to answer some reader's questions from the information furnished and refers the patient to his physician, the book would probably strengthen existing patient-physician relations.

The question and answer method used is probably more interesting to most readers than the usual

If you haven't already received your free copy of our new 64 page catalog of clinical Reagents and Stains, write for same today. It lists all of the more commonly used laboratory reagents and stains. You will find it very helpful.

ULMER REAGENTS AND STAINS HELP ACHIEVE ACCURACY

It is our objective to produce the finest reagents obtainable for clinical laboratory use. Their consistent accuracy saves hours of the technician's time.

Our scientific laboratory control is your assurance that Ulmer reagents are always fresh and meet the most exacting standards for each procedure. Every step of the manufacturing process is checked from the raw materials to the finished product. Moreover, our chemists are available to assist with any procedures with which you may be experiencing difficulties. Do not hesitate to call on them for assistance or advice.

For prompt and efficient service as well as guaranteed satisfaction, insist on Ulmer Reagents and order them direct from P & H.

text, and is more likely to include the questions uppermost in patients' minds. However, it takes more space since the questions are printed in full, and since the questions and answers are somewhat repetitious.

In the introduction the author sells himself and his book in a way that seems immodest. Probably his experience in writing for non-professional consumption has led him to be positive in order to produce a book that will have wide appeal and be convincing.

In summary, this is a good book for the heart patient which would inform and benefit him and be acceptable to most physicians. It is understandable and interesting but a bit long (376 pps.). It could be recommended for the cardiac patient who has more than usual anxiety about his condition, and who would wish a lengthy written discussion in addition to the explanation given by his physician.

Donal R. Sparkman, M.D.

PSYCHOPHARMACOLOGY: Pharmacologic Effects on Behavior. Edited by Harry H. Pennes, M.D., D.Med. Sci. (Neurology), Consultant in Psychiatric Reasearch, Department of Mental Hygiene, New York Psychiatric Institute, New York, N.Y. 41 Participants. 362 pp. Price $8.00. Paul B. Hoeber, Inc., New York. 1958.

This symposium by 41 participants, including biochemists, physiologists, pharmacologists, experimental psychologists, psychiatrists and psychoanalysts, attempts to explain the mechanism by which some of the newer psychopharmacologic agents effect behavior. It is by necessity a rambling, speculative and controversial but interesting discussion because very little is really known about the basic action of these drugs. When one considers that the mode of action of ether is still unknown, it is not surprising that the participants seem to be unable to arrive at any unanimity of opinion regarding even a tentative hypothesis about how these drugs work. For the main part, the discussion is limited to the tranquilizers, chlorpromazine, reserpine and meprobamate, and the psychosis-producing drugs, L.S.D. and mescaline, which already dates this new book in the rapidly developing field of biochemic factors in mental illness.

Although the clinical use of these drugs has been well established on an empirical basis for several years, it is hoped that basic investigations, such as described in this book, will lead to more definitive chemotherapy of psychiatric disorders. The average clinician upon reading this book will be confused but impressed with the complexity and difficulty of biochemic investigation when it involves the action of drugs on the human brain and behavior. The investigator doing basic research in the field of psychopharmacology will undoubtedly wish to have this book in his library for reference as to current work and theories, some of which are here published for the first time.

Frederick Lemere, M.D.

STUDIES IN FERTILITY 1956—Including Papers Read at the Conference of the Society for Study of Fertility, London, 1956: Vol. VIII of the Proceedings of the Society. Edited by R. G. Harrison, M.A., D.M., Derby Professor of Anatomy in the University of Liverpool. 138 pp. Illustrated. Price $5.00. Charles C Thomas, Springfield, Ill. 1957.

This small interesting volume contains a number of articles concerned with current trends in research as well as clinical papers on fertility. Most of these papers were read at the Conference of the Society for the Study of Sterility held in London in 1956. Its contents are conveniently divided into male and female sections, experimental and clinical.

While this volume has a larger number of articles concerning research in the direction of male fertility, there are two excellent clinical articles in

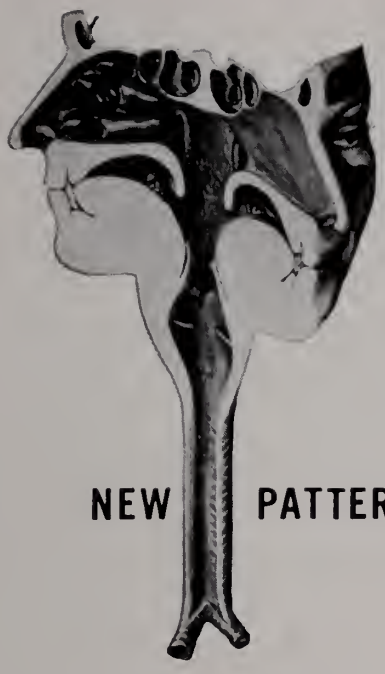
(Continued on page 1536)

why all the fuss over potassium?

Many physicians will recall when safe but potent organomercurials were first introduced. At the time there was considerable worry about possible potassium loss. Patients were instructed to take foods rich in this mineral, and not infrequently potassium supplements also were advised. After enough experience was gained, it became evident that only the exceptional case could lose enough potassium to be concerned about. And with oral organomercurial diuretics this was practically never a problem.

Why revive the subject now? Because clinical experience with nonmercurial diuretics indicates most of them have such a specific effect on potassium that with their use very real problems must be faced. Enough potassium loss can lead to digitalis toxicity or to a classical overt hypopotassemia. Since a fair percentage of cardiacs who receive diuretics are also digitalized, this excess potassium excretion is clinically serious. Clinical experience is still too limited with some nonmercurial diuretics to say just how often such loss will occur—but warnings already have been sounded by some clinical investigators as to the need for potassium supplementation.

Experience in many patients, for many years, demonstrates that potassium loss is never a problem when NEOHYDRIN® is the oral diuretic. And there is no refractoriness to this effective oral organomercurial.



LAKESIDE

Latest advance in treatment of Sinus & Nasal Congestion

new "KRYL"

"KRYL" provides rapid relief from the congestion as well as associated headache, fever, aches and pains of colds and allergic rhinitis—without depression—without stimulation.

NEW PATTERN IN SINUS AND NASAL DECONGESTION

ANTIHISTAMINE ACTION
WITHOUT SEDATION

SYSTEMIC DECONGESTION
WITHOUT SIDE EFFECTS

ANALGESIC-ANTIPYRETIC ACTION
WITHOUT DRUG STIMULATION

ANTI-STRESS VITAMIN TO
MAINTAIN TISSUE INTEGRITY

"THERUHISTIN" — Newest type of antihistamine for control of excessive nasal secretion and congestion — highly potent (92 per cent effective)[1] yet unusually free from side effects — *less than one per cent incidence of drowsiness.*[1-3]

l-Phenylephrine — Unusually long-acting *oral* vasoconstrictor[4] relieves nasal blockage, promotes better drainage — without local pathologic changes reported with topical agents. Relieves bronchial spasm.

Aspirin and Phenacetin — Analgesic-antipyretic synergists, to relieve fever, aches and pains. Freedom from antihistamine drowsiness obviates need for drug stimulants.

Ascorbic Acid — High levels of vitamin C aid in preventing nasal edema due to impaired vascular and mucous membrane integrity,[5] and replenish adrenal ascorbic acid reserves.[6]

new

"KRYL"

for symptomatic relief of colds, hay fever, and sinus congestion

Each tablet contains:

Isothipendyl HCl ("Theruhistin"®)	4 mg.
Aspirin	230 mg.
Phenacetin	160 mg.
l-Phenylephrine HCl	5 mg.
Ascorbic Acid	100 mg.

DOSAGE: Adults, 2 tablets initially. Thereafter, and until symptoms disappear, 1 tablet every four hours. Children (6 to 12), half the adult dose.

SUPPLIED: Bottles of 100 and 1,000 tablets.

a new type of effectiveness in depression and fatigue states

Anti Depressant

Deaner®

p-acetamidobenzoic acid salt of 2-dimethylaminoethanol

The effects of 'Deaner' are unlike those of other energizers. After coming on gradually, effects are prolonged...*free from* hyperirritability, jitteriness or emotional tension...*free from* excessive motor activity...*free from* loss of appetite...*free from* elevation of blood pressure or heart rate ...*free from* sudden letdown on discontinuance of therapy.

'Deaner' *a totally New Molecule*

has proved to be of value in the alleviation of a wide variety of emotional disturbances.[1] It is indicated in

- chronic fatigue states
- mild depression
- chronic headache
- migraine
- neurasthenia
- behavior problems and learning defects in children

'Deaner' produces greater daytime energy, better ability to concentrate, and a more affable mood.[2] It promotes sounder sleep.[2] In children it enhances adaptability and lengthens attention span.[3]

Dosage: Initially, 1 tablet (25 mg.) daily in the morning. Maintenance dose, 1 to 3 tablets; for children, ½ to 3 tablets. Full benefits may require two weeks or more of therapy. 'Deaner' is supplied in scored tablets containing 25 mg. of 2-dimethylaminoethanol as the *p*-acetamidobenzoic acid salt.

NORTHRIDGE, CALIFORNIA

For dietary management of serum cholesterol...

Mazola® Corn Oil

...a natural food and the only readily available vegetable oil made from golden corn

...rich in important unsaturated fatty acids, contains 56% linoleic acid

EASY AND PLEASANT TO ADMINISTER

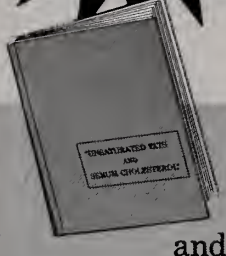
Mazola Corn Oil, a highly palatable natural food, can easily be included as part of the everyday meals...simply and without seriously disturbing the patient's usual eating habits.

EFFECTIVE

Extensive recent clinical findings now show that serum cholesterol levels tend to be lower when an adequate amount of Mazola Corn Oil is part of the daily meals... high levels are lowered...normal levels remain normal.

PREFERRED

Nutrition authorities commonly recommend that from one-third to one-half of the total fat intake should be of the unsaturated type, whenever serum cholesterol control is a problem. The high content of important unsaturated fatty acids in Mazola, plus its other desirable characteristics, make it the oil of choice.



UNMATCHED QUALITY

A superlative cooking oil, a delicious salad oil, clear, bland and odorless... adequate amounts of Mazola can be eaten daily as a natural food in a wide variety of salad dressings as well as in cooked, fried and baked foods.

Available *FREE* on your request...

Each TABLESPOONFUL of MAZOLA (14 Gm.)
Provides approximately:

LINOLEIC ACID	7.4 Gm.
Sitosterols	130 mg.
Natural tocopherols	15 mg.
Calories	126
Unsaturated Fatty acids	85% of total

LATEST LITERATURE REVIEW

"Unsaturated Fats and Serum Cholesterol"

A comprehensive review of recent research findings and current concepts. This book covers the following subjects.

1. The occurrence and behavior of cholesterol in the human body.
2. The effect of different dietary fats on serum cholesterol levels.
3. The nature of the active components in vegetable oils.
4. Suggestions for practical diets.

Prepared as a special service for Physicians by Corn Products Co.

(Continued from page 1530)

the female infertility section, the one entitled Brief Evaluation of Some Therapeutic Measures Used at an Infertility Clinic During the Past Twenty Years being of particular interest from the practical aspect to the clinician. The other, entitled The Use of a New Long-Acting Progestational Compound, describes in detail the present use and value of this important hormone. The male clinical section on Partitioned Ejaculates and Testicular Biopsies was particularly excellent.

It would be impossible in a short review to abstract all 13 articles. Those who are devoted to research reflect the enthusiasm of the workers in the field of fertility who have always given us new avenues of approach to our clinical problems.

Those who are specialists in the field of fertility would enhance their libraries by obtaining the proceedings of this society in a condensed form.

LEDERLE LABORATORIES DIVISION
AMERICAN CYANAMID COMPANY
PEARL RIVER, N. Y.

THE CHEMICAL DYNAMICS OF BONE MINERAL. By William F. Neuman, Ph.D., Associate Professor of Biochemistry and Pharmacology, University of Rochester; and Margaret W. Neuman, B.S., Instructor in Pharmacology, University of Rochester. 209 pp. Illustrated. Price $5.00. University of Chicago Press, Chicago. 1958.

This is an exhaustive book on precisely what the title says—the dynamics of chemicals involved in bone minerals.

I thought it a scholarly and well organized work, but felt a little disappointment in being unable to discern within the description of these dynamics anything which would enable any practicing physician to decide about an issue which has been of extreme importance to doctors everywhere and has had a special sharpness in my own community.

I refer to the fact that one can read this little monograph in its entirety and come away with no conviction whatever as to the merits of fluoridation. Perhaps this is too much to ask of a book of this kind. There is reference made, of course, to the fact that fluoride is deposited in bone and that in excessive quantity it constitutes a toxic agent within bones. None of this is unknown, however, to the scientific reading public, and therefore represents somewhat of a disappointment to me.

Nothing about this comment is intended to be unfair to the scholarly quality of the work. The organization of the book appears to me to be excellent. The printing, paper and binding are all first grade.

Dean K. Crystal, M.D.

ELECTROCARDIOGRAPHY. By Michael Bernreiter, M.D., Assistant Clinical Professor of Medicine, University of Kansas Medical School. 134 pp. Illustrated. Price $5.00. J. B. Lippincott Co., Philadelphia and Montreal. 1958.

The jacket of this book suggests that the need for a new book covering the fundamental aspects of electrocardiography has been widely felt. I do not agree with this. The fundamental principles have not changed recently and there are many books published on this subject each year, all of similar content.

As a short, concise book on clinical electrocardiography this book has merit—particularly in that it is shorter, and the discussions are clearer and more to the point than many other fundamental books. The preface suggests that the author intends this for medical students, general practitioners and internists—it can not do all this and does not. Its value to the internist is only for refreshing his memory on material well known to him—and this, of course, has value.

There are several very distracting matters in the presentation. Most figures are photographs of cardiograms reduced in size, making them hard to see. I would have preferred a larger size and less length to the strip. All figures are interspersed on entire pages with nearly the same size print as the text. Thus, an entire page is often half empty. Frequently, the text skips four or more pages with these figures between, making reading of the text and matching the legends to the subject in question an annoyance. Page 67 has an entire title at the head of the page misplaced and not related to the content immediately beneath. This is not a picayune criticism because it took me many minutes to decipher the mix-up and get on with the reading. Many pages of figures are not numbered while others are. This is apparently an omission because the next numbered page does not pick up the continuity of the last numbered page but rather assumes the unnumbered page was numbered. Quinidine is spelled "quinidin" part of the time.

This book is adequate to refresh one's memory in fundamentals of electrocardiography or in learning the subject. Many books have this and much more. This book does not represent an important contribution to the already overcrowded literature on the subject of electrocardiography.

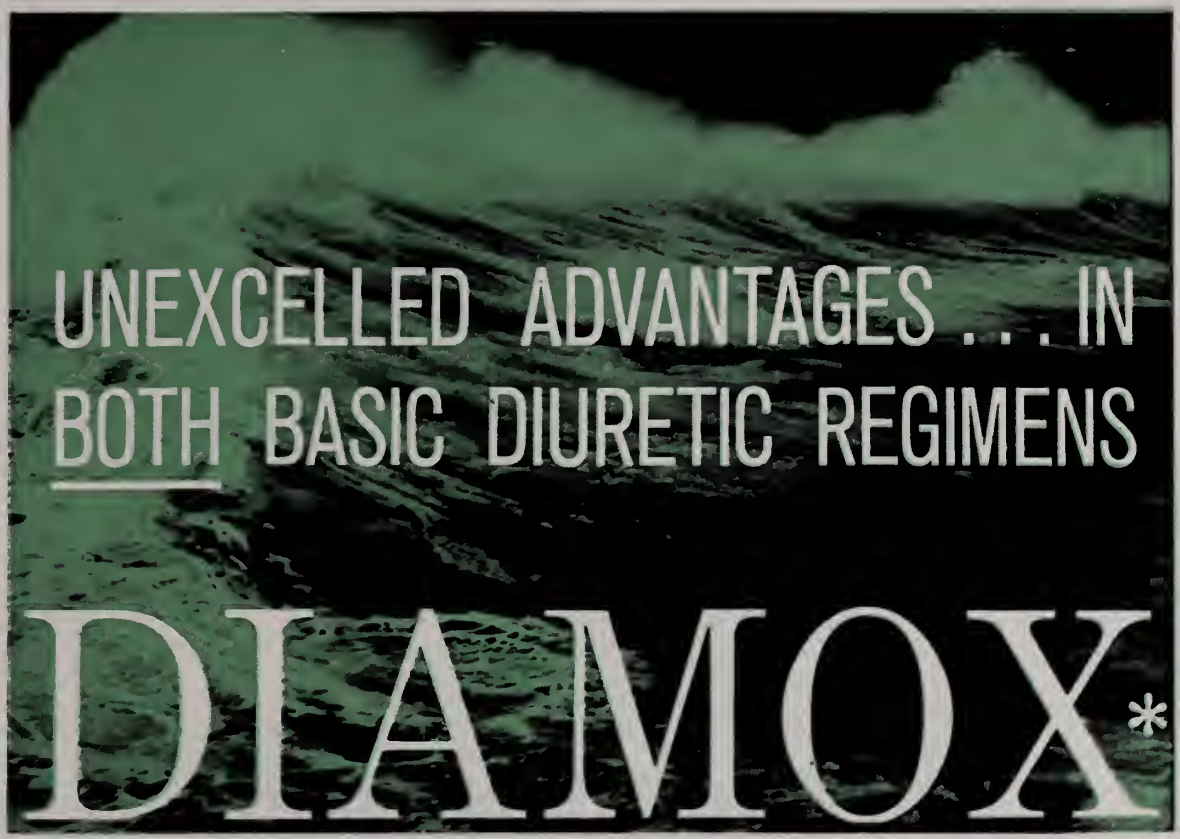
The Case of the Pretty Penny

JUNIOR at the soda fountain and the cost engineer presenting an estimate may differ in sum and total when determining what constitutes a "pretty penny," but in the final analysis they both might be correct. For they both certainly would agree that it was not the amount of money spent but the value of the purchase that decided. The towering skyscraper, the chocolate soda—each fills an inestimable need; yet they are far apart on the economic scale.



Calculating the cost of alcoholism, too, presents differing viewpoints. Ask society and the answer comes back "Over a billion dollars annually." Or ask the alcoholic. Then listen while he totals the countless heartaches with broken days and wasted nights. Each penny spent gains a brighter hue in the light of a billion dollars when one is purchasing a lifetime of sobriety. For then, the "pretty penny" reflects its true value.

bicarbonate-regulating diuretic

Acetazolamide Lederle

HOW DIURETICS ACT

Primarily by regulation of bicarbonate transport	DIAMOX acetazolamide
Primarily by regulation of chloride transport	mercurials chlorothiazide

1

Advantages of DIAMOX in single-drug diuresis

DIAMOX — operating through the well-understood mechanism of *bicarbonate* transport regulation—provides ample, prolonged diuresis in the great majority of patients.

DIAMOX is virtually nontoxic . . . has not caused renal or gastric irritation . . . has no pronounced effect on blood pressure. It is rapidly excreted, does not accumulate in the body, permits convenient dosage adjustment, allows unbroken sleep. Small, tasteless, easy-to-take tablets . . . usual dosage, only one a day.

- CARDIAC EDEMA
- PREMENSTRUAL TENSION
- EDEMA OF PREGNANCY
- OBESITY

2

Advantages of DIAMOX in intensive, two-drug diuresis

When intensive diuresis must be maintained, DIAMOX, alternated with an agent for regulation of *chloride* transport, has proved a regimen of choice. Through dual *bicarbonate-chloride* regulation, it produces maximal sodium-water excretion with minimal distortion of serum electrolyte patterns, greater patient comfort, lessened risk of induced drug resistance.

- ADVANCED CONGESTIVE HEART FAILURE
- REFRACTORY TOXEMIA OF PREGNANCY

all-day
or all-night protection
from

TENSION HEADACHE

with
one oral dose

Compazine* Spansule†

capsules are especially useful for prompt and prolonged relief from tension headache.

For the patient whose anxiety and nervousness are manifested as tension headache, one 'Compazine' *Spansule* capsule taken in the morning provides protection *throughout the day.*

Patients on 'Compazine' are, in virtually all cases, free from drowsiness, and often experience an alerting effect. They can carry on normal activity.

And, on the other hand, for the patient who cannot sleep because of anxiety and tension, one 'Compazine' *Spansule* capsule taken before retiring provides relief *throughout the night.*

'Compazine' *Spansule* capsules: 10 mg., 15 mg. and 30 mg.

Smith Kline & French Laboratories,
Philadelphia

†T.M. Reg. U.S. Pat. Off. for sustained release capsules, S.K.F.

NEW DRUGS

Monthly report on most recent introductions by the pharmaceutical industry.

V-Cillin K Sulfa Tablets (Lilly)
Prophylaxis and treatment of mixed infections of the respiratory, gastrointestinal and urinary tract.

Sinutab Tablets (Warner-Chilcott)
For relief of sinus headache and congestion.

Phenistix Reagent Stick (Ames)
Designed for the detection of phenylketonuria.

Vas I Zinc Eyedrops (Ophthalmos)
Antiseptic and decongestant eye drops.

Adrenalex Capsules (Darwin)
A balanced hormone, vitamin and hematopoietic substances for menopausal and geriatric patients.

Neo-Thalidine Granules (Merck, Sharp & Dohme)
An internal antiseptic for preoperative preparation of the bowel; a virtual sterile bowel resulting in 18 to 20 hours.

Bradosol Lozenges (Ciba)
For temporary relief of minor sore throat and mouth irritation due to common cold.

Cyclospasmol Tablets (Ives-Cameron)
For vasospastic and obliterative disorders, including intermittent claudication, leg ulcer and Raynaud's disease.

A.F.F. Tablets (Invenex)
For iron deficiency anemia.

Anusol-HC Suppositories (Warner-Chilcott)
For treatment of acute and chronic proctitis, hemorrhoids and pruritis of the anus where inflammation is involved.

Arobon Wafers (Pitman-Moore)
For treatment of diarrhea in both children and adults.

Belbarmine Tablets (Haskell)
For the treatment of tension and obesity.

Candettes Lozenges, Tablets, Jel & Syrup (Pfizer)
For symptomatic relief of the common cold.

Corilin Liquid (Schering)
Pediatric management of symptoms of colds, teething, inoculations and itching.

Cosa-Terramycin Pediatric Drops (Pfizer)
For treatment of a wide range of infections of the respiratory, gastrointestinal and urinary tracts.

Dermasulf Cream (Carroll Dunham Smith)
For relief of acne and wherever topical sulfur is used.

Dialose Plus Capsules (Stuart)
As a laxative.

Dimetane (Ten & 100) Injections (Robins)
Symptomatic relief of many manifestations of the allergic state.

Diomedicone Tablets (Medicone)
Stool softener.

Fermatin Capsules (Rorer)
For easily fatigued, elderly, convalescent, pregnant, or anemic patients.

Ilosone Pulvules (Lilly)
For bacterial infections.

Kenalog Ointment, Cream & Lotion (Squibb)
For a wide variety of skin infections and irritations.

Kryl Tablets (Ayerst)
For symptomatic relief of the common cold.

Madribon Tablets and Suspension (Roche)
For URI, urinary tract, systemic and soft tissue infections caused by susceptible microorganisms.

in Parkinsonism

The "HIGHLY SELECTIVE ACTION" of

Disipal®*

Brand of Orphenadrine HCl

"CANNOT BE DUPLICATED BY ANY OTHER CURRENT REMEDY"

"In a series of 176 patients...a valuable adjunct to therapy...highly selective action...that cannot be duplicated by any other current remedy ...effective as a euphoriant...and as an energizing agent against weakness, fatigue, adynamia, and akinesia...potent action against sialorrhea, diaphoresis, oculogyria, and blepharospasm... also lessens rigidity and tremor...minimal side reactions...safe...even in cases complicated by glaucoma."

Doshay, L.J., and Constable, K.: Treatment of Paralysis Agitans with Orphenadrine (Disipal) Hydrochloride: Results in One Hundred Seventy-Six Cases, J.A.M.A. *163*:1352 (Apr. 13) 1957.

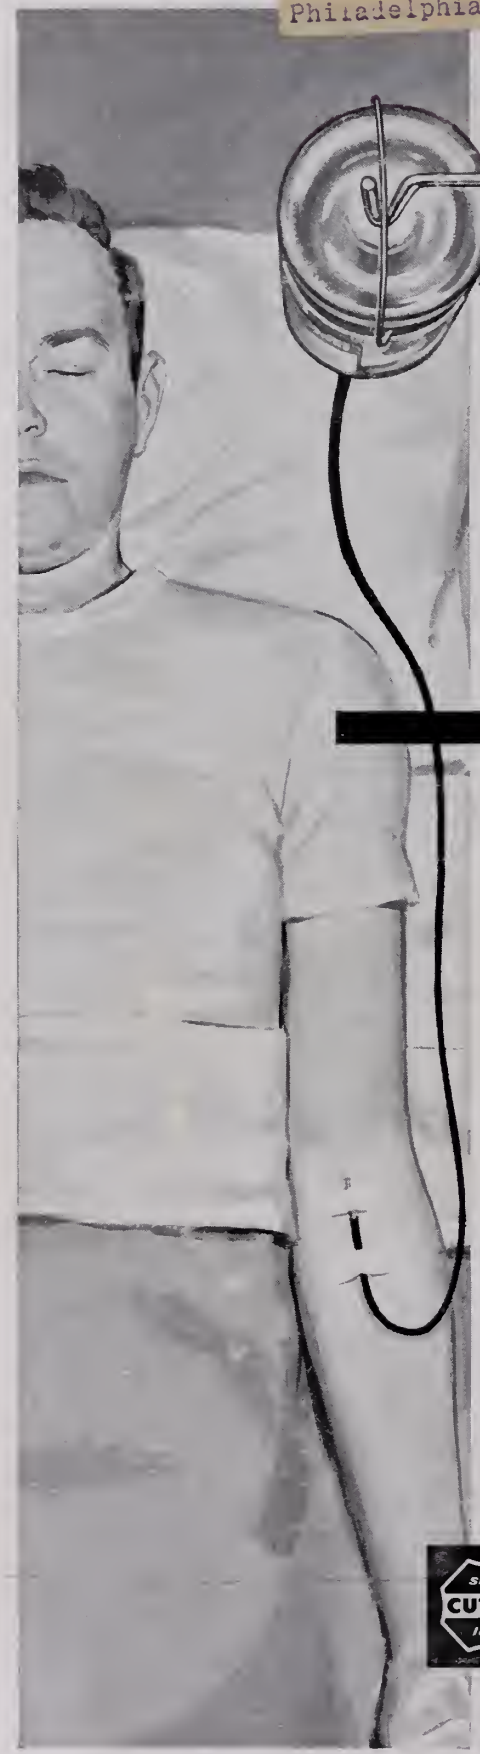
in Skeletal Muscle Spasm

due to sprains, strains, herniated intervertebral disc, low back pain, whiplash injuries and many other painful skeletal muscle disorders, Disipal brings effective and prompt relief from spasm and pain. "The number of office visits...is reduced significantly. The dosage schedule is simple, and side actions are minimal."

Finch, J.W.: Clinical Trial of Orphenadrine (Disipal) in Skeletal Muscle Disorders. Scientific Exhibit at Mississippi Valley Medical Society Meeting, St. Louis, Missouri, Sept. 3-5, 1957.

Advantages

- Speedy relief of muscle spasm
- Orally effective
- Minimal side actions
- Mildly euphoriant
- Nonsoporific
- Tolerance no problem
- No known organic contraindications
- Economical



Dosage:

Usually 1 tablet (50 mg.) t.i.d.

*Trademark of Brocades-Stheeman & Pharmacia. U.S. Patent No. 2,567,351. Other patents pending.

AGAINST THE UBIQUITOUS HOSPITAL STAPHYLOCOCCUS

CHLOROMYCETIN®

Staphylococci are notorious for the variety of infections they cause and for their ability to develop resistance to certain antibiotics.[1-3] According to recent *in vitro* studies, however, these stubborn pathogens remain sensitive to CHLOROMYCETIN.[3-8]

Highly effective against most strains of staphylococci, CHLOROMYCETIN has been reported of value in treatment for such serious infections as staphylococcal pericarditis,[9] antibiotic-resistant postoperative wound infections,[10] antibiotic-resistant breast abscesses,[3,11] pneumonia due to antibiotic-resistant staphylococci,[12] postoperative staphylococcal enteritis,[13] and septicemia.[14,15]

CHLOROMYCETIN (chloramphenicol, Parke-Davis) is available in several forms, including Kapseals® of 250 mg., bottles of 16 and 100.

CHLOROMYCETIN is a potent therapeutic agent and, because certain blood dyscrasias have been associated with its administration, it should not be used indiscriminately or for minor infections. Furthermore, as with certain other drugs, adequate blood studies should be made when the patient requires prolonged or intermittent therapy.

Dramamine-*D*™

brand of dimenhydrinate with dextro-amphetamine sulfate

adds the alertness factor to antiemetic therapy

Dramamine-*D* keeps patients alert and cheerful while it controls nausea and dizziness. Available on prescription only.

Indications: vertigo; nausea and vomiting of pregnancy, travel sickness and other conditions.

Adult dosage: one tablet every 4 to 6 hours.

Each scored, orange-colored tablet of Dramamine-*D* contains 50 mg. of Dramamine® and 5 mg. of dextro-amphetamine sulfate.

References on the combination of these two drugs available on request.

SEARLE

for depression

▲Deprol▲†

Clinically confirmed in over 2,500 documented case histories[1,2]

CONFIRMED EFFICACY

Deprol ►
- acts promptly to control depression *without* stimulation
- restores natural sleep
- reduces depressive rumination and crying

DOCUMENTED SAFETY

Deprol is unlike amine-oxidase inhibitors

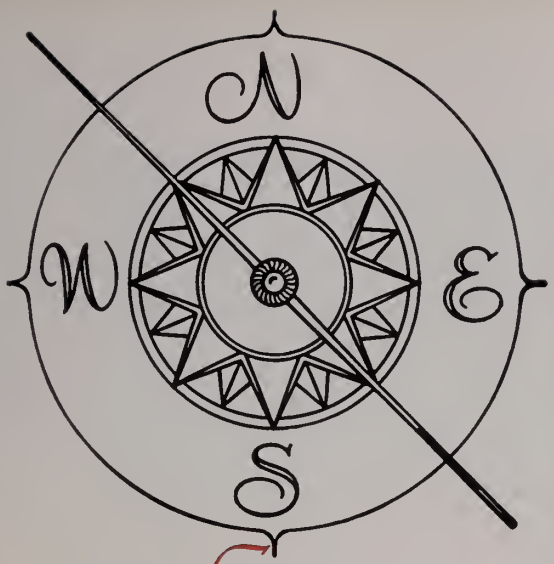
- ► does not adversely affect blood pressure or sexual function
- ► causes no excessive elation
- ► produces no liver toxicity
- ► does not interfere with other drug therapies

Deprol is unlike central nervous stimulants

- ► does not cause insomnia
- ► produces no amphetamine-like jitteriness
- ► does not depress appetite
- ► has no depression-producing aftereffects
- ► can be used freely in hypertension and in unstable personalities

Dosage: Usual starting dose is 1 tablet q.i.d. When necessary, this dose may be gradually increased up to 3 tablets q.i.d.

Composition: Each tablet contains 400 mg. meprobamate and 1 mg. 2-diethylaminoethyl benzilate hydrochloride (benactyzine HCl).



Supplied: Bottles of 50 scored tablets.

1. Alexander, L.: Chemotherapy of depression—Use of meprobamate combined with benactyzine (2-diethylaminoethyl benzilate) hydrochloride. J.A.M.A. 166:1019, March 1, 1958. 2. Current personal communications; in the files of Wallace Laboratories.

FAST-ACTING ORAL BROAD-SPECTRUM THERAPY. The modern blue and yellow ACHROMYCIN V Capsules, combining equal parts of pure crystalline ACHROMYCIN Tetracycline HCl and Citric Acid, provide unsurpassed oral broad-spectrum therapy.

Speed of absorption adds new emphasis to the benefits of true broad-spectrum action, minimum side effects and wide range effectiveness that have established ACHROMYCIN as an antibiotic of choice for decisive control of infection.

REMEMBER THE V WHEN SPECIFYING ACHROMYCIN V. New blue and yellow capsules (sodium-free)—250 mg. with 250 mg. citric acid, and 100 mg., with 100 mg. citric acid.

ACHROMYCIN V dosage: Recommended basic oral dosage is 6-7 mg. per lb. body weight per day. In acute, severe infections often encountered in infants and children, the dose should be 12 mg. per lb. body weight per day. Dosage in the average adult should be 1 Gm. divided into four 250 mg. doses.

Hospital practice of infant feeding

Standard formulas for FEEDING REGULATION

Underfeeding is a common cause when infants fail to gain and thrive. In the earliest stage, when caloric intake is inadequate, the infant cries after feeding, remains constipated, and the restlessness from hunger is mistaken for colic. A changed or weakened formula appears to be indicated.

But clinical studies show that a young infant requires a formula of 2 ounces of whole milk (40 calories), a teaspoon of Karo Syrup (15 calories), and a half-ounce of added water *per pound of body weight per day*. Of the total calories, a successful formula yields about 15-20% in protein, 50-60% in carbohydrate, and 25-35% in fat. Whole milk must be reinforced by adding 5% to 10% carbohydrate (1) to provide protein-sparing effect which permits protein anabolism instead of energy production; (2) sufficient calories for tissue formation; (3) proper utilization of fat; (4) suitable acid-base relationships in the intestinal tract and (5) adequate weight gains.

WHOLE MILK FORMULAS

Age Months	Whole Milk Fluid Oz.	Water Oz.	Karo Syrup Tbsp.	Each Feeding Oz.	Number of Feedings in 24 Hours	Total Calories
Birth	10	10	2	3	6	320

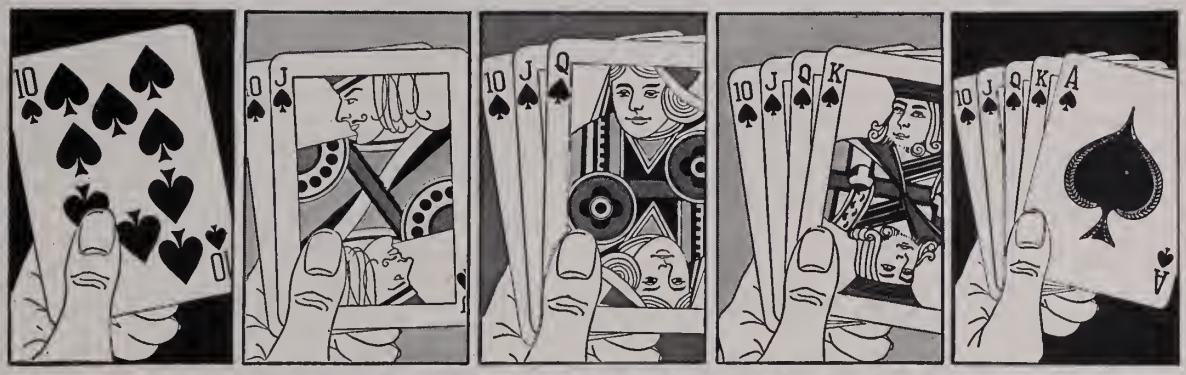
ADVANTAGES OF KARO® SYRUP IN INFANT FEEDING

Composition: Karo Syrup is a superior dextrin-maltose-dextrose mixture because the dextrins are non-fermentable and the maltose is rapidly transformed into dextrose which requires no digestion.



Concentration: Volume for volume Karo Syrup furnishes twice as many calories as similar milk modifiers in powdered form.

Purity: Karo Syrup is processed at sterilizing temperatures, sealed for complete hygienic protection and devoid of pathogenic organisms.

Low Cost: Karo Syrup costs 1/5 as much as expensive milk modifiers and is available at all food stores.

Free to Physicians—Book of Infant Feeding Formulas with convenient schedule pads. Write: Karo Infant Feeding Guide, Box 280, New York 46, N. Y.

Exactly how does new Halodrin* restore the "premenopausal prime" in postmenopausal women?

Webster defines "prime" as the period of greatest health, strength, and beauty. In a woman, these are the childbearing years between puberty and menopause—the years when her hormone production is highest.

The inevitable reduction in this hormone production as she enters the menopause often results in physical discomfort in the form of hot flushes, nervousness, insomnia, or a multiplicity of other symptoms with which you are familiar. Superimposed on this physical picture is the psychic trauma brought on by this unavoidable evidence of aging. The thing that brings her to a physician is simply that she "feels bad."

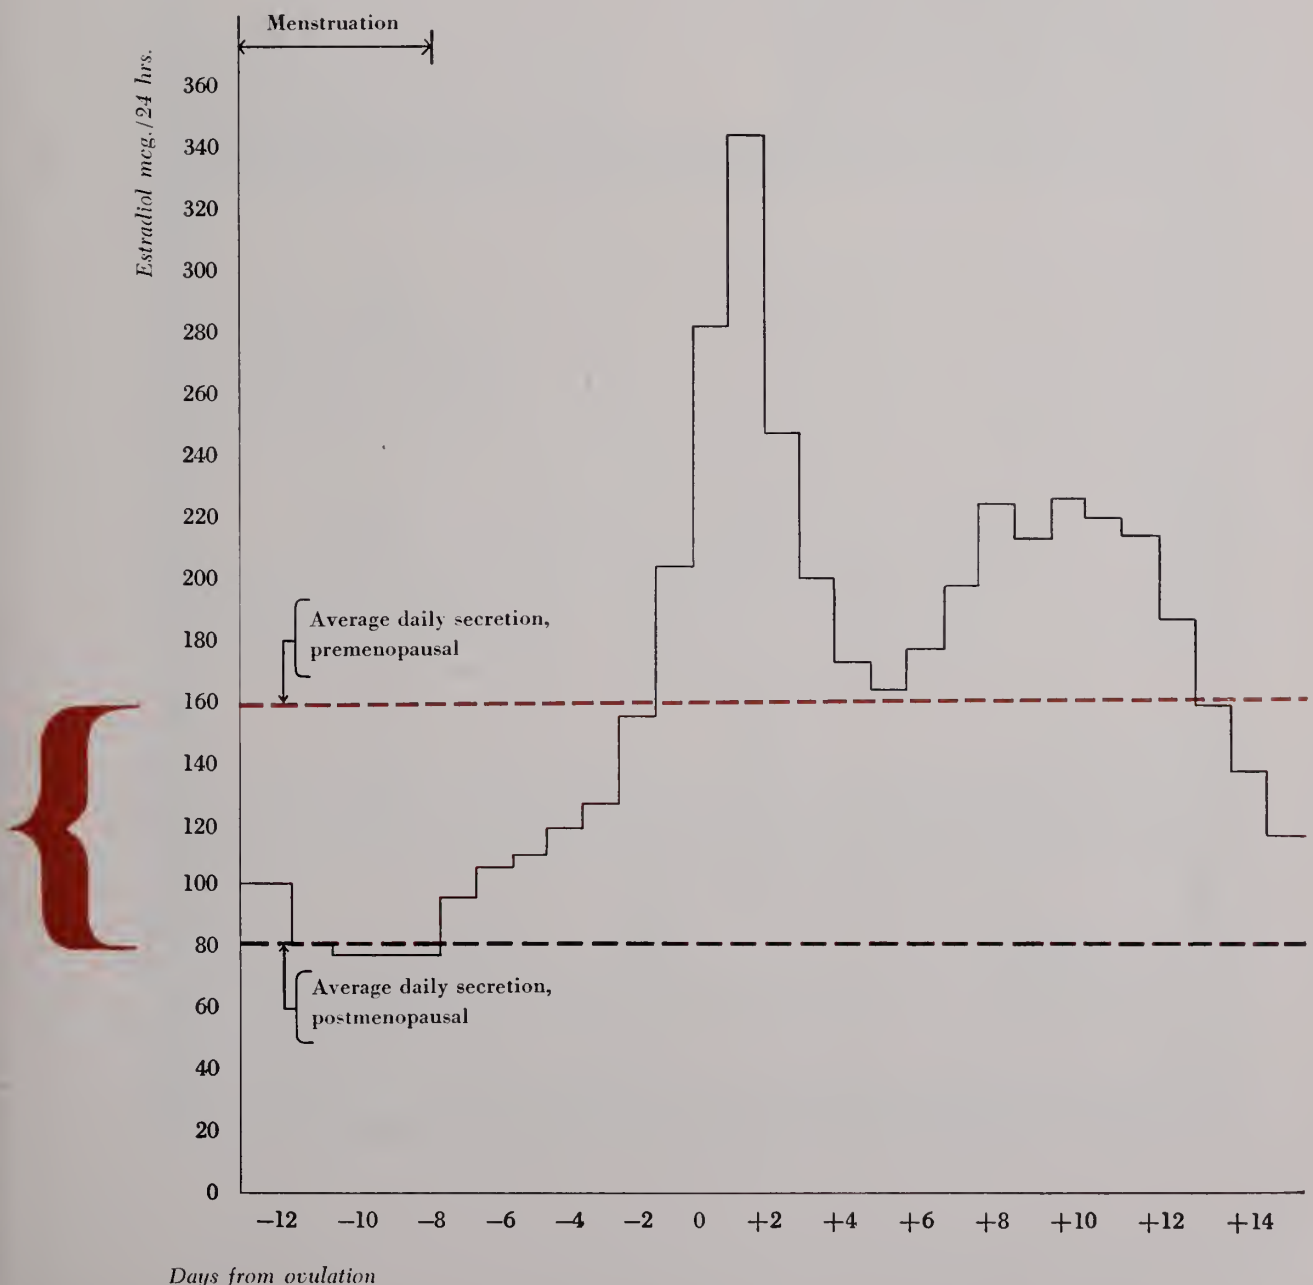
You can't make her 35 again—but the odds are good that you can make her feel like it! The secret is a combination of reassurance and hormones. The exact form and amount of the former defy objective analysis, but the latter can now be provided with scientific precision. Reduced to essentials, here is the explanation of exactly how hormones—in the form of Upjohn's new Halodrin—restore the "premenopausal prime."

The normal premenopausal woman secretes estrogens in the urine in the form of estradiol, estrone, and estriol, in an approximate 28-day average ratio of 39:15:46. Starting with this urinary excretion of estrogens, it is possible to calculate backwards and estimate the amount of estradiol that must have been secreted endogenously in order to produce these urinary levels. This is possible because the proportion of estrogens which appears in the urine following parenteral administration has been established in castrated women.

On this basis, the average endogenous output of estrogens is about 160 micrograms per day during a menstrual cycle, and 80 micrograms per day in postmenopausal women (see chart opposite). Therefore, the restoration of the "premenopausal prime" in the postmenopausal woman requires the replacement of approximately the equivalent of the 80 micrograms of estradiol per day that she no longer secretes endogenously.

Oral ethinyl estradiol is about 2 to 2½ times as potent as parenteral estradiol. Therefore, the replacement of 80 micrograms of endogenous estradiol production per day is accomplished by the oral administration of 32 to 40 micrograms of ethinyl estradiol per day.

Each Halodrin tablet contains 20 micrograms of ethinyl estradiol, which means that the recommended dosage of 2 tablets per day provides 40 micrograms of ethinyl estradiol. This offsets the loss of 80 micrograms of endogenous estradiol production in the menopausal woman; i.e., restores the "premenopausal prime."



Each Halodrin tablet also contains 1 mg. of Upjohn-developed Halotestin* (fluoxymesterone)—the most potent oral androgen known. The primary purpose is to "buffer" the ethinyl estradiol just enough to prevent breakthrough bleeding, which is obviously undesirable in the menopause. It also exerts other beneficial hormonal effects, one of which, in common with ethinyl estradiol, is a powerful anabolic action so desirable in patients of advanced years.

SANDOZ

CORRESPONDENCE

AMA Speaks Out

Action of the House, referred to by Dr. Gundersen in the letter below, was decisive rejection of a reference committee report and demand for immediate action to oppose activities of certain closed panel groups. See pages 1065 and 1068 in the August issue for report of this phase of the June meeting at San Francisco. For the type of activity giving rise to the House action, see the editorial, Typical Attack, in this issue. Ed.

La Crosse, Wisconsin

EDITOR, NORTHWEST MEDICINE:

As directed by the House of Delegates, the American Medical Association currently is engaged in a broad educational campaign to acquaint the profession and the public on "the benefits to be derived from preservation of the American right to freedom of choice of physicians . . ."

This campaign actually is two-fold. The first phase—to the profession—stresses the inherent dangers of third party encroachment on the private practice of medicine and urges medicine to re-emphasize the importance of policing our ranks and in preserving the high quality of medical care America enjoys today.

The second campaign—geared to the general public—emphasizes the following areas: (1) The patient should have the right to choose his personal doctor; (2) The benefits to be gained from a close personal doctor-patient relationship, and (3) The need for selecting a personal phyisician before you are sick.

The AMA has published several informational pieces on free choice directed to the medical profession—in my president's message in the September 27 issue of the *Journal of the AMA* and in the October 20 issue of the *AMA News*.

We hope you will cooperate with us in implementing the House of Delegates action on benefits derived from freedom of choice.

Sincerely,
Gunnar Gundersen, M.D.
President, American Medical Association

Itinerant Surgery

Bremerton, Washington

EDITOR, NORTHWEST MEDICINE:

It has recently been my privilege to serve on a Committee interviewing applicants for admission to the American College of Surgeons. It was in all a pleasant experience and extremely heart warming to see and meet the individuals interested in joining the American College of Surgeons. These, without exception, were men of considerable training, doubtless good surgical technicians, and men of sound moral and ethical purpose. Our Committee does not have the power to accept or reject applicants. It is merely a fact-finding Committee and, as such, is interested in all the factors that make safe surgeons. It is not therefore surprising that in our interviews we discussed some of the unsolved ethical problems facing the surgical world today. One of these received more than casual comment and needs thoughtful consideration—the itinerant surgeon.

There is little doubt in my mind that the occasional case in the smaller community can be well handled by the visiting surgeon. There are times and circumstances when it may be an undue hardship for a patient to leave his own community and have his surgery elsewhere. But, in general, if a patient cannot be under the continued care of his surgeon and becomes the recipient of divided responsibility, sooner or later such a patient will suffer. Unfortunately, and yet understandably, the actual operation or surgical procedure has received too much attention, and the less spectacular but equally important preoperative appraisal and postoperative conduct through a surgical experience, received little or no consideration.

My former surgical chief, the beloved and eminent Allan O. Whipple, used to stress the fact that surgery begins long before the actual operation and continues long after. The operation represents merely an act or a scene in the total drama and not necessarily the most important one. Dr. Whipple did not want to meet his patient for the first time in the operating room, and busy as he was, he did not wish to relegate to others the responsibility of preventing or mitigating postoperative difficulties. He wanted to be present in those distressing postoperative moments when a word of encouragement or a kindly but stern word of advice might alter significantly the course of his patient. To be sure, others could do the same, but he felt the responsibility. It was not unusual to see this great man return to the hospital at midnight to check on some ward patient upon whom he had performed an important operation the preceding morning. He could have called the ward nurse or the surgical resident by telephone, but he seemed to prefer to see for himself that all was well, and on many occasions these postoperative calls were extremely rewarding to his patient.

Although the expression, "itinerant surgery," was not used until recently, it was in the past a common practice and justifiably so. Transportation of patients was difficult and surgeons were few. It was easier then to bring the surgeon to the patient and hope for the best than to bring the patient to the surgeon and compound the difficulties of all, but now the situation has changed. Transportation to surgical areas is not difficult, and

(Continued on page 1576)

(Continued from page 1575)

although high-powered facilities and surgical centers are not always necessary, frequently good postoperative care is impossible in the small, understaffed and inadequately-equipped suburban hospital.

One of the interesting facts about itinerant surgery needs special comment. With few exceptions this type of surgery is done by young men—often well trained. These young men, finding themselves not too busy, are easily enticed to small communities to carry out surgery on a part-time basis. There is, of course, a strong economic factor and all too often this may lead to a pernicious type of barter. It is not strange that when these young surgeons become busy in their city practices, they cease their itinerant ways and at this point they generally admit that it was unwise and that they are glad to be released from it. However, a certain amount of damage has already been done.

Despite the fact that the patients of itinerant surgeons may do reasonably well, the practice of itinerant surgery often leads to a type of informal and haphazard training in small communities where untrained physicians, working under itinerant surgeons, proceed to do more and more surgery on a local level. Frequently this proves to be disastrous.

What then shall we conclude about itinerant surgery? At times it will be permissible, but as a general measure, in my opinion, it should be condemned. For those itinerant surgeons, who would aspire to the American College of Surgeons, the greatest surgical institution on earth, let them bear the burden of proof that the practice is justified.

R. O. Diefendorf, M.D.

Clarification

Oregon Arthritis and Rheumatism Foundation, Inc.
Lumbermans Building
Portland 4, Oregon

EDITOR, NORTHWEST MEDICINE:

This letter is sent to you to clarify the position of the Oregon Arthritis and Rheumatism Foundation. It is part of the Arthritis and Rheumatism Foundation founded ten years ago under the auspices of the physicians composing the American Rheumatism Association. Organized medicine has always had the most prominent voice in the formation of policy and practice, through County and State Medical Societies.

Recently the National Foundation for Infantile Paralysis announced a change in name to the National Foundation and an intention to include arthritis (and other conditions with popular appeal) in its sphere. The Arthritis and Rheumatism Foundation initiated negotiations to combine the activities of the two groups. After months of negotiation, it became apparent that the NFIP contemplated no change in policy with its change in name, and that many of its present policies were totally unacceptable to the majority of the members of our medical committees. The Inter-Chapter Medical Advisory Committee, at its meeting in San Francisco in June, therefore made the following recommendation:

> We recommend that the Arthritis and Rheumatism Foundation and its Chapters continue their programs and committments. While we are receptive to any new aid in this field, we are of the opinion that the Arthritis and Rheumatism Foundation is a strong, healthy, growing body and should continue its present policies and vigorously expand its program.

None of the lay or professional members of our organization have expressed the slightest dissatisfaction with this recommendation.

R. E. Rinehart, M.D.

Waste

Seattle, Washington

EDITOR, NORTHWEST MEDICINE:

There have been newspaper reports that King County Hospital and the State Welfare Program are in financial difficulties.

I realize there are many factors responsible for this, but recently my attention was drawn to a case where apparently there was an unnecessary waste of public money.

A boy, age 4, who is on welfare, was admitted to King County Hospital for a routine planned circumcision. The physical examination was negative. The surgery was not done until the *fifth* day following admission. He was discharged the day following surgery. The mother of the child could not understand the reason for this delay nor could I after reading his hospital chart.

Four unnecessary days in a hospital waiting for a circumcision. Can you imagine what the parents' reaction would have been, had this been a private case?

The newspaper stated that services may have to be curtailed. Why not curtail the wastage instead?

Yours truly,
A. Searle, M.D.

announcing

a new order of magnitude in corticosteroid therapy!

The great corticosteroid era opened ten years ago with the introduction of Cortone® (Cortisone). Today, MERCK SHARP & DOHME proudly presents the crowning achievement of the first corticosteroid decade—DECADRON (dexamethasone)—a new and unique compound, which brings a new order of magnitude to corticosteroid therapy.

Decadron*

DEXAMETHASONE

to treat more patients more effectively

MSD

MERCK SHARP & DOHME
DIVISION OF MERCK & CO., INC.
PHILADELPHIA 1, PENNSYLVANIA

a new order of magnitude

in anti-inflammatory potency

DECADRON "possesses greater anti-inflammatory potency per milligram than any steroid yet produced,"[1] and is "the most potent steroid thus far synthesized."[2] Milligram for milligram, it is, on the average, 5 times more potent than 6-methylprednisolone or triamcinolone; 7 times more potent than prednisone; 28 times more potent than hydrocortisone; and 35 times more potent than cortisone.

in dosage reduction

Thanks to this unprecedented potency, DECADRON is "highly effective in suppressing the manifestations of rheumatoid arthritis when administered in remarkably small daily milligram doses."[3] In a number of cases, doses as low as 0.5-0.8 mg. proved sufficient for daily maintenance. The average maintenance dosage in rheumatoid arthritis is about 1.5 mg. daily.

in elimination and reduction of side effects

Virtual absence of diabetogenic activity, edema, sodium or water retention, hypertension, or psychic reactions has been noted with DECADRON.[1,2,3,4] Other "classical" reactions were less frequent and less severe. DECADRON showed no increase in ulcerogenic potential, and digestive complaints were rare. Nor have there been any new or "peculiar" side effects, such as muscle wasting, leg cramps, weakness, depression, anorexia, weight loss, headache, dizziness, tachycardia, or erythema. Thus DECADRON introduces a new order of magnitude in safety, unprecedented in corticosteroid therapy.

in therapeutic effectiveness

With DECADRON, investigators note "a decided intensification of the anti-inflammatory activity"[3] and antirheumatic potency.[4] Clinically, this was manifested by a higher degree of improvement in many patients previously treated with prednisteroids,[3] and by achievement of satisfactory control in an impressive number of recalcitrant cases.[3,4]

in therapeutic range

More patients can be treated more effectively with DECADRON. Its higher anti-inflammatory potency frequently brings relief to cases resistant to other steroids. Virtual freedom from diabetogenic effect in therapeutic dosage permits treatment of many diabetics without an increase in insulin requirements. Absence of hypertension and of sodium and fluid retention allows effective therapy of many patients with cardiovascular disorders. Reduction in the incidence and severity of many side effects extends the benefits of therapy to numerous patients who could not tolerate other steroids. And a healthy sense of well-being, reported by nearly all patients on DECADRON, assures greater patient cooperation.

To treat more patients more effectively in all allergic and inflammatory disorders amenable to corticosteroid therapy

DOSAGE AND ADMINISTRATION
With proper adjustment of dosage, treatment may ordinarily be changed over to DECADRON from any other corticosteroid on the basis of the following milligram equivalence:

One 0.75 mg. tablet of Decadron* (dexamethasone) replaces:

one 4 mg. tablet of	one 5 mg. tablet of	one 20 mg. tablet of	one 25 mg. tablet of
methylprednisolone or triamcinolone	prednisolone or prednisone	hydrocortisone	cortisone

SUPPLIED:
As 0.75 mg. scored pentagon-shaped tablets; also as 0.5 mg. tablets, to provide maximal individualized flexibility of dosage adjustment.

Decadron*

DEXAMETHASONE

Detailed literature on DECADRON is available to physicians on request.

A Pod of Peas,

A Light Bulb...

And You

STUDENTS OF GENETICS will immediately recognize Mendel's beloved sweet pea. For it is the very symbol of the patient monk's laborious study, the results of which immeasurably enriched man's knowledge of himself. Long years of tedious toil, patient research interrupted by countless failures: these, too, were the lot of Thomas Edison, whose diligence and perseverance reached fruition in the first practical incandescent light bulb. He tested over 1,600 substances before finding a material which would function properly as a filament for his lamp. Yet Edison never considered these as failures, but as stepping-stones to success.

Behind man's every endeavor lies research, a valuable tool in the quest for scientific truth. In the search for the cause and cure of alcoholism too, research is indispensable, for this end can be realized only through critical and exhaustive investigation and experimentation. Therefore, Shadel continues to offer you, from 23 years of operation, research information gathered and developed by experienced specialists and technicians from over 10,000 patients which it has had the opportunity to serve.

Our Presidents

In a world of swift and sometimes kaleidoscopic change there is urgent need for leadership. With it, change can lead to progress but without it, only to chaos. Leadership of medicine in society is necessary if we are to preserve social organization based on individual responsibility. Leadership within medicine places the burden of this extra-medical obligation squarely upon the shoulders of those selected by their fellows as most capable to bear it. Without exception, the men chosen this year to lead medicine in the four states of the Northwest have proven both their interest and their ability through years of service to organization. It remains for membership to appreciate the devotion of such leaders and to realize, with them, the seriousness of problems facing the profession in our changing world.

HERMAN A. DICKEL, M.D.
PRESIDENT, OREGON STATE MEDICAL SOCIETY

Herman A. Dickel is imbued with the spirit of the Northwest since he is a native of Washington and received most of his postgraduate training in Oregon and Washington. He is of the third generation of a pioneer family who came to the Palouse area shortly after the Civil War. Childhood and youth were spent in Montana and premedical education (a degree in chemistry from Montana University in 1933) was obtained in that state. Medical degree was granted by Northwestern in 1937.

Internship followed at St. Vincent's in Portland and training in psychiatry was begun the next year at the University of Oregon Medical School. Training continued at Hastings State Hospital at Ingleside, Nebraska; Johns Hopkins Hospital and clinics at Baltimore, and Puget Sound Sanitarium, Tacoma, Washington. Since October 1942 he

has been engaged in private practice of psychiatry and has served in teaching capacity at the University of Oregon Medical school. He is now associate clinical professor of psychiatry.

His advice and guidance have been sought by a number of agencies, both public and private. He was consultant to the Oregon State Board of Parole and Probation from 1942 to 1946, has been consultant to the Oregon Medical Advisory Board to the Selective Service System since 1943, member of the Advisory Committee to the State Board of Control for the Oregon State Training Schools, and was a founding member of the Board of Directors of the Portland Community Child Guidance Clinic.

He has served as a member of the Board of Trustees of the Oregon Arthritis and Rheumatism Foundation, the Oregon Mental Health Association, and has been on the Advisory Committee on Mental Health on the Oregon State Board of Health.

He is a Fellow of the American College of Physicians, the American Psychiatric Association and the North Pacific Society of Neurology and Psychiatry (of which he was president in 1948), the Association For Research of Nervous and Mental Diseases, the American Association for the Advancement of Science, the Western Electroencephalographic Society, and the Portland Academy of Medicine (for which he was vice-president in 1949).

He has been active in medical society affairs since 1949, having served as a delegate to the State Society, having served on the Mental Health Committee and the Public Health Committee for a number of years, and having been councilor for the Multnomah County Medical Society from 1952 to 1955. Dr. Dickel was president of Multnomah County Medical Society from 1956 to 1957 and was made president-elect of Oregon State Medical Society in 1957.

He has contributed a variety of articles to professional journals, and is co-author of a book on anxiety-tension states with G. D. Haugen and Henry H. Dixon.

In 1940 he married a nurse, Elnora E. Dillow, and they have one son, Charles Timothy. The Dickels reside in Portland, and have made the Northwest very much their home all their lives.

EMMETT L. CALHOUN, M.D.
PRESIDENT, WASHINGTON STATE MEDICAL ASSOCIATION

Emmett L. Calhoun, a Washington native, comes from pioneer stock. His paternal grandfather, Samuel G. Calhoun, was the fourth physician to establish a practice in Seattle where Emmett was born. Only war and the necessity to go elsewhere for medical education have taken him from the Northwest. Because of his innate modesty, few know the distinguished service he rendered in uniform in both World Wars. Two awards of the Purple Heart and a Silver Star indicate more than casual participation in battle. In one heavy engagement in the Pacific, while aboard a carrier, he operated on casualties for 27 hours without stopping. His rank, at retirement, was Rear Admiral. In World War I, at the age of 19, he served in France with the medical corps of the 161st Infantry Division.

Dr. Calhoun took his premedical training at the University of Washington, went to Chicago for four years at Northwestern and upon receiving his degree, returned promptly to Seattle for internship at Seattle City Hospital. In 1926 he

married Dorothy Ehrlich of Seattle who helped him in developing the practice he established in Grays Harbor that year. She was a charter member of the Board of Trustees of the Woman's Auxiliary to Washington State Medical Association, organizer and first president of the Grays Harbor Auxiliary and Southwestern Washington organizer for the Auxiliary to Seattle Orthopedic Hospital. They have two sons, John who is employed by Stauffer Chemical Company in Portland and Robert who is a junior in medicine at Johns Hopkins.

In practice he considers himself a general practitioner although much of his work is in surgery. He is a Fellow of the American College of Surgeons.

Dr. Calhoun comes to his new position from many years of experience and responsibility in the affairs of medical organization. He has served repeatedly on the Board of Trustees of the state association, has been a trustee of the Washington Physicians Service for six years, was president of the Grays Harbor Medical Service Bureau and has served the Grays Harbor County Medical Society in many capacities including two terms as its president.

DONALD K. WORDEN, M.D.
PRESIDENT, IDAHO STATE MEDICAL ASSOCIATION

Donald K. Worden has gained reputations as a lover of good fun and as a successful politician. He has been mayor of Lewiston since 1951. To those who know him well enough to penetrate his penchant for joking, he has a third attribute. He is profoundly concerned for the welfare of his fellow man, not only for those within the profession but for the man on the street as well. The disguise is well maintained but sometimes, as he addresses a meeting, it drops away to reveal the sincerity of conclusions reached only after much quiet reflection and study.

Dr. Worden was born in Wymore, Nebraska, took his premedical education at the University of Wyoming at Laramie, and was graduated from the University of Nebraska School of Medicine in 1925. He trained in the Murray Hospital at Butte and subsequently practiced in the Murray Clinic until he moved to Lewiston, Montana, in 1933. Four years later he moved to his present location, Lewiston, Idaho, where he specializes in EENT.

He is an enthusiastic supporter of prepayment and was one of the organizers of the North Idaho Medical Service Bureau. He was director of that organization for a number of years and has served as its president.

Interest in medical organization has taken him through many committee assignments in his local society and in the state association. He has been president of the North Idaho District Medical Society and was a delegate to the state association for many years. In the state organization he has been a member of the Cancer Committee, the Advisory Committee to the State Department of Public Assistance, the Prepaid Medical Care Committee and the Professional Relations Committee. For the past four years he had been Councilor for District One.

Dr. Worden is justifiably proud of four children, all of whom have inherited something of his stimulating personality and six grandchildren whom he entertains as frequently as his many obligations will permit. In the remaining brief interludes from more serious duty, he grows show-quality roses and enjoys a better than average game of golf.

WILLIAM M. WHITEHEAD, M.D.
PRESIDENT, ALASKA STATE MEDICAL ASSOCIATION

William M. Whitehead was born and educated in the state of Virginia. He graduated from the University of Virginia Medical School in 1931. He came West after graduation and interned at the Virginia Mason Hospital in Seattle, Wash. He spent one year as ship's surgeon for the American Mail Line, traveling to the Orient. In 1934, he moved to Wrangell, Alaska, where he was married to Dorothy Johnson of that city. In 1935, he moved to Juneau, Alaska, where he and his wife and five children have resided since, except for one and a half years spent in Virginia doing OB and GYN.

Dr. Whitehead has been very active in community and territorial affairs. He is a past president of the Rotary Club and the Chamber of Commerce. He has been secretary of the Board of Medical Examiners since 1943 and a member of the Territorial Board of Education since 1945. He was president of the Alaska Territorial Medical Association in 1944 and was again so honored at the Fairbanks meeting in May 1958.•

Typical Attack

A story published October 22, 1958 by a small weekly newspaper in Renton, Washington, may be of interest to those who remain unconcerned about attacks of the United Mine Workers on the medical profession. Editor of the weekly, who refused to state his circulation, stated that he thought the article came from a paper published by the United Mine Workers. The story represents, in a small way, the problem faced by physicians in Pennsylvania and Colorado where activities of the United Mine Workers Welfare Fund are much more intense than they are in the Northwest. The story follows:

Curb on Doctors Cuts High Costs

Back in October 1957 the United Mine Workers found it necessary to specify which doctors and hospitals may be used by beneficiaries of its huge medical care program, to curb fee gouging, needless hospitalization, excessive surgery and other "abuses" by doctors.

Ever since then the union has been locked in battle with the "Doctors Trust"— the American Medical Association — which has tried to "blacklist" doctors who comply with the unions' plan, and to get state laws passed that would outlaw plans which list "acceptable" doctors.

This week the union released figures showing how greatly its welfare fund, as well as miners and their families, have benefited from curbing the abuses. It reported that in the fiscal year 1957-58 hospital and medical care costs were reduced by $14 million in comparison with the previous year.

The union stressed this saving was made without any reduction in the plan's coverage and services and "notwithstanding a sharp increase in medical costs throughout the nation." Also, it noted the reduction was made in nine months, since the specification program was not in effect the first three months of the year.

Further, the UMW report showed a 9.2 per cent decrease in hospital admission rates over 1956-57 and a 9.3 per cent drop in days of hospital care. •

AAPS Opposes Corporate Practice

The Association of American Physicians and Surgeons is a voluntary organization dedicated to preservation of private practice of medicine and the free enterprise system. At its recent meeting it passed, among others, the following resolution:

RESOLUTION ON CORPORATE PRACTICE OF MEDICINE

WHEREAS, the corporate practice of medicine is generally condemned as unethical and illegal, and

WHEREAS, the disposal of the services of its faculty or staff by a medical college or hospital for a fee constitutes the corporate practice of medicine.

THEREFORE, BE IT RESOLVED that the House of Delegates of the Association of American Physicians and Surgeons, Inc., in regular session assembled in Chicago, Illinois this 11th day of October, 1958 condemns such corporate practice by colleges and hospitals.

GUEST EDITORIAL:

Bill of Rights

Public Relations Committee
Of The Washington State Bar Association

Patrick Henry, whose ringing words, "Give me Liberty, or give me death," stand for all time as a symbol of the American spirit of freedom, would be horrified to be alive today and learn the results of a recent poll conducted among teen-agers by a large university opinion panel.

He would hear, for example, that the following startling beliefs were held: 26 per cent of the teen-agers would permit search and seizure without a warrant; 34 per cent believe free speech should be denied to certain people; over 50 per cent of those polled feel most people are not capable of deciding what is best for themselves; and 41 per cent do not believe in complete freedom of the press.

All of us need to remind ourselves constantly of the rights which free men cherish as "unalienable," and which our Founding Fathers hammered into our basic law.

Another Founding Father, James Madison, who knew that the passage of time can dull our vigilance in protecting our own rights said:

"People are very frequently amazed to discover that the Bill of Rights is not a grant of privileges handed down to them by the government, but rather it is a curb and a restriction laid upon the government by the people. The Bill of Rights, we must remember always, is but an instrument. It must be wielded, cared for by each succeeding generation."

The truth of Madison's words is startlingly demonstrated by the following direct quotation from the Constitution of Soviet Russia:

"The citizens . . . are guaranteed by law, freedom of speech; freedom of the press; freedom of assemblies and meetings; freedom of street processions and demonstrations."

These fine statements are almost interchangeable with our own first amendment, yet everyone knows how meaningless the words really are in Russia today.

By contrast, our own Bill of Rights reaffirmed existing freedoms, and continues to be jealously guarded as a living thing—affecting each American, protecting his rights from encroachment by government or individuals, but also preventing him from violating the rights of others.

The Bill of Rights is not just a piece of paper on which is written a number of high sounding phrases. It is a vital document as important to every citizen today as it was on the day it was adopted.•

The Bar Association states that this material is written to inform, not advise. Facts may change the application of the law.

Care of the Urinary Bladder After Operation

C. D. Creevy, M.D.
MINNEAPOLIS, MINNESOTA

A major element in postoperative management is care of the urinary bladder. Damage and prolonged convalescence can result from neglect but may be prevented by application of a few simple principles.

There is no organ in the body which so often plays the unhappy role of the innocent bystander who was accidentally injured as does the urinary bladder in the course of operations upon other, unrelated organs. I refer, not to direct surgical trauma at the time of operation, but to the effects of neglected or mistreated postoperative retention of urine. This complication is especially frequent after operations which confine the patient to bed. It is often described as "reflex," but it is actually due to a combination of three factors.

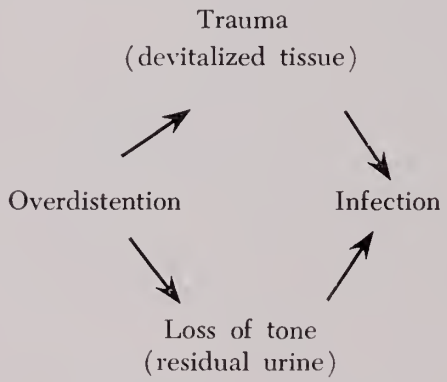
Factors

First, many patients are unable to urinate in the horizontal position even when in good health. Second, is the role of pain in patients with incisions in the abdominal wall or perineum. In such cases, contraction of the voluntary muscles of urination is painful and hence more or less subconsciously avoided. Third, is the effect of drugs. This may take the form of temporary residual paralysis after spinal anesthesia but usually it is due to the administration of opiates which may tighten the internal sphincter or make the patient unaware of fullness of the bladder until it is overstretched. Antispasmodics may lessen the contractility of the detrusor muscle, especially if opiates are given at the same time. The anticholinergic drugs used for peptic ulcer, some of the antihistamines, and a few of the antihypertensive agents (ganglion blocking) can precipitate urinary retention.

The situation is much aggravated by removal of the rectum or uterus. The vesical plexus may be injured either directly or by a postoperative inflammatory reaction. Loss of anatomic support may play a part, as may postoperative swelling around the internal meatus.

Damage Done by Retention

Some surgeons are loath to have their patients catheterized until prolonged, painful distention of the bladder has rendered the situation intolerable. They maintain that avoidance of catheterization is avoidance of infection and remain blissfully unaware of the havoc that prolonged painful distention of the bladder ordinarily produces, especially when supplemented by the patient's futile efforts to void. As Cabot long ago pointed out, prolonged distention of the bladder injures it and makes it a ready victim of infection.



Experimentally, such distention causes mucosal and submucosal hemorrhages and thus produces

Presented at meeting of Idaho State Medical Association at Sun Valley, Idaho, July 8, 1958.

devitalized tissue which is an ideal culture medium for bacteria. Unfortunately, to this situation is added loss of tone by the detrusor as the direct result of the same injury. This has long been evident from the experience of patients with hitherto symptomless obstruction at the vesical neck who, either because of indulgence in alcohol or because of a long ride in an automobile, hold their urine too long, are then unable to let it go, and develop persistent retention.

This crude clinical observation has been proved experimentally by Kirwin and Hawes. They had six ambulatory young men entirely free from lesions of the urinary tract hold their urine as long as possible. After they had finally voided, they were catheterized. All had residual urine which ranged from 70 to 365 cc., with an average of 170 cc. Remembering that these were robust, ambulatory men, it is easy to understand the frequency of urinary retention in sick, postoperative patients who must void lying down despite painful incisions and the inhibitory effects of drugs.

The situation may be depicted thus:

Prevention by Adequate Care

This unfortunate situation is readily prevented (but much less readily cured once it has appeared) by proper attention to the bladder following operation. Account must be taken of the fluid intake. A patient who receives 3,000 cc. of fluid per day will ordinarily put out at least one-half that amount of urine. Since the average bladder will be painfully distended by 500 to 600 cc. of urine, it must be emptied at least three, and often four, times daily to avoid overstretching.

Also, fluids given intravenously may accumulate very rapidly in the bladder, at the rate of 500 cc. an hour, or even more. Yet many a surgeon will order a liter or more of fluid intravenously immediately after operation, caution the house staff and nurses against catheterization unless absolutely unavoidable, and write an order to "catheterize every eight hours if necessary." An hour later the bladder is full; but, if the order is taken literally, seven hours will elapse before relief comes unless someone intervenes. Infection follows catheterization; the catheter and the intern or nurse who wielded it get the blame, which obviously attaches to the surgeon who, in the words of Cabot, "prepared the soil." Next time, he is even more determined to avoid catheterization.

Do not forget that an occasional patient with postoperative retention will dribble painlessly from a full bladder instead of complaining of painful distention.

Everyone is familiar with the dodges used to evoke urination, such as pouring warm water over the genitals or hand, applying a hot-water bag to the suprapubic area and running water within the patient's hearing. These are not objectionable in themselves, and not infrequently are followed by micturition. They should be used only until distention becomes mildly uncomfortable without being painful, when a catheter should at once be employed. The gentle, aseptic passage of a small, well lubricated Thieman catheter does no harm unless the bladder has been previously damaged. If catheterization has to be repeated more than once or twice, a Foley-Alcock catheter should be left in and connected through one arm of a sterile glass Y-tube and rubber tubing to a sterile reservoir hung at the bedside and containing sterile fluid (either water or a mild antiseptic); the other arm goes to a sterile empty bottle beneath the bed. Thus the bladder is kept empty, avoiding both trauma and stagnation of urine, and it can be irrigated by releasing a clamp. This obviates the contamination which is inevitably introduced from without when unsterile equipment is used or when the catheter is irrigated by hand by any but the most skilled assistants. The value of prophylactic antibiotics while a catheter is being used is open to debate.

Management of Prophylactic Indwelling Catheter

Because of the frequency of postoperative urinary retention, it seems to me wise to insert a Foley catheter at the start of any extensive operation, and to leave it until the patient has rallied.

Many surgeons will follow such regimens only to undo their good effects by premature removal of the catheter, or by forgetting the bladder as soon as the catheter is out. It should be left in place until the patient is gaining strength and is

able to move about freely. After the catheter has been removed, the patient is observed closely. As long as he voids good volumes at normal intervals, nothing need be done. If he voids frequently with straining or dysuria (or if he has complete retention), a Foley catheter is used to measure the residual urine, and is left in place if it exceeds 75 to 100 cc.

If there was no history of urinary difficulty prior to operation, the patient who requires recatheterization may improve with cholinergic drugs (pilocarpine, urecholine).

If residual urine or retention resists these measures, cystoscopic examination to discover obstructive lesions or neurogenic vesical dysfunction is indicated. *If neither is found* and the patient's general state is good, one may try a nasty German trick: 1 cc. of 1 per cent pilocarpine (10 mg.) intravenously after the bladder is full. If the patient voids, he will make every effort to urinate thereafter in order to avoid another such treatment.

The regimen outlined above is a simple one, but its meticulous application will save both patient and surgeon a very great deal of worry and discomfort and will shorten many a convalescence. Failure to follow it may result not only in urinary infection, but in persistent retention of urine which may necessitate piling a second, unplanned operation on top of the first one.

Care After Cord Injury

Much more could be said about the management of neurogenic vesical dysfunction (or cord bladder if you prefer). Suffice it to say here that, in those dysfunctions due to injury of the spinal cord, an attempt should be made first to empty the bladder by the Credé maneuver sufficiently often to prevent overdistention. If this fails or is impractical, an inlying catheter with an irrigator, such as that of Munro and Hahn, permitting tidal irrigation, should be used, since this is a very satisfactory means of minimizing or preventing damage to the urinary tract. If, after improvement of the spinal cord is complete, it becomes evident that the innervation of the bladder is permanently destroyed, cystostomy should be done, since it is much easier to maintain than an inlying catheter and is free from the risk of periurethritis, prostatitis, and epididymitis. Should recovery of the cord then occur unexpectedly, the bladder has been preserved intact and will resume its function if the tube is removed. •

Reformer's Folly

According to a Middle Ages legend there were gangs of students who went in search of teachers—good teachers being exceedingly scarce—and upon finding one worthy of that title they would "shanghai" the learned one and keep him captive in order to gain understanding. These medieval seminars or study groups were of sound design, with eyes cast in the right direction, as right today as then. Merely substitute a gentle invitation for the rough and tumble of shanghaiing, and there's the pattern and our answer to these inquiries.

Reverse the above procedure. Imagine a gang of self-designated "teachers" shanghaiing "students" in order that the "ignorant ones" might be blessed with their wisdom. The folly of this is obvious. But such is the "practical" way now in vogue. This is the way of the reformer.

Treatment of Fractures of the Patella

Don H. O'Donoghue, M.D.
Oklahoma City, Oklahoma

Dissatisfaction with results of conservative treatment led to operation in most cases of patellar fracture. The patella may be only a phylogenetic remnant and unnecessary. Experience indicates that no patella is better than a poor one.

There is much of interest in history of treatment of fractured patella. Gross, in 1830, in his textbook Anatomy, Physiology and Diseases of the Bones and Joints,[1] has an interesting section on patellar fractures. He predicates fibrous union only, the result depending upon how well the pieces can be held in approximation. Various ingenious devices were used, such as the Schmalz's knee box, Sir Astley Cooper's leather straps and various other bandages and devices designed to hold the upper fragment down and the lower fragment up, without the necessity for or the danger of opening the skin. By 1842, Liston, in his book The Elements of Surgery,[2] gives the same prognosis but deplores the use of "straps, buckles, and apertures to receive the portions of the bone" as "worse than useless." He says that breaking of the skin over the joint is a catastrophe frequently resulting in amputation.

Non-Operative Era

This general conception continued throughout the nineteenth century with only an occasional pioneer having the temerity to attempt to replace the fragments by surgery. Indeed, this was done early only under the pressure of an already open wound and then infection frequently supervened with disaster the result. This discouraged the surgeon from open surgery. In fact as recently as 1922, one of my classmates, overcome by the ennui of a surgical clinic (dry!) fell into the pit from the surrounding gallery and broke his patella. He was promptly utilized for demonstration. He had a transverse fracture of the middle third of the patella with separation of the fragments and was treated by cross-diamond adhesive strapping, holding the upper fragment down and the lower fragment up. The fact that he developed non-union and went on to bone grafting does not alter the fact that closed strapping was considered preferable to open replacement, even in an enlightened medical school as late as the 1920's.

Fig. 1. Baseball player treated many years ago by excision of this lateral fragment after many months of disability from unrecognized fracture. Silhouette view would have revealed this fragment.

The long series of unsatisfactory results had their effect and, encouraged by the general up-

Read before the 66th Annual Meeting of the Idaho State Medical Association, Sun Valley, Idaho, July 9, 1958.

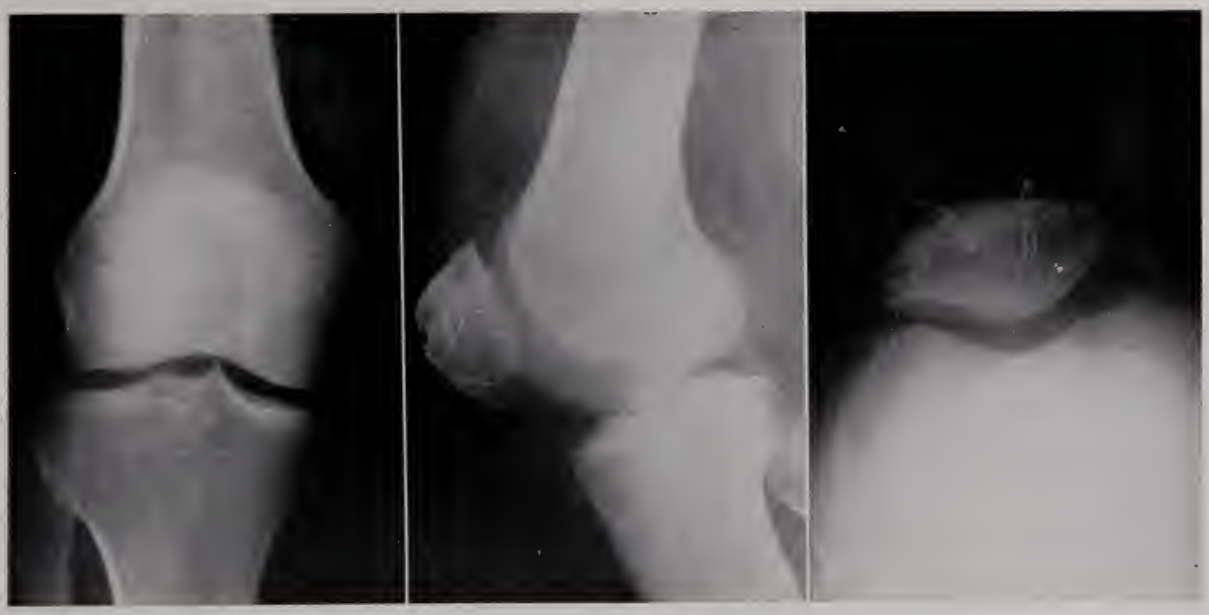

Fig. 2. Comminuted fracture of the patella treated many years ago by reposition of fragments and suture. There was continually increasing disability. Patellectomy would have given better result.

surge of surgical techniques in other areas, the patellar fracture came to be considered one which demanded open reduction. Wilson and Cochran, in their book, Fractures and Dislocations,[3] urged (1) closed reduction of the fracture if not greatly displaced or comminuted; (2) open reduction for the badly displaced or comminuted fracture with "careful replacement and fixation of all the fragments of the patella."

Campbell in his Orthopedic Surgery,[4] states that fracture of the patella is always surgical, if complete. Careful reposition and suture of all fragments is recommended. Phillip D. Wilson in

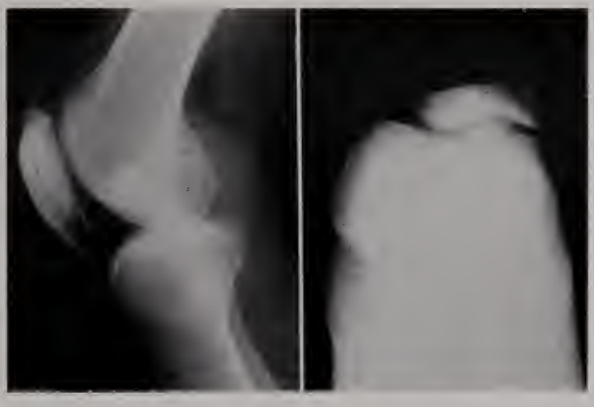

Fig. 3. Lateral and silhouette views of the patella following automobile accident two years ago. Comminuted fracture was treated without surgery and was in cast eight weeks. Present findings are: gross audible and palpable subpatellar crepitation, marked pain, restriction of motion, and increasing disability. Patellectomy at the time of injury would have given much better result than late operation will.

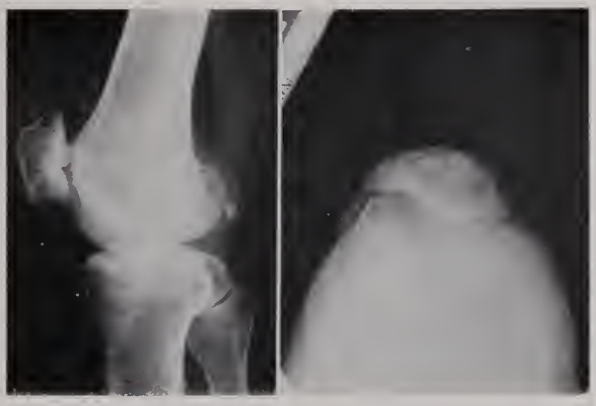

Fig. 4. Transverse fracture of the patella 18 months after careful suture. Note gross irregularity of the under surface due to absorption because of chondro-marginal fragmentation along the fracture line. This probably was quite smooth originally. Present treatment should be patellectomy. Better late than never!

Management of Fractures and Dislocations,[5] presents a compend of the work done at the Massachusetts General Hospital, and recommends open reduction for all fractures of the patella, if the fragments are displaced. Careful attention is given to suture of the fragments. Many methods are detailed, the suture preferred being fascia lata, in some cases kangaroo tendon, and in other cases, wire. Emphasis is placed on the necessity for a very accurate replacement of all fragments.

Fragment Removal

In 1937, Key and Conwell in the Management

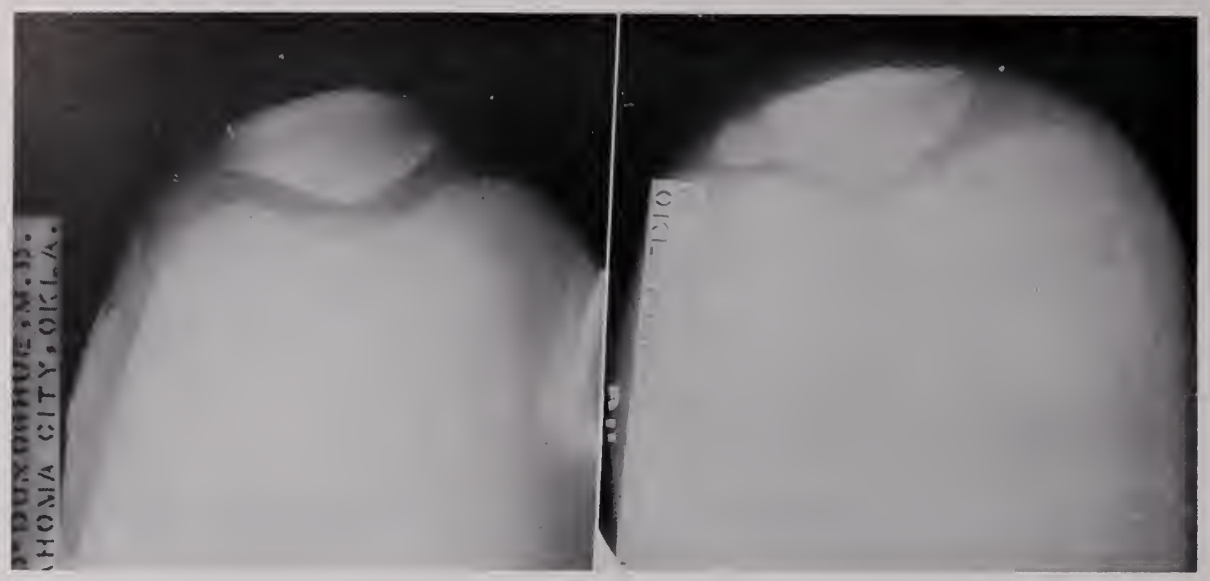

Fig. 5. Lateral marginal fracture of the patella treated by excision of the fragment and repair of the tendon to the patella. Normal function resulted. Note opposite knee for comparison. This is an excellent example of the silhouette view.

of Fractures, Dislocations and Sprains, second edition,[6] recommend open reduction of all displaced fractures of the patella with careful suture. Here, however, is mentioned, for the first time, removal of the small fragments and suture of the patellar tendon to the remaining patella. Only a couple of lines is given to this method of treatment.

Campbell in Operative Orthopedics[7] urges operative treatment of all complete fractures. The book describes in great detail the several methods of suturing and, first, urges very accurate repositioning of all the fragments. Second, it discusses at some length the removal of the smaller fragments with retention of a single, large piece, and suture of the tendon to the remaining piece. Third, for the first time noted in a standard text, patellectomy is mentioned. A rather cautious discussion is given restricting its use to the very badly comminuted fracture, which obviously could not be treated by any other method. However, by 1949, Campbell in the revised edition of Operative Orthopedics advises: (1) suture of the fragments if it is a simple transverse fracture, (2) removal of the small fragments and retention of the larger fragment if there is a single large fragment and, (3) patellectomy for comminuted fractures with displacement. By 1956, in the third edition of the same work, he sounds a word of caution about indiscriminate patellectomy. He does add one more indication for patellectomy—namely, the comminuted fracture of the upper one-third of the bone. He states that the only indication for suture of bone to bone is in the simple, uncomplicated, non-comminuted fracture of the patella.

Key and Conwell in Fractures, Dislocations, and Sprains recommend the following: operative treatment in those fractures in which there is definite separation of the fragments and "in all doubtful cases. * * * With two large fragments, the operation of choice is to wire them together. * * * With one large and one or more smaller fragments, it is advisable to remove the smaller fragments and suture the ligament directly to the large fragment. * * * If the patella is extensively comminuted, it is advisable to excise the entire patella (seldom is this indicated)."

Cave in Fractures and Other Injuries[10] states that: (1) transverse fractures of the middle one-third should be repaired by meticulous suture and he cautions against any possible irregularity at the suture line, (2) polar fracture with small fragments at either the upper or lower extremity of the patella should be treated by removal of the pieces and repair of the tendon to the bone and (3) patellectomy should be done in all comminuted fractures and in all other fractures where the above conditions cannot be fulfilled.

Surgery Accepted

Therefore, we see, in the past 100 years, complete revolution from the conviction that all fractures of the patella resulted in non-union and

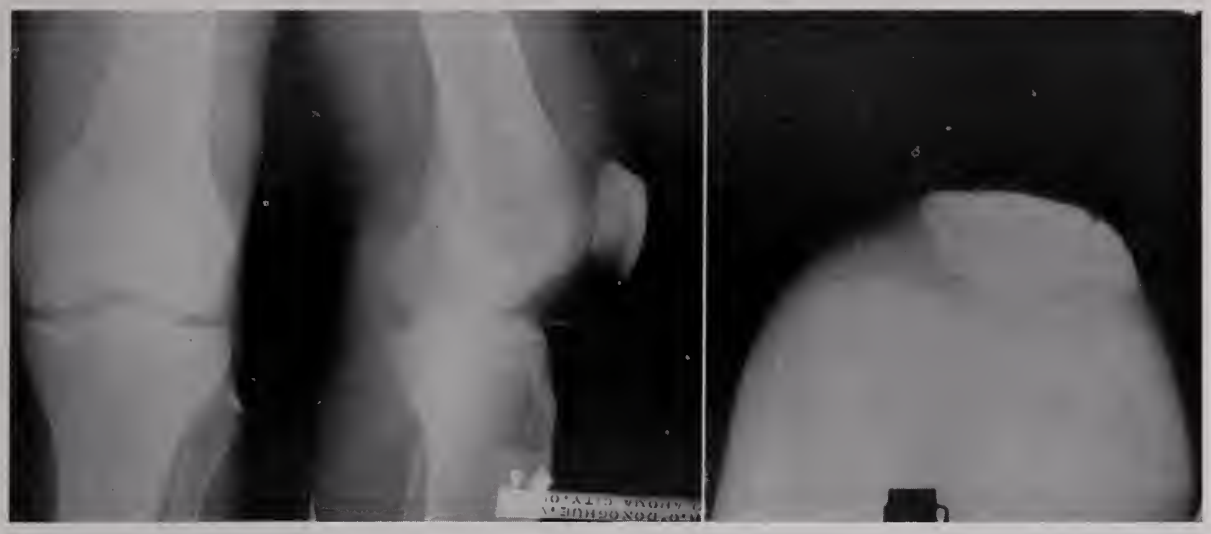

Fig. 6. This case illustrates the importanee of silhouette view. Even very eareful study of the A.P. and lateral pietures failed to reveal this fracture. The patient had months of disability before the eondition was recognized. This is not a bi-partite patella. Removal of this fragment promptly relieved the symptoms.

severe disability to the concept that excellent function is possible and can be attained by proper measures. Indeed within the last 25 years, since surgical treatment has become entirely accepted in the treatment of fractures of the patella, there has been a reversal of thought from the original idea of carefully replacing each fragment, with careful resuture of the jig-saw puzzle, to the conception that if one large fragment could not be left, the patella should be removed. The single exception is the transverse fracture of the middle third.

So much for the textbooks which, of necessity, must be conservative, and report generally accepted measures. What of the current literature? As indicated above, patellectomy in isolated cases has long been done. In 1860, and later in 1890, Althman reported cases, and by 1910 Heineck[11] reported a series of 10 cases in which patellectomy had been done for fractures of the patella where some other method seemed to be unsuitable. In spite of isolated reports of favorable results, patellectomy was not a generally accepted procedure.

Throughout the period of 1920 to 1940, surgical repair had a steadily increasing popularity and soon became the treatment of choice. There was a multiplicity of reports on various methods of repair, each stressing the importance of carefully preserving each fgragment, and suturing it meticulously into place, as one would fit a jig-saw puzzle. The main preoccupation of this period was with the method, not with principle. Catgut, fascia lata, kangaroo tendon, silk, wire, or braided wire—all had their proponents. The master carpenter, Fred Albee, even advocated an I block graft for certain transverse fractures of the middle third.

Many surgeons had encountered the obvious

Fig. 7. X-ray made five months after fracture of the patella that was treated by wire suture. This patient fell two months after suture and re-fraetured the patella. It was again sutured by wire. He had been dismissed as healed one week before this picture was made. There was no intervening aecident or ineident. Three months post-patellectomy he was back at regular work with 45 degree flexion. Three years post-patelleetomy he had normal motion and no pain.

Fig. 8. Upper view shows apparently clean transverse fracture of the patella which was sutured as indicated by the pencil marks. Lower view was taken after union. Note marked irregularity at the fracture site. This was possibly poor technique, yet was done by a competent surgeon. Primary patellectomy gives better final result than salvage patellectomy.

impossibility of suturing all the fragments, and had more or less surreptitiously discarded pieces that would not fit. If the patella was completely fragmented, there seemed no recourse but to remove it all. If one or more large pieces were available they were preserved and the tendon carefully sutured to the remaining fragments.

Choice Rather Than Necessity

In 1935, J. E. M. Thomson[12,13] presented cases showing the distinct advantage of removing the smaller fragments of polar fractures and suturing the tendon to the intact larger piece. Here was a real advance. Here was advocated removal of fragments, not because one had to, but as a method of choice.

The method became increasingly popular and was enthusiastically adopted because of better functional results. However, many strange things were done in the name of preserving a single intact fragment. The principle is eminently sound and this remains the best method for certain cases.

However, in too many instances, the cases were fitted to the method rather than the method to the cases. The basic principle is that tendon to bone healing is easier, better, quicker, and less complicated than bone to bone. However, the precept originally proposed by Thomson, that an intact patella should remain, was often overlooked. Unless the remaining fragment can assume the role of an essentially normal patella, the method will fail.

What about patellectomy? Unless the remaining fragment, or fragments, can function better than no patella, it is foolish to preserve the fragment.

As has been said, patellectomy had been done by necessity for many years. Despite relatively good results in very severe cases, the method was presented apologetically. In 1937, however, Brooke[14,15] presented a revolutionary report in which he concluded that the patella was a phylogenetic remnant, and that quadriceps function was better without a patella. He urged patellectomy in all fractures, and supported his thesis well. He presented patellectomy as the treatment of choice rather than of necessity.

Arguments Pro and Con

So the issue was joined, to preserve or to sacrifice the patella. Bruce and Walmsley,[16] working with rabbits, reported a refutation of Brooke's conclusions and concluded that the patella has a vital function and that it should not be sacrificed. In the next 10 years voluminous reports, pro and con, flooded the literature.[17-22] By 1948, however, patellectomy had attained a place as an elective measure alongside closed treatment, open repair, and removal of fragments. In 1949, I reported my conclusions, recommending:[21]

(1) Non-surgical treatment for fractures without displacement.

(2) Removal of small polar fragments and suture of the tendon to the remaining fragment, providing two-thirds of the patella

(3) Removal of small marginal fragments, provided the remaining patella was intact.

(4) Patellectomy in all other fractures.

It will be noted that in no case was bone to bone union required under this concept.

The complete metamorphosis from non-surgery to predominant open operation did not happen over night. Many factors were operative in effecting this change:

(1) General dissatisfaction with results obtained by non-surgical methods.

Fig. 9. Comminuted fracture of the patella accompanied by table fracture of the upper tibia. This case illustrates the distinct advantage of patellectomy in the case of multiple injury, since by patellectomy, motion can be actively started much sooner with less danger of over-calcification. This is type of case which in the past was very meticulously re-sutured, often with disastrous results from the standpoint of function.

(2) Improvement of surgical techniques.
(3) Improvement in anesthesia.
(4) Better x-ray visualization.
(5) Antibiotics, minimizing danger of infection.
(6) Better operating room facilities.

Gradually these factors overcame the inhibitions caused by the danger of infection, danger from anesthesia, and general poor patient risk.

What was largely behind the progress from bone reposition to bone removal? The work of Brooke[14] and many others revealed the true nature of the patella, and while not all agreed that the patella was expendable (Haxton[18]), certainly all thinking surgeons came to see that there was a point at which no patella was better than a poor one. Tompkins, Fulton, Hayes and I,[20] in 1950, carefully reviewed many cases with an abnormal patella from fracture and other causes as compared to a normal patella, and also as compared to results after patellectomy. We concluded, among other things:

"In fractures of the patella, removal of the fragments and repair of the tendon to the remaining large fragment is definitely better than patellectomy from the standpoint of strength. Cases

Fig. 10. Patient with giant cell tumor of lower femur extending into the knee joint. He had marked restriction of motion of the knee. He fell pulling his patella in two. Following patellectomy, motion markedly improved over what he had before his fracture. Ten years following removal of the giant cell tumor there is no recurrence. Range of motion is 180 to 90 degrees.

Fig. 11. Result five months following comminuted fracture of the patella treated by wire suture. In spite of good appearance of the joint space in the silhouette view, the rounded shape of the under surface shown in the lateral view gives relatively small bearing surface. Patient had restriction of flexion, subpatellar crepitation, and pain on squatting or stepping up.

should be carefully selected, however, or treatment will fail for other reasons. * * * Patellectomy yields excellent results in patients in whom other treatment—namely, wiring, repair of retained fragments, partial excision—has been used inadvisedly and failed. It definitely improves strength as well as motion. * * * Patellectomy gives very satisfactory strength in a very complicated case in which other treatment would be unsatisfactory. No reluctance need be felt in its use from the standpoint of weakness of the quadriceps following removal of the patella. * * * following patellectomy, there is a distinct loss of strength in quadriceps function, especially in complete extension."

So the indications for patellectomy have steadily expanded as experience has increased. More and more surgeons have come to realize that the difference is so small between a normal patella and no patella that one cannot afford to compromise for much less than a potentially normal bone.

Bone repair by suture of fragments becomes decreasingly attractive when it is considered that morbidity is greater, risk of impairment of motion is more, and that union may fail. All these hazards are hardly justified when the final results may well be less functional than that after primary patellectomy.

Fig. 12. Comminuted fracture of the patella in which heroic efforts were made to preserve a small fragment. This is, of course, ridiculous since this small bony bearing was inevitably inefficient and painful. Patellectomy in this 60 year old woman completely relieved her symptoms. On examination five years after patellectomy, her knee was symptom free. There was no swelling or tenderness and she had normal range of motion. Patellectomy should have been done at the time of injury.

The case reports attached show a few of the cases where patellectomy was necessary as a salvage procedure. These cases are self-explana-

Fig. 13. Comminuted fracture of the lower one-half of the patella treated by careful reposition of the fragments (1939). This patient was not seen until a few days after the injury because of multiple other injuries, and operation was postponed two weeks to permit abrasions to heal. The terrific calcification is a considerable handicap to this heavy patient. Primary procedure should have been suture to the upper fragment if feasible or patellectomy.

tory and illustrate full well that, at least in these cases, primary patellectomy should have been done as the treatment of choice rather than utilized many months, or years later, following a long period of disability.

Points in Technique

The technique of patellectomy is well described in any standard text of the treatment of fractures. Various divergencies in technique are of little importance. The cardinal factors are to obtain an entirely smooth surface to glide over the patellar groove and a firm, even suture that approximates the ends of the quadriceps and patellar tendons. In my early experience, many of the cases lacked a few degrees of complete extension, and were weak on complete extension. I make every effort to suture the tendons very snugly and very securely. I believe it is much more important to be able to extend the knee strongly and completely than it is to flex it completely. I will cheerfully sacrifice some degree of flexion in order to obtain this.

Another point which I think is of great importance is in regard to the femoral condyles. The anterosuperomedial, and particularly the anterosuperolateral, margins between the femoral shaft and the articular surface are frequently quite sharp and after the patella is removed, present a definite prominence. In many cases the remaining tendon will snap over this condylar eminence, particularly laterally. Therefore, I think it is advisable to smooth this off with a rongeur and rasp presenting as smooth a surface as possible at the margins of the cartilage so that the repaired tendon may slide over it freely.

The suture should be firm enough to permit the knee to be test flexed to approximately a right angle before the skin wound is closed. With this type of strong repair, quadriceps setting and active straight leg raising can be started at once. Initial long leg stirrup splints can be replaced in

Fig. 14. Compound comminuted patella. This is the type of case where patellectomy is mandatory. She had a very good result following patellectomy in spite of multiple other fractures. On examination five years after her injury, she had virtually no complaint of the knee but had considerable weakness in complete extension.

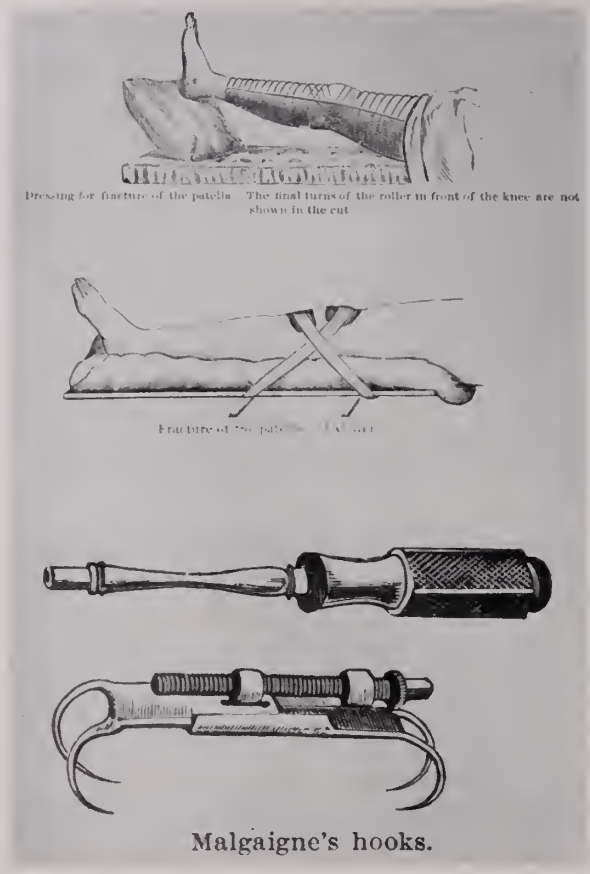

Fig. 15. Cuts from old textbook showing at top the spiral wrapping to approximate fragments which had great popularity. Middle illustration shows similar procedure with different technique. Neither of these techniques did more than to keep the fragments from retracting widely and could result only in a fibrous union if union occurred at all. The bottom cut shows one of the types of hooks that was used to pull the fragments together and get firm approximation. This represents one of the more heroic efforts to avoid open operation. The implications of the hooks are quite obvious since one or more of them undoubtedly entered the knee and the very infection which was feared so much would certainly supervene.

two weeks by cotton cast and weight bearing may be started. All dressings can be removed in four weeks, and very active rehabilitation continued. Even the very elderly will respond well to this program with amazingly complete return of function.

Conclusion

In conclusion, let me list again my convictions as to the treatment of fracture of the patella.

Patellectomy is the treatment of choice in all fractures of the patella with the following definitely circumscribed exceptions:

1. Fractures without displacement and without obvious chondral damage should be treated by aspiration, injection of hyaluronidase, compression splinting until swelling subsides and then a long leg cast for four weeks or more.

2. Fracture of the patella with polar fragments, either upper or lower end, should be treated by meticulous removal of all fragments, and repair of the tendon to the remaining single fragment. After repair, function should be tested on the operating room table to observe that the patella does not rock forward in flexion. Unless the sliding motion is smooth and without tilt, the fragment should be removed and the patillectomy completed. Do not leave an obviously abnormal fragment with severe chondral damage.

3. Lateral marginal fragments may be removed with the same restrictions as above.

4. With these exceptions only, patellectomy should always be done and done early, within a few hours if possible. A few hours delay may grow into several days or even weeks of disability due to abrasion, infection, circulatory blebs and contaminated cuts. There is no margin for compromise with infection. This principle applies even more specifically if bone is to remain.

In my opinion, there is no justification for any attempt to obtain repair of bone to bone in the treatment of fractures of the patella. •

Diet and Coronary Heart Disease

J. Edwin Wood, Jr., M.D., Julian Beckwith, M.D.,
Alfred Chanutin, M.D. and David Smith, M.D.
CHARLOTTESVILLE, VIRGINIA

Suspicion rather than proven fact seems to indicate tentative acceptance of the idea that high fat diets may accelerate atherosclerosis. Administration of unsaturated fats may or may not have value but they probably do no harm. There is some justification for recommending use of cooking oils high in unsaturated fatty acids and in suggesting dietary fat restriction for patients with hypercholesteremia or coronary diease.

This brief title implies a closer association than can be fully substantiated. We are not really sure whether certain dietary trends in man can actually lead to atherosclerosis, and even less do we know that changes in diet may lead to regression of established coronary atherosclerosis or prevention of this disorder.

However, since the relatively recent appearance of a voluminous literature bearing on this subject it is well to sift this to decide what our position is at this time.

First it is important to limit this discussion to one form of arteriosclerosis (there are several types)—namely, atherosclerosis characterized by plaque formation. The field should be narrowed further to the occurrence of this disease in the coronary arteries as characterized by the clinical syndromes of angina pectoris, coronary thrombosis with infarction, accompanying replacement fibrosis or scar formation and occasionally congestive heart failure, although the last named does not bear on the argument.

Even with this seemingly narrow subject under discussion it will still be difficult to reach a conclusion on the effect of diet on the causation or amelioration of coronary atherosclerosis.

Of the several theories relating to mechanisms leading to atherosclerosis, this discussion will deal primarily with the metabolic theory emphasizing the role of the blood lipids as a factor in atherosclerotic production. Discussion of the physical, degenerative and thrombotic theories will be purposely omitted and influences of genetic factors, as well as hormonal factors, must be left out at this time.

It is important to recall that the other theories mentioned above deal with events that lead to the deposition or accumulation of the lipid filled and fibrotic plaque. If we can establish that the ultimate lesion (whatever the theoretic pathogenesis) can be modified or prevented by any reasonable clinical approach, dietary or otherwise, then an examination of this subject is highly in order.

Background for Relationship of Serum Cholesterol and Atherosclerosis

A number of observations over the years have awakened a new interest in the subject of lipid metabolism and its relation to atherosclerosis. Some of these are old and some quite recent. Perhaps one of the major factors presently stimulating interest is the epidemiologic study of coronary heart disease and diet in various countries and ethnic groups. Perhaps in addition it would be wise at this point to put down some recent findings leading to this renewed interest.

1) Animal feeding experiments show that addition of cholesterol and neutral fats leads to higher than normal serum cholesterol for the

Sommer Memorial Lecture. Presented by the senior author at meeting of the Oregon State Medical Society, Portland, Oregon, September 7, 1958.

species in question and frequently enough to atherosclerosis, even to a type of myocardial infarction in recent rat experiments.

2) Under certain conditions, atherosclerotic changes may be prevented in animals or actual regression of established lesions brought about by estrogen administration.

3) The association of the increased incidence of human atherosclerosis and coronary artery disease with diabetes, myxedema, xanthomatosis, hyperlipemia, and hypercholesteremia, is generally accepted.

4) Women under menopausal age have less coronary heart disease than men and a few studies indicate that estrogen administration to males lowers the serum cholesterol. Also, coronary heart disease increases in females after the menopause.

5) Epidemiologic studies appear to indicate that the high neutral fat diets of some countries are associated with higher incidence of coronary heart disease, whereas the incidence of coronary disease is lower in the countries using less fat.

This has been further broken down to the *implication* that the fortunate low coronary disease peoples use a greater proportion of unsaturated fatty acids. Violent contrary opinion has been voiced as to the accuracy of the epidemiologic approach.

6) Sitosterols and phytosterols administered to both man and animals lower serum cholesterol.

7) The administration of unsaturated fatty acids to man lowers serum cholesterol.

A quick perusal of these indicates at once that almost invariably discussion hangs on the level of the lipids in the blood—whether it be in animal experimentation or clinical study. Elevated blood lipid levels are supposed to accompany experimental production of atherosclerosis in animals and serum lipid reduction conversely is supposed to be a good thing in man. Appraisal of therapeutic maneuvers for the amelioration of atherosclerosis up to this point must be largely indirect and inferential in man.

However, recently Wood has introduced an objective approach to the general subject of arteriosclerosis with the reporting of an arterial pressure volume curve in the extremity of man in vivo. Measurements on the lower extremity of 29 subjects without clinical evidence of arteriosclerosis showed values so different from 19 patients with objective advanced evidence of arteriosclerosis that he felt the method to be a valid means of following objectively the course of peripheral arteriosclerosis. The results were reproducible on repeated tests in the same subject. If these observations can be extended in man in long term observation there is considerable hope that we need no longer infer but will be able to measure. At the moment, however, no direct observations are available on human coronary atherosclerosis and the effects of dietary fat unless the coronary flow measurements of Gorlin can be turned to this purpose.

It would be acceptable no doubt in this west side of the country to argue the point concerning the relative value of cholesterol and other lipid fractions in their relationship to coronary atherosclerosis in man. This challenge we must forego for two excellent reasons: 1) lack of personal experience and 2) lack of time. Fortunately, most observers agree that serum cholesterol is as good an index in a statistical study of the incidence of myocardial infarction as the low density lipoproteins. It is becoming evident from several studies that beta lipoprotein cholesterol shows the greater changes with differences in dietary fat particularly in the older age groups. Gofman, however, does not agree with this and finds a higher correlation of certain low density lipoproteins with myocardial infarction and a less close one with overall serum cholesterol content. This falls into a research argument not immediately germane to the present discussion. Lately, at the spring research meetings at Atlantic City, it was reported that the serum triglycerides showed a higher correlation with myocardial infarction incidence than did cholesterol.

General agreement exists on one very important point—neither analysis of serum cholesterol nor the low density lipoproteins have any specific value in prediction for the individual. We have seen (as have others) many patients with normal serum cholesterol develop myocardial infarction and conversely abnormal serum cholesterol values do not necessarily presage this affection. It must be admitted, however, that the latter state generally is associated in high frequency with myocardial infarction, witness patients with familial hypercholesteremia, myxedema, diabetes, and other high cholesterol states.

Epidemiology

Time does not permit a detailed review of the many observations along this line but a brief

sample of the trend will enhance the current argument.

Several years ago it came to light that the native Bantu in South Africa, living largely on a mealie meal diet, apparently had a much lower incidence of "degenerative" heart disease than local white South African groups or Americans. Later this was extended to show that as these natives moved to populated areas and acquired a better diet and income, their originally low serum cholesterol levels rose with their affluence. The peoples of Southern Italy likewise showed a less striking but sharply lower death rate from this type of heart disease. Additional comments have been made on the fall of death rate with restricted fat diets during the war periods in Denmark and Britain. Objection to this is noted below.

More recently, attention has been called to the quite low coronary heart disease death rate in the Japanese and the concomitant low cholesterol levels in certain Japanese groups. Keys, extending this in a recent study with White and Bronte-Stewart, found a rather striking correlation between the per cent of fat calories in the diet and serum total cholesterol in four groups of Japanese farmers, miners, mechanics, and clerks. This was compared to a high dietary fat-high cholesterol finding in Japanese living in Los Angeles. Hawaiian Japanese occupied a position between the two groups both as to diet and as to serum cholesterol level. It seemed to be clear that male Japanese mortality was about one-tenth American male mortality for coronary heart disease but figures were not available for Japanese living in America.

While these and numerous other studies are convincing, Page *et al.*, Morrison and others have voiced objection to the accuracy of this type of study. Page particularly points out the inaccuracies brought about by differences in diagnosis and certification in different countries and also the equally difficult task of estimating fat consumption of a group of individuals in any country. Morris also takes an adverse view and finds no good grounds for comparison in countries with data sufficiently accurate to be reasonably compared. In Holland, Norway, and Denmark with moderate to high fat consumption, he notes "sizeable but comparatively low mortality rates"; whereas in Finland, Scotland, and New Zealand, again with diets moderately to very high in fat, the coronary heart disease mortality in middle-aged men is severe. Yudkin likewise finds no relation between fat intake and coronary heart disease noting that although the fat intake in Norway, Denmark, The United Kingdom, and Canada are essentially the same, there was considerable difference in the range of coronary heart disease mortality. He admits that, while fat consumption is higher in general in those countries with higher coronary mortality, it was lower for several years in The United Kingdom while coronary mortality continued to rise. He suggests that the relative over consumption of food associated with reduced physical exercise is one of the several causes of the disease.

Keys does not believe that exercise explains this difference and counters by returning to the finding that physical activity does not explain the large differences in serum cholesterol concentration observed between populations eating different amounts of fat. Many good clinicians believe that regular graded exercise throughout life and even after the development of coronary disease is a salutary thing. This point has not been fully clarified either concerning relation to coronary collateral circulation or the relationship of exercise to long time serum cholesterol levels. Our own experience with violent exercise in short time observations on football players does indicate a slight fall in serum cholesterol during the season of activity in spite of enormous diets high in fat. This is no doubt the general experience, as noted by Mann who found a rather striking effect of severe exercise in young males on a high calorie high fat diet. Serum cholesterol values were low during forced exercise and rose with inactivity and weight gain.

This brings up the question of obesity and its relation to heart disease of this type and to serum cholesterol levels. Insurance statistics on the former are unfavorable to obesity but other observers do not agree. In fact, as Block and his associates point out, 10 year survival rates in obese patients with angina are better than in others with angina. Turning to serum cholesterol and obesity, Brozek and Keys point out that, in general, relative underweight-overweight and obesity are associated positively with the cholesterol level when the general cholesterol level is low. In areas in which it is high, no such relationship seems to exist or at best there is a slight elevation in markedly overweight individuals.

In summary, the true relationship of dietary fat to the development of atherosclerosis is not

finally settled. If, however, we accept the tentative hypothesis that a positive relationship does exist and take an additional, even less secure, step that therapeutic reduction of serum cholesterol is a desirable thing, what methods are available and are they justified at present?

Effect of Diet on Serum Cholesterol

It is important to observe that the serum cholesterol varies considerably in any individual over an extended period of time. Long time observation is essential to determine the effect of diet. Previous epidemiologic studies appear to show a positive relationship but objections have been raised.

Our own clinical experience indicates that serum cholesterol can be lowered significantly by the reduction neutral or hydrogenated fats. Volunteer medical students electing to adjust their diet in three groups on a high, medium, and low fat basis came out with serum cholesterol findings in the same ratio respectively. A group of seven unselected subjects "cut back" on their "fats" and showed a diminished cholesterol in each case. Seven controls to match did not change their diets and had no appreciable change in serum cholesterol. This agrees with other experience.

It is also generally agreed that appreciable reduction of serum cholesterol in hypercholesteremia patients can best be accompanied by a low neutral fat diet whatever additional therapeutic maneuvers are used.

It is not difficult to instruct a patient in a low fat diet. Time does not permit a detailed dietary list here but an excellent guide to this subject is available in the book of Stead and Warren on Low Fat Cookery. The omission of solid fats from the diet and the use of vegetable oils in their stead for cooking will go a long way toward neutral fat reduction. A recent margarine on the market—high in unsaturated fatty acid content, looking like butter and tasting almost as good—relieves the "no butter" problem on the morning toast. Salad dressings can be made with corn oil or olive oil, the former being somewhat higher in unsaturated fatty acids.

Unsaturated Fatty Acids

The general agreement by Kunsill, Ahrens, Beveridge, and Bronte-Stewart, that relatively unsaturated fats of vegetable oils or unsaturated fats of marine origin tend to lower serum cholesterol in human beings whereas the hydrogenated vegetable oils or animal fats tend to raise serum cholesterol, immediately set off a wave of interest among clinicians. I am sure that many found as we did that some of these oils could be used for cooking but were poorly tolerated in large amounts as medication. Lately, however, capsules containing reasonable amounts of unsaturated fatty acids are available and, in unpublished reports, four capsules a day have been said to lower serum cholesterol levels when given over long periods. We do not know whether this will prove advisable or not but it holds interest and we have a number of hypercholesteremic patients on such a regimen.

The extreme importance of using a diet low in saturated fats in conjunction with administration of unsaturated fatty acids as such or as corn oil has been brought out by Keys who points out that the removal of 1 Gm. of butter fat from the diet has about the same cholesterol lowering effect as the addition of 3 Gm. of one of the high linoleic acid oils. In other words, exclusion of the saturated (Keys) fats has the greatest effect and this can be enhanced by the addition of corn oil and cotton seed oil.

Sitosterol

The administration of sitosterol for the lowering of serum cholesterol has been advocated by some, and questioned by others. It apparently has some effect on lowering serum cholesterol; but according to Riley and Steiner still further observations are necessary to establish that the fall in serum cholesterol coincident with sitosterol ingestion is greater than the fluctuation of serum cholesterol levels that ordinarily occurs in patients with coronary atherosclerosis. Our patients do not like the chalky mixture, the daily amounts necessary and the expense involved. Long time studies show a tendency to rebound after initial fall of serum cholesterol in spite of continued administration of sitosterol.

Conclusion

The high fat diet has been indicted but not convicted as a cause or accelerator of atherosclerotic heart disease. However, suspicion runs sufficiently high to warrant the reduction of our already high fat diet (45 per cent of total calories) to a reasonably lower value (25 to 30 per cent). At present this should apply to patients with coronary disease or hypercholesteremia, or both.

The use of cooking oils high in unsaturated fatty acids is warranted.

The administration of unsaturated fatty acids

as such, or as oils of high unsaturated fatty acid content, as medication in large amounts is under study and the true value of such a maneuver is not known. It would appear to be harmless.•

Our Dual Legal System

Our double decker system of state and federal laws may drive tidy minds mad.

Why should man and wife share community property here, while in New England only the husband holds title? How can Uncle Sam tax crooks for things the states make crimes? Why jail a gangster not for murder but for his back taxes?

Well, the reason is simple. By dividing the large sources of power, we make power-grabbing hard. The federal government can do some things the state others. And the forty-eight states have wide scope to run their affairs as they like whether they jibe or not with other states.

Yet we strive for some uniformity.

1. Our states have commissions to study uniform laws, but each state chooses to enact them as they please.

2. State courts dig away at the problem. There is a tendency for the courts to strive for uniformity in the law by following precedents set in other states.

3. The U. S. Supreme Court may move in once in a while. The First Amendment forbids Congress but not the states "from abridging the freedom of the press."

Not until 1925, did the U. S. Supreme Court side with the press against state laws which curtailed the freedom of the press.

New York had passed a law, which limited the press, against printing articles urging "criminal anarchy." To rescue the free press, the Supreme Court had to by-pass the First Amendment. It turned to the Fourteenth which forbade a state from depriving a person of "life, liberty, or property without due process of law." The Court held the due process clause protects the 'liberty' of the press "from impairment by the states."

Such decisions require more uniformity in the laws of all states by requiring all states to refrain from passing laws in restraint of basic constitutional rights.

Washington State Bar Association

Clinical Pathologic Conference

MULTNOMAH COUNTY HOSPITAL, PORTLAND, OREGON

Prepared under the direction of Warren C. Hunter, M.D.

Hance F. Haney: This patient presents an interesting example of the common problem of multiple system disease in the aged patient. That is, he presented good evidence of urinary tract infection and obstruction, evidence of old healed apical tuberculosis and bilateral cataracts. I am sure all of us who have worked in the clinics could think of many more possibilities which might have been brought out with further study.

History

Dr. Haney: This 78 year old man was seen in the clinics initially because of the symptoms of urinary tract obstruction and later because of bilateral cataracts. Inactive tuberculosis was thought to be present in both apices of the lungs as judged by x-ray findings. In June, 1955, he was admitted for the first time to Multnomah County Hospital for perineal prostatectomy for relief of urinary tract obstruction. At surgery an invasive nonresectable malignancy of the prostate was found, and radical prostatectomy was felt to be impossible. We have then a diagnosis of carcinoma of the prostate at the outset of our consideration. In October, 1956, because of low back pain, x-rays of the pelvis and lumbosacral spine were obtained, and a collapse of the fifth lumbar vertebra demonstrated. On the basis of the x-ray findings it was felt that the etiology was osteoporosis rather than malignancy. We have then at this point no x-ray evidence of metastatic malignancy. Hormone therapy was instituted and carried out for a period of at least two years. His second admission to Multnomah County Hospital was occasioned about 10 months later by increasing evidence of urinary tract obstruction, and again no evidence of bony metastases was demonstrated on x-ray studies. The acid phosphatase at this time was 1 King-Armstrong unit. Transurethral resection produced tissue which again was found to be carcinoma of the prostate. Two weeks later an orchiectomy was done under local anesthesia. Stilbesterol therapy was again initiated. During the course of the hospitalization he received two transfusions. From August to October the patient felt quite well, but sometime in October he developed gradually increasing jaundice and dark urine and because of this was admitted to Multnomah County Hospital. At this time, examination revealed normal edge of the liver in normal position. During further examinations it was found that the size of the liver decreased progressively. We have listed considerable laboratory work which, I am sure, all of you have noted. I am going to ask the students to answer just a few questions. In a patient of this kind one of our first problems is to explain the jaundice. Up to the time that he developed jaundice the diagnosis seemed quite clear.

Questions

Dr. Haney: We now have four important questions:

1. How can we best explain the development of jaundice?
2. What laboratory evidence would support the impression?
3. Does the protocol indicate need to bring in other possibilities in differential diagnosis?
4. What evidence may be presented for or against the presence of extensive metastatic disease?

X-Ray Findings

Charles T. Dotter: The chest films disclose bilateral apical infiltrative densities showing no change over several years and believed to be due to inactive pulmonary tuberculosis. Examination of the genito-urinary tract at an early date disclosed bilateral function with no dilatation. Two years later another study demonstrated moderate dilatation of the left collecting system after ap-

parent nonfunction of the right kidney. Radiographic examination of the skeleton showed chronic collapse of L-5 but no other discrete osseous abnormality. Borders of the bone show no destruction, and adjacent bone is similar in density. Radiologic diagnosis of this lesion was osteoporotic collapse. Contract examination of the bladder, subsequent to the initial prostatectomy, disclosed heaped-up, rounded densities at the base of the bladder, consistent with recurrent carcinomatous tissue. In summary, then, the films disclose diminished renal function, bilateral chronic inactive apical tuberculosis, recurrent mass at the floor of the bladder and an osteoporotic collapse of L-5.

Application of Laboratory Data

Warren C. Hunter: This case has so many interesting clinical pathologic-facets that Dr. Landreth of the Department of Clinical Pathology has prepared a brief summary on lantern slides. We will turn the meeting over to him for a time now.

Eugene Landreth:

Table 1.

Hepatic Function Studies		Normal
Serum Bilirubin	10.8 mg.	1 mg.
Direct	7.4 mg.	
Indirect	3.4 mg.	
Serum Albumin	2.9 Gm.	3.2-4.1 mg.
Serum Globulin	3.9 Gm.	2.6-3.8 mg.
Total Protein	6.8 Gm.	6-7.8 mg.
Thymol Turbidity	22 units	0-5 units
Cephalin Flocculation	4+units	0-1+units
Alkaline Phosphatase	14 units	0-13 units
Prothrombin Time	11 %	100 %
Vitamin K Response	None	

It is very gratifying to the clinical pathologist to find a case in which all of the laboratory findings are concise, clear cut, quite consistent and really need very little elaboration. The laboratory results can be divided into three main groups: those dealing with hepatic function, those dealing with renal function and the urinary tract, and the electrolyte studies. First are the hepatic function studies which are not excessive in number but certainly represent an adequate battery of tests. As you can see, all of the liver function studies are abnormal except for alkaline phosphatase. There is very low prothrombin time and there is no vitamin K response. There is reversal of the albumin-globulin ratio with low serum albumin. There is high serum bilirubin with predominance of direct reacting bilirubin.

Table 2.

	Pre-H	Post-H	Hepatic	Patient
Bilirubin	I	D	D	D
Alkaline Phosphatase	O	+++	O−+	O
Flocculation Test	O−+	O	+++	+++
Proteins	O	O	−A+G	−A+G
Vitamin K Response		Normal	Impaired	

To visually illustrate the distinguishing features of these tests it is interesting to compare them with the laboratory results usually found in hepatic, prehepatic, and posthepatic jaundice. How clearly this demonstrates the correlation with the typical picture of hepatocellular disease: Increased serum bilirubin more direct than indirect, normal alkaline phosphatase, increased flocculation and turbidity studies, low serum albumin and high serum globulin, and impaired response to vitamin K. To me this series of liver function studies is quite characteristic of hepatocellular disease.

Table 3.

Renal and Urinary Tract	Normal	
BUN	12 mg./100 ml.	7-15 mg./100 ml.
Urine	4 + Pus	
	Many Bacteria	
	Aerobacter Aerogenes	
Acid Phosphatase	1 unit	0-3 units
Acid Phosphatase	4 units	

Tests related to the urinary tract show BUN of 12 mg. per 100 ml. which is quite normal, urinalysis indicating urinary tract infection, and two acid phosphatase determinations, first of 1 KA unit and then of 4 KA units. Acid phosphatase of 4 units is approaching the suspicious range, which is around 5. In this situation the determination of the so-called true prostatic phosphatase might be helpful in evaluating this result.

Table 4. Electrolyte Studies.

Serum Sodium	132 mEq./L
Serum Potassium	−3.7 mEq./L
Serum Chloride	106 mEq./L
Serum Bicarbonate	20 mEq./L

The electrolytes tested are normal save for a slightly lowered alkali reserve. The only test that really bothers me is the sedimentation time, which is normal in the face of the elevated serum globulin, and an obvious urinary tract infection.

Clare Peterson: I would like to go back in the protocol for a short way, Dr. Hunter, before you clarify the situation, because the terminal events interest me and are of some considerable significance. Dr. Haney has indicated that this man had severe and multiple system disease, and the clinical laboratory evidence is convincing that there was severe liver disease. Yet, from a clin-

ical standpoint, he remained rational, cooperative, and reasonably stable until sudden, severe, and continuous epigastric pain developed. Someone has to explain what happened, and it is not just a matter of the why-of-it, but of the whys-of-it (as Alan Gregg once said in discussing the phenomena of dying and death).

I can see any number of possibly reversible situations in the terminal events described and, surely, everyone with liver damage does not die a so-called liver death. So the possibility of an abdominal catastrophe must be considered: an undiagnosed hemorrhage from stress ulcers of the esophagus, stomach or duodenum; or endocrine failure, specifically acute adrenal insufficiency; or death from the unrecognized hypoxia of a space-taking bilateral pleural effusion in such a patient. In addition to these possibilities, with the quiet, distended and tympanitic abdomen there is the old possibility of acute gastric dilatation. And of the possibilities, there are more.

I mention them at this point, because something happened suddenly to a patient who had been relatively stable, though seriously ill, and this something led to a series of events which terminated in death. And this may very well have represented a reversible sequence.

Pathologic Findings

Dr. Hunter: The skin was deeply jaundiced; the liver was 5 cm. above the costal margin; had a sharp edge and, furthermore, was very wrinkled externally. The cut surfaces were brown, and without evidence of scarring. The liver actually decreased in size under the eyes of a very competent intern who stated that he had carefully observed the decrease in the size of the organ during life. I was able to confirm his observation. The organ weighed only 1,040 Gm. whereas all others were within normal limits for the body weight.

In microscopic sections of the liver some intact liver cells and many semi-necrotic ones were observed while others had disappeared altogether. There was some attempt to form liver cells from bile duct epithelium. Within many lobules there were some intact hepatic cells. There is enough admixture of cellular change to make one think initially of cirrhosis with a later onslaught of necrosis. However, I cannot agree that it is cirrhosis of the liver of any type for the reason that there is no increase whatsoever in the periportal connective tissue.

The real surprise in this case is not in the liver, which I think one would anticipate, but in the pancreas. Grossly the interlobular tissue was dark and bloody, accentuating the paler lobules of parenchyma. Microscopically the reason is tremendous hyperemia, edema and hemorrhage in the interstitial tissue. There is a very real pancreatitis—acute, hemorrhagic and, rather strangely, with only the most minimal fat necrosis. Some ducts contain inspissated material. A cross section through the prostate shows the old transurethral resection. There is some carcinoma within the gland and it extends into the floor of the bladder as was found in the last transurethally resected tissue. In part, the carcinoma cells are quite intact while in other areas the cells are foamy. This conceivably might represent the result of the estrin therapy for carcinoma.

Discussion

Dr. Hunter: I think there will be universal agreement that certainly one of the main causes of death in this individual was the hepatic insufficiency. I have always felt that the time relationship between the two tranfusions received at the last transurethral resection (I was told verbally he had a mild degree of shock) and the hepatitis is a clear one. Approximately two months elapsed between the transfusions and the onset of the final illness. Therefore, we feel it is entirely compatible with a homologous serum virus-type of hepatitis.

He was bleeding very widely at the time of death; the large bowel had a great deal of blood intramurally; there was hemorrhage in the sigmoid which had been visualized sigmoidoscopally. I have the feeling that the man went into severe shock at the time of the examination of the sigmoid and that this actually was the final episode. But he was also bleeding very widely elsewhere.

The pancreatitis is something entirely new to me in any fatal case of viral hepatitis or homologous serum hepatitis that I have ever seen. I have found nothing on it in the literature. The book entitled, Frontiers of Hepatitis, that came out of the conference held at the Henry Ford Hospital in Detroit a couple of years ago makes no mention whatever of any involvement of the pancreas in this type of hepatitis. In one textbook I did find the statement that sometimes in mumps, in infectious mononucleosis and in some of the Coxsackie infections, pancreatitis is known to occur.

Here we have a pronounced acute pancreatitis, not quite the usual because there is no fat

necrosis to speak of, but otherwise typical enough of acute hemorrhagic pancreatitis. There is every reason to believe that it came about in the same manner that many instances of pancreatitis do—namely, from obstruction of the ducts stopping them up enough so that when the pancreas functions actively there is enough over-distension and rupture of the secreting acini to start the process. I did not find a papillitis or any edema of the duodenum to account for obstruction.

Dr. Dotter is quite correct in saying that the collapse of the one vertebra is not due to carcinoma of the prostate, nor did the patient have it elsewhere than in the prostate and bladder. He did have healed pulmonary tuberculosis; there was bilateral hydronephrosis related to the obstruction occasioned by the carcinoma of the prostate.

The problem that exists because of the similarities and differences between infectious hepatitis and what is variously called homologous serum jaundice or better, homologous serum hepatitis has been well summarized by W. P. Havens in the Nov. 2, 1957, issue of *Journal of The American Medical Association,* pages 1091 to 1095. Immunologically there are two distinct forms recognized at the present time. Are these different diseases or variants of the same disease? The relation of the two at present is obscure.

There are certainly some points of difference, because an attack of infectious hepatitis commonly confers immunity and it is said that the disease may be prevented by the use of normal globulin, a thing that usually fails to have any effect in homologous serum hepatitis. Epidemiologic and experimental evidence indicates the lack of any cross immunity between the viruses. As far as the pathology is concerned, you have seen a little of it in this case at one phase, and I emphasize at one phase, because it makes a tremendous difference when one sees the lesion.

The disease is being better studied today than it was in the past because needle biopsies of the liver have contributed materially to the knowledge of the very earliest phases of hepatitis. First, there is what seems to be a degenerative process in the hepatic cells followed by necrosis, then their disappearance, and of course in the liver whenever there is opportunity at all for regeneration, liver parenchyma reforms with alteration of the lobular pattern because this process is not an absolutely diffuse and evenly distributed one. The reticulum is unaltered; mononuclear cells are found as the inflammatory cell; there is proliferation of the reticuloendothelium. Healing can take place and, of course, in most instances is complete.

There are three definite forms—the acute which is sometimes fulminating, a persistent variety and finally a recurrent type. Points in prevention that are of importance to all of us are the matter of sanitation, food handling, clean hands and lack of contamination of fingers by feces. One of the most important things which, I am sure, is quite familiar to all is that in the use of all needles for parenteral injection a consistent effort should be made to sterilize these by any or all of the following means: boiling for 30 minutes, or 15 to 20 pounds of steam pressure for 20 minutes, or dry heat up to 180 C. for an hour. Better still, of course, is to use new needles in every case instead of re-using them. Dr. Haney, I would like to turn the discussion back to you for additional comments.

Dr. Haney: In summary, the evidence presented supports the diagnosis of *homologous serum hepatitis* which rapidly produced extensive destruction of liver parenchyma. Dr. Peterson has pointed to the need for consideration of several diagnostic possibilities in relation to the development of epigastric pain, one of which is *acute pancreatitis.* It is of great interest that the latter diagnosis was proven at necropsy.

Is it possible that further attempts should have been made to stop the bleeding at a time when there seemed to be no rise of prothrombin in response to vitamin K? Dr. Koler, will you discuss this question?

Robert Koler: This man was bleeding; actually, I do not believe we know why. Our only evidence in this direction is a one stage prothrombin time that on two occasions was 9 per cent and 11 per cent; this may, in fact, have a bearing on the one other laboratory procedure that bothered Dr. Landreth. I would wonder if he may have been low in a number of factors including fibrinogen. We know very well that fibrinogen depression will cause a sedimentation rate that has been high to become more nearly normal; this is seen in chronic passive congestion in the liver and might have been a factor here. Another possible mechanism in a patient who has known carcinoma of the prostate certainly is an active fibrinolysin secreted by the tumor from the prostate gland. Tagnon's work has shown that stilbesterol pretty well neutralizes

such fibrinolytic enzymes, and that may have at least minimized this man's bleeding which really did not become clinically apparent, in spite of these low values for prothrombin, until terminally. I suspect, if specific measurements had been made, that there might have been a depression of several factors, including prothrombin, proaccelerin, fibrinogen and perhaps others. To get to the answer to your question, Dr. Haney, I think that if it had been available and if there had been time to give it, fresh plastic bag blood plus continuing the stilbesterol would have been the treatment of choice in this preterminal bleeding state.

Dr. Dotter: I question Dr. Landreth on his statement about the inconsistency between the laboratory data and the clinical story. The lack of consistency is one of interpretation. The facts are, of course, consistent. Also, would it not be worthwhile to attempt to track down the donor who gave the suspect transfusion and take him out of future circulation?

Howard Lewis: Hemorrhage like this is seen very commonly in acute hepatic necrosis, which is what we are dealing with here. I think Dr. Koler very properly stated it when he said that there are undoubtedly a number of factors involved in the causation of such bleeding, and some of these factors, no doubt, had nothing to do with the clotting mechanism that are more properly related to vascular injury at the capillary level. As one watches a person go through the evolution of an acute hepatic necrosis, which I have had the chance to seen on a number of occasions, one of the things that appears near the time of death, usually within about 12 hours of demise, is this sudden outburst of hemorrhage which cannot be controlled with transfusions. It is not clearly related in every instance to the prothrombin time because I have seen death occur within 48 hours of the time of onset of any evidence of illness. I would say that this bleeding is characteristic of a state of acute hepatic necrosis or acute yellow atrophy. Sometimes we see the liver go on to the point where the only thing that is left is the reticulum and amorphous debris, yet with no recognizable evidence of liver disease. I have never seen, as pointed out by Dr. Hunter, an associated pancreatitis with infectious hepatitis. As I looked at these slides, Dr. Hunter, it looked to me like these were mostly polymorphonuclears. Is that correct?

Dr. Hunter: No, they are monocytes.

Dr. Lewis: And that is not the kind of cellular infiltrate one would necessarily expect in a bile type of disease is it? Would it suggest that there might be two things? And to make it harder, pain of the kind that this man had is also seen in acute hepatic necrosis.

I think this fits into the category of what our genial friend Dean Seabrook always says "in my series of one case." We would have to put it in this category, because I have not seen it happen before. We are dealing with a different organ. I do not know whether there are always granulocytes in pancreatitis of the ordinary variety in which hemorrhage is a factor. I can not answer it because I do not have a standard or anything to go by.

Are there any questions from the floor?

The question was asked as to how does one explain the pain in acute hepatic necrosis and also what is the cause of the hyperthermia seen so frequently? The pain is difficult to explain. We have always thought that hepatic pain, as we know it, is due to capsular stretching and inflammation, and there is no question that it is the most common cause of hepatic pain. However, it has been demonstrated that there are pain fibers within the liver itself extending along the blood vessels probably well up near their terminal branches and that these pain fibers are capable of transmitting pain from unknown disturbances within the liver. There are enough cases on record to support this so that I think there is little doubt that this is one pain mechanism. There can be pain from something intrinsic in a liver disease that is unassociated with the capsular distention and, as a matter of fact, may be associated, as in this case, with capsular shrinkage. I think that is the explanation for the pain seen in this disease. There is no other logical explanation. We know that the nerve fibers are there, which has not been thought to be true until recent years.

No doubt the fever, to a considerable degree, has a cerebral cause. You can not help but believe that the thermal regulatory apparatus is out of order in these people because so often their temperature curve will, in the terminal stages of disease, instead of showing the usual swings as in a fever associated with infection, necrosis or other causes, will start to go up steadily in the same way that you see the temperature rise in a person who has had a craniotomy, a head injury, terminal stages of meningitis or an injury to the brain by an acute vascular lesion.

I feel sure that much of this fever is due to a disturbance to the thermal regulatory apparatus by the intoxication that exists. We of course know that there is an acute biochemic injury to the whole body and to the brain, associated with hepatic insufficiency and liver coma, the ammonia intoxication being only an illustration of an important feature of it.

There is one last thing that I would like to ask the resident who saw this patient. So often the initial manifestation of the onset of acute hepatic necrosis is a change in personality. I know every student has heard this time and again, but I can not emphasize it too much. I remember seeing a young fellow once in the Army, when we were just learning about this situation, who had had two colostomies for bullet wounds and was emaciated. He was a very nice fellow. All of a sudden he began to be irritable and his personality changed completely. Before he died he was in hepatic coma for five days. Dr. Edwards, did this man show any such manifestations?

Miles J. Edwards: The man was disoriented, but after starting tube administration of 3,000 calories per day he quite dramatically changed and became rational again.

Conclusion

Dr. Hunter: I have always felt that the decision to use blood in this case is open to question. I heartily agree with Dr. Dotter that the blood bank should be notified in cases of this kind so that virus carrying donors never will be bled again.•

Federal Medical-Health Spending for Fiscal Year 1959

(July 1, 1958 to June 30, 1959)

The Federal Government's medical activities are on a massive scale and they continue to grow. This year for all health programs (research, medical care, public health) Uncle Sam is spending about 62.6 per cent more than he did five years ago, 13.5 per cent more than last year. Programs in 22 separate agencies and departments of Government range from cancer research to federal employee clinics. The total cost is $2.8 billion, or $344.7 million more than last year. Right now the agencies and the Bureau of the Budget are working on requests to be presented to Congress in January. There is little question that the bills, when finally enacted next year, will set another new high for medical spending.

Medical-Health Budgets of Federal Departments Agencies and Commissions for This Fiscal Year

AGENCY	FISCAL 1959	FISCAL 1958
Department of Health, Education, and Welfare	$1,116,207,806	$ 849,395,800
Veterans Administration	843,524,000	849,374,000
Department of Defense	751,115,000	702,305,000
Atomic Energy Commission	45,462,000	40,085,000
International Cooperation Admin.	39,600,000	37,300,000
Department of State	21,638,380	15,718,110
National Science Foundation	19,575,000	7,500,000
Office of Civil and Defense Mobilization	13,617,000	3,177,000*
Federal Employees Health Programs	11,000,000	10,000,000
Department of Labor	8,827,000	8,069,476
Panama Canal Co. and Panama Canal Zone Government	3,959,900	5,988,300
Department of Treasury	3,854,500	3,837,850
Department of Justice	2,105,000	1,796,000
District of Columbia	2,000,000	3,700,000
Federal Trade Commission	1,600,000	1,500,000
Department of Commerce	1,212,400	911,300
Civil Service Commission	426,000	387,000
President's Comm. for Employment of the Physically Handicapped	214,700	182,575
Small Business Administration	150,000	70,000
Department of the Interior	140,000	154,950
National Advisory Committee to Selective Service	19,000	19,000
Office of the Attending Physician of Congress	13,145	12,145
TOTALS	$2,886,260,831	$2,541,483,506

*The figure for fiscal 1958 is the appropriations of the Federal Civil Defense Administration and the Office of Defense Mobilization; now combined in the Office of Civil and Defense Mobilization.

Cutaneous Foreign Body Reactions Simulating Other Dermatoses

Michael J. Scott, M.D.
SEATTLE, WASHINGTON

Any agent capable of penetrating skin is a potential cause of cutaneous foreign body reaction. Many objects deemed unlikely to penetrate may do so under certain circumstances. The exact mechanism of penetration may vary but once the foreign substance pierces the epidermis, regardless of how accomplished, the stages for development of a foreign body reaction begin. Embedded objects are generally associated with the characteristic syndrome of inflammation, tenderness, cellulitis and suppuration but the absence of these cardinal signs does not necessarily indicate that a foreign body reaction is not present. Certain substances are less prone to cause these reactions than others. Occasionally the clinical manifestations elicited are variable and non-specific.

Substances resistant to putrefaction and decomposition may remain physically unaltered for a considerable period of time while embedded in skin or mucous membrane and are especially apt to elicit bizarre cutaneous reactions. Numerous agents, including metallic fragments, steel wool, glass, fiberglass, spun glass, plastics, wood splinters, silica, beryllium and extraneous hair are in this category. Both benign and malignant lesions may be simulated. Among other conditions, foreign body reactions may resemble verrucae, keratoses, cysts, calluses, pyodermas, deep mycoses, melanomas, and epitheliomas.

Two apparently identical foreign bodies embedded simultaneously in the same individual, in proximate locations, may result in two entirely different clinical pictures. For example, two wooden splinters embedded under identical circumstances in adjacent areas may produce a typical foreign body reaction at one site and a lesion clinically indistinquishable from a wart at the other. An attempt to discuss why this phenomenon occurs would only be conjecture, as the reason certain foreign bodies elicit such bizarre imitation lesions is not fully known. Discussion will be limited to these variable, nonspecific reactions which may, at times, resemble other dermatoses and thereby present baffling diagnostic problems. I will endeavor to demonstrate several such unusual foreign body reactions observed during the past decade which have simulated other dermatoses. These imitations are not common, but neither are they as rare as the few reported cases would indicate.

These foreign body reactions may so closely resemble another skin disorder that it becomes clinically impossible to differentiate the two unless the foreign body is detected. Sometimes a portion of the foreign material may be seen protruding from the lesion. In others, it is completely embedded in skin and external evidence of penetration may not exist. It may or may not be palpable. Protruding or not, a foreign body may be very difficult to detect and examination for it can hardly be too meticulous. More than a casual inspection is generally necessary.

In many instances the correct diagnosis is not made until the foreign object is accidentally observed as the lesion is being removed surgically.

A good number undoubtedly escape detection when any entire benign tumor mass is discarded without dissection following surgical removal. I believe it is an advisable procedure to thoroughly dissect any mass surgically removed from the skin prior to discarding it. On several oc-

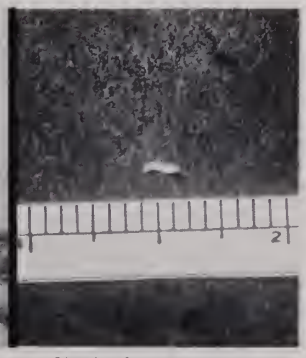
Foreign Body Reactions Simulating Melanomas:

Blackish nodule due to an embedded portion of a fishing hook.

Bluish-black lesion surrounding an embedded metallic splinter in a hemangioma on the medial aspect of the knee.

Bluish nodule of two months duration which developed in a nevus on the posterior aspect of the ankle following the embedding of a cactus thorn.

Foreign Body Granulomas Resembling Epitheliomas:



Enlarging mass of four months duration due to a glass fragment apparently embedded six years previously in an automobile accident.

Ulceration on lower lip containing two, small, embedded bone fragments. Note one bone particle protruding from superior portion of the lesion. The patient was struck with an accurately hurled bone immediately upon rendering an unfavorable comment regarding the delicacy of his wife's cooking.

Nodule in the posterior auricular region enclosing an embedded plastic fragment.

Plastic fragment recovered from patient at left. It became separated from the frame covering of the patient's glasses.

Foreign Body Granulomas Simulating Benign Lesions:

Foreign body reaction resembling a plantar wart resulting from an embedded dog hair. The hair completely penetrated the epidermis.

The dog hair extracted from lesion at left.

Cystic lesion of two months duration on left side of lower lip caused by beryllium from the lining of a broken fluorescent lighting tube. The beryllium apparently entered through a small abrasion on the lip.

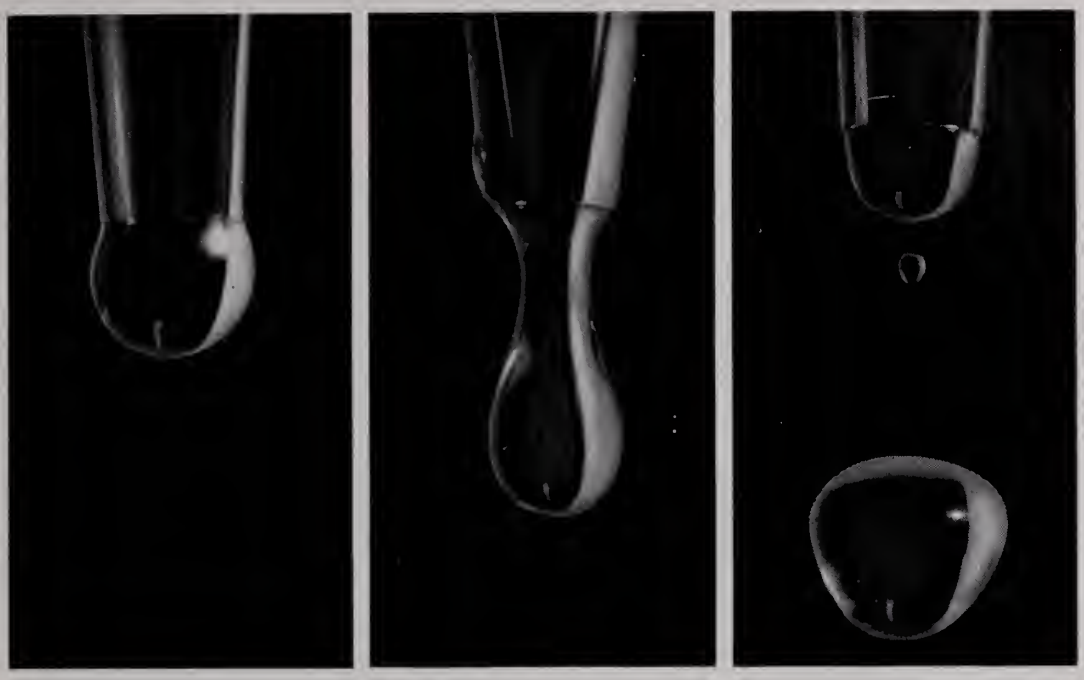
Interdigital pilonidal sinus between the ring and middle fingers of a barber's hand resulting from embedded hair fragments.

casions I have found this to be a rewarding habit as minute foreign bodies completely embedded in the tumor mass may otherwise be overlooked.

It may be argued that it is just of academic interest to find the specific etiologic foreign agent in disposable material since a cure will result once it has been removed, either knowingly or unknowingly. Nevertheless there is at least some self-satisfaction in having discovered it. The foreign substances previously mentioned generally appear physically unaltered due to their resistance to decomposition. Several objects I have removed had apparently been embedded for many months, and a few for many years.

In general, all of these unusual lesions are nonspecific and unless the foreign object is located a definite diagnosis can not be rendered without considerable reservation. Except for their foreign body content they are frequently indistinguishable from the disorder they mimic. In my experience the sites of predilection are the exposed cutaneous areas although they do occur elsewhere. Since males doing manual labor are more apt to encounter agents capable of penetrating skin, unusual foreign body reactions of this type occur more frequently in them. Housewives, however, accumulate their fair share when utilizing steel wool scouring pads (e.g., SOS, Brillo) and other agents encountered around the home.

Conclusion



Certain foreign body substances occasionally elicit bizarre cutaneous reactions which may present a baffling diagnostic problem. Both benign and malignant lesions may be simulated. These lesions, although not common, are more prevalent than the few reported cases would indicate. A high index of suspicion is perhaps the most important prerequisite in making a diagnosis. ●

Blue Shield Payments to Physicians

Blue Shield plans in the United States paid physicians nearly $268 million for services rendered members during the first six months of 1958. This represented slightly more than 92 per cent of the Plans' earned subscription income. Payments to physicians by U. S. and Canadian Plans combined topped $289 million in the same period—representing 92.5% of total earned subscription income.

From Blue Shield Medical Care Plans Newsletter, Volume 3, November 1958.

In Biliary Distress

ZANCHOL®

Improves Flow and Color of Bile

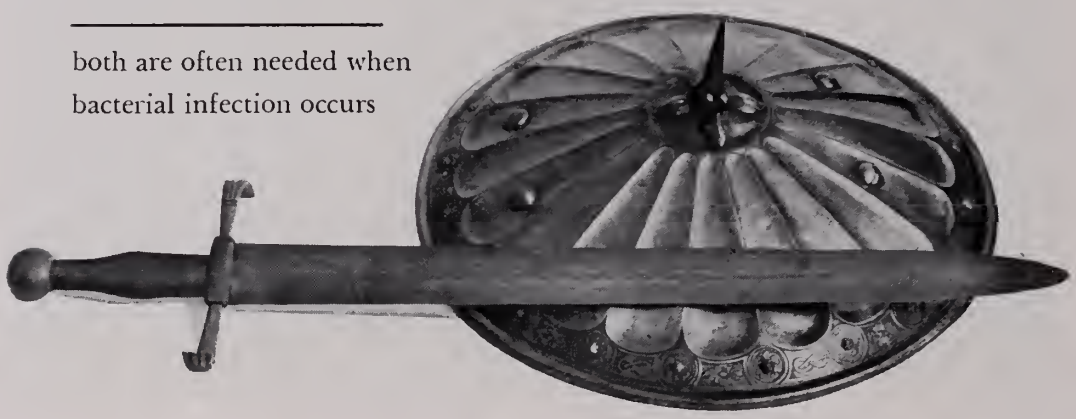
Zanchol (brand of florantyrone), a distinct chemical entity unrelated to the bile salts, provides the medical profession with a new and potent hydrocholeretic for treating disorders of the biliary tract.

The high degree of therapeutic activity of this new compound and its negligible side reactions yield distinct clinical advantages.

- Zanchol produces a bile low in sediment.
- Zanchol enhances the abstergent quality of bile.
- Zanchol produces a deep, brilliant green bile, regardless of its original color, suggesting improved hepatic function.
- Zanchol improves the flow and quantity of bile without increasing total bile solids.

Bile with these qualities minimizes biliary stasis, reduces sediment and debris in the bile ducts and discourages the ascent of infection.

For these reasons ZANCHOL has shown itself to be a highly valuable agent in chronic cholecystitis, cholangitis and care of patients following cholecystectomy.



Administration: One tablet three or four times a day. Zanchol is supplied in tablets of 250 mg. each. G. D. Searle & Co., Chicago 80, Illinois. Research in the Service of Medicine.

SEARLE

▮ prompt, aggressive
antibiotic action
▮ a reliable defense against
monilial complications

---

both are often needed when
bacterial infection occurs

for a direct strike at infection

Mysteclin-V contains tetracycline phosphate complex

It provides a direct strike at all tetracycline-susceptible organisms (most pathogenic bacteria, certain rickettsias, certain large viruses, and Endamoeba histolytica).

It provides the new chemical form of the world's most widely prescribed broad spectrum antibiotic.

It provides unsurpassed initial blood levels — higher and faster than older forms of tetracycline — for the most rapid transport of the antibiotic to the site of infection.

for protection against monilial complications

Mysteclin-V contains Mycostatin

It provides the antifungal antibiotic, first tested and clinically confirmed by Squibb, with specific action against Candida (Monilia) albicans.

It acts to prevent the monilial overgrowth which frequently occurs whenever tetracycline or any other broad spectrum antibiotic is used.

It protects your patient against antibiotic-induced intestinal moniliasis and its complications, including vaginal and anogenital moniliasis, even potentially fatal systemic moniliasis.

MYSTECLIN-V

Squibb Tetracycline Phosphate Complex (Sumycin) and Nystatin (Mycostatin)

Give your diagnostic skill the advantage of **MODERN** instrumentation

PRICES DELIVERED
CONTINENTAL U. S. A.

Whenever a diagnostic "tool" can give you some *added* advantage in *better* performance or *wider* usefulness — your own diagnostic skill is aided by *more complete facts*, and your time is saved through simpler, more convenient use. *Each of these Sanborn instruments gives you just such added advantages.*

With the new Rappaport-Sprague Acoustic Stethoscope, sounds which are only faintly discernible or at the threshold of audibility with conventional stethoscopes become clearly audible, providing new assurance in auscultation. Equipped with five chest pieces for sensing and localizing sounds of various pitch, and three sets of ear pieces for proper fit, this new Stethoscope clearly reflects the results of ten years of research and investigation undertaken during its development.

In the Visette electrocardiograph, *true* portability in a clinically accurate ECG is now a practical reality. By its brief case size and 18-pound weight, the Visette lets you take 'cardiography *to your patient* — in his home, at the hospital, at an industrial plant clinic, wherever the need exists. Modern electronic components — a new, much lighter galvanometer — design innovations ranging from pushbutton grounding and double-check standardization signals to fully automatic stylus stabilization as leads are switched — make the Visette the most *convenient* ECG you (and your technician) can use. And this first (and still the only) 18-pound 'cardiograph is now *being used* by more than 3000 doctors, both here and abroad.

For the benefits modern instrumentation can give you and your patients — by extending your diagnostic abilities and saving your time in day-to-day practice — ask your local Sanborn man for complete facts on these two unusual instruments. He will also be glad to tell you how you may use a Visette for 15 days in your own practice *without cost or obligation*, through the exclusive Sanborn "Try-Before-Buying" plan. Call or write him soon — or address Inquiry Director at the main office in Waltham, Mass.

A Summary Report on

CORTROPHIN®-ZINC

(Corticotropin-Alpha Zinc Hydroxide)

Description: A unique patented electrolytic process (developed by Organon research) produces a complex of *alpha* zinc hydroxide and corticotropin. This complex offers considerable advantages for practical ACTH therapy.

Characteristics: New Cortrophin-Zinc provides corticotropin of unsurpassed purity with low foreign protein content. This reduces the risk of sensitization reactions.

Since about 5% of the corticotropin is uncombined, onset of clinical response is rapid. But the balance, present as a complex of alpha zinc hydroxide, provides a prolonged action so that the effective time span of a single dose is usually several days. Injection of the new electrolytic Cortrophin-Zinc is virtually painless.

Pharmacology: A potent stimulator of cortical activity, Cortrophin-Zinc *does not depress* functioning of the suprarenal glands. Unlike the corticosteroids, adrenocorticotropic hormone arouses the adrenal glands to produce *natural* steroids in natural proportions. In a 5-year study of patients on ACTH therapy, no case of adrenal *or pituitary* depression or atrophy has been observed.

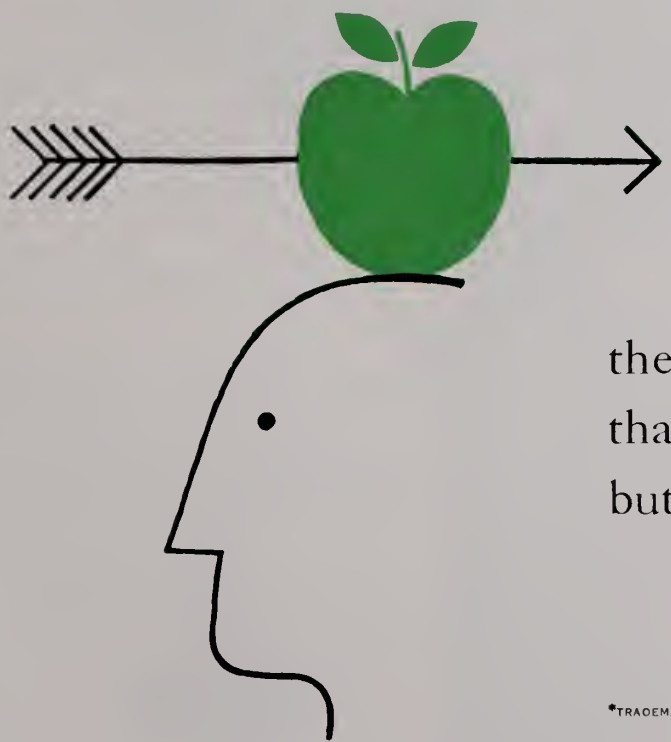
Because Cortrophin-Zinc is virtually painless on injection and its prolonged action obviates frequent injections, it is now practicable to use Cortrophin-Zinc in most of the indications where formerly reliance has been on corticosteroids. This freedom from apprehension of deleterious depressive effects permits clinical use of valuable hormone therapy on a broader scale than has been possible heretofore.

Clinical Uses and Dosage: The many published reports on the use of Cortrophin-Zinc as well as ACTH, in thousands of patients indicate its value in over 100 disorders. Most responsive have been: allergies and hypersensitivities, rheumatoid arthritis, bronchial asthma, serum sickness and inflammatory skin and eye diseases.

Dosage should be individualized, but generally initial control of symptoms is obtained with a single injection of 40 units of Cortrophin-Zinc daily, until control is evident. Maintenance dosage is generally 20 units (or less) twice a week.

Use of Cortrophin-Zinc with oral steroids is now recommended as a safety measure to supply the important suprarenal stimulation and lessen the hazard of atrophy. Periodic use of Cortrophin-Zinc is advocated with all steroid analogs, such as cortisone, hydrocortisone, prednisone, prednisolone, methylprednisone, and triamcinolone.*

Supply: 5-cc vials containing 40 and 20 U.S.P. units of corticotropin per cc; 1-cc ampuls containing 40 and 20 U.S.P. units of corticotropin, with sterile disposable syringes.



*Write for complete literature and bibliography containing specific dosage schedules to:

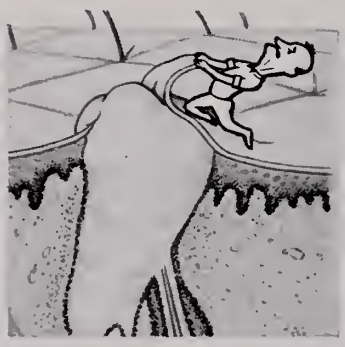
IN ACNE

Fostex® degreases the skin and helps remove blackheads



Fostex contains a combination of surface active agents (Sebulytic*) which:

◂ Completely emulsify excess oil so that it is quickly washed off the skin.

◂ Penetrate and soften comedones, unblocking the pores and facilitating removal of sebum plugs.

Fostex dries and peels the skin

◂ The Sebulytic base of Fostex dries and promotes peeling of the skin . . . actions enhanced by the keratolytic effects of micropulverized sulfur and salicylic acid.

*(Sodium lauryl sulfoacetate, sodium alkyl aryl polyether sulfonate, sodium dioctyl sulfosuccinate.)

FOSTEX CREAM
for therapeutic washing of skin in the initial phase of acne treatment, when maximum degreasing and peeling are desired.

FOSTEX CAKE
for maintenance therapy to keep skin dry and substantially free of comedanes.

Fostex is easy for your patients to use

◂ Patients stop using soap on affected skin areas. Instead they use Fostex for therapeutic washing of the skin. The Fostex lather is massaged into the skin for 5 minutes—then rinse and dry.

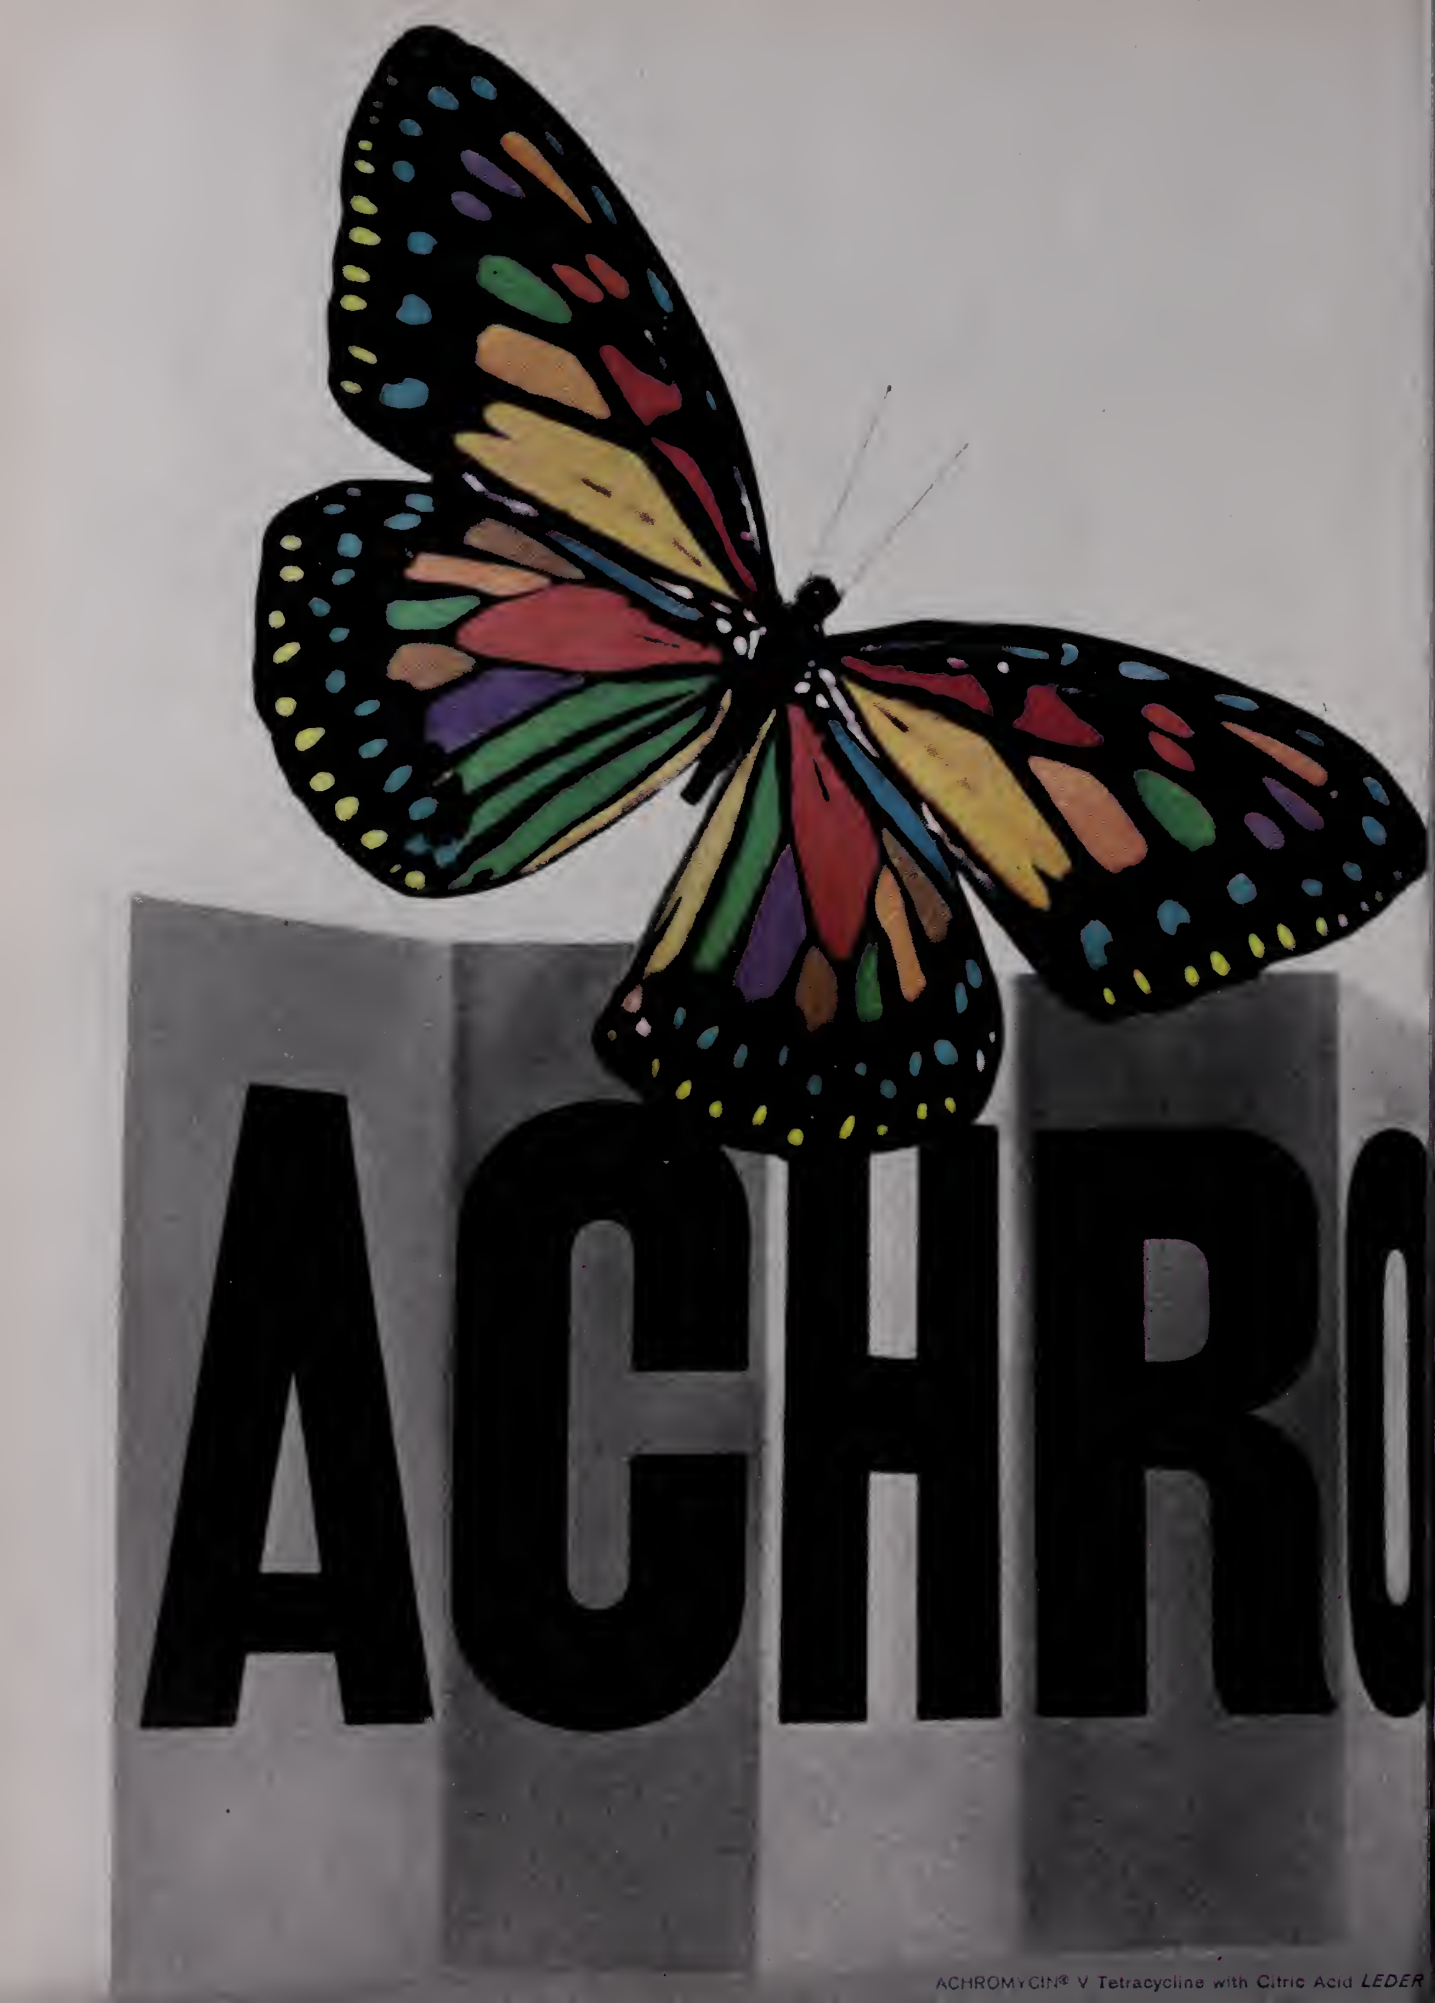
Meat...

and its fat-protein calorie ratio*

For every calorie of fat provided by the average American dietary only 0.3 calorie of protein is provided. The quality of this protein ranges from poor to excellent.

On the other hand, cooked meat as usually eaten supplies from three to five times this number of protein calories in relation to the calories derived from its fat. The protein of meat is invariably of high biologic quality.

	Calories from Fat	Calories from Protein
in the average American dietary	1	0.3
in beef rump roast	1	1.27
in beef flank steak	1	1.42
in lamb leg roast	1	1.55
in pork loin chop (lean portion only)	1	1.36
in cured ham	1	1.04
in veal cutlet (lean portion only)	1	1.40



The high protein yield of meat exceeds that from any other main dish food in man's diet. The amino acid composition of meat protein closely approaches the quantitative proportions needed for effective biosynthesis of human tissue.

Meat—the chief source of top-quality protein, B vitamins, and minerals in the American diet—is also an excellent vehicle for nutritionally valuable fat, the amount of which is readily controlled by trimming and by selection of cuts.

*Leverton, R.: The Fat, Protein, and Calorie Value of Cooked Meats. Proc. 9th Research Conf. sponsored by the Council on Research of the American Meat Institute, University of Chicago, March 1957.

The nutritional statements made in this advertisement have been reviewed by the Council on Foods and Nutrition of the American Medical Association and found consistent with current authoritative medical opinion.

why all the fuss over potassium?

Many physicians will recall when safe but potent organomercurials were first introduced. At the time there was considerable worry about possible potassium loss. Patients were instructed to take foods rich in this mineral, and not infrequently potassium supplements also were advised. After enough experience was gained, it became evident that only the exceptional case could lose enough potassium to be concerned about. And with oral organomercurial diuretics this was practically never a problem.

Why revive the subject now? Because clinical experience with nonmercurial diuretics indicates most of them have such a specific effect on potassium that with their use very real problems must be faced. Enough potassium loss can lead to digitalis toxicity or to a classical overt hypopotassemia. Since a fair percentage of cardiacs who receive diuretics are also digitalized, this excess potassium excretion is clinically serious. Clinical experience is still too limited with some nonmercurial diuretics to say just how often such loss will occur—but warnings already have been sounded by some clinical investigators as to the need for potassium supplementation.

Experience in many patients, for many years, demonstrates that potassium loss is never a problem when NEOHYDRIN® is the oral diuretic. And there is no refractoriness to this effective oral organomercurial.

LAKESIDE

Now—All cold symptoms can be controlled

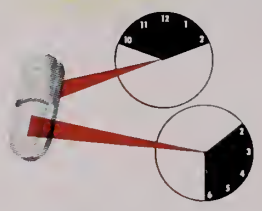
This new timed-release tablet provides:

...the superior decongestant and antihistaminic action of Triaminic

...non-narcotic cough control as effective as with codeine, but without codeine's drawbacks

...an expectorant to help the patient expel thickened mucus

...the specific antipyretic and analgesic effect of well-tolerated APAP



...the prompt and prolonged activity of timed-release medication

Each* TUSSAGESIC *Tablet contains:

TRIAMINIC®	50 mg.
(phenylpropanolamine HCl	25 mg.;
pheniramine maleate	12.5 mg.;
pyrilamine maleate	12.5 mg.)
Dormethan (brand of dextromethorphan HBr)	30 mg.
Terpin hydrate	180 mg.
APAP (N-acetyl-p-aminophenol)	325 mg.

Also available:
for those who prefer liquid medication—
Tussagesic suspension
In each 5 ml.: Triaminic, 25 mg.; Dormethan, 15 mg.; terpin hydrate, 90 mg.; APAP, 120 mg.

Tussagesic timed-release tablets provide relief in minutes, which lasts for hours

first—3 to 4 hours of relief from the outer layer

then—3 to 4 more hours of relief from the inner core

Dosage: 1 tablet in the morning, mid-afternoon, and evening, if needed. Should be swallowed whole to preserve the timed-release action.
Suspension: Adults—1-2 tsp. every 3-4 hours; Children 6-12 years old—1 tsp. every 3-4 hours; Children under 6—dosage in proportion.

NEW **Tussagesic***

**Contains* TRIAMINIC *to* STOP *running noses and open stuffed noses orally*

Oregon State Medical Society NOVEMBER COUNCIL MEETING

At its meeting on Saturday, Nov. 1, 1958 the Counеil of the Oregon State Medieal Soeiety approved two resolutions reeommended by the Soeiety's Committee on Naional Poliey for submission to the House of Delegates of the American Medieal Assoeiation at its 1958 Interim Session to be held December 2-4 in Minneapolis. The first resolution recommends that the Speaker of the A.M.A. House of Delegates and the Chairman of the Board of Trustees jointly appoint a committee to make a survey of the alleged praetiee by a small segment of the medical profession of eharging excessive fees and performing unnecessary procedures and to reeommend means of controlling these praetices which may be employed by eomponent and constituent medieal soeieties. The seeond resolution requests that the A.M.A. sponsor a National Congress on Prepaid Health Insuranee to consider formulating plans for offering sound and eonstantly improved voluntary health insurance. These resolutions are as follows:

REPORT OF COMMITTEE ON NATIONAL POLICY

(Presented to the Council on November 1, 1958)

The Committee on National Poliey was directed by the Council at its meeting on Saturday, Oetober 4, 1958 to consider four matters introduced by W. Wells Baum, Alternate Delegate to the American Medical Association. These matters were as follows:

1. That the Ameriean Medical Association be requested to establish an "ad hoc" committee to study the problem of physicians who eonsistently make what is considered to be unreasonable charges for their serviees particularly for services rendered patients who are known to have the benefits of pre-paid medieal eare insurance.
2. That the Society express to the House of Delegates of the American Medical Assoeiation its views regarding the "closed pancl" system of medical practiee.
3. That the Ameriean Medical Association be requested to sponsor a Joint Council on Prepaid Medical Care Plans.
4. That the Ameriean Medieal Association be requested to exert leadership in the establishment of a loan fund for medical students.

At its meeting on Oetober 15, 1958, the members of the Committee considered it appropriate to submit recommendations to the House of Delegates of the American Medical Association regarding the establishment of an "ad hoe" committee to study the problem of physieians who consistently make what is eonsidered to be unreasonable charges for their services, and regarding the sponsorship of a joint eouncil on prepaid medical care plans. Resolutions on these two subjects are attached to this report and are reeommended for adoption by the Council at this meeting for submission to the House of Delegates of the American Medieal Association at its 1958 interim session being held December 2-4 in Minneapolis.

The Committee, however, was of the opinion that more time was required to eonsider recommendations regarding the Soeiety's attitude toward the "elosed panel" system of medieal praetice. And also that the Soeiety's Delegates to the Ameriean Medical Assoeiation should investigate the loan services whieh are now available to medical students prior to recommending that the American Medieal Association establish a loan fund for medical students.

At its meeting, the Committee also eonsidered the Resolution submitted to the House of Delegates of the Oregon State Medieal Society at its 84th Annual Session held September 3-5, 1958, by T. L. Hyde of The Dalles. This Resolution read as follows:

> NOW THEREFORE BE IT RESOLVED that our representatives to the American Medieal Association be instructed to diligently attempt to persuade the AMA to cooperate with the osteopathie schools in every way possible to improve their edueational standards and effectiveness.

The Committee recalled that the Ameriean Medical Association has already offered to assist osteopathie schools by making an inspeetion and recommendations. This offer, it is our understanding, was not accepted by the osteopathie schools. Sinee the problem of relations between medicine and osteopathy is a subject of constant study by the American Medieal Assoeiation, your Committee is not making any recommendations regarding this Resolution at this partieular time.

Recommendations

Your Committee reeommends that the Resolutions attached to this report be adopted for submission to the House of Delegates of the American Medieal Assoeiation at its Interim Session being held December 2-4, 1958, in Minneapolis.

Respectfully submitted,

A. O. Pitman, M.D., Chairman
Committee on National Poliey

COMMITTEE ON NATIONAL POLICY

Resolution concerning a survey of the alleged practice by a small segment of the medical profession of charging excessive fees and performing of unnecessary procedures.

(Presented to the Council on November 1, 1958)

WHEREAS, it has been frequently asserted that a small segment of the medical profession consistently charge higher fees than circumstances warrant, and with regularity perform an excessive number of diagnostic procedures and, in addition, perform unnecessary surgical procedures, thereby substantially increasing the cost of medical care; and,

WHEREAS, it has also been asserted that these practices are more prevalent when such physicians are caring for patients who are known to have the benefits of prepaid medical, surgical and hospital insurance; and,

WHEREAS, such practices, to the extent that they may exist, have grave moral and ethical implications and, moreover, prevent the efficient and economical administration of prepaid health insurance plans and impede the progress of these plans in developing the most comprehensive health insurance protection possible; and,

WHEREAS, these practices also bring discredit upon the great body of physicians who are constantly striving to foster the most judicious utilization of prepaid medical care insurance benefits; and,

WHEREAS, reliable and accurate information regarding the existence of these practices and the extent to which they exist is essential if corrective procedures are to be undertaken; and,

WHEREAS, the application and enforcement of the Principles of Medical Ethics is primarily the responsibility of component and constituent medical associations; and,

WHEREAS, medical associations do not possess legal authority to utilize disciplinary proceedings to control those physicians whose practices and conduct are inimical to the best interest of the public and the profession generally;

THEREFORE, BE IT RESOLVED: that the Speaker of the House of Delegates and the Chairman of the Board of Trustees be directed to appoint jointly a special committee which shall:

(a) Have a survey conducted to determine whether a segment of the medical profession is consistently charging excessive fees and performing unnecessary procedures especially where prepaid health insurance is involved and the extent to which these practices exist; and,

(b) If such practices are found to exist, recommend procedures, in addition to the application of the Principles of Medical Ethics, which may be employed by component and constituent medical societies to combat these undesirable practices.

Other actions of the Council were as follows:

Adopted the following recommendations of the Committee on Public Health:

1. That a new and simplified means of reporting communicable disease be adopted. The procedure is recommended by the Oregon State Board of Health and is designed to make it easier and simpler for physicians to fulfill their obligations to report communicable diseases to their local health departments. The simplified method was developed by the State Board of Health following the conduct of four pilot studies in four counties in Oregon. The new procedure is a composite of the best features of each study. The physicians of Oregon will be receiving instructions and the necessary reporting forms from their local health departments as soon as they are printed and ready for distribution.

Under this plan, reportable communicable diseases are divided into three categories as follows:

a. Reportable immediately by telephone

b. Reportable by individual case card (EP-50)

c. Reportable only by total number of cases

General practitioners, internists and pediatricians will receive each week a return addressed envelope and the individual case reporting card (EP-50). The physician will simply complete the individual case card for those communicable diseases which are to be reported by individual case and mark on the flap of the return addressed envelope the total number of cases of each disease reportable only by total number of cases, tear off the flap and insert it with any individual case cards which he has completed and insert both in the return envelope and mail. Other physicians will receive supplies as needed. On the reverse side of the individual case card is to be printed the diseases in each category.

2. Approved the preparation and distribution by the Oregon State Board of Health of a wallet size personal immunization record card.

3. Approved the preparation also by the Oregon State Board of Health of an "Immunization Recommendations for the Pre-School Child" pamphlet for distribution by physicians and health departments to the parents of pre-school children.

4. Approved the revision of the "Immunization Manual for Physicians" which was published in 1950.

Approved the following recommendations of the Committee on Public Policy regarding legislative proposals which may be introduced in the 1959 Oregon Legislature:

1. Amendments to the Dental Practice Act to be sponsored by the Oregon State Dental Association which would amend the Dental Practice Act so as to prohibit advertising in any form by practicing dentists.

2. Amendments to the Practical Nurse Act proposed by the Oregon State Nurses Association providing that the membership of the Oregon State Board of Nursing shall be increased to include two licensed practical nurses.

3. A recommendation that the Society adopt a policy of favoring legislation for the registration but not the licensure of paramedical groups.

The Council also authorized the Commitee on State Industrial Affairs to request that the State Industrial Accident Commission place its revised Rules and Regulations which have already been adopted by the Council and the Commission in effect at the earliest possible

(Continued on page 1634)

(Continued from page 1633)

date. The Commitee was also authorized to request that the Commission begin at once to pay allowances for facilities and materials used in minor surgical procedures performed in the physician's office. The Committee was likewise authorized to solicit the views of each component society regarding the adequacy of the present "Maximum Medical Fee Schedule" of the State Industrial Accident Commission.

Some Changes Approved in Standards Set By School Bus Driver Physical Examination

Oregon's school bus driver physical examination program entered the final stages in early November when the State Board of Health reported that more than 1750 examination reports had been approved for licensure, and less than 2.5 per cent of all applicants were turned down for physical reasons.

Still in the hopper for evaluation were an estimated 400 examinations.

Meanwhile the State Medical Society's Committee on Traffic Safety, medical advisory group for the new program, approved some changes in physical standards which cleared the way for licensure of a number of additional applicants.

The Committee approved changes in auditory acuity standards, and in standards applying to hernia.

However, Chairman Otto C. Page of Portland announced that the existing vision requirement which rules out drivers with vision in only one eye is being retained. The Committee discussed possible revision of standards for persons with one eye who have demonstrated driving ability after receiving word that petitions in support of such drivers had been submitted by residents in three school districts. In each instance the driver owned the equipment and held a contract with the school district.

Recognizing that although some financial hardship cases undoubtedly are being created by administration of the program, the Committee members were unanimous in their opinion that current visual standards can be medically supported.

Following are the most recent Committee recommendations to the Board of Health for changes in school bus driver physical standards:

1. That the existing standard on vision be adhered to as reasonable and the minimum that can be medically supported for drivers of transportation vehicles such as school buses. It was again emphasized that the existing standard on visual acuity was already below that of Interstate Commerce Commission requirements for truck drivers and requirements for drivers of over-the-road transportation buses such as Greyhound.
2. That the existing standard on auditory acuity be changed as follows:
   a. Instead of using the present screening requirement of hearing the ordinary spoken voice in each ear at 2 feet, the examining physician use recommended standard test words and determine whether applicant can repeat correctly at least 50 per cent of the test words heard at a 5 *foot distance* in the better ear—*the examiner to be turned away* from the applicant so the latter cannot see the former's lip movements.
   b. If applicant fails to pass above screening test he be required to undergo an audiometer evaluation test and a record of such test (audiograms) be submitted along with the completed physical examination form for review.
   c. Applicants over 65 years of age be re-examined and reconsidered by the reviewing committee at each license renewal period.
   d. Hearing loss for the speech frequency in the better ear, aided or unaided, not to exceed 30 decibels. Periodic examination and evaluation of hearing in each driver having a hearing loss to be mandatory.
   e. If applicant's hearing is corrected by the use of a hearing aid, the individual be required to wear it at all times during operation of a school bus.
   f. Aphonia and severe speech defect be disqualifying.
   g. Individuals subject to sudden, unpredictable attacks of vertigo (Meniere's disease or other vestibular disturbances) be disqualified.
3. The existing standard applying to hernia be changed to read as follows:
   a. Inguinal or femoral hernia be non-acceptable until satisfactorily repaired except where the examining physician certifies that in his opinion the hernia, due to its small size, lack of symptoms or other significant reason, will not interfere with the safe driving of a school bus, the applicant with the defect may be accepted.
4. That no further revisions be made in existing standards for this year since most of the bus driver applicants already have completed their examinations. It is understood that the State Board of Health would like to have Committee re-evaluate the standards during the year and make further recommendations as indicated for application at the next license renewal period.

Laurence Selling Honored at University of Oregon Charter Day Observance

Laurence Selling of Portland was honored by the University of Oregon at its Charter Day Observance held on Wednesday, October 22, in the Ballroom of the Erb Memorial Union Building in Eugene. He was granted an award for distinguished service to the State along with Mr. E. B. McNaughton of Portland, Chairman of the Board of the First National Bank and Mr. William M. Tugman, newspaper publisher and editor of Reedsport, Oregon. Dr. Selling joined the faculty of the University of Oregon Medical School in 1912 and became Head of the Department of Medicine and the Division of Neurology in 1928. He retired as a member of the faculty in 1947 with the rank of emeritus professor of medicine. A $200,000 research scholarship fund has been established in his name in honor of his contributions to medicine.

Dr. Selling's interest in education was not limited to the field of medicine. For a period of 18 years he served as a member of the Board of Regents of Reed College and played a major role in the development of that institution.

The Society is highly honored to have one of its esteemed members receive this high recognition.

There Will Be A "Doctor In The House" Edwin R. Durno Wins State Senate Seat

With the election of Edwin R. Durno of Medford to the Senate from Jackson County, the medical profession in Oregon will be represented again in the Oregon State Legislature.

Dr. Durno will bring to his new responsibility a broad background in the affairs of the profession in this State. He is currently a member of the Oregon State Board of Medical Examiners, an agency on which he has served since 1947. In this capacity, he has given tirelessly of his time to assure that Oregon has the services of the most highly qualified physicians.

Dr. Durno was one of the original incorporators of Oregon Physicians' Service and is a past-president of both the Jackson County and Southern Oregon Medical societies. He was one of the leaders in the promotion of the new Rogue Valley Memorial Hospital in Medford and many other civic improvement projects.

As a member of the University of Oregon basketball team, he was the first Pacific Coast Conference player to be named All-American. Following graduation from Oregon, Dr. Durno remained as an assistant in physical education. Later in 1922, he taught physical education and coached football and basketball at Medford High School.

Dr. Durno completed his medical education at Harvard University in 1927, and, after intern and residency training at the Massachusetts General Hospital, returned to Medford to practice in 1930. During World War II he served three years with the Army Medical Corps, two of which were in the European theatre in three campaigns. He received the purple heart at Liege, Belgium, in December of 1944. He held the rank of major when discharged.

In addition to the candidacy of Dr. Durno, the Society watched with great interest the strong race which Mrs. Frank E. Fowler of Astoria made for the position of Representative from Clatsop County. Mrs. Fowler, who will be remembered as the Executive Secretary and Legal Advisor to the Oregon State Board of Medical Examiners from 1941 to 1948, was admirably qualified to serve in the Legislature and the Society was hopeful that she would be successful. During the time that Mrs. Fowler was affiliated with The Oregon State Board of Medical Examiners, she served as the Society's Legislative Representative at the 1945 and 1947 sessions. She is currently the Legislative Chairman of the Society's Woman's Auxiliary.

In reflecting upon Dr. Durno's election to the Senate, it is interesting to note that the medical profession has been represented in the Oregon State Legislature continuously since the 1931 session except during the sessions in 1949 and 1957. F. H. Dammasch of Portland, who served in the House of Representatives for six regular and one special session, was a candidate for the 1949 Legislature but was not elected. Dr. Dammasch died in December of 1955 and there were no candidates for either the House of Representatives or the Senate from the medical profession for the 1957 Legislature.

According to the information at the disposal of the Society, the first doctor of medicine to serve in the Oregon State Legislature was Andrew C. Smith of Portland who was a member of the Senate during the 1901 and 1903 sessions. Dr. Smith did not seek office again until 1914 when he was a successful candidate for the House of Representatives and served during 1915.

For the next 16 years the Oregon State Legislative sessions were without a "doctor in the house." In 1931, Joel C. Booth of Lebanon was a successful candidate for the Senate from Linn County and served for one full term in the 1931 and 1933 sessions. It is not certain whether Dr. Booth sought reelection but the records indicate that he did not return to the Legislature until 1939. Beginning in that year, he was a member of the Senate of the next four Legislatures.

It is also interesting to note that there were five physicians in the Legislature in 1937 and 1941; four in 1939 and 1943; three in 1933 and 1935; two in 1945 and one physician in the 1931, 1947, 1951, 1953 and 1955 Legislatures.

Following Dr. Booth or serving concurrently with him during the subsequent sessions were these physicians:

James A. Best of Pendleton who was a member of the House of Representatives in 1933 and later was a member of the Senate continuously from 1935 through 1943.

F. H. Dammasch of Portland was a member of the House of Representatives first in 1933 and then returned 10 years later for the 1943 session. He was subsequently a member of the House of Representatives during the sessions of 1947, 1951, 1953, and 1955.

C. T. Hockett of Enterprise was a member of the House of Representatives for four consecutive sessions beginning in 1935.

J. F. Hosch of Bend served in the House of Representatives concurrently with Dr. Hockett.

H. R. Kauffman of Toledo was a member of the Senate for one term and served during the 1941 and 1943 sessions.

Archie K. Higgs of Portland and *A. Orville Waller* of Eugene were both members of the House of Representatives during the 1937 session.

William A. Moser of Grants Pass was a member of the Senate of the 1945 Legislature.

In 1948, Regner W. Kullberg of Astoria was a candidate for the House of Representatives from Clatsop County. He was, however, not elected. Likewise, in 1948 William J. Weese of Ontario was a candidate for the Senate but was defeated by Mr. Elmo Smith, who as it will be remembered became President of the Senate, an office he held at the time of the death of Governor Paul Patterson, at which time, of course, Senator Smith was elevated to the Governorship.

The Society looks with justifiable pride upon its members who have given this public service to our State.

Eugene Surgical Society Hears Two Medical Educators

Guest speakers at the fourth annual Eugene Surgical Society meeting October 17 and 18 were John A. Gius, professor and chief of the department of surgery of University Hospitals at the State University of Iowa, and Abou D. Pollack, assistant professor of pathology at Johns Hopkins University School of Medicine. Dr. Gius presented two papers and Dr. Pollack conducted the clinical pathologic conference on the second day of the meeting.

Papers were also read by three Eugene physicians. C. D. Donohue spoke on urology; Julius H. Hessel discussed vascular emergencies; and James Brooke reported on European trends in the surgery of arthritis.

Former AMA Trustee R. A. Fenton Dies

Death early November 2 ended the long and distinguished career of Dr. Ralph Albert Fenton of Portland, prominent eye, ear, nose and throat specialist and former Trustee of the American Medical Association.

Dr. Fenton served as Trustee to the AMA from 1936 to 1945. Prior to his election to the high office, he participated as an Oregon Delegate to the AMA Section on Laryngology, Rhinology and Otology.

During his medical career which dated back to 1906, Dr. Fenton was honored many times for his research and writings.

Dr. Fenton was born in Lafayette, Oregon, on Nov. 5, 1880, son of the late Judge W. D. Fenton. He was graduated from old Central Grammar School in Portland in 1894 and later from Portland Academy. He studied two years at the University of California and was graduated from the University of Oregon in 1903. He obtained his medical degree from Northwestern University Medical School in 1906, and entered practice in Portland a year later after completing an internship at the Illinois Eye and Ear Infirmary in Chicago.

Dr. Fenton was Professor of the Department of Otolaryngology at the University of Oregon Medical School from 1909-46 when he was named Emeritus Professor.

During World War I Dr. Fenton went overseas as a Major in Base Hospital 46, serving in many of the same sectors of France as the famed 91st Division. He also served in the Army of Occupation in Germany and rose to the rank of Colonel in the Army Reserves.

In addition to his many professional and medical society activities, Dr. Fenton also devoted considerable time to volunteer service as a member of the Advisory Committee to the Sommer Memorial Lecture Fund.

Dr. Fenton's outstanding work was recognized in 1928 when he was presented the Casselberry prize of the American Laryngological Association, in 1943 when he received the De Roaldes medal and again in 1943 when he received an honorary doctor of science degree from the University of Oregon.

Dr. Fenton was prominent in many professional organizations. He was a past-president of the Oregon Academy of Ophthalmology and Otolaryngology; president in 1931 of the Portland Academy of Medicine; a councilor from 1926-1930 of the American Laryngological, Rhinological and Otological Society; a director in 1927 of the American Board of Otolaryngology; vice-president in 1927 and secretary in 1916 and president in 1942 of the Pacific Ophthalmology and Otolaryngology; vice-president in 1927 of the American Laryngological Association, and secretary in 1916 and President in 1942 of the Pacific Coast Oto-Ophthalmological Society.

In addition to his affiliation with the Oregon State and Multnomah County Medical Societies, Dr. Fenton also was a Fellow in the American College of Physicians and a member of the American Otological Society, and was U. S. Delegate to the International Congress on Military Medicine and Pharmacy at The Hague in 1931.

Dr. Fenton also was a student of languages and was able to speak in seven tongues, including Siamese and Chinook. His keen interest in a wide variety of activities outside the medical world ranged from gardening to many years of service on the Board of Directors of the Portland Library Association.

Dr. Fenton is survived by the widow, Mabel Copley-Smith, whom he wed in 1908. Memorial services were held at the First Unitarian Church in Portland.

C. O. Wainscott of Pendleton Passes

Dr. C. O. Wainscott of Pendleton died unexpectedly of a heart attack on October 25, after killing a deer in the Lehman Springs vicinity.

Dr. Wainscott, native of Grant County where he was born in 1885, was the oldest practicing physician in the point of service in Umatilla County when he retired last March after 46 years of practice. He graduated from the Medical Department of Willamette University in 1912.

He established his practice in Hermiston that year and remained there until called into the United States Army Medical Corps during World War I. He spent two years in the American Expeditionary forces serving in France. He held the rank of Captain at the time of his release from service.

Following World War I, he resumed his practice in Hermiston where he practiced for about a year before moving his practice to Pendleton.

Dr. Wainscott was active in many phases of community life as well as holding a prominent place in medical circles in Eastern Oregon for many years. He was a member of the Umatilla-Morrow County Medical Society, the Eastern Oregon District Medical Society, the Oregon State Medical Society and the American Medical Association. He was honored by the Oregon State Medical Society at the time of his retirement by election to life membership.

OSMS To Have Centennial Exhibits

The Oregon State Medical Society will be represented by one and possibly two exhibits when the Oregon Centennial Exposition opens next June in Portland.

At its last meeting the Committee on Public Relations voted to arrange for one large exhibit of general medical interest, providing space can be donated for this purpose.

Chairman Charles E. Littlehales explained the Committee did not feel that sufficient funds would be available to sponsor a suitable exhibit if the space must be purchased.

Another Centennial exhibit is being prepared by the Committee on Oregon Medical History under chairmanship of E. G. Chuinard. The exhibit will depict the colorful era of pioneer medicine in the Oregon territory as seen in the careers of famous early day physicians.

The medical history exhibit was authorized by the House of Delegates at its meeting in Portland during September.

Lane County Medical Society

At the November meeting of Lane County Medical Society, Emmett E. Woodward of Eugene discussed Cervical Cytological Cancer Detection. Also included on the program was the showing of the American Cancer Society Film, Time and Two Women, following which there was a discussion period. It was announced during the meeting that the county society would again cosponsor an Athletic Injuries Course with the University of Oregon next June.

Portland Physician Named to High Post

At the interim meeting of the American Institute of Ultrasonics in Medicine held in Philadelphia August 23, Arthur C. Jones of Portland was elected to the Executive Board for 1959-1960.

A. J. Kreft Retires as President of Izaak Walton League of Oregon

For the past two years the Izaak Walton League of Oregon has prospered under the dynamic leadership of A. J. Kreft of Portland.

Dr. Kreft, a member of the Council of the Oregon State Medical Society and past Chairman of the Committee on Public Relations, has brought recognition to the entire profession through his volunteer service as president of the well-known organization of sportsmen dedicated to the preservation of natural resources.

The League's publication, *Outdoor Oregon*, editorialized on its retiring president as follows:

> So-Long Doc . . .
>
> That perspicacious physician, A. J. Kreft . . . more familiarly known as "Doc" to his legion of friends in and out of the League throughout the State . . . is laying his splintered gavel on the rostrum and oiling up his spinning reel and shotgun for some badly needed relaxation come November 29, when he retires as Oregon Division President.
>
> This writer, like many other people, has been pressed, urged and cajoled by the good doctor to do his share for IWLA lo these many times during the past biennium. Dr. Kreft is a dedicated man, responsible to the ideals of the organization he has served so well. Yet with this dedication he has always allowed himself exposure to all sides of any question.
>
> During his two year term, the League has prospered in many ways. It has grown in stature in the eyes of outsiders and most of all he has created a climate of enthusiasm and awareness of obligation within the many state chapters.
>
> Conservation programs in Oregon are richer through Dr. Kreft's two years of devoted service as state president. As one, all Waltonians, wish him well.

UOMS Receives $1 Million in Grants

Since the beginning of the research year on May 1, the University of Oregon Medical School has received more than $1,316,000 in gifts, grants and equipment. Largest of the research grants is $300,131 from the National Institute of Neurological Diseases and Blindness of the U. S. Public Health Service for a study of the problems of pregnancy and their relationship to inborn defects in children.

Other large PHS grants include: a half million dollars for training and research in the division of experimental medicine; $40,127 for work on the partial standardization of the psychiatric interview; $35,000 for multiple sclerosis research; $26,504 to Archie R. Tunturi, assistant professor of anatomy; $24,863 to John M. Brookhart, head of the department of physiology; $23,979 to Donald E. Pickering, assistant professor of pediatrics; and $20,000 to Charles T. Dotter, head of the department of radiology.

Grants from other sources are: $27,000 from the National Science Foundation for a study of the biochemistry of natural melanins; $20,000 from the Atomic Energy Commission for a study of the use of radioactive sodium in cerebral edema, brain tumors, and focal lesions, and for a study involving radioactive phosphorus; $10,000 from the McDermott Foundation of Dallas, Texas, to support a constitutional medicine project; and $9,200 from the U.S. Air Force for research on cardiovascular reactions of Alaskan Eskimos.

HERMAN A. DICKEL, M.D.

President's Page

The opportunity given to the President of a State Medical Society to visit the many county and component medical societies throughout the State has deeply impresed me especially in one respect.

I had always thought that physicians because of rather similar professional education and interests would show singularity in their sense of responsibility to one another. I thought that "medicine" contains men and women who think, feel, act, behave and deal with one another on a common ground, not alone because of the education and interest they share, but because they are professional people bonded together by Hippocratic Oath, professional ethics, licensing obligations and respect for dignity of the profession.

I am duly impressed to find that such is not always the case, at least not in our State.

Admittedly I may have been a bit naive, and perhaps (for special reasons) I am stretching a point to emphasize an existing condition.

I am talking about the matter of *"Neglect"!* I'm talking about the manner in which intellectually well endowed men and women, academically well trained for medicine, professionally well prepared to practice their art and science anywhere, can so frequently neglect their deep moral obligations to help fellow physicians resolve the many problems they face in the day-to-day practice of medicine.

Oh yes, we offer assistance in good will by referring patients; we attend scientific lectures presented by our colleagues; we exchange greetings and other words at staff meetings; we socialize and sometimes "bend a few."

But how often do we get together to compare notes on the problems in the practice of medicine at the only practical time when such things can be brought up, discussed and solved—the regular meetings of our component medical societies?

Some component societies do a magnificent job. In these areas there exists fine spirit of cooperation and friendliness. Patients and the community speak well of these doctors.

In other areas, especially in larger districts, such is not the case. Many fine physicians completely ignore or neglect their fellow physicians' plight by staying away from county society meetings, or by publicly expressing opinions which are harmful in the long run to other physicians as well as themselves. In these areas, even though the individual doctor practices good medicine, medical organization is not so respected. No one person suffers then—we all do.

There is something, then, we can all do. We can make a solemn pledge, not to ourselves but to each of our colleagues, to treat him with greater honor and respect. We can promise to help where it means the most, at the regular business meetings of the medical society where the deeply professional aspects of medical practice are opened, looked at and solutions explored and found.

Do not neglect your professional friends. Attend your local society meetings and *share* the burden of helping to solve some of these intricate problems.

Herman A. Dickel, M.D.

President

"Much better– thank you, doctor"

Proven in research

1. Highest tetracycline serum levels
2. Most consistently elevated serum levels
3. Safe, physiologic potentiation (with a natural human metabolite)

And now in practice

4. More rapid clinical response
5. Unexcelled toleration

COSA-TETRACYN*

GLUCOSAMINE-POTENTIATED TETRACYCLINE

CAPSULES
(black and white)
250 mg., 125 mg.
(for pediatric or long-term therapy)

ORAL SUSPENSION
(orange-flavored)
125 mg. per tsp. (5 cc.)
2 oz. bottle

NEW! PEDIATRIC DROPS
(orange-flavored) 5 mg. per drop, calibrated dropper,
10 cc. bottle

COSA-TETRASTATIN*

glucosamine-potentiated tetracycline with nystatin

Antibacterial plus added protection against monilial super-infection

CAPSULES (black and pink) 250 mg. Cosa-Tetracyn (with 250,000 u. nystatin)

ORAL SUSPENSION 125 mg. per tsp. (5 cc.) Cosa-Tetracyn (with 125,000 u. nystatin), 2 oz. bottle

COSA-TETRACYDIN*

glucosamine-potentiated tetracycline-analgesic-antihistamine compound

For relief of symptoms and malaise of the common cold and prevention of secondary complications

CAPSULES (black and orange)—each capsule contains: Cosa-Tetracyn 125 mg.; phenacetin 120 mg.; caffeine 30 mg.; salicylamide 150 mg.; buclizine HCl 15 mg.

WASHINGTON STATE
MEDICAL ASSOCIATION
1309 Seventh Avenue
Seattle 1, Washington

ANNUAL MEETING
Seattle
September 13-16, 1959

President, Emmett L. Calhaun, M.D., Aberdeen Secretary, Wilbur Watsan, M.D., Seattle Executive Secretary, Mr. R. W. Neill, Seattle

State Health Dept. and USPHS Establish Shellfish-Sanitation Research Lab

The first Pacific Coast shellfish-sanitation research laboratory was opened November 14 on Burley Lagoon at Purdy, Wash. The facility is a joint venture of the Washington State Department of Health and the United States Department of Health, Education and Welfare, Public Health Service.

A $40,000 appropriation by the 1957 legislature has enabled the state to lease the location, construct the facilities and maintain the buildings. As its share, the Public Health Service is staffing the laboratory with a four-man team of research scientists from its Sanitary Engineering Service. The scientists, who will man the laboratory for a minimum five-year period, will conduct experiments on the sanitary bacteriology of harvesting, processing and marketing of commercial species of shellfish in the area.

The research team hopes to present evidence for the establishment of more valid sanitation control standards pertaining to Pacific Coast oysters and clams. Results of the studies are expected to be helpful to the shellfish industry and the entire Pacific Northwest. The findings and progress of the team will be announced in interim technical reports which will be distributed by the Public Health Service.

Three Elected to State Legislature

Returns of the November elections show that two physicians and a physician's wife will be returned to the State Legislature when the 36th session convenes in January for 60 days. A. O. Adams (R) of Spokane will serve his fourth term as a member of the House of Representatives; James L. McFadden (D) of Port Angeles, who was chairman of the House Committee on Medicine, Dentistry and Drugs during the last session, will return for his third term; and Mrs. John W. Epton (D), wife of a Spokane physician, will serve her second term in the House.

Film Wins International Science Prize

The film, "Ovulation and Egg Transport in the Rat," produced by R. J. Blandau and the University of Washington School of Medicine, has won a top prize in the third International Review of Scientific Motion Pictures in Padua, Italy. Dr. Blandau's movie was awarded a Silxer Ox Skull in the biological-science division of the competition. A Japanese film, "The World of Microbes," won the first prize, a Golden Ox Skull. Dr. Blandau is professor of anatomy and assistant dean of the University School of Medicine. A total of 63 movies submited by 18 countries were entered in the annual event.

YEAR'S WORK BEGINS—The Executive Committee and Board of Trustees of the Washington State Medical Association for 1958-59 began their year's work with meetings in Seattle during October. Top photo shows session of Executive Committee, whose members are, from left: Frederick A. Tucker, Seattle, president-elect; Emmett L. Calhoun, Aberdeen, president; Milo T. Harris, Spokane, past-president and Committee chairman, and Wilbur E. Watson, Seattle, secretary-treasurer. In lower photo, President Calhoun welcomes new members of Board of Trustees, from left: William H. Hardy, Aberdeen; John R. Hogness, Seattle; Dr. Calhoun; Gayton S. Bailey, Seattle, and Robert B. Hunter, Sedro Woolley.

Washington Internists Elect Officers

At their recent annual meeting in Seattle, members of the Washington State Society of Internal Medicine elected Robert W. Simpson, Seattle, to the presidency for 1959. G. Marshall Whitacre of Tacoma assumed the presidency for the coming year succeeding John Skinner of Yakima. Warren Spickard of Seattle was re-elected to the post of secretary-treasurer.

Others named to high offices include: William Watts of Seattle, Harold Gunderson of Everett and Joseph Delaney of Spokane, councilmen; Merritt Stiles of Spokane and Dr. Skinner, delegates; and Fred Radloff of Wenatchee and Dr. Delaney, alternate delegates. Holdover councilmen are Heyes Peterson of Vancouver, Dr. Radloff and Robert Lane of Tacoma.

Mr. James Meehan, district representative of the Equitable Life Assurance Society of the United States, addressed the meeting of more than 100 Washington State internists.

WSMA President Visits County Societies—*Top row, from left; Okanogan County Medical Society meeting*: Louis S. Dewey, Okanogan, member of WSMA Board of Trustees; WSMA President Emmett Calhoun of Aberdeen; Mr. Richard Peary, Republic, president of Ferry County Bar Association; Harold Lamberton, Brewster, president of Okanogan County Medical Society. *Bottom row, from left, Grant County Medical Society meeting*: Wayne L. Piper of Ephrata, secretary of Grant County Medical Society; Dr. Calhoun; Ronald M. Gill, Moses Lake, president of the county society.

President Calhoun Speaks on Medical Care For the Aged at Visits to County Societies

Beginning his visits to county medical societies, President Emmett L. Calhoun of the Washington State Medical Association, recently appeared before medical groups in Ephrata, Wenatchee and Okanogan. He has other engagements to attend meetings of societies in Walla Walla, Skagit, King, Yakima, Whatcom and Clark Counties. Tentative dates are scheduled for Lewis and Cowlitz County Societies.

Dr. Calhoun declared medical care for the aging population continues to be a serious problem facing the profession. "The Forand Bill, which would provide medical and hospital care through the Social Security system, failed in Congress this year, but the bill is by no means dead. The medical profession must give serious and immediate attention to this problem, or the government will take over its solution and, perhaps, in ways we will not like.

"If the medical profession does not soon come up with some answers to the problem of the care of the aged, we will be faced with a real crisis, because the government will force an answer right down our throats."

Dr. Calhoun said physicians are handicapped by two important things, lack of communications and lack of unity. "For instance," he stated, "we have in this state a system of caring for the indigent—the welfare medical program handled by doctors themselves—that is without equal in the United States. Yet few doctors outside of this state know about it." He said the American Medical Association has recognized the lack of communications, and has begun publication of a bi-weekly newspaper to improve this situation across the country.

As to the problem of unity, Dr. Calhoun declared: "It seems to take some great crisis to get the medical profession to act with even a semblance of unity."

Noting that the State Legislature will convene in January, Dr. Calhoun said there will be many serious legislative proposals affecting the profession. It is vitally important, he stated, that physicians get to know their state and national representatives, and inform them of their views.

Vitally interested in all phases of prepaid medical plans in Washington State, Dr. Calhoun sought information and counsel from physicians wherever time permitted. He met with the Chelan County Bureau Board of Trustees in Wenatchee.

In Okanogan, the Washington State Medical Association President appeared before a joint meeting of the Bar and Medical professions. To them, he outlined the Code of Cooperation adopted by the National Bar Association and the American Medical Association, explained the possibilities of this sort of cooperation on county and state levels, and urged consideration of this type of program by both groups.

Dr. and Mrs. Calhoun attended the Western Conference on Prepaid Medical Plans in San Francisco.

Bentley Colcock of Boston To Speak At Seattle Surgical Society Meeting

Guest speaker at the 1959 Annual Meeting of the Seattle Surgical Society will be Bentley P. Colcock, staff surgeon at the Lahey Clinic in Boston. During the two-day session, which will be held January 30 and 31 in the Olympic Hotel, Dr. Colcock will discuss the papers presented and in addition will read three papers. He will talk on carcinoma of the thyroid, biliary tract surgery and carcinoma of the colon. Dr. Colcock, who is a fellow of the American College of Surgeons, specializes in surgery of the thyroid and abdomen.

BENTLEY P. COLCOCK, M.D.

Dr. Colcock received his medical degree in 1933 from the University of Pennsylvania School of Medicine. He took his internship and residency training in surgery at the Philadelphia General Hospital. From 1936 to 1938 he was associated with the Lahey Clinic in Boston as a fellow in surgery. Following this he was named to his present position as staff surgeon at the Clinic. During World War II, he was a chief general surgeon in the Army Medical Corps, serving in Africa and Italy. He was discharged with the rank of Lieutenant Colonel.

Program for the Surgical Society's annual meeting has been arranged under the chairmanship of J. Thomas Payne. Wilbur Watson is president of the group.

3:05 p.m. Results to Date in Open Heart Surgery at the University of Washington—K. A. Merendino, Loren Winterscheid, R. Blumberg, Roy Vetto, and David Dillard
3:20 p.m. Common Duct Exploration Without Operative Cholangiography—Allan W. Lobb
3:30 p.m. Hemobilia—I. J. Gustafson, J. T. Payne
3:40 p.m. Surgical Aspects of Jaundice—Bliss L. Finlayson
3:50 p.m. Pancreatitis; Surgical Approaches—Lucius D. Hill and Caleb S. Stone, Jr.
4:00 p.m. Duplications of the Gastrointestinal Tract—Frank C. Henry
4:10 p.m. Discussion of Papers—Bentley P. Colcock

Evening

6:00 p.m. Social Hour
7:00 p.m. Banquet
Problems in Biliary Tract Surgery—Bentley P. Colcock

SATURDAY, JANUARY 31, 1959

Morning

8:00 a.m. Breakfast
8:45 a.m. Panel—Ulcerative Colitis
Moderator: J. T. Payne
Panel Members: Bentley P. Colcock
Sherwood B. Fein
William B. McMahon
9:45 a.m. Intermission and Adjournment to Olympic Bowl
10:00 a.m. Fracture Healing in Children—Louis H. Edmunds
10:10 a.m. Coccyodynia—Ernest M. Burgess
10:20 a.m. Current Views on the Metastatic Spread of Carcinoma of the Colon—Matthew H. Evoy
10:30 a.m. Some Recent Advances in the Treatment of Prostatic Carcinoma—O. A. Nelson
10:40 a.m. Repair of Third Degree Obstetrical Lacerations—Edwin T. MacCamy
10:50 a.m. Discussion of Papers
11:00 a.m. Intermission
11:15 a.m. The Mucosal Polyp and Carcinoma of the Colon—Bentley P. Colcock

Honorary Membership Conferred

William L. Ross, Jr., of Yakima has been elected an honorary member of the Yakima County Medical Society in recognition of his long and distinguished career. The honor was conferred by Fred Burrows, president of the society. Dr. Ross has been in active medical practice for 42 years, with most of that time spent in Yakima. He has held many offices in his county and state medical groups and is a past-president of the state chapter of the American College of Surgeons and of the Western Section of the American Urology Association.

If not... here's why you should try new Tessalon Perles

- controls cough by dual action—in the chest as well as at cough centers of the brain.
- 2½ times as effective as codeine[1] without the side effects of codeine.
- controls cough frequency without decreasing productivity or expectoration.
- Perles offer convenient, precise dosage and relief for 3 to 8 hours.

AVERAGE ADULT DOSAGE: 100 mg. t.i.d.
In refractory cough, up to 6 perles (600 mg.) a day may be given.
AVERAGE DOSAGE FOR CHILDREN UNDER 10:
One Pediatric Perle (50 mg.) t.i.d.
SUPPLIED: TESSALON *Perles*, 100 mg. (yellow).
Pediatric Perles, 50 mg. (red).
Pediatric Perles available Oct. 1, 1958.

1. Shane, S. J., Krzyski, T. K., and Copp, S. E.: Canad. M.A.J. 77:600 (Sept. 15) 1957.

Mazola® Corn Oil...a palatable food effective in the management and control of serum cholesterol levels

Extensive clinical tests show that when the diet contains an adequate amount of Mazola Corn Oil, serum cholesterol levels tend to be normal . . . high blood cholesterol levels are lowered, normal levels maintained.

Fortunately for both physician and patient, Mazola Corn Oil is not only rich in unsaturated fatty acids, it is also a delicious food. It becomes an enjoyable and normal part of the patient's daily meals—no complicated or special diet is required.

Here is a therapy easy for you to prescribe, easy and pleasant for your patients to follow.

Nutritional authorities generally recommend that fats should provide no more than 30% of the total calories. In cholesterol-lowering diets from one-third to one-half of these fats should be unsaturated, such as in Mazola Corn Oil.

IN COOKING OR SALADS

Mazola Corn Oil is a superlative cooking oil as well as a delicious salad oil. Adequate amounts can be eaten daily—in a wide variety of salad dressings and in a great number of fried and baked foods.

MOST EFFECTIVE

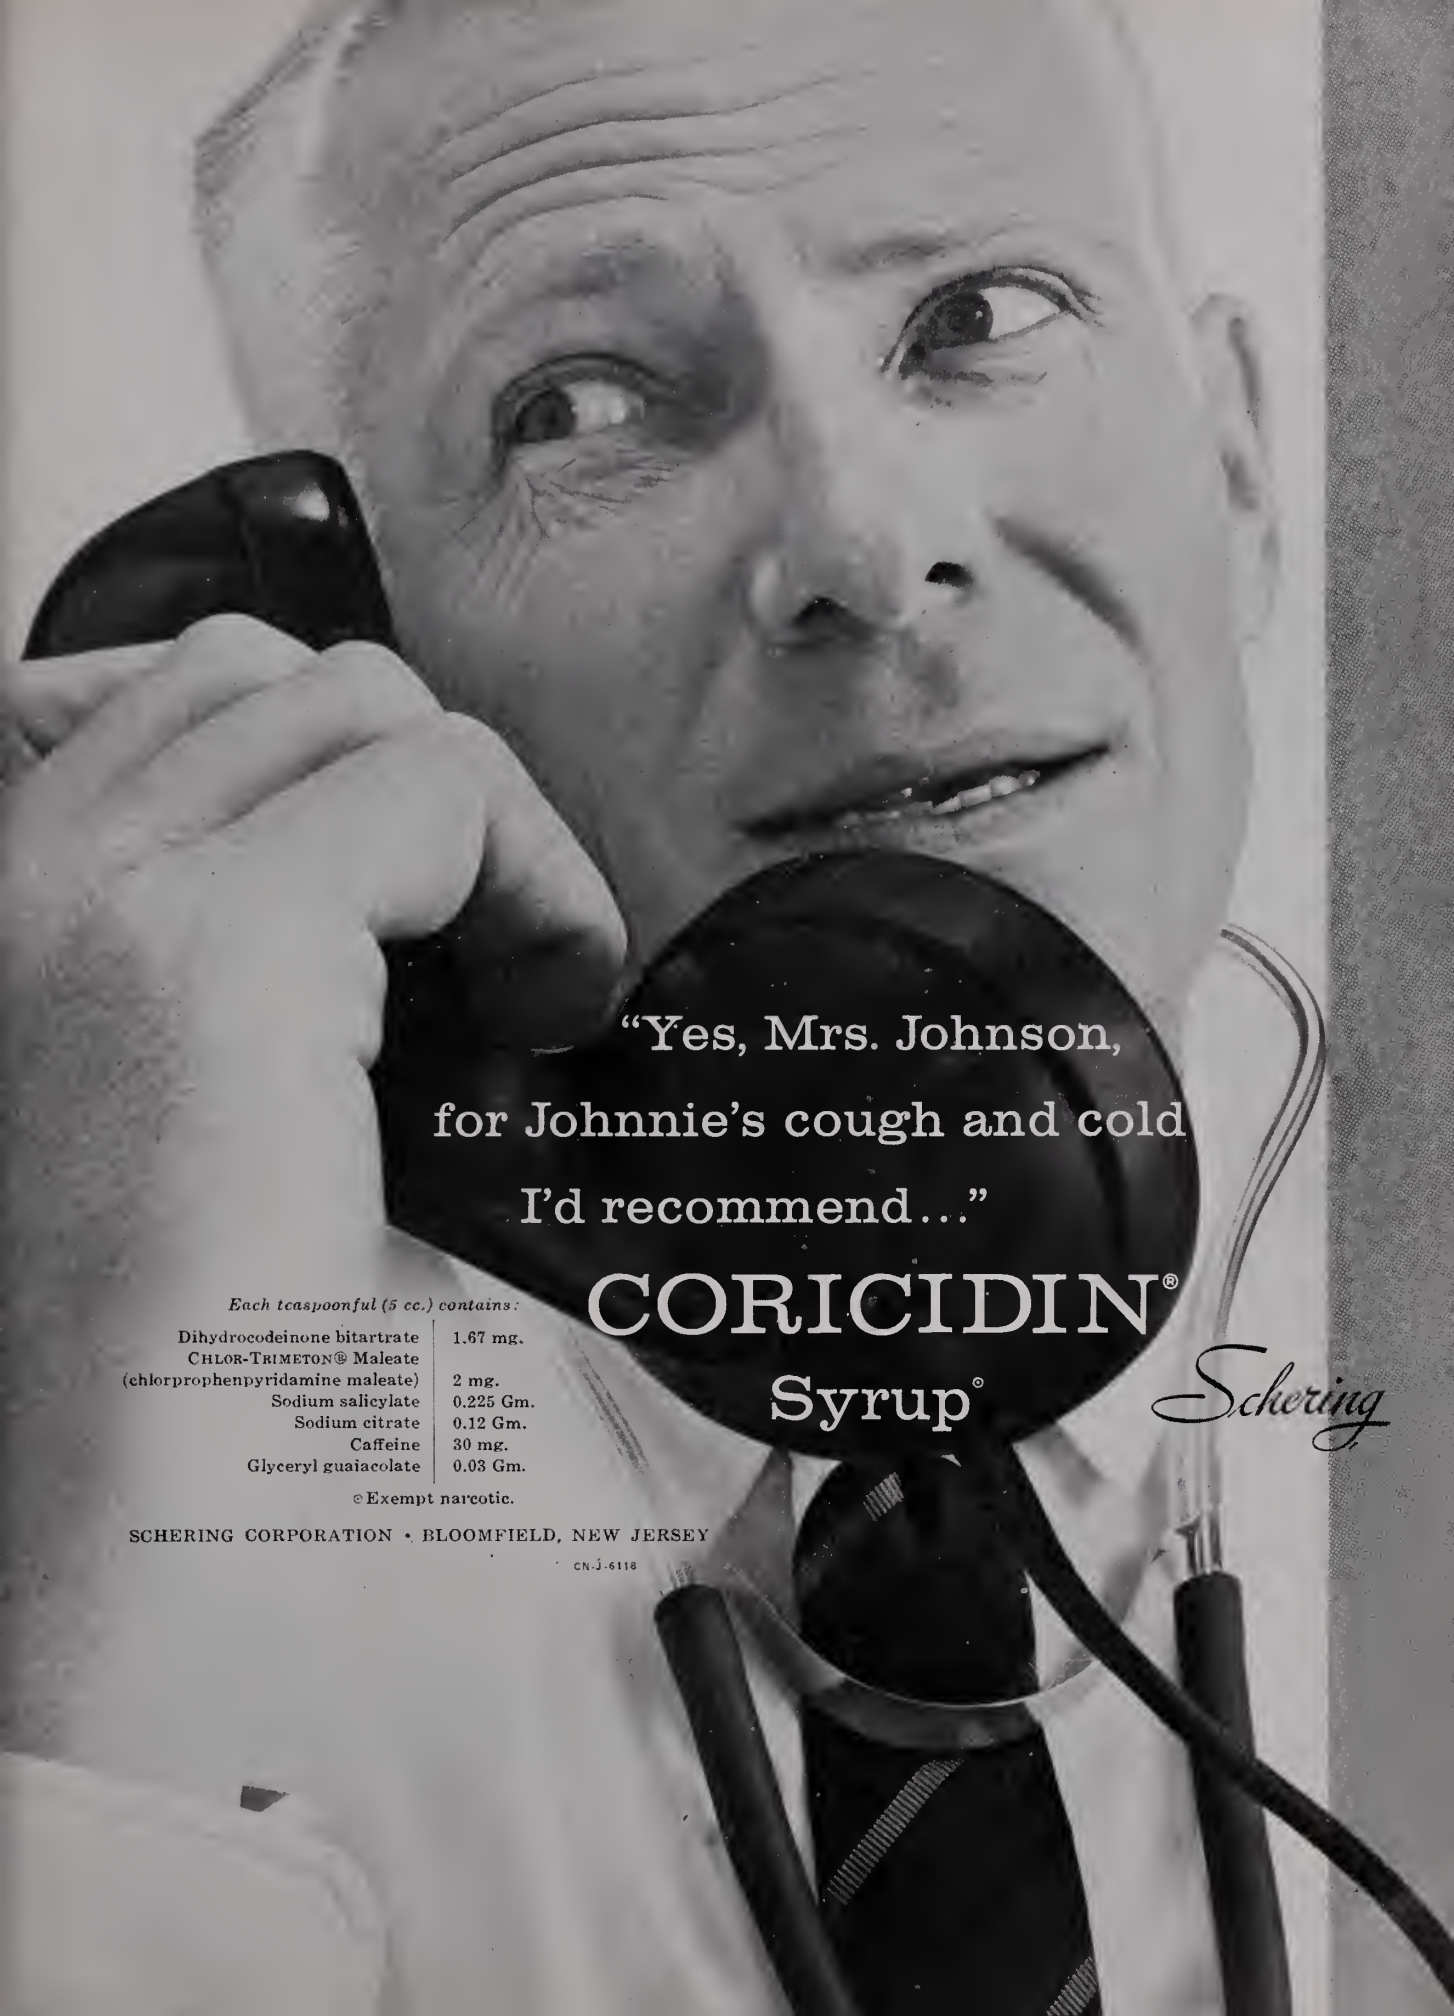
Pure, clear, bland and odorless. Mazola Corn Oil is stable and dependable, providing the full measure of cholesterol-lowering unsaturated fatty acids characteristic of corn oil.

ECONOMICAL

Mazola Corn Oil is sold in grocery stores throughout the country, is available everywhere. Its comparatively low cost makes it as economical as it is effective.

CORN PRODUCTS REFINING COMPANY

MAZOLA* CORN OIL is a rich source of unsaturated fatty acids. It can form a regular part of the diet without major changes in eating habits to provide an effective unsaturated oil as a part of the daily meals.



EACH TABLESPOONFUL OF MAZOLA CORN OIL PROVIDES NOT LESS THAN:

Linoleic Acid	7.4 Gm.
Sitosterols	130 mg.
Natural Tocopherols	15 mg.

TYPICAL AMOUNTS PER DIET

For a 3600 calorie diet	3 tablespoonsful
For a 3000 calorie diet	2.5 tablespoonsful
For a 2000 calorie diet	1.5 tablespoonsful

*Reg. U. S. Pat. Off.

Each teaspoonful (5 cc.) contains:

Dihydrocodeinone bitartrate	1.67 mg.
CHLOR-TRIMETON® Maleate (chlorprophenpyridamine maleate)	2 mg.
Sodium salicylate	0.225 Gm.
Sodium citrate	0.12 Gm.
Caffeine	30 mg.
Glyceryl guaiacolate	0.03 Gm.

©Exempt narcotic.

SCHERING CORPORATION • BLOOMFIELD, NEW JERSEY

J. G. Matthews of Spokane Honored On His 77th Birthday by Hospital Guild

The 77th birthday anniversary of St. Luke's Hospital's oldest active staff member, J. G. Matthews, was celebrated by a gala, surprise party given by the Doctors Matthews guild of the hospital. In addition to guild members and hospital officials and personnel, Dr. Matthews' wife and their daughter, Mrs. Danforth M. Wallace of Indiana, attended the event.

Dr. Matthews is one of the oldest active physicians in Spokane, serving on all three of the local hospitals. He entered the University of Maryland School of Medicine and College of Physicians and Surgeons in 1901, the last year the institution could accept a man without a high school education, and finished in the upper fourth of his class. Following his graduation in 1905, Dr. Matthews practiced in a primitive coal-mining town in western Maryland.

Dr. Matthews moved to Spokane in 1908 and was associated with his brother, A. A. Matthews, until the latter's death in 1940. A. T. Perry has been his associate for the last 10 years.

In 1910 Dr. Matthews began three years of specialty training in surgery at Johns Hopkins Hospital and he visited the Mayo Clinic one week a year while the Mayo brothers were alive. He served in the medical corps with evacuation hospitals during World War I.

Seattle Gynecological Society

Those named to head the Seattle Gynecological Society for the coming year are L. Bruce Donaldson, president, and Robert N. Rutherford, secretary-treasurer. The election of officers was held at the September 17 meeting at the Washington Athletic Club. It has been requested that all notices be directed to Dr. Rutherford at 707 Broadway, Seattle 22, Wash.

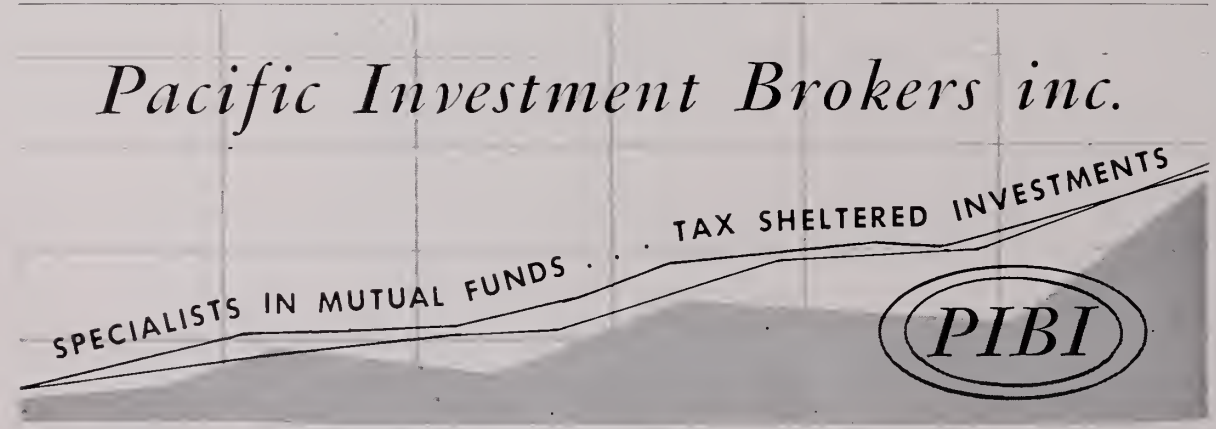
King County Medical Service Elects

Eugene F. McElmeel has been elected president of the King County Medical Service Corporation to succeed Roland D. Pinkham. Vice-president is Albert F. Lee and secretary-treasurer is Robert A. Pommerening. Those named trustees are: Robert C. Manchester, Gordon A. Dodds, Frank C. Henry and John R. Wilton. All are Seattle physicians.

Obituaries

Dr. William Huey, 45, died October 25 in a Seattle hospital of a myocardial infarction and arteriosclerotic heart disease. Dr. Huey received his medical degree in 1939 from the University of Edinburgh Faculty of Medicine, Scotland. He had practiced in Calgary, Alta., 10 years before moving to Seattle three years ago. During World War II, he served as a flight surgeon with the Royal Air Force.

Dr. Park Weed Willis, Sr., 91, Seattle surgeon, died October 26 in his home of a cerebral thrombosus and generalized cerebral arteriosclerosis. Dr. Willis was graduated from the University of Pennsylvania Medical School in 1891 and was awarded the school's Alumni Award of Merit in 1951. He was the oldest original member of the medical staff of the Children's Orthopedic Hospital in Seattle, and was a founder and the first president of the Seattle Community Fund. Dr. Willis was the first president of the Washington State Medical Association and a past president of the King County Medical Society. He was a founder and fellow of the American College of Surgeons. In 1945, Whitman College, from which Dr. Willis received his bachelor-of-science and master's degrees, awarded him an honorary doctor-of-laws degree. He served on the Whitman College board of trustees from 1909 to 1949.



Dr. Albert E. Hillis, 84, a past-president of the Pierce County Medical Society, died October 24 in South Pasadena, California. Dr. Hillis had practiced in Tacoma for 40 years before retiring two years ago and moving to California. He received his medical degree in 1902 from the University of Michigan Medical School, Ann Arbor.

Locations

John S. Dunlop has entered into association with Albert F. Degner of Bremerton. Dr. Dunlop was graduated from the University of Illinois School of Medicine in 1955 and served his internship at Pierce County Hospital in Tacoma. He recently completed a tour of duty with the U.S. Air Force.

Clark County Medical Society

Trauma of the Chest Wall was title of the paper presented by Charles H. Sparks of Portland, guest speaker at the November 4 dinner meeting of Clark County Medical Society. During the business session that followed reading of the paper, William J. Gardner was elected to active membership in the Society.

Southwestern Physicians Hear C. Smyth Lecture on Treatment of Rheumatoid Arthritis

Overdosage is a serious medical problem in treating rheumatoid arthritis with the new more powerful modifications of the cortisone drugs, Charley Smyth, associate professor of medicine at the University of Colorado and a nationally known rheumatologist, told members of the Southwestern Idaho District Medical Society at a meeting in October.

Pointing out that of all types of arthritis, rheumatoid arthritis is the "big crippler," with about one-third of all patients suffering from this type, Dr. Smyth said that physicians have fallen down on the greater chance to use the newer cortisone drugs because "we are all in the habit of relating dosage to cortisone and we unconsciously give larger and larger dosage, running a serious chance of overdosing." He warned physicians present to give the new, powerful drugs only to those patients who have definite indications of arthritis.

Dr. Smyth described the important new "sheep red blood cells" test for diagnosing arthritis cases. This laboratory test for early diagnosis has caused much interest, according to Dr. Smyth, who added that work had been done at the University of Colorado toward perfecting the test.

A training clinic for physicians was held at the Elks Rehabilitation center with Dr. Smyth as lecturer to conclude his two-day visit in Boise. During his visit Dr. Smyth and Chester Stevenson, Chief of Medicine at the Veterans Administration, conducted a diagnostic and teaching clinic for hospital staff members. Dr. Smyth's appearance in Boise was sponsored by the Idaho Chapter of the American Rheumatism and Arthritis Foundation.

Panel Discusses Health Program

President Donald K. Worden attended the annual meeting of the Idaho Congress of Parents and Teachers in Nampa, October 23. Dr. Worden participated in a panel which discussed "A Continuous Health Program." Other physicians who participated in the panel were J. R. Farber, Nampa pediatrician, and J. E. Wyatt, Boise, director of the City-County Health Department.

More than 700 members of the PTA from all sections of Idaho attended the session.

Cancer Programs Approved

Four Idaho hospitals have been named by the American College of Surgeons as conducting approved cancer programs. They are: Saint Luke's Hospital, Boise; the Latter Day Saints Hospital and the Saered Heart Hospital, Idaho Falls, and Merey Hospital in Nampa.

PRESIDENT'S CITATION AWARDED: Quentin W. Mack, Boise (r), president-elect of the Idaho State Medical Association, is shown receiving the "Physician's Award" for outstanding, meritorious service by the President's Committee on Employment of the Physically Handicapped at ceremonies in Coeur d'Alene, October 10. Mr. Vernon Banta, Washington, D.C. (l), Deputy Executive Secretary of President Eisenhower's Committee on the Handicapped, presented the award. Dr. Mack serves as chairman of the medical sub-committee of the state committee for Employment of the Physically Handicapped and is a member of AMA committee on Medical Rating of Physical Impairment.

Boise Valley Chapter of ACS To Meet

The mid-winter meeting of the Boise Valley Chapter of the American College of Surgeons will be held in Boise on Saturday, December 13.

Guest Speakers will be Walter J. Burdete, Salt Lake City, professor of surgery, University of Utah School of Medicine, and Walter P. Work, San Francisco, professor of otolaryngology, University of California School of Medicine.

Local speakers on the program include H. M. Chaloupka, Quentin W. Mack, Robert S. Smith and F. B. Jeppesen, all of Boise, and J. Lesley Montgomery of Caldwell.

L. J. Stauffer of Priest River Retires

L. J. Stauffer, long-time Priest River physician, has retired from active medical practice and is now making his home in Bothell, Wash. Dr. Stauffer was honored at a local Chamber of Commerce meeting in October when he was given a movie camera as a going away gift from a long list of Priest River friends. Mr. Don McInnis, president of the Chamber, made the presentation.

Vita-Metrazol

elixir and tablets

reactivates

A general tonic indicated in geriatrics, fatigue and senility—where apathy is the dominating symptom.

Contains Metrazol with selected vitamins.
Usual Dose: 1 or 2 tablets or teaspoonfuls of *Vita*-Metrazol 3 or 4 times daily.
Availability: Elixir in pint bottles, tablets in bottles of 100.

Metrazol®, brand of Pentylenetetrazol, E. Bilhuber, Inc.

one of the most frequent symptoms for which the patient seeks medical attention."[1]

SYNEPHRICOL®

ANTIHISTAMINIC • DECONGESTANT

Cough Syrup

...relieves the cough due to colds
...eases the allergic cough

Synephricol acts by prompt and prolonged decongestion of bronchial mucous membranes, by mild central sedation, and by decreasing sensitivity of the pharyngeal mucosa through antihistaminic action.

FORMULA:

(4 cc. teaspoonful)

Neo-Synephrine® hydrochloride	5.0 mg.
Thenfodil® hydrochloride	4.0 mg.
Dihydrocodeinone bitortrote*	1.33 mg.
Potassium guaiocol sulfonate	70.0 mg.
Ammonium chloride	70.0 mg.
Menthol	1.0 mg.
Chloroform	0.0166 cc.
Alcohol	8%

*Exempt narcotic

DOSAGE:

Adults—1 or 2 teaspoonfuls every two to four hours, not to exceed 5 doses in twenty-four hours.

Children 6 to 12 years—½ to 1 teaspoonful four or five times daily.

BOTTLES OF 1 PINT AND 1 U. S. GALLON.

Resolutions Considered at 66th Annual Session

Following are the final resolutions considered by the House of Delegates of the Idaho State Medical Association during the 66th annual meeting, Sun Valley, July 6-9, 1958. Action of the House is in italics.

Resolution No. "K"

Whereas, the existing Idaho State Code requires an annual chest x-ray for communicable disease detection in school teachers, and

Whereas, repeated examinations have worked an economic hardship on many teachers, and

Whereas, the detection of tuberculosis by this means has been unproductive in repeated annual examination, and

Whereas, a pre-employment physical examination including a chest x-ray of any teacher entering a different school system would seem an adequate method of detecting communicable disease,

Now Therefore Be It Resolved, that the present law requiring an annual chest x-ray examination be repealed and that pre-employment physical examinations of teachers be required as a requisite to employment in a school system.

Resolution No. "K" was adopted by the House.

Resolution No. "L"

Whereas, it is common knowledge that syphilis is not transmitted through food or food handling, and

Whereas, syphilis as a disease has been nearly eradicated by newer methods of control, and

Whereas, the now required examination is a nonproductive procedure and an unnecessary economic burden on the worker, and

Whereas, all food handlers are subject to inspection by the State Board of Health,

Now Therefore Be It Resolved, that the section of the Idaho Code pertaining to the serological examination of food handlers be repealed and that the Idaho State Medical Association sponsor such legislation.

Resolution No. "L" was adopted by the House.

Resolution No. "M"

Whereas, it has been fairly well shown that the incidence of poliomyelitis has declined since the advent of the vaccination program against the disease, and,

Whereas, it is evident that the complete success of any vaccination program will depend upon the number of those vaccinated in the susceptible age groups, and

Whereas, surveys have shown that the age most susceptible range to 40 years,

Now Therefore Be It Resolved that the Idaho State Medical Association go on record as being in favor of vaccination against poliomyelitis for those to 40 years of age who have not yet been so vaccinated, and

Be It Further Resolved that this association encourage its component societies to further their publicity in their local areas to encourage such vaccination in these susceptible individuals.

Resolution No. "M" was adopted by the House.

Resolution No. "N"

Subject: The creation of an Allied Professional Committee for Higher Education

Whereas, the Idaho State Medical Association was instrumental in securing the legislation making Idaho a member of the Western Interstate Compact for Higher Education, and

Whereas, Medicine, along with Dentistry and Veterinarian Medicine, are vitally interested in the full development of this compact to provide graduate education for Idaho students in these fields, and

Whereas, a joint interest of the state associations of medicine, dentistry and veterinarian medicine would provide a more effective way of securing greater participation in the compact,

Now Therefore Be It Resolved that the Idaho State Medical Association create a liaison committee with the Idaho State Dental Association, the Idaho State Veterinarians Association and such other interested groups as may exist to study and present to the Legislature of the State of Idaho a presentation of the needs in graduate education in these fields, and

Be It Further Resolved that this committee cooperate with the Idaho Commissioners of the Western Interstate Commission for Higher Education.

Resolution No. "N" was adopted by the House.

Resolution No. "O"

Whereas, the Constitution and By-Laws Committee has studied the geographical boundaries of the ten component societies as instructed, and

Whereas, the committee finds that smaller societies are more active, have better attendance and are more representative of the feelings of the membership as a whole, and

Whereas, it is felt that there may well be a struggle to maintain the freedom of medicine in the future in the United States, and

Whereas, larger component societies by the unwieldly bulk of their numbers and lack of attendance do not adequately express the opinions of the individual members, and

Therefore, it is recommended that the boundaries of the component societies remain unchanged with one exception, that of the Southwestern Idaho District Medical Society.

It is the recommendation that this society be divided into two parts, one consisting of Adams, Canyon, Gem, Owyhee, Payette and Washington counties and the other to consist of Ada, Boise, Elmore and Valley counties.

Resolution No. "O" was rejected by the House.

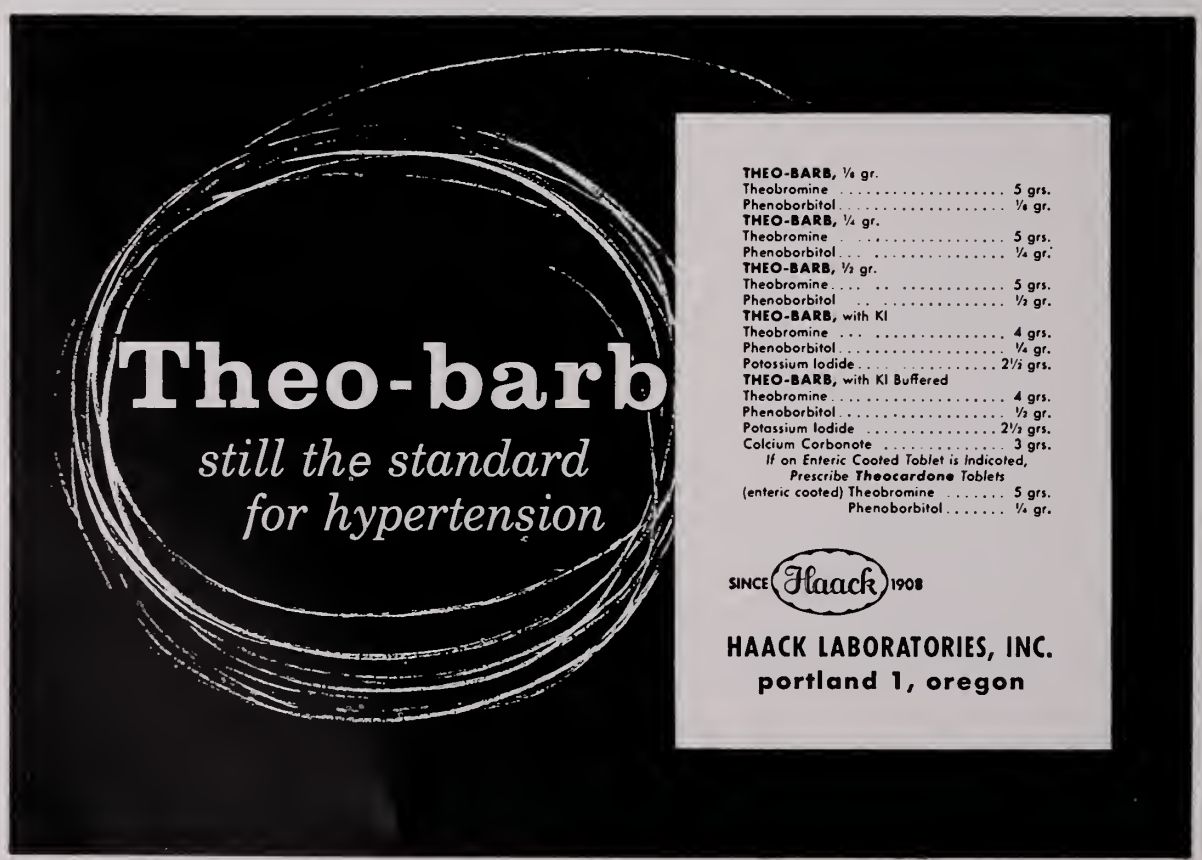
Idaho Chapter of AAGP Elects Officers At Annual Meeting in Boise

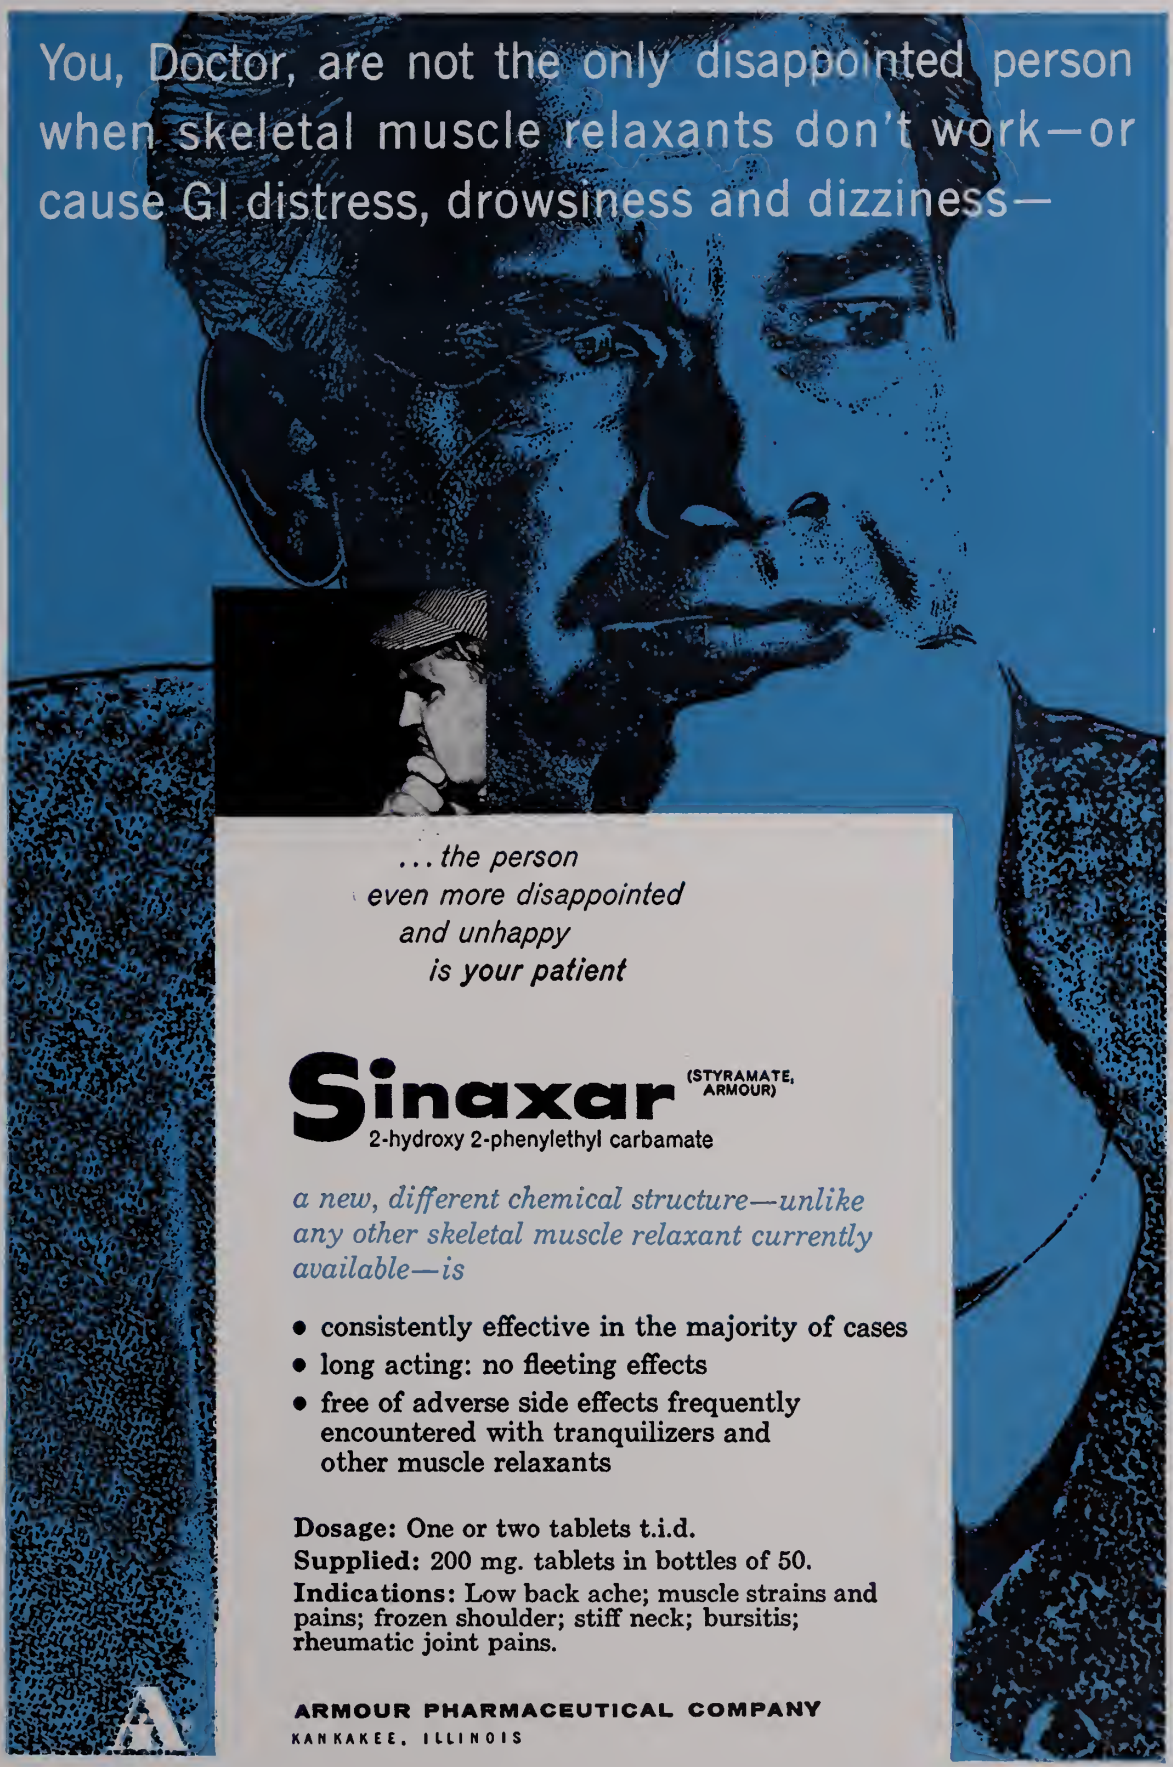
New officers of the Idaho Chapter, American Academy of General Practice, elected during the recent session in Boise, include: Joseph G. Wilson, Moscow, president; Arch T. Wigle, Pocatello, president-elect; W. Wray Wilson, Coeur d'Alene, secretary-treasurer; Asael Tall of Rigby and Ralph Buttermore of Grangeville, delegates to AAGP; and Aldon Tall of Rigby and L. F. Lesser of Boise, alternate delegates. Incumbent directors are Orvid Cutler of Preston and John T. Brunn of Meridian. Newly elected directors are John M. Ayers of Moscow, named to complete the unexpired term of Clyde E. Culp; John Bingham of Idaho Falls, to complete the unexpired term of Dr. Wigle; Joseph Marshall of Twin Falls and Joseph M. Thomas of Boise.

Approximately 100 physicians registered for the seventh annual meeting of the Idaho Chapter, which was held in the Hotel Boise. Guest lecturers were: Stuart Knox of the College of Medical Evangelists, Loma Linda, Calif.; M. Erik Wright of the University of Kansas, Kansas City, Mo.; R. B. Robins, president of the American Academy of General Practice, Camden, Ark.; William W. Hoffman, Stanford University, Palo Alto, Calif.; and Chester Swinyard, New York University.



The state chapter's next annual meeting will be held in Moscow, Oct. 22-23, 1959.

State Board of Medicine



Two Temporary Licenses were issued during October to the following:

Horace E. Brogan, Moscow. Graduate St. Louis University School of Medicine, 1943. Internship St. John's Hospital, St. Louis, Missouri, 1943-44. Granted T-215 October 10. University of Idaho Student Health Service.

Philip Sheridan King, III, Pullman, Washington. Graduate University of Nebraska College of Medicine, 1952. Internship Good Samaritan Hospital, Portland, Oregon, 1952-53. Pathology Residency, Sacred Heart Hospital, 1954-57 and Baylor University Medical School, 1957. Granted T-214 October 20. Radiology.

You, Doctor, are not the only disappointed person when skeletal muscle relaxants don't work—or cause GI distress, drowsiness and dizziness—

... the person even more disappointed and unhappy is your patient

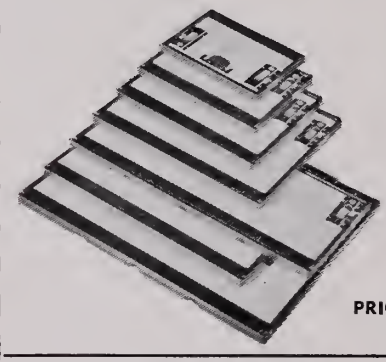
Sinaxar (STYRAMATE, ARMOUR)
2-hydroxy 2-phenylethyl carbamate

a new, different chemical structure—unlike any other skeletal muscle relaxant currently available—is

- consistently effective in the majority of cases
- long acting: no fleeting effects
- free of adverse side effects frequently encountered with tranquilizers and other muscle relaxants

Dosage: One or two tablets t.i.d.
Supplied: 200 mg. tablets in bottles of 50.
Indications: Low back ache; muscle strains and pains; frozen shoulder; stiff neck; bursitis; rheumatic joint pains.

ARMOUR PHARMACEUTICAL COMPANY
KANKAKEE, ILLINOIS



complete protection

To build sound bones and teeth, and to promote body resistance to disease, infants need sufficient quantity of vitamins A, C and D. When you prescribe Special Morning Milk and orange juice, or another source of ascorbic acid, vitamin requirements are normally met. Among all brands of evaporated milk, *only* Special Morning Milk is fortified with both vitamins A *and* D (2,000 U.S.P. units vitamin A and 400 U.S.P. units vitamin D per reconstituted quart).

Special

ALASKA STATE MEDICAL ASSOCIATION
1121 Fourth Avenue
Anchorage, Alaska

ANNUAL MEETING
March 19-21, 1959
Juneau

President, William Whitehead, M.D., Juneau

Secretary, Robert B. Wilkins, M.D., Anchorage

WILLIAM M. WHITEHEAD, M.D.

President's Page

This is the first opportunity I have had to thank the entire membership for electing me president of your Association at the Fairbanks meeting. Each month I hope to be able to report to you what has been going on within our new state. We are aware of the fact that only about one-half of our membership is able to attend our yearly meetings, so through this page we will endeavor to keep each member informed of our activities.

Statehood has and will create problems which we have never had before. It has given us much more national recognition than previously. The medical profession must be alert and on constant guard. Actually, the Medical Practice Act now in effect is excellent so we must be aware and protect it at all times.

As secretary of the Board of Medical Examiners for 15 years, it is very obvious to me that statehood has influenced a great number of doctors in wanting to come to Alaska to live. Most of our inquiries in the past were from curiosity-seekers, but now our inquiries are about five times more than before statehood and most of them seem to have a sincere desire to come to Alaska. One group of seven men has been desirous of moving to our state. The real fact is that we have just about enough doctors. There is space once in a while for one. We must have considerably more population before there is much demand for more doctors. The general practitioner still plays the biggest part in Alaska medicine although we are beginning to get more qualified specialists. When we were a territory, the stateside doctor was interested in Alaska but hesitated to make the move. Now that Congress has given us statehood, the stateside man has lost his fear for if Alaska is good enough to be granted statehood by Congress, there must be something there worthwhile.

The pharmaceutical houses are showing a tremendous amount of interest. Already one large concern has been considering a TV program and another has sent an interviewer to talk to the wife of an Alaskan doctor concerning the doctor-wife relationship, the results of which will soon be known in its monthly publication.

As you undoubtedly have heard from Blue Cross, there has been much curtailment of Medicare.

Your meeting for 1959 will be held in Juneau on March 19, 20, 21, at which time the new state legislature will be in session. In the past the territorial legislature convened during the latter part of January and adjourned 60 days later, so we will be in session after the legislature has been well organized. Hereto-

ACHROCIDIN

TETRACYCLINE-ANTIHISTAMINE-ANALGESIC COMPOUND LEDERLE

A versatile, well-balanced formula for treating common upper respiratory infections, particularly during respiratory epidemics; when bacterial complications are observed or are likely; when patient's history is positive for recurrent otitic, pulmonary, nephritic, or rheumatic involvement.

CHECKS SYMPTOMS: Includes traditional components for rapid relief of the traditional nonspecific nasopharyngitis, symptoms of malaise, chilly sensations, inconstant low-grade fever, headache, muscular pain, pharyngeal and nasal discharge.

Available on prescription only.

Adult dosage for ACHROCIDIN Tablets and new caffeine-free ACHROCIDIN Syrup is two tablets or teaspoonfuls of syrup three or four times daily. Dosage for children according to weight and age.

TABLETS *(sugar coated)*

Each Tablet contains:

ACHROMYCIN® Tetracycline	125 mg.
Phenacetin	120 mg.
Caffeine	30 mg.
Salicylamide	150 mg.
Chlorothen Citrate	25 mg.

Bottles of 24 and 100.

SYRUP *(lemon-lime flavored)*

Each teaspoonful (5 cc.) contains:

ACHROMYCIN® Tetracycline equivalent to tetracycline HCl	125 mg.
Phenacetin	120 mg.
Salicylamide	150 mg.
Ascorbic Acid (C)	25 mg.
Pyrilamine Maleate	15 mg.
Methylparaben	4 mg.
Propylparaben	1 mg.

Bottle of 4 oz.

Lederle LEDERLE LABORATORIES, a Division of AMERICAN CYANAMID COMPANY, Pearl River, New York

(Continued from page 1661)

fore the legislature has been composed of 16 senators and 24 house members. The new state legislature will be made up of 20 senators and 40 members of the house. This new redistricting of Alaska will give every community representation. Therefore the type of legislature is going to be different, so I think it is wise that we meet while it is in session.

We are arranging what should be an excellent program. We have been able to obtain noted speakers on skin diseases, chest diseases with allergic manifestations, cancer authorities, and of course the Polio Foundation will be represented. It is now time for our own members to be preparing papers which they will present, and to notify me of their titles.

I will try to arrange with NORTHWEST MEDICINE that your Association be allowed one member on the Board of Trustees and one member on the Editorial Advisory Board.

Of course,  *women like "Premarin"*

Therapy for the menopause syndrome should relieve not only the psychic instability attendant the condition, but the vasomotor instability of estrogen decline as well. Though they would have a hard time explaining it in such medical terms, this is the reason women like "Premarin."

Doctors, too, like "Premarin," because it really relieves the symptoms of the menopause. It doesn't just mask them — it replaces what the patient lacks — natural estrogen.

Four Hundred Orthopedic Surgeons Hold Four-Day Scientific Session in Portland

Some 400 orthopedic surgeons from 17 states and Hawaii gathered in Portland, Oregon, October 22 to discuss subjects ranging from orthopedic diseases in small animals and football injuries to spinal surgery. The four-day session was the 22nd Annual Meeting of the Western Orthopedic Association.

Orthopedic Diseases in Animals

James Miles of Denver and co-author by invitation, Francis Andlin, D.V.M., also of Denver, presented the very unusual paper on Orthopedic Diseases in Small Animals which proved to be both entertaining and instructive. Through an amazing array of x-rays and photographs showing a variety of orthopedic diseases in dogs, cats and monkeys, the authors were able to illustrate how these paralleled experiences encountered in some of the surgeons' own problem patients. It was also pointed out that certain strains of animals are particularly susceptible to some diseases, such as Siamese cats to osteogenesis imperfecta and boxer dogs to dysplastic hips. Degenerative arthritis and disc protrusions were also shown to occur frequently in animals.

As athletic consultant for the University of Oregon football team, Donald Slocum of Eugene spoke with authority on The Mechanics of Football Injuries. He showed colored slides of how different types of injuries were incurred.

Radiation Induced Disease Discussed

Discussion of a timely research subject, Radiation Induced Osteogenic Sarcoma, was presented by Terrence H. Cochran of the Radiobiology Laboratory of the University of Utah; Webster S. Jee, radiobiologist at the same institution, and James S. Arnold of the U. S. Naval Radiological Defense Laboratory. They reported that intravenous injection of five different radioisotopes in dogs produced approximately 50 tumors, most of which were microtumors. However, they were able to produce osteogenic sarcoma in dogs using each of the five isotopes tested.

Using himself as the "victim" in an ultra-slow motion picture study, Irving Tuell of Seattle gave visual evidence to support his thesis that in the usual type of rear-end automobile collision the so-called "whip-lash" mechanism is not present. The film showed Dr. Tuell in a stopped car being hit by a second auto, first at 10 miles an hour and then at 20 miles an hour. The audience could see that Dr. Tuell's head did not bob back and forth like a weight on the end of a spring, but in fact never returned to more than an upright position.

Medicolegal Aspects of Orthopedic Surgery

Judge Eugene K. Oppenheimer of the circuit court in Multnomah County, Oregon; Mr. Hugh L. Biggs, legal counsel for the Oregon State Medical Society; and George B. Long, Portland internist, were members of a panel which discussed the legal aspects of orthopedic surgery. Illustrated situations of legal complications which could arise in the patient-surgeon relationship were presented in a down-to-earth, factual manner. Question period that followed indicated that the panel members' comments had been quite thought-provoking and well appreciated.

Unstable Internal Fixation of Fractures of Neck of the Femur was title of the extremely well-documented paper presented by Max Scheck of San Francisco. Dr. Scheck emphasized that posterior comminution of the neck of the femur gave non-union in 11 out of 15 such cases, and he suggested that early use of a primary replacement prosthesis could be seriously considered.

William Duncan of Seattle read an original paper on Plantar Reflexes in the Infant in which he spoke of the four basic cutaneous reflex patterns normally present in the newborn. Dr. Duncan then went on to show how some of these persist in spastics.

President Speaks on Western Waterfowl

President Joe Davis, in his presidential address, departed from the usual custom of a ponderous discussion of problems to divert his audience with a dissertation on Western Anatidae. It turned out to be a gentle ribbing of the audience in which, without implying that his friends were a bunch of birds, he extolled certain qualities of waterfowl as being desireable professional attributes. The better birds (Anatidae) usually display strength, fortitude and straight-forwardness.

On Friday, October 24, a group of three papers were presented on spinal surgery in the cervical and low back areas, emphasizing both the anterior and posterior approaches. Authors of these papers were Howard Cherry of Portland, Gerald Gill and Hugh White of San Francisco, and Paul Harmon of Los Angeles.

Charles Lowman of Los Angeles in speaking on Flailness of the Lower Extremities in Poliomyelitis pointed out the importance of abdominal fascial transplants in helping paralytics to walk.

One of the newer methods of diagnosis that shows a great deal of promise for the future was discussed by Robert L. Samilson and Frank L. Raney, Jr., both of San Francisco. In their paper, entitled Diagnostic Arthrography of the Shoulder, Drs. Samilson and Raney gave the method, and the normal and abnormal findings in the shoulder after injection of radiopaque material. Louis Edmunds of Seattle who used this diagnostic method on several patients after having had the procedure carried out on himself to show its innocuousness, added his comments to the authors' discussion.

Prizes Awarded to Residents

One of the features of the program was the awarding of prizes by the Association for outstanding research papers by residents in training in centers in the 11 Western states. A total of 21 papers were submitted. First place honors were shared by L. C. Folkes, who wrote on The Relative Importance of Periosteum and Blood Supply in Fracture Healing, and Albert F. Martin for his paper on Pathomechanics of the Knee Joint. Dr. Folke, who is at present in training at Children's Orthopedic Hospital in Seattle, prepared his paper while resident at the Veterans Administration Hospital in Portland. Dr. Martin did his work at the University of

California Medical School and Samuel Merritt Hospital in Oakland.

Second prize went to co-authors W. D. Guyer, now in Bend, Oregon, and C. A. Fagan, resident at Emanuel Hospital, Portland. They prepared their paper, Cavus Deformity of the Foot, while both were in training at the Shriners Hospital, Portland.

Third place honors were won by William Burkhalter and Sheldon Roger of the University of Colorado Medical Center and by Howard R. Baker of the Veterans Administration Sawtelle facility at Los Angeles. Drs. Burkhalter and Roger wrote on Prosthesis Arthroplasty of the Hip. Dr. Baker's subject was Non-Union of Fractures of the Trochanteric Area of the Femur.

Election of Officers

Election of officers raised William F. Stanek of Denver to the presidency of the Western Orthopedic Association with two other Denver physicians, J. Sims Norman and Alba Glasburn, being elected vice-president and historian respectively. Frazier McPherson of San Diego was named president-elect and Walter Scott of Los Angeles was renamed treasurer-historian.

The group's annual meeting next year will be held in Denver and the 1960 meeting will be in San Diego.•

Illinois Medical Society Requests Old Photos

The Illinois State Medical Society is preparing an exhibit centered around an *Illinois Medical Journal* article which told of the role of physicians in the development of the automobile in the United States at the turn of the century.

To help illustrate this exhibit, the Society will appreciate the loan of old photographs showing physicians at the wheels of cars of 1900-1910 vintage. Scenes showing difficulties on the road, or poor highway conditions, are especially desired. Enlargements will be made of these photographs and the originals returned undamaged.

Photographs should be accompanied by a memo giving the name and town of the physician, whether living or deceased, and the make and year of the automobile. They should be sent to Mr. John A. Mirt, Illinois State Medical Society, 185 North Wabash Avenue, Chicago 1.

Western Conference on Anesthesiology To Be Held April 1-4 in Phoenix, Arizona

"The Heart of Anesthesia" will be the theme of the Biennial Western Conference on Anesthesiology to be held at the Westward Ho Hotel in Phoenix, Arizona, April 1-4, 1959.

The program will include individual papers and panel discussions. Topics selected for panel discussions are Applications of Clinical Anesthesia, Practical Uses of Monitory Devices—Which, When, How, to Whom?, and Unsolved Problems of Cardiac Surgery.

For additional information write to Boyden L. Crouch, M.D., 301 W. McDowell Rd., Phoenix, Arizona.

BOOKS

RECEIVED

The following books have been received. Publication of this acknowledgment is to be considered adequate return to the sender. Selected titles will be reviewed as space permits.

The Eye. A Clinical and Basic Science Book. By E. Howard Bedrossian, B.S., M.D., M.Sc. (Med.), F.A.C.S., Assistant Professor of Ophthalmology in the Graduate School of Medicine of the University of Pennsylvania, Philadelphia, Pa.; Assistant Surgeon, Wills Hospital, Philadelphia, Pa.; Associate Ophthalmologist, Graduate Hospital, Philadelphia, Pa.; Chief of Ophthalmology, Delaware County Hospital, Drexel Hill, Pa.; Fellow, The American College of Surgeons; Fellow, Philadelphia College of Physicians; Fellow, The American Academy of Ophthalmology and Otolaryngology; Fellow, Aero Medical Association. With a Foreword by Edmund B. Spaeth, M.D. 340 pp. Illustrated. Price $11.00. Charles C Thomas, Springfield, Ill. 1958.

Electrolyte Changes in Surgery. Kathleen E. Roberts, M.D., Assistant Chief of Medicine, United States Public Health Service Hospital; Assistant Professor of Medicine, Stanford University College of Medicine, San Francisco, California; Formerly, Assistant Professor of Medicine, Cornell University College of Medicine; Section Head, Clinical Physiology Department, Sloan-Kettering Institute for Cancer Research; Consultant, United States Public Health Service Hospital, New York City. Parker Vanamee, M.D., Assistant Attending Physician, Memorial Hospital for Cancer and Allied Diseases; Assistant Professor of Medicine, Cornell University College of Medicine; Associate, Sloan-Kettering Institute for Cancer Research, New York City. J. William Poppell, M.D., Chief, Section of Cardio-Pulmonary Physiology and Associate, Sloan-Kettering Institute for Cancer Research; Assistant Attending Physician, Memorial Hospital for Cancer and Allied Diseases; Assistant Professor of Medicine, Cornell University College of Medicine, New York City. 113 pp. Illustrated. Price $4.50. Charles C Thomas, Springfield, Ill. 1958.

Applied Medical Library Practice. By Thomas E. Keys, A.B., M.A., Librarian of the Mayo Clinic, Rochester, Minnesota; Assistant Professor of History of Medicine, Mayo Foundation; Graduate School, University of Minnesota. With chapters by Catherine Kennedy, B.S., L.S., Associate Librarian, Mayo Clinic; Ruth M. Tews, B.S., L.S., Hospital Librarian, Mayo Clinic. 495 pp. Price $10.75. Charles C Thomas, Springfield, Illinois. 1958.

The Care of the Geriatric Patient. Edited by E. V. Cowdry, Ph. D., Sc. D. (Hon.) Director of Wernse Cancer Research Laboratory, Washington University School of Medicine; formerly President of the Gerontological Society and of the Second International Gerontological Congress; Chairman of the Medical and Scientific Committee, American Society for the Aged, Inc. 438 pp. Illustrated. Price $8.00. The C. V. Mosby Company, St. Louis, Mo. 1958.

Schizophrenia. By Manfred Sakel, M.D. 335 pp. Price $5.00. Philosophical Library, New York.

Treatment of Breast Tumors. Robert S. Pollack, M.D., F.A.C.S., Clinical Instructor in Surgery, Stanford University School of Medicine; Clinical Instructor in Surgery (Oncology), University of California School of Medicine; Assistant Chief of Surgery, Mount Zion Hospital, San Francisco, California; Consulting Surgeon, Oakland Veterans' Administration Hospital; Consulting Surgeon, Oakland Naval Hospital, Oakland, California. 147 pp. 47 Plates and 16 Text Figures. Price $6.00. Lea and Febiger, Philadelphia, Pa. 1958.

The Doctor Business. By Richard Carter. 283 pp. Price $4.00. Doubleday & Company, Inc., Garden City, New York.

Injuries and Surgical Diseases of the Ischium. Henry Milch, M.D., Attending Orthopedic Surgeon, Hospital for Joint Diseases, New York. 162 pp. Illustrations. Price $10.50. Paul B. Hoeber, Inc., Medical Book Department of Harper and Brothers, New York, N.Y. 1958.

Poisoning. A Guide to Clinical Diagnosis and Treatment. 2nd Ed. By W. F. von Oettingen, M.D., Ph. D., National Institutes of Health, U.S. Public Health Service, U.S. Department of Health, Education and Welfare. 627 pp. Price $12.50. W. B. Saunders Company, Philadelphia, Pa. 1958.

Amid Masters of Twentieth Century Medicine. A Panorama of Persons and Pictures. By Leonard G. Rowntree, M.D., Formerly Western Medical School, Victoria Hospital, London, Canada; The John Hopkins Medical School; Professor of Medicine, University of Minnesota; Chief of Medicine, Mayo Foundation; Director of Philadelphia Institute for Medical Research; Executive Officer of the A.E.F. Air Service (Medical), World War I; Chief of Medicine, National Headquarters of Selective Service; World War II, Colonel, M.R.C., U.S.A. Presently Chairman, Medical Advisory Board, The American Legion; Chairman, Dean's Committee, V.A. Hospital, Coral Gables; Co-founder, University of Miami, School of Medicine. With an Introduction by G. F. Lull, M.D., Secretary and General Manager, The American Medical Association. 684 pp. Illustrated. Price $11.50. Charles C Thomas, Springfield, Ill. 1958.

Difficult Diagnosis. A Guide; to the Interpretation of Obscure Illness. By H. J. Roberts, M.D., Diplomate of the American Board of Internal Medicine; Fellow of the American College of Chest Physicians; Associate of the American College of Physicians; Staff, Good Samaritan Hospital and St. Mary's Hospital, West Palm Beach, Florida; Formerly, Research Fellow and Instructor in Medicine, Tufts University Medical School; Formerly, Research Fellow and Instructor in Medicine, Georgetown Medical School. 913 pp. Price $19.00. W. B. Saunders Co., Philadelphia, Pa. 1958.

(Continued on page 1668)

(Continued from page 1667)

The Circulation of the Blood. Two Anatomical Essays by William Harvey together with nine letters written by him. The whole translated from the Latin and slightly annotated by Kenneth J. Franklin. 184 pp. Illustrated. Price $4.50. Charles C Thomas, Springfield, Ill. 1958.

Pediatric Methods and Standards. 3rd Ed. Department of Pediatrics, School of Medicine, University of Pennsylvania. Editor Fred H. Harvie, M.D., Associate Professor of Clinical Pediatrics. 300 pp. Price $4.50. Lea and Febiger, Philadelphia, Pa. 1958.

Tumors and Tumorous Conditions of the Bones and Joints. By Henry L. Jaffe, M.D., Director of Laboratories and Pathologist, Hospital for Joint Diseases, New York, N.Y., Consultant, Armed Forces Institute of Pathology, Washington, D.C. 701 Illustrations on 194 Figures. 629 pp. Price $18.50. Lea & Febiger, Washington Square, Philadelphia 6, Pa. 1958.

Trifluoperazine. Clinical and Pharmacological Aspects. Twenty-five Original Reports with an Introduction by Henry Brill, M.D., Assistant Commissioner, New York State Department of Mental Hygiene, Albany, New York. 219 pp. Price $3.50. Lea and Febiger, Philadelphia, Pa. 1958.

What We Do Know About Heart Attacks. By John W. Gofman, M.D., Professor of Medical Physics, University of California, Berkeley. 180 pp. Illustrated. Price $3.50. G. P. Putnam's Sons, New York. 1958.

Clinical Obstetrics and Gynecology. (A Quarterly Book Series) Vol. I, No. 3. Symposium on Special Diagnostic Aids. Edited by C. Paul Hodgkinson, M.D.; Symposium on Abnormal Uterine Bleeding. Edited by John I. Brewer, M.D. September 1958. 852 pp. Illustrated. Price $18.00. Paul B. Hoeber, Inc. Medical Book Department of Harper & Brothers, New York. 1958.

Convulsive Disorders of Children. Dora Hsi-Chih Chao, M.D., Physician and Assistant Director, Blue Bird Clinic, Methodist Hospital, and Assistant Professor of Pediatrics and Neurology, Baylor University College of Medicine, Houston; Ralph Druckman, M.D., Neurologist, Blue Bird Clinic, Methodist Hospital, and Assistant Professor, Departments of Neurology and Physiology, Baylor University College of Medicine, Houston; Peter Kellaway, A.M., Ph. D., Director, Blue Bird Clinic, Methodist Hospital and Associate Professor, Department of Physiology, Baylor University College of Medicine, Houston. 151 pp. Illustrated. Price $6.00. W. B. Saunders Co., Philadelphia, Pa. 1958.

Epilepsy. Manfred Sakel, M.D. With a preface by Otto Poetzl, Professor Emeritus, University and Clinic of Vienna. 204 pp. Price $5.00. Philosophical Library, New York. 1958.

Emergency War Surgery. U.S. Armed Forces Issue of Nato Handbook Prepared for Use by the Medical Services of Nato Nations. United States Department of Defense. 411 pp. Illustrated. Price $2.25. U.S. Government Printing Office. Washington 25, D.C. 1958.

REVIEWS

Books reviewed in the columns of Northwest Medicine may be borrowed by any subscriber. Write Miss Ruth Horlomert, Librarian, King County Medical Society Library, Room 121, Cobb Bldg., Seattle 1, Wn. The library appreciates, but does not demand, reimbursement for postage.

CONGENITAL ANOMALIES OF THE HAND AND THEIR SURGICAL TREATMENT. By Arthur Joseph Barsky, M.D., D.D.S., Professor of Clinical Surgery, Albert Einstein College of Medicine, New York City. 165 pp. Illustrated. Price $5.75. Charles C Thomas, Springfield, Ill. 1958.

This 160 page monograph has been written by an experienced plastic surgeon and is based largely on 165 personal cases. In addition there is a survey of the medical literature over the past 35 years with a review of 200 articles. Several Egyptian papyri were reviewed by the author and this will give the reader some conception of his thoroughness. The monograph is extensively illustrated. In addition to the text itself, there is a glossary of terms, and extensive bibliography and an appendix containing a statistical recapitulation of the author's own cases. This monograph would be a valuable reference source for any surgeon dealing with children.

A. J. Sheridan, M.D.

MEMOIRS OF A G.P. By Otis Marshall, M.D. 155 pp. Price $3.50. Vantage Press, New York. 1958.

Dr. Marshall's memoirs of a varied and colorful career are an excellent word picture of the life of a currently informed M.D. during the first half of the 20th century.

He touches upon the frequent struggle to get a primary medical education, the unintentional or accidental results that may gain a reputation, whereas his best work is frequently overlooked, or may even be his downfall. Throughout his years of private practice is interwoven that wonderful patient—family physician relationship, a far cry from the studied "bedside manner" of many doctors today, and most vividly expressed by a 4 year old child. My son George and I spent a short vacation with friends in an old mining camp. They had two children, a boy of 4 and a girl 9. Hazel and I were seated on one side of the table with Raymond and George opposite us. We were having a wonderful time when George asked: "Dad, will you please pass the gravy?" Raymond turned on him with eyes flashing. "What did you call him?" "I called him Dad—he is my Daddy, Raymond." "He is not your Daddy! He is Dr. Kellogg!"

This book will be read and enjoyed by the general public as well as the profession.

It gives one a glimpse of the early practice of medicine in Virginia, and Dr. Marshall's trips abroad give the reader the impression of being on a well-conducted tour.

During the transition period from empirical medicine to a scientific basis the demands on the general practitioner varied with the population. In the old settled eastern states, medical centers and specialists were available, whereas in the isolated sections of the far west the doctors were on their own and specialists in every department of medical endeavor.

G. O. A. Kellogg, M.D.

MANAGEMENT OF CHILDHOOD ASTHMA. By Frederic Speer, M.D., Assistant Clinical Professor of Pediatrics, University of Kansas School of Medicine. 116 pp. Price $4.75. Charles C Thomas, Springfield, Ill. 1958.

The most favorable comment that can be made about this book is the fact that there are 100 readable pages. The print is large and any physician can read and digest the material in a single sitting.

The introduction is different than most other books on allergy. None of the theory or immunologic aspects of allergy are touched. The first chapter covers the Asthmatic Child and His Family. We are then introduced to the Diagnosis of Asthma and its etio-

(Continued on page 1670)

nasal and paranasal congestion and control secondary invaders

Now, a single unique preparation, Trisulfaminic, can provide dramatic relief from congestion, and at the same time protect the patient from secondary bacterial invaders. Often within minutes of the first dose, congestion begins to clear; the patient can breathe again.

Trisulfaminic is particularly valuable for the "almost well" patient who is recovering from influenza but is left with congested nasal and bronchial passages. And for patients with purulent rhinitis, sinusitis or tonsillitis, combination therapy with Trisulfaminic offers a most realistic approach to total treatment.

Oral Decongestant Action. Through the action of Triaminic, nasal patency is achieved rapidly and dramatically. Adequate ventilation helps eliminate mucus-harbored pathogens. And because Trisulfaminic is administered *orally,* there is no problem of rebound congestion, no pathological change wrought in the nasal mucosa.

Wide-Spectrum Action. Secondary bacterial infections, which are always a threat in upper respiratory involvement, are forestalled by the wide-spectrum effectiveness of triple sulfonamides. This added antibacterial protection makes Trisulfaminic highly useful in treating the debilitated patient who is prone to lingering or frequently recurring colds.

Trisulfaminic *tablets and suspension*

TRIAMINIC PLUS TRIPLE SULFAS

Each Tablet and each 5 ml. teaspoonful of Suspension contains:

Triaminic®	25 mg.
(phenylpropanolamine HCl	12.5 mg.;
pheniramine maleate	6.25 mg.;
pyrilamine maleate	6.25 mg.)
Trisulfapyrimidines U.S.P.	0.5 Gm.

Dosage: Adults—2 to 4 tablets or teaspoonfuls initially, followed by 2 tablets or teaspoonfuls every 4 to 6 hours until the patient has been afebrile for 3 days. Children 8 to 12 years—2 tablets or teaspoonfuls initially, followed by 1 tablet or teaspoonful every 6 hours. Younger children—dosage in proportion.

SMITH-DORSEY • a division of The Wander Company • Lincoln, Nebraska • Peterborough, Canada

(Continued from page 1668)

logic factors. The author then introduces you to the history taking and techniques of testing.

The writer might be criticised for his statement that he uses intracutaneous testing very little although he does not state at what age. It is true that intracutaneous testing, or the intradermal testing, is not used extensively in infants; however, it is a very important part of our diagnostic equipment. In children a great many important positives may be missed without adequate testing and adequate testing means intradermal tests.

The chapter on the Treatment of the Asthmatic Attack is simplified and probably adequate; however, the chapter on Hyposensitization may be found confusing to one starting to practice this phase of allergy. The chapter on Allergic Cookery is insufficient.

I am sure the book expresses Dr. Speer's manner in which he practices allergy and is written in a simple, readable style. The physician trained in allergy would derive very little from it .The general practitioner or the pediatrician who is untrained in allergy, but is interested in the diagnostic and care of asthma in childhood, could give his asthmatic patients adequate care by putting in practice the procedures as discussed in this book.

J. E. Stroh, M.D.

ANOMALIES OF INFANTS AND CHILDREN. By D. McCullagh Mayer, D.D.S., M.D., Associate Professor of Plastic Surgery, New York Medical College, New York; and Wilson A. Swanker, M.D., Professor of Plastic and Aesthetic Surgery, Ankara University, Turkey; Associate, New York Medical College. 454 pp. Illustrated. Price $12.00. McGraw-Hill Book Co., Inc., New York. 1958.

Within the covers of this book may be found a well organized comprehensive list of the congenital anomalies. It starts from the head and works down the complete anatomy in orderly fashion. It gives enough of a synopsis of the embryology, anatomy, pathology and treatment to whet the appetite of the student, who may then seek a more comprehensive discussion of the particular subject by referring to the ample bibliography at the end of each chapter.

It should be a handy desk reference for quick perusal on most congenital anomalies. Only one subject is treated extensively and reflects the author's special interest. That subject is burns.

David M. Harris, M.D.

ORTHOPEDIC DISEASES: PHYSIOLOGY, PATHOLOGY, RADIOLOGY. By Ernest Aegerter, M.D., Professor of Pathology and director of Department of Pathology, Temple University Medical Center and School of Medicine; Professor of Orthopedic Pathology, University of Pennsylvania Graduate School of Medicine, and John A. Kirkpatrick, Jr., M.D., Assistant Professor of Radiology, Temple University Medical Center. 602 pp. 354 figures. Price $12.50. W. B. Saunders Co., Philadelphia and London. 1958.

A pathologist and a radiologist have joined forces to present an excellent book on the various diseases which directly or indirectly affect the skeletal system. While not intended to be a complete catalogue of all bone disease, it does include uniformly complete descriptions of the common as well as the lesser known congenital, developmental, nuritional, circulatory, metabolic, infectious and neoplastic disorders of bone. The initial chapters on "General Considerations of Connective Tissues" will serve to bring the practitioner abreast of the intensive activity in the field of bone morphology and function, and will, for some time to come, be useful to the student as a point of departure in his area. The subject material is carefully organized, easy to read, and avoids technical minutiae. There is a commendable minimum of medical name-dropping, and the reference material at the conclusion of each chapter is carefully selected and current. The illustrations, photomicrographs, and x-ray reproductions are outstanding, from the point of view of both reproduction and content, and are well related to each other and the text. The title is somewhat misleading, in that the text material is devoted almost entirely to abnormalities of the bony skeleton. A similar treatment of the pathology of the soft parts would be an excellent companion piece.

William R. Duncan, M.D.

HOSPITAL PLANNING FOR THE ANESTHESIOLOGIST. By William H. L. Dornette, M.D., Professor of Anesthesiology and Head of the Department, The University of Tennessee College of Medicine, Memphis, Tennessee; Formerly, Assistant Professor of Anesthesiology, The University of Wisconsin College of Medicine, Madison, Wisconsin; The University of California School of Medicine, Los Angeles, California. 119 pp. Illustrated. Price $5.25. Charles C Thomas, Springfield, Ill. 1958.

This small book of about a hundred pages is must reading for anyone who has the responsibility of participating in formulating the plans for a new hospital. It is divided into 27 short chapters dealing with specific subjects. Much of the material has been published previously in the News Letter of the American Society of Anesthesiologists, Inc., in a column called, "Hospital Planning and Construction."

The author has the ability to direct the reader's attention to specific problems and to make a number of suggestions which stimulate one to think in terms that best suit a local situation. If all the ideas presented were incorporated in a single plan the resulting structure would be unrealistic. However, it is helpful to realize that a small book exists which deals with many valuable suggestions in solving a highly complicated problem.

The author has used, to advantage, a number of photographs and cartoons to convey information or establish a point of view. These help to hold one's attention while data on highly technical though necessary details are placed before the reader. Dr. Dornette is to be commended for his readable style and the fact that he has explored the need and possibilities so thoroughly.

C. P. Wangeman, M.D.

PATHOLOGY FOR THE PHYSICIAN. Ed. 6, thoroughly revised. By William Boyd, M.D., Dipl. Psychiat., M.R.C.P. (Edin.), Hon. F.R.C.P (Edin.), F.R.C.P. (Lond.), F.R.C.S. (Can.), F.R.S. (Can.), L.L.D. (Sask.), (Queen's), D.Sc. (Man.), M.D. (Oslo), Professor Emeritus of Pathology, University of Toronto; Visiting Professor of Pathology, University of Alabama, Formerly Professor of Pathology, University of Manitoba and University of British Columbia. 900 pp. 489 illustrations and 12 plates in color. Price $17.50. Lea & Febiger, Philadelphia. 1958.

This is the sixth edition of the text previously published with the title, Pathology of Internal Diseases. It is up-to-the-minute and thorough, including discussions of such items as the carcinoid tumor-cardiovascular syndrome, and the fine structure of the kidney and its relation to function, as shown by electron microscopy. The photomicrograph illustrations, including the electron microscope reproductions, are good, but the gross pictures are few and of variable quality. There are a number of typographic errors. I noted most in the chapter on the adrenals.

Boyd's lucid and entertaining style of writing is well-known and needs no added comment. This book should be as popular as its predecessors.

Gordon LaZerte, M.D.

ETIOLOGY AND TREATMENT OF LEUKEMIA: PROCEEDINGS OF THE FIRST LOUISIANA CANCER CONFERENCE. Edited by Walter J. Burdette, Ph.D., M.D., Professor and Head of Department of Surgery and Director of Laboratory of Clinical Biology, University of Utah College of Medicine, Salt Lake City, Utah. 167 pp. Illustrated. Price $4.00. C. V. Mosby Co., St. Louis. 1958.

This is an almost verbatum transcript of a symposium on the Etiology and Treatment of Leukemia of the First Louisiana Cancer Conference. The date of this meeting is not recorded. It was sponsored by the Louisiana State University School of Medicine and Tulane University School of Medicine. The

book contains about 120 pages of text. Experts in each field present their views. Virus etiology of cancer is discussed by Jerome T. Syverton, etiology of leukemia by Arthur Kirschbaum, infectious concept of leukemia by Ludwik Gross and filterable agents prepared from leukemic tissue causing leukemia and other cancers in mice by Woolley.

The first part is probably the most interesting section of the book from the average practitioner's standpoint, because there is so much in the literature about viruses and cancer. They present arguments for and against a viral etiology and agreement is far from attained.

Treatment of leukemia is discussed but this type of material is more easily available than is the discussion of etiology of leukemia. It made excellent reading for me and I am sure it would for anyone else having any interest in the etiology of any malignancy. This is an interesting topic currently and many different concepts are explored.

Q. B. DeMarsh, M.D.

HANDBOOK OF TREATMENT OF ACUTE POISONING. Ed. 2. By E. H. Bensley, M.D., Associate Professor of Medicine and Lecturer in Toxicology, McGill University; and G. E. Joron, M.D., Assistant Physician, Department of Metabolism and Toxicology and Department of Medicine, Montreal General Hospital; Demonstrator in Medicine, McGill University. 212 pp. Price $4.00. E. & S. Livingstone Ltd., Edinburgh & London, 1958. Distributed by Williams & Wilkins Co., Baltimore.

This is a good handbook on poisoning which should be very useful in the physician's office. Substances are grouped under general headings as well as indexed individually, leading to a practical and quick reference system. Treatment is itemized at the same place in the book where the substance is listed and hence cuts down second checking which tends to be time-consuming. Of particular help in this book is a division in the treatment section of what to do until the physician arrives as well as what to do by the physician. The treatments are listed in adult doses which can be fairly adequately changed to pediatric doses when indicated.

Donald A. Sutherland, M.D.

SIGNS, SYMPTOMS AND TREATMENT OF CERTAIN ACUTE INTOXICATIONS. Ed. 2. By William B. Deichmann, Ph.D., Professor and Chairman, Department of Pharmacology, University of Miami, School of Medicine, Coral Gables, Florida; and Horace W. Gerarde, M.D., Ph.D., Bureau of Biological Research, Rutgers, The State University, New Brunswick, New Jersey. 154 pp. Price $3.75. Charles C Thomas, Springfield, Ill. 1958.

This is an excellent, comprehensive handbook. It has good indexing and up-to-date treatment. The first edition of this same book has been used in many physician's offices as well as Poison Control Centers. There is a good section on general supportive measures. Again the authors have prepared a handbook that covers most of the poisons encountered in everyday practice. No handbook can, of course, hope to cover even a large portion of the 250,000 plus products commercially available.

Donald A. Sutherland, M.D.

RELIGIOUS DOCTRINE AND MEDICAL PRACTICE. By Richard Thomas Barton, M.B., B.S., M.D., Associate Consultant, University of California. Foreword by Raymond B. Allen, M.D., Chancellor, University of California at Los Angeles. 94 pp. Price $3.75. Charles C Thomas, Springfield, Ill. 1958.

The author has presented, in a 90 page book, concise, factual, up-to-the-minute information for physicians whose practice includes patients of differing religious faiths.

What do the large religious groups in America believe about healing, the nature of disease, diet, and the role of the physician? Is there a place for spiritual healing? How can the physician cooperate with a priest or rabbi in restoring his patient to physical and mental health? These and many other questions are skillfully answered.

This book brings together for the first time the present day beliefs concerning medicine, disease, faith healing, abortions, birth control, artificial insemination, blood transfusions, and autopsies of the major religious bodies in the U.S.A. (i.e., Protestantism, Roman Catholicism, Judaism, Eastern Orthodox, Islam, Mormons, Jehovah's Witnesses, Adventists, Christian Science, Unity).

All physicians, especially psychiatrists, will find this book a valuable addition to their libraries.

Willard F. Goff, M.D.

MEDICAL TERMINOLOGY SIMPLIFIED. By Louis L. Perkel, B.S., M.D., Professor of Gastroenterology, Seton Hall College of Medicine, Jersey City, New Jersey. Foreword by Charles L. Brown, M.D., Dean, Seton Hall College of Medicine, Jersey City, New Jersey. 103 pp. Price $3.85. Charles C Thomas, Springfield, Ill. 1958.

Doctors and medical students who are interested in words and how they got that way will be fascinated by this book. For the student, it gives basic information on how medical terms are built and from what sources they derive. This is vital information for the novitiate.

For the older physician who thinks he knows already, there is still much of interest. Example: "symposium" in ancient Greece meant a drinking party with some intellectual conversation. Now it means a conference with intellectual conversation—but no drinking.

While the author may not be totally accurate as to the modern definition of the term, the word that the Greeks had for it starts an interesting trend of thought.

Symposium cannot be synonymous with cocktail party. Though the drinking is there, the conversation rarely can be termed intellectual. This implies that either the Greeks were a heartier breed or that their booze was watered down to considerably less than our standard 80-proof.

You will have fun with this book. I recommend it.

Eric R. Sanderson, M.D.

MODERN CLINICAL PSYCHIATRY. Ed. 5. By Arthur P. Noyes, M.D., Superintendent, Norristown State Hospital, Norristown, Pennsylvania; and Lawrence C. Kolb, M.D., Professor and Executive Officer, Department of Psychiatry, College of Physicians and Surgeons, Columbia University. 694 pp. Price $8.00. W. B. Saunders Co., Philadelphia and London, 1958.

The essence of viewpoint and facts in American psychiatry today are presented with overall comprehensiveness in this textbook. The first seven chapters appear to serve the purpose of getting on top of an immense amount of basic psychiatric insight. I felt a sense of frustration at the degree of verbiage and redundancy encountered in that attempt. However, after wading through this area, I was pleasantly surprised to gain a precipitate of orientation, quite valuable to the remaining 21 chapters. And perhaps this is the gain achieved at the cost of redundancy.

The remainder of the book consists of sufficient and yet concise chunks of knowledge. The final chapter deals with psychiatry and the law, which in my experience has been a vague area to most medical men engaged primarily beyond the field of psychiatry itself. Indeed, I commend this book as valuable psychiatric coverage for student and physician alike.

Bernard J. Pipe, M.D.

CHEMISTRY OF LIPIDES AS RELATED TO ATHEROSCLEROSIS: A SYMPOSIUM. Compiled and Edited by Irvine H. Page, M.D., Cleveland Clinic Foundation, Cleveland, Ohio. 342 pp. Price $8.50. Charles C Thomas, Springfield, Ill. 1958.

In this series of 18 lectures, scientists from California to Sweden take the student back to his biochemistry, then push him through a rapid preview of such matters as gas-liquid chromatography, cis-trans forms, plasmalogens, lipoprotein lipase, and

(Continued on page 1672)

(Continued from page 1671)

other complex matters, such as cellular enzymology and thioltransacylation. There is one lecture only, by E. H. Ahrens, Jr., that deals with current clinical experiments on unsaturated fatty acids—and this seems misplaced and limited in perspective in the midst of the more basic reports. Some of the material, I find, serves to sharpen the focus of the fading outlines of my biochemistry. Some serves to increase my acquaintance with current approaches and techniques even if I do not fully understand the details. And some is gibberish to me.

William E. Watts, M.D.

CLINICAL AND IMMUNOLOGIC ASPECTS OF FUNGOUS DISEASES. By J. Walter Wilson, M.D., Los Angeles, Calif., Clinical Professor of Medicine (Dermatology), University of Southern California. 280 pp. Price $6.75. Charles C Thomas, Springfield, Ill. 1957.

Better start at the beginning of this book. So often in medical texts one may read chapters in any order without loss of continuity. Not so here, where the introduction leads to chapter one and the first few chapters lay the groundwork for the rest of the book.

The author feels that study of the systemic fungous disease, coccidioidomycosis, delineates some clues which are especially valuable in bettering our understanding of the mycoses in particular and of the infectious diseases in general. As he presents it, this disorder exhibits a unique series of well defined phenomena which, when correlated with the clinical course of the disease, serves to advance one's understanding of epidemiology, pathology, allergy and immunology. Some of these phenomena are duplicated, at least partially, in several of the deep mycoses and indeed in some non-mycotic diseases. Throughout the book the author pursues an interesting thread of theory that gradually unfolds and makes for continuity in what, at times, appears to be apparent contradiction.

This is a book that will stimulate your thinking and will contribute to your true understanding of this too frequently neglected area in medicine.

E. Harold Laws, M.D.

MANUAL ON CARDIAC RESUSCITATION. Ed. 2. By Robert M. Hosler, M.D., Cleveland, Ohio. 208 pp. Price $5.50. Charles C Thomas, Springfield, Ill. 1958.

The thoracic surgeon has mixed feelings when reading this manual. It would appear that the book might well have been coauthored by Dr. Claude Beck since the majority of the information included is his and he is referred to constantly. Further, the first half of the manual is redundant with non-contributory details of history, mechanisms of heartbeat and etiology of cardiac arrest. The actual meat of the book is succinctly outlined in a few pages in the middle of the book and this would well accomplish the purpose of the manual without the other information that has been included. However, the additional information does make interesting reading.

It seems to me that the most important contribution of the book, since the treatment of cardiac arrest is now rather clearly understood in all major hospitals, is the suggestion that cardiac massage and defibrillation be used in instances of acute coronary insufficiency with mechanism death. Certainly a significant number of people who die of coronary insufficiency could be saved by using this method promptly. The suggestion made by the author that these patients be grouped in convenient areas of the hospital with adequate equipment available is an excellent one. It would seem mandatory to put some such plan into operation.

The techniques of resuscitation following drowning deserve more amplification and a more prominent place in the manual.

If this book were required reading for all interns, a new generation of physicians would have a basic understanding that perhaps many physicians currently practicing do not possess. Certainly there would be benefit to all practicing surgeons in at least scanning the book in order to be fully cognizant of the facts that Dr. Hosler is presenting, even though many surgeons undoubtedly have these facts at their fingertips.

Franklin R. Smith, M.D.

ESSENCE OF SURGERY. By C. Stuart Welch, M.S., M.D., Ph.D., Professor of Surgery, Albany Medical College of Union University, Albany, N.Y.; and Samuel R. Powers, Jr., M.D., M.Sc.D., Professor of Experimental Surgery, Albany Medical College of Union University, 320 pp. 50 figures. Price $7.00. W. B. Saunders Co., Philadelphia. 1958.

A summing up of one's thinking on any subject sems apropos in the field of general surgery and is certainly not only the prerogative of novelists, philosophers and others. I think every doctor would do well to review this 300 page summing up of principles of surgical treatment which have withstood the test of time and have remained foremost in the thinking behind this recording of a large surgical experience. The first chapter is a brief review of surgical history with a discussion of the physiologic advances of our present century, a discussion of the influence of the two great wars, with reference to the dilemma of surgical specialization and with a brief review of experimental surgery at this time.

Prior to a discussion of the principles of surgical treatment the authors discuss in considerable detail much of what we understand of the phenomenon of bodily injury, wound healing, loss of body fluids, with a summary of our present knowledge regarding types of and concepts in the etiology of shock. The author elucidates principles in the treatment of

(Continued from page 1672)

infection after discussing the nature of same, principles of pre- and postoperative care, principles of operative management and technique, principles of extirpative surgery, reconstructive surgery, physiologic surgery with a discussion of the role of surgery in the modification of body function. It is interesting to see a summary of the experience in the last two wars relative to the interruption of critical blood vessels and the effect thereof.

I think the amount of basic important information included in this small volume far exceeds that included in much more prolific efforts and I feel it would be worth a great deal to all doctors though it will be likely most attractive to surgeons.

Allan W. Lobb, M.D.

ORR'S OPERATIONS OF GENERAL SURGERY. Ed. 3. By George A. Higgins, M.D., Associate Professor of Surgery, University of Kansas School of Medicine; Lecturer in General Surgery and Surgical Technique, University of Kansas City School of Dentistry; and Thomas G. Orr, Jr., M.D., Associate in Surgery, University of Kansas School of Medicine, Kansas City, Missouri. 1016 pp. 1990 illustrations on 835 figures. Price $20.00. W. B. Saunders Co., Philadelphia. 1958. .....

This book is the revised (third) edition of the fine operative manual written by Dr. Thomas G. Orr, Sr., in 1944. It was in the process of revision by Dr. Orr when he died, the revision being completed ably by his students, the present authors.

The book includes a tremendous field of operative procedures which are well proven, and many which are still in the process of development. Because of the large number of procedures described, detail has been omitted in many. There is detail, however, in many common operations described. This gives the book great value for those who do not do a great volume of surgery. The major procedures, such as aortic grafting, are described in summary. However, a well selected bibliography at the end of each general system refers the reader to as much detail as he will ever need.

The illustrations are satisfactory and do much towards describing the operations. The original art work is well reproduced. Borrowed illustrations are mediocre to poor in their reproduction.

The book is a fine reference for the student and surgical house officer. It is valuable for the physician who does little or no surgery, as a résumé of procedures. The practicing surgeon will find its usefulness limited because of the vast amount of material covered in insufficient detail.

J. Thomas Payne, M.D.

DIAGNOSTIC MEDICAL PARASITOLOGY. By Edward K. Markell, Ph.D., M.D., Assistant Professor of Infectious Diseases, Division of Parasitology and Tropic Diseases, Department of Infections Diseases, School of Medicine, University of California, Los Angeles; and Marietta Voge, M.A., Ph.D., Assistant Professor of Infections Diseases, Division of Parasitology and Tropic Diseases, Department of Infectious Diseases, School of Medicine, University of California, Los Angeles. 276 pp. 115 figures, 5 in color. Price $7.00. W. B. Saunders Co., Philadelphia and London. 1958.

After a brief period of looking parasites more or less in the eye during World War II, most of the looking eyes, along with the heads of their owners, seem to have gone back into the sand. Disinterest, if not rampant, is at least common. It is a little hard to understand. Parasites do exist even in temperate zones. To be sure, those vectored by arthropods are not apt to be seen, except perhaps in persons brought swiftly to stateside airports, from other climes, but intestinal parasites are not strangers here. Some believe that potentially harmful amoebae can be found in at least one of every ten patients seen in the average medical office. Perhaps, like putting a finger in the rectum, searching in the stool for evidence of parasitic infection stirs up some subconscious disrelish in those whose medical motivation is toward other portions of the anatomy and away from the unpleasantness of messing around with excreta.

This small volume by Markel and Voge can be helpful to the physician who does not wish to overlook diseases caused by parasites. It is not, however, a discussion of those diseases. The reader will have to supply his own index of suspicion. The book is exactly what its title says it is, although common clinical conditions are described briefly. It is mainly concerned with description of each parasite and with mehods used in identification. Helpful illustrations have been used liberally.

Herbert L. Hartley, M.D.

CARBON DIOXIDE THERAPY. Ed. 2. Neurophysiological Treatment of Nervous Disorders. Edited by L. J. Meduna, M.D., Professor of Psychiatry, University of Illinois, College of Medicine, Chicago, Ill. 541 pp. Price $14.50. Charles C Thomas, Springfield, Ill. 1958.

The larger part of this book, about four-fifths of it, consists of reports of carbon dioxide therapy on various psychoneurotic states. Those who have used carbon dioxide and are already convinced of its usefulness will find much to support their position in this section of the book. The contributors in general are quite enthusiastic. Those who may be more skeptical of its value will find much to criticize. One gets the impression that there are practically never any failures since all of the cases reported gained at least some measure of benefit from this form of therapy. One cannot help having some misgivings regarding this because no form of therapy can be quite as good as is implied in this section of the book. There are no reports of any real failures, and no controlled experimental design is evident in the reports.

The first section of the book deals with technique and theory and is written by Dr. Meduna. A great deal of evidence is presented concerning undeniable effects of carbon dioxide on physiologic systems but it appears at times as if the author is stretching these in order to substantiate the observed clinical effects. The chapter on "Techniques and Administration of Treatment" is clear both as to the apparatus involved and the methods of administration.

One must remember that this book appears only 11 years after the introduction of carbon dioxide therapy by Meduna in 1947. It appears that there are distinct possibilities to this form of therapy but that the specific indications have not yet been clarified and that a sound fundamental rationale for its effectiveness in certain cases has yet to be formulated.

J. M. Dille, M.D.

CRIME AND INSANITY. Edited by Richard W. Nice. 280 pp. Price $6.00. Philosophical Library, New York. 1958.

This book is more a series of essays than an integrated discussion of the problem. The editor in following his expressed desire to make ". . . no effort to limit the selection of topics discussed by contributors . . ." has sacrificed a unified approach and thorough discussion. However, he gains an interesting diversity of opinion as experts in different disciplines examine the questions of the inter-relationship of crime, insanity, the individual and society. This divergence of viewpoint and approach is one of the main assets of the book. The lack of coordination manifests itself most in the repetition of common thoughts by the various experts and is most notably lacking in the apparent omission of discussion of certain points which may have reflected divergent opinions.

In spite or because of this laissez faire approach to editing, the book is a worthwhile study in a serious sociologic problem. Most doctors will find little to help them in their everyday practice, but can gain an insight into present opinions and their logical explanation. The importance of this development in medical-legal conceptions is well-known to all who take even a passing interest in the problems of society. Psychiatrists will be particularly interested in reading the sections devoted to changing legal ideas and their relationship to psychiatric testimony.

LIVERMORE SANITARIUM

This facility provides an informal atmosphere seldom found in hospitals elsewhere. A sound and scientific approach to emotional problems is provided with careful deliberation, with the patients' best interests given every consideration. Our approach is eclectic with emphasis along the lines of dynamic and psychobiologic psychiatry. Every recent therapy is available.

Individual services are amply provided for; in individual cottages if desired, so that the patient's every need is considered.

All diagnostic and ancillary consultative services are available.

Information upon request.

It is not possible to make any blanket statement concerning the style, since it is as heterogeneous as the substance. Some of the authors have done a masterly job in clarity of presentation, but some are muddied by the verbiage of sociologic patois.

Paul J. Alexander, M.D.

THE NEUROLOGIC EXAMINATION — Incorporating the Fundamentals of Neuroanatomy and Neurophysiology. 2nd Ed. By Russell N. DeJong, M.D., Professor of Neurology and Chairman of Department of Neurology, University of Michigan Medical School. 1078 pp. Illustrated. Price $20.00. A Hoeber-Harper Book, Paul B. Hoeber, Inc., N. Y. 1958.

This is a second edition of a book that can truly be called different than other texts in the field of neurology. It performs efficiently a necessary function in this specialty—namely, that of teaching. It is written by a man with a vast fund of knowledge in the field and deals primarily with neurology as it should be taught at all levels of educational attainment.

It is different from the standard neurologic text in that it is not concerned primarily with pathology and pathologic changes but, instead, deals with signs and symptoms and their correlation with neuro-anatomy and neuro-physiology. This is the essence of the specialty of neurology.

Each portion of the neurologic examination is discussed in detail and the basic reasons for the different responses obtained are presented.

This is not a small monograph but is a book of reference proportions, composed of 1,078 pages.

I would recommend this text particularly to those who see occasional neurologic problems and wish a ready reference for anatomic and physiologic correlation of their clinical findings.

John R. Mullins, M.D.

ELECTROCARDIOGRAPHIC ANALYSIS, Vol. I: BIOPHYSICAL PRINCIPLES OF ELECTROCARDIOGRAPHY. By Robert H. Bayley, M.D., Professor of Internal Medicine, Director of Heart Station, University of Oklahoma School of Medicine and University Hospitals, Oklahoma City. 237 pp. Illustrated. Price $8.00. Paul B. Hoeber, Inc., 1958.

This book is volume I of a projected two volume set. As stated in the title, this volume concerns biophysic principles. The second volume is to deal with the clinical applications of electrocardiography.

The author explains the formation of the various electrocardiographic wave forms and their projections as vectors on the triaxial reference system. The book presents a rather formidable first impression in that numerous equations suggest that a knowledge of physics is a prerequisite to understanding the contents of the book, and this alone usually scares away the majority of physicians. In addition, there is a glossary of abbreviations and Greek letter symbols which covers nine pages, and with which the reader must first familiarize himself before he can understand the contents.

Halcyon Hospital, Inc.
9239 - First N. E.
Seattle 15, Wash.
LAkewood 2-7631

A private hospital for the treatment of nervous and mental illnesses. Dynamically oriented individual psychotherapy and modern somatotherapies. High ratio of psychiatrically trained staff to patients. Occupational and recreational therapy department with registered therapist. Open psychiatric staff.

Nonetheless, once this difficulty is overcome the book becomes quite readable and is really not as formidable as it first appears. Very logical and basic explanations are given for the various abnormal electrocardiographic wave forms. The subjects of myocardial infarction, peri-infarction block, and primary and secondary T-wave changes are particularly well covered in my opinion.

The physical aspects of the book are especially inviting; it is very attractively bound with excellent illustrations, both diagrams and reproductions of tracings. The subject matter is well organized and it is not repetitious.

It is certainly not a book with which one could "brush up" on a superficial knowledge of electrocardiography, but it will reward anyone who wishes to reinforce his basic concepts of the formation of electrocardiographic patterns. No attempt is made to cover abnormalities of rate and rhythm. I am looking forward with great interest to the second volume which will deal with the clinical applications of these principles.

John D. Collins, M.D.

CIBA FOUNDATION SYMPOSIUM ON CEREBROSPINAL FLUID—Production, Circulation and Absorption. Edited by G. E. W. Wolstenholme, O.B.E., M.A., M.B., B.Ch.; and Cecilia M. O'Connor, B.Sc. 335 pp. 141 illustrations. Price $9.00. Little, Brown & Co., Boston. 1958.

This small volume (which, like most current medical books, is overpriced) offers the interested reader a considerable return for the time invested. The current status of fact and speculation regarding cerebrospinal fluid physiology is well covered by an impressive panel of experts, not all of whose views are non-controversial.

The book, like the symposium of which it is a record, is not designed as a "practical" work, in the sense that one can refer to it to solve problems arising in the course of patient care. Rather it brings together the knowledge and opinions of a group of men whose interests have dictated energetic labors on certain aspects of the cerebrospinal fluid. Thus, although any physician who sees patients with central nervous system disease may find useful data, the individuals to whom this book will be of greatest use is the specialist in nervous system physiology, whether he be interested in clinical medicine or in basic science.

Lawrence M. Knopp, M.D.

CORRELATIVE NEUROANATOMY AND FUNCTIONAL NEUROLOGY. Ed. 9. By Joseph G. Chusid, M.D., and Joseph J. McDonald, M.S., M.Sc.D., M.D., Dean of Medical Faculty, American University of Beirut, Lebanon; Formerly Professor of Surgery, Columbia University, New York. Illustrated by Ralph Sweet. 344 pp. Price $4.50. Lange Medical Publications, Los Altos, Calif. 1958.

The authors and publishers of this book may look with pride upon the product of their labors. It is a volume designed to orient the physician in neurology and it performs this admirably. It is lucid throughout and places emphasis on those aspects of the basic neurologic sciences which are of practical importance. It makes no pretense at being a reference work for theoreticians. I believe "Correlative Neuroanatomy and Functional Neurology" is the book which best satisfies the needs of the medical student during his clinical years, the house officer during his training, and the general practitioner and internist in his daily practice. The diagrams and drawings are of the highest order, culled from the most authoratative sources and reproduced with clarity. The book is inexpensive but sturdy (paperback cover). Criticism might be made of the brief section on chronic subdural hematoma and internal carotid artery thrombosis, entities which are of increasing clinical import. There are excellent brief discussions of electromyography, cystometry and audiometry, but perhaps too much space is given to electroencephalography. The index is excellent.

Gerald R. Nowlis, M.D.

PHYSICS FOR THE ANAESTHETIST—Including A Section on Explosions. Ed. 2, By Sir Robert Macintosh, D.M., F.R.C.S.E., F.F.A.R.C.S., M.D. (hon. causa) Buenos Aires and Aix-Marseilles, Nuffield Professor of Anaesthetics, University of Oxford; William W. Mushin, M.A., M.B., B.S., F.F.A.R.C.S., Professor of Anaesthetics, Welsh National School of Medicine, University of Wales; Formerly First Assistant, Nuffield Department of Anaesthetics, University of Oxford; and H. G. Epstein, M.A., Ph.D., F.F.A.R.C.S., First Assistant, Nuffield Department of Anaesthetics, University of Oxford. 443 pp. Price $15.50. Charles C Thomas, Springfield, Ill. 1958.

Anesthesiologists everywhere will welcome the return of this textbook in its second edition after having been out of print for five years. Its success in reviewing and demonstrating applications of elementary physics to the behavior of anesthetic gases and to mechanics of anesthetic apparatus has made it indispensable to those seeking a clearer understanding of them. It will be sought after especially by those preparing for anesthesia specialty board examinations.

The authors—all originally at Oxford, England—have succeeded in accomplishing the notoriously difficult task of reconciling a reasonable degree of scientific accuracy with simplicity, brevity and readability. The occasional use of peculiarly British terms, such as "earthed" (electrically grounded), does not detract appreciably from the value of the textbook in the United States.

Entire chapters are devoted to clarify physics of gaseous density, specific heat, vaporization, heat loss, latent heat of crystallization, gas laws, reducing valves, flow of fluids and gases through tubes and orifices, diffusion and osmosis, physical data and conversion factors. Reference to the newer anesthetic, halothane (Fluothane), is missing.

Four chapters have been added to this edition on oxidation, combustion and explosions. This new section contains much valuable information for those who must concern themselves with explosive hazards in operating rooms. However, the style of some of the material in these new chapters is not consistent with the elementary, easily-assimilated approach of the others, nor have the authors reverted here to the orthodox approach of other physics textbooks. To me, the result was somewhat disappointing. This, however, is a minor detraction from this otherwise splendid text.

The format and printing are excellent. It is replete with colored illustrations which are unusually effective in explaining abstract physical principles and for diagraming the inner works of anesthetic equipment.

Physics for the Anaesthetist should be a part of every anesthesiologist's library and will be of value, as well, to others active in related fields, such as inhalation therapy and pulmonary function studies.

Kenneth F. Eather, M.D.

A TEXTBOOK OF PSYCHOLOGY. By Donald Olding Hebb, Professor and Chairman, Department of Psychology, McGill University, 276 pp. 78 figures. Price $4.50. W. B. Saunders Company, Philadelphia and London. 1958.

This college textbook, clearly conceived, well written, and excitingly challenging, is a definite improvement over several other texts of which I am aware. I tested it on my son, who had just taken a course in psychology and his response was: "Why, this makes psychology interesting."

The material is dealt with in such a manner that the student is invited to constantly expand his views and raise his sights. It encourages him to seek the unknown around the next corner. It leaves with him a feeling that we are indeed "wonderfully and fearfully made."

The chapter headings in this book are as follows: 1. Behavioristics and the study of the mind; 2. mental processes: the inference from behavior; 3. modes of sensory control: reflex and mediating process; 4. the nervous system; 5. neural transmission; 6. heredity, maturation, early learning; 7. problems of learning and memory; 8. motivation: needs, drives and emotions; 9. perception, knowledge and response; 10. problems relating to thought; 11. statistical thinking; 12. problems of measurement; and 13. psychology and the scientific method.

The writer attempts to avoid dogmatism, and admits in the closing paragraphs that, "We have hardly begun to understand the human mind. The complexity of the events controlling behavior is too great to be analyzed in terms of nerve impulses or the detailed relations between specific structures of the CNS."

We are reminded of St. Paul's description of his own mind and behavior: "My own behavior baffles me. For I find myself not doing what I really want to do but doing what I really loathe . . . I often find that I have the will to do good, but not the power. . . . When I come up against the Law, I want to do good, but in practice I do evil. My conscious mind wholeheartedly endorses the Law, yet I observe an entirely different principle at work in my nature. This is in continual conflict with my conscious attitude, and makes me an unwilling prisoner to the law of sin and death . . . It is an agonizing situation . . ." (Phillips translation).

When all is said and done, does scientific materialism offer a satisfying answer to the problem of understanding and helping the human personality in need?

Ivar W. Birkeland, M.D.

BLOOD GROUPS IN MAN. Ed. 3. By R. R. Race, Ph.D. (Cambridge), M.R.C.S. (England), F.R.S., Director, Medical Research Council Blood Group Research Unit, The Lister Institute, London; and Ruth Sanger, Ph.D. (London), B.Sc. (Sydney), Medical Research Council Blood Group Research Unit, The Lister Institute, London. Foreword by Professor Sir Ronald Fisher, F.R.S. 377 pp. Price $8.50. Charles C Thomas, Springfield, Ill. 1958.

In the field of blood grouping, Drs. R. R. Race and Ruth Sanger hold unquestioned pre-eminence. Since 1950, when the first edition of their book appeared, this famous pair have maintained a world-wide reputation as the authorities to whom one turns when faced with difficult problems in the identification of red cell antigens and antibodies.

In recent years, blood group investigation has grown in proportion to the increased numbers of blood transfusions given and the newly-awakened interest in medical genetics. As a result, the blood group systems (which were nine in number and fairly readily understood in the second edition of this book) have increased to eleven and have become much more complex. It is no longer possible to ignore such phenomena as gene mutations, modifying genes, suppressor genes, gene deletions, and apparent position effect of one gene on another.

Faced with the problem of fitting these and many other phenomena into a pattern which is at once understandable and reasonable, the authors have succeeded in clarifying a great deal of heterogeneous information which has appeared in the literature since their previous book. Their delightful style has not failed them, making what could be difficult reading into a pleasant experience.

Race and Sanger are the first to admit that there remain many perplexing serologic puzzles which defy explanation at the present time. This is particularly obvious in their chapter on the Lewis groups which contains statements of disarming frankness such as "We try to think of Leb as little as possible" or "Pettenkofer has a theory, but it is in German and it beats us: Lewis theories are difficult enough in English."

Of especial value are the sections on the ABO and Rh blood group systems. The latter has been masterfully confined within a single chapter in spite of the introduction of a great deal of new material. By referring to their earlier editions or to original papers, lengthy discussions have been avoided, leaving a readily-digested nucleus of important information.

Blood Groups in Man has become a classic, and the third edition is an absolutely essential addition to the bench of the laboratory worker in this field and to the library of anyone whose interests include blood transfusion, hematology, serology, or genetics.

NEW DRUGS

Monthly report on most recent introductions by the pharmaceutical industry.

Diabinese Tablets (Pfizer)
In selected diabetic patients it eliminates or decreases the requirements for insulin and provides satisfactory control.

Calcicaps—Phosphorus Free Tab. (Nion)
Where phosphorus-free calcium therapy is indicated.

Cevipak Tablets (Nion)
For prevention and treatment of allergies and the common cold.

Nino Tabs Tablets (Nion)
Dietary supplement for the growing child.

Name Change:
From **Chlor-Trimeton** (Repitabs and Compound Syrup);
To **Demazin** (Repetabs and Syrup)

Novahistine-DH Tablets (Pitman-Moore)
For relief of cough and nasal congestion. Narcotic comp.

10 VK Liquid (Wyeth)
For common bacterial infections including streptococcal, pneumococcal, and susceptible staphylococcal types.

Triquin Tablets (Winthrop)
For Lupus Erythematosus especially the chronic discoid type, polymorphic light eruptions, and solar urticaria.

Turgasept Aerosol (Turgasept)
For bactericidal, fungicidal, and "odorcidal" use in hospitals, sick rooms and clinics.

Hemoid Ointment (Boyle)
For treatment of hemorrhoids.

LH 400 Injection (Darwin)
Anticoagulant for use in the prevention and treatment of thrombosis-embolism. Contraindicated in severe liver disease and where internal bleeding is a factor.

Halodrin Tablets (Upjohn)
For symptomatic relief of the menopause, male climacteric, and osteoporosis.

Biomydrin Cold Tablets (Warner-Chilcott)
For symptomatic relief of the common cold. (Limited marketing)

Trilafon Suppositories (Schering)
For nausea and vomiting in adults and as a tranquilizer and antiemetic in children.

Cosa-Tetracyn Pedi. Drops (Pfizer)
For treatment of a broad range of bacterial infections in children.

Elphetamine Tablets (Canright)
For mood elevation and appetite control.

Muripsin Tablets (Norgine)
For HCl deficiencies associated with gastrointestinal unrest, gastritits, chronic febrile diseases, convalescence, allergies, pernicious anemia, and gastric resection.

Nolamine Tablets (G. W. Carnick)
For relief of upper respiratory and nasal congestion associated with common colds.

Ger-Esco Tablets (Esco)
For use in geriatric therapy.

Cozyme Injection (Travenol)
For cases of intestinal atony and abdominal distention to relieve postoperative retention of flatus and feces.

Phytex Liquid (Wynlit)
For treatment of dermatomycosis.

Super Hydramin Powder (Nion)
May be used either as a sole dietary source or as a dietary supplement.

Lavedrine Capsules (Lenz)
To depress appetite in obesity control.

Trancopal Tablets (Winthrop)
A non-hypnotic muscular relaxant and tranquilizer that works on the CNS by selective inhibition of reflexes without affecting normal alert consciousness or autonomic function.

Gast-Rex Tablets (Maney)
For the management of peptic ulcers and for the relief of gastric hyperacidity.

Iloclor Tablets (Haskell)
For symptomatic relief of allergies and the common cold.

Flavahist Baby Cough Syrup (Boyle)
For relief of simple cough due to common cold.

U. R. I. Capsules (Darwin)
For symptomatic relief of symptoms of URI and common cold.

Hormozyme Tablets (Upjohn)
Where hormone therapy is required in menopausal symptoms, male climacteric, general debilitation and osteoporosis of various etiology.

Lipomul I. V. Inj. (Upjohn)
Oil-in-water emulsion; each 500 cc. supplies approximately 800 calories.

Nitrovas Tablets (Amfre-Grant)
For long-term management of angina pectoris through coronary vasodilation.

Pro-Duosterone Tablets (Roussel)
For diagnosis of pregnancy in its earliest weeks.

Monocidene Liquid (Klee)
Vaginal douche for trichomonas vaginitis and astringent effect.

Decadron Tablets (Merck, Sharp & Dohme)
For a variety of allergic and inflammatory disorders.

Blessamine Capsules (Marvin R. Thompson)
Prenatal dietary supplement.

Stelazine Tablets and Inj. (Smith, Kline & French)
For the treatment of psychopathic patients such as withdrawn, apathetic schizophrenics; chronic patients refractory to other therapies; delusions and hallucinations.

Barbacaine Drops (Cutter)
Antispasmodic-sedative for infant colic. Does not contain belladonna or its alkaloids.

Betadine Vaginal Douche (Tailby-Nason)
For moniliasis, trichomoniasis, and nonspecific vaginitis.

Fluor I Strip Strips (Ophthalmos)
For diagnostic procedures where staining of the eye is desired.

Hydro-Tar Cream (Almay)
Indicated as an antipruritic, anti-eczematic and anti-inflammatory agent.

Neo-Resulin-F Cream
Resulin-F Cream (Almay)
For acne rosacea and acne vulgaris.

Betadine Aerosol Spray (Tailby-Nason)
For preoperative preparation and postoperative protection of the surgical area.

Vanul Suspension (Vanguard)
For gastric and duodenal ulcers.

Orabilex Capsules (Fougera)
Medium for x-ray visualization of the gallbladder.

Taomid Tablets & Syrup (Roerig)
For infections caused by Streptococci, Staphylococci, and Pneumococci. Also mixed urinary infections involving Gram neg. organisms.

(For more complete information on action, use and dosage, see the latest issue of *PharmIndex* available at your regular prescription pharmacy.)

Many such hypertensives have been on *Rauwiloid* for 3 years and more*

for Rauwiloid IS better tolerated... "alseroxylon [Rauwiloid] is an antihypertensive agent of equal therapeutic efficacy to reserpine in the treatment of hypertension but with significantly less toxicity."

*Ford, R.V., and Moyer, J.H.: Rauwolfia Toxicity in the Treatment of Hypertension, Postgrad. Med. *23*:41 (Jan.) 1958.

For gratifying Rauwolfia response

Rauwiloid®

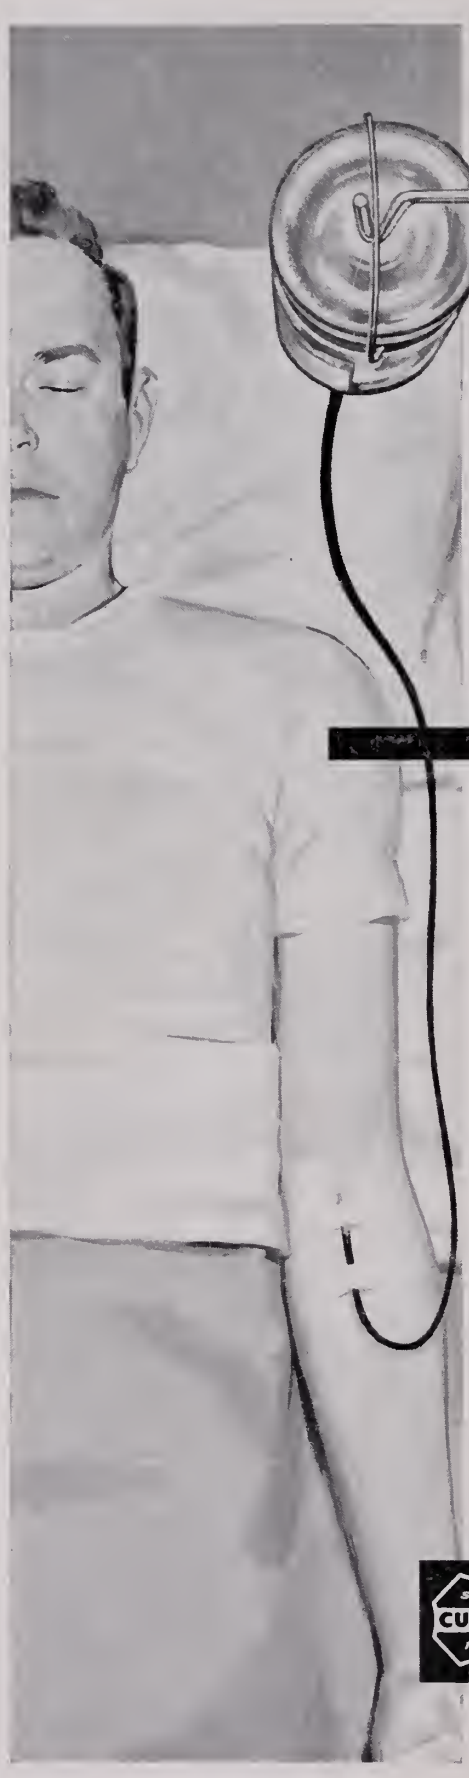
ALSEROXYLON, 2 MG.

virtually free from side actions

just two tablets at bedtime

After full effect one tablet suffices

Enhances safety when more potent drugs are needed.



Rauwiloid® + Veriloid®
alseroxylon 1 mg. and olkavervir 3 mg.
for moderate to severe hypertension.
Initial dose, 1 tablet t.i.d., p.c.

Rauwiloid® + Hexamethonium
alseroxylon 1 mg. and hexomethonium chloride dihydrate 250 mg.
in severe, otherwise intractable hypertension. Initial dose, ½ tablet q.i.d.

Both combinations in convenient single-tablet form.

Riker
NORTHRIDGE, CALIFORNIA

Library,
College of Phy.of Phila.
19 South 22nd Street,
Philadelphia 3,Pa.

REGAIN

ELECTROLYTE BALANCE PROMPTLY

- improve blood volume
- restore circulatory and renal efficiency
- control or prevent hypopotassemia

with **POLYSAL**® for replacement

Electrolyte Composition
(milliequivolents per liter)

CATIONS		ANIONS	
Sodium	140 mEq.	Chloride	103 mEq.
Potassium	10 mEq.	*Bicorbonote	55 mEq.
Colcium	5 mEq.		
Mognesium	3 mEq.		

*Obtoined from metobolic conversion of ocetote ion.

Avoiloble in Distilled Woter or 5% Dextrose in 250, 500, 1000 cc. Softiflosks.®

MAINTAIN

ELECTROLYTE BALANCE SMOOTHLY

- eliminate "saw-tooth" effect to prevent water intoxication, edema, overloading
- supply basic needs of electrolytes
- provide uniform hydration

with **POLYSAL®-M** for maintenance

Electrolyte Composition
(milliequivolents per liter)

CATIONS		ANIONS	
Sodium	40 mEq.	Chloride	40 mEq.
Potossium	16 mEq.	*Bicorbonate	24 mEq.
Colcium	5 mEq.		
Magnesium	3 mEq.		

*Obtoined from metobolic conversion of loctote ond ocetate ions.

Avoiloble in 2½% Dextrose in Softiflosks®—250, 500 cc.; in 5% Dextrose in Softiflasks—250, 500 ond 1000 cc.; in 10% Dextrose in Saftiflosks—500 ond 1000 cc.
